Should the student proceed on his account, the lectures necessary for the L.R.C.S.I. will amount to £65; hospital attendance about £25; lying-in hospital from £4 4s. to £7 7s. These, with the diploma fee of £26 5s., represent the essentials. The sum of £50, paid down at the commencement is taken by the College of Surgeons as payment in full for all lectures requisite, and all the hospitals allow a considerable discount. Thus, the absolute payment will amount to somewhere about £83, taking the minimum mode of payment. In addition to this sum are to be considered the payments for "grinding" or "coaching," as the Londoners call it, a process almost universal, but by no means necessary to any industriously inclined student. The fixed sum is at present, for private teaching, £15 15s. for the surgical and medical qualifications, and £5 5s. for pharmacy, &c. Should the candidate "grind" for the army and navy examinations, a fee varying from £10 10s. to £21 is, we believe, usual. Should the candidate perform operations on the subject as a practice, they will cost something extra. So that, assuming the extras or voluntary costs are incurred, the total will vary, say, from £114 to £120 on a moderate scale: it is, of course, to be expected that pupil holders should have some extra payment; we therefore might name for them 140 guineas.

PAYMENT OF FEES.

If the student becomes an apprentice, he need not trouble himself about his payments. If he is his own manager, he must enter his name with the secretaries of the school and hospital, and pay for the lectures and hospital he intends to take out. If he is wise he will not adjourn the majority of his lectures, as he may, to the next year, but will take in his first year a full third of his curriculum. He is *supposed* to pay the professor's fee or hospital fee in full on entering his name, but few students do so; and many, we are sorry to say, are in the habit of entering for the minimum allowable number of lectures, and paying the minimum allowable proportion of the fee, putting off the attendance perhaps for ever, certainly until the last moment, and adjourning the payment until it becomes necessary to take up the certificates.

By a most objectionable laxity of system a student may get credit for one of his four years of attendance by paying a couple of guineas for dissections, and he may think himself safe in doing so if money be scarce; but if he does not pay his full third or fourth of the fees each year it often happens that he has to put off his examination from year to year—perhaps for ever—for want of the money to pay the accumulated fees of previous years.

The entry of names and commencement of study is supposed to date from the 1st of October in each year, but really does date from the 1st of November, and may be delayed by the dilatory until the 25th of the same month.

The student then begins work, attending hospital each morning at nine o'clock, and occupying his day from half-past eleven to five between lectures and dissections. His holidays —if the term be not ignoble—are a fortnight at Christmas and a week at Easter, and he finally returns home at the end of July.

The progress of each year is the same, except that he usually devotes more attention to "grinding," dissection, and hospital dresserships, and less to lectures in his later years of study. At the end of his second year he will take his "first half" examination, and by so doing relieves himself, in a great measure, of the study of anatomy, and be in the position of devoting his third year to surgery and medicine. After the expiration of his third session, his student life, whether it begin in laziness and end in hurry and incompetency, or whether it commence in diligence and end in the confidence of proficiency, ends with the last examination, and he goes forth into the world either an ignoramus or a reliable surgeon, whichever his choice may have been.

PRIVATE TEACHING, OR "GRINDING."

The classes for private instruction, or "grinding," as it is technically and generally called, are carried on in Dublin with universality and success.

As a rule, all private teachers are connected with schools of medicine, and being also hospital physicians or surgeons, can afford special advantages in the way of clinical instruction to their pupils.

Grinding is followed in two methods—namely, on what are commonly known as the "public" and the "private" plans. In the former, a number of gentlemen, varying in different schools from two to four, associate themselves into a firm, or co-partnership, and each man, selecting particular branches, gives instruction to those only. For these classes a pupil may enter at any period of his course, by payment of a certain sum: but as the amount demanded generally is the same at whatever period of his course the student joins the class, and as he is taught for it until he obtains his degrees, it is usual to enter as early as possible, so as to secure the largest amount of instruction; but while there can be no objection to entering the name at the earliest period, we strenuously advise the student not to devote himself to "the grind" for the first, or even for his second year of study, but to apply himself to his hospital and dissecting.

"Private grinding" is simply an arrangement quite independent of the other. A student who may, or may not, be a member of another class wishes for instruction; he goes to a "grinder," who, for a sum of, usually, £3 3s. per month, instructs him in the required branches of his profession. As a rule, each teacher devotes himself to particular subjects: thus, one gentleman grinds in, perhaps, Anatomy, Physiology, Surgery, and Medicine, another in Surgery alone, whilst a third will teach Chemistry, Botany, and Materia Medica.

Each of these plans will be perceived to have its own particular advantages. By entering for public grinding a pupil, on the payment of a moderate sum, secures that he shall be taught all his necessary subjects; while, on the other hand, if he enters for private grinding, he may, from being in a smaller class, secure a larger amount of individual attention; but does so at an increased expense, and must pay separately for the various branches of his teaching.

It does not require a very arithmetical head to see the difference between paying—say £15 15s.—for being taught for four years at least, in Anatomy, Physiology, Medicine, and Surgery, and paying £3 3s. per month for instruction in Anatomy and Physiology, and the same for Surgery or Medicine.

◆

REGULATIONS AND BYE-LAWS OF LICENSING BODIES IN IRELAND.

UNIVERSITY OF DUBLIN.

(*For Names of Professors and Examiners see Advertisement.*)

The Board of Trinity College, acting under the advice of their distinguished Medical Registrar, Professor Haughton, has steadily pursued a course which has raised the medical degrees of the University of Dublin to the highest rank—we might almost say—amongst the licensing authorities of the three kingdoms, and which merits the warm acknowledgments of all friends of priority of medical education.

REGULATIONS OF THE SCHOOL OF PHYSIC.

Matriculation.

Every student must be matriculated by the senior lecturer, for which a fee of five shillings is payable; but he need not attend any of the Arts Courses unless he desire to obtain a Licence or Degree in Medicine or Surgery. No student can be admitted for the Winter Courses after the 25th November.

QUALIFICATIONS FOR DEGREES AND LICENCES.

Bachelor in Medicine.

Candidates must be graduates in Arts, and may obtain the degrees at the same commencement as the B.A., or at any subsequent one. The medical education of a Bachelor in Medicine is of four years' duration, and comprises the following lectures:—

Winter Courses.—Anatomy and Physiology; Practical Anatomy, with Dissections; Surgery; Chemistry; Practice of Medicine; Midwifery.

Summer Courses.—Botany; Materia Medica and Pharmacy; Institutes of Medicine; Medical Jurisprudence and Comparative Anatomy; Heat; Electricity and Magnetism.

Hospital attendance on a Medico-Chirurgical Hospital during three courses of nine months each, with clinical lectures; six months' Practical Midwifery. Six months' Dissections and three months' Laboratory Instruction in Chemistry are required.

The Courses may be attended at any recognised Medical School.

The fee for the *Liceat ad Examinandum* is £5.

The fee for the degree of M.B. is £11.

Doctor in Medicine.

A Doctor in Medicine must be M.B., or qualified to take that degree, for three years. He must also read two Theses before the Regius Professor of Physic.

Total fees for this degree, £13.

Bachelor in Surgery

Must be a B.A., and have spent four years in the study of Surgery and Anatomy. (a)

The Curriculum comprises the following, in addition to the Course for the M.B.:—

Theoretical and Operative Surgery ...	One Course.
Dissections	Two Courses.
Ophthalmic Surgery	One Course.

Nine months in a metropolitan hospital.

Candidates are required to perform operations on the dead subject.

Candidates for the B.S. who have already passed the M.B. will be examined in Anatomy and Surgery only.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the degree of Bachelor in Surgery, £1.

Master in Surgery

Must be a B.S. for three years' standing, and must read two Theses, as for the M.D.

Fee for the degree of Master in Surgery, £11.

UNIVERSITY LICENCES.

Candidates for the Licences in Medicine or Surgery must be matriculated in Medicine, and must have completed *two years in Arts*

Licentiate in Medicine.

The Course and Examination are the same as for the M.B.

An L.M., on proceeding to the degree of B.A., may become a B.M. on paying the fees without further examination.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Medicine, £5.

Licentiate in Surgery.

The Course and Examination necessary for the Licence in Surgery is the same as for the degree of Bachelor in Surgery.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Surgery, £5.

MEDICAL SCHOLARSHIPS.

Two Medical Scholarships are given annually, value £20 per annum each, tenable for two years, the examinations for which are held each year in June, in the following subjects:—Anatomy and Physiology, Chemistry, Materia Medica, Botany, Experimental Physics, and Comparative Anatomy.

Medical School Exhibitions.

The Professors of the University School give three Exhibitions annually, two senior, value £15 and £10, open to all students who have been three years attending the school, the subjects being—Practice of Medicine, Surgery, Pathology and Forensic Medicine; one junior, value £15, the time and subjects of examination being the same as those for the Medical Scholarship.

The Board of Trinity College have recently passed orders:—1. That three-fourths of the lectures must be attended. 2. That a daily roll be called by each Professor.

Students entering for Demonstrations and Dissections are required to pay Eight Guineas before December; Dissections only, Five Guineas; Demonstrations only, Three Guineas.

Candidates for the M.B. are required to produce a certificate of actual attendance upon cases of Fever.

(*Full particulars as to the Educational Staff, Hours of Lectures, &c., in the School of Physic of the University will be found in our advertising columns.*)

Official regulations may be obtained from the Rev. S. Haughton, F.T.C.D., Trinity College, Dublin.

(a) Students in the School of Physic before 22nd June, 1872, may obtain the M.Ch. according to the Regulations previously in force.

THE QUEEN'S UNIVERSITY IN IRELAND. FACULTY OF MEDICINE.

DEGREE OF DOCTOR OF MEDICINE.

EACH candidate for the degree is required—

1. To have passed in one of the Queen's Colleges the examination for Matriculation in Arts. 2. To have attended in one of the Queen's Colleges lectures on one Continental Language for six months, and on Natural Philosophy for six months; also two Medical Courses. For the remainder of the medical courses, certificates will be received from any recognised lecturer. 3. To pass three University Examinations.

The Medical Curriculum is divided into two periods of two years each.

The first period comprises attendance on Chemistry, Natural History, Anatomy and Physiology, Practical Anatomy, and Materia Medica, Practical Chemistry in a recognised laboratory, and six months of a medico-chirurgical hospital.

The second period comprises Anatomy and Physiology, Practical Anatomy, Surgery, Midwifery and Diseases of Women and Children, Medicine, Medical Jurisprudence, Practical Midwifery, and eighteen months' Hospital Practice.

At least two of the above courses of lectures must be attended in some one of the Queen's Colleges.

The University Examinations are held twice in each year, in June and September.

Each candidate for examination must forward to the Secretary, before the 1st of the month, notice of his intention to offer himself, along with his certificates.

THE FIRST UNIVERSITY EXAMINATION IN MEDICINE comprises a modern language, Experimental Physics, Zoology, and Botany.

Students may present themselves at any time after the close of the first winter session. Before being admitted to examination each candidate must produce evidence of having completed the prescribed courses.

THE SECOND UNIVERSITY EXAMINATION IN MEDICINE comprises the following subjects: Anatomy, Physiology, Materia Medica, and Chemistry, to which will be added Zoology and Botany in the examination of candidates who have not previously passed the first examination. Such candidates may either undergo their examination in Modern Languages and Experimental Physics as a part of the second examination, or at any time between the second and the degree examination.

Students may present themselves for the second examination at the termination of the first period of the curriculum, or at any subsequent period, but no student can postpone his second examination until he presents himself for his degree examination.

DEGREE EXAMINATIONS IN MEDICINE AND SURGERY, AND EXAMINATION FOR THE DIPLOMA IN MIDWIFERY.

The Examination for the M.D. comprises the subjects recommended for study during the second period.

The examination for the M.Ch. comprises Surgery, including Operative and Clinical Surgery.

The Examination for the Diploma in Midwifery comprises the Theory and Practice of Midwifery and the use of obstetrical instruments and appliances.

Both Honour and Pass Examinations are held in September. The Examination held in June is a Pass Examination.

(*See Advertisements of Queen's Colleges, Belfast, Galway, and Cork.*)

Official regulations may be obtained from G. J. Stoney, Esq., Queen's University, Dublin Castle.

◆

ROYAL COLLEGE OF SURGEONS IN IRELAND.

(*For names of Professors in the College see Advertisement of the School of Surgery.*)

CONSIDERABLE changes have been effected in the subjects and methods of examination in the College within the last year.

The examination for

LETTERS TESTIMONIAL, OR THE L.R.C.S.I.

is divided into two parts, known as the first and second halves.

The junior class must produce certificates of—

a, Preliminary examination, including Greek, ; *b*, three courses of lectures on anatomy and physiology; *c*, three on practical anatomy, with dissections; *d*, two on chemistry; *e*, one on materia medica; *f*, one on botany; and *g*, one on forensic medicine. This class is examined in anatomy, histology, physiology, materia medica, and chemistry.

The senior class must produce certificates of—

a, Three courses on surgery; *b*, one on practice of medicine; and *c*, one on midwifery; also attendance on a recognised hospital for three winter and three summer sessions. This class is examined in surgery, operative surgery and appliances, practice of medicine, medical jurisprudence, and prescriptions.

The fees are: £5 5s. as registered pupil of the College; £5 5s. for the Junior Class Examination, which is not returned in case of rejection, but is allowed in the fee for his second examination; £15 15s. for the Senior Class Examination—total £26 15s.

Pupils *who neglect registering themselves previous to going in for the preliminary examination* must pay ten shillings for that examination, to which, however, registered pupils, in addition to their other privileges, are free.

Every candidate rejected at the quarterly examination is required to pay to the College the sum of £2 2s. on applying for re-examination.

Method of Examination.—Candidates must lodge their fees and certificates one week before the day.

JUNIOR CLASS.—The candidates are examined in alphabetical order, and the examination occupies three days: 1st day, dissections; 2nd day, written examination on anatomy, physiology, histology, materia medica, and chemistry; 3rd day, *viva voce* examination on the same subjects. No candidate can proceed to the second day who has not passed the first, or to the third, who has not passed the second.

First Day, Dissection.—The hours of examination are from 10 to 12 a.m., 12 to 2, and 2 to 4 o'clock p.m. Each candidate first makes a dissection of a region allotted to him, half-an-hour, at least, being given him for this purpose. Then he is examined on the anatomy of that part, as well as upon that of those other regions which may have been dissected by other of the candidates. When the examination is over, the whole Court of Examiners assembles and adjudges the marks. The numbers of the candidates who have passed are posted in the hall of the College, and they are eligible to go in for the second day's written examination.

Second Day, Written Examination.—Four hours are devoted to the written examination: Two hours from 10 to 12 o'clock, a.m., to anatomy and histology; and two hours, from 2 to 4 o'clock, p.m., to physiology, materia medica, and chemistry. Eight questions in anatomy are printed and given to each candidate, an answer to four of them only being required. If any candidate has completed his paper before the end of the two hours, he may leave the hall upon handing his answers to the examiner. The examination in histology is part of the written examination. Two slides of different subjects are placed under two microscopes, and marked A.B. Five minutes are allowed to examine them; the student then goes to his place and writes his answer. Two similar slides are to be placed at the other end of the table, to be examined by the candidates in a similar manner. Each candidate separately inspects *either* set of slides. During the second two hours (2 to 4 o'clock), three questions in physiology, two in materia medica, and two in chemistry are given, the candidate's English and orthography being taken into account in adjudicating his marks.

Third Day, Viva Voce.—Two examiners attend each candidate for one quarter of an hour at four separate tables, viz.: three on anatomy and physiology, and one on materia medica and chemistry—one conducting the examination, and the other listening. Each examiner, at the conclusion of each examination, expresses his opinion of same by "marks," and hands the marks to the councillor presiding at such examination. When the examination is over, the whole court assembles and adjudicates upon the marks.

Senior Class.—The Examination occupies four days. 1st day, written examination on surgery, practice of medicine, medical jurisprudence, and prescriptions; 2nd day, *viva voce* examination on surgery and practice of medicine; 3rd day, clinical examination; 4th day, operative surgery.

First Day.—Written Examinations occupy four hours, thus allotted: From 10 to 12 a.m., to surgery; the number of surgical questions shall be six. From 2 to 4 p.m., to practice of medicine, medical jurisprudence, and prescriptions. Two printed questions shall be given in practice of medicine, two in medical jurisprudence, and two in prescriptions. *Second Day:* The *viva voce* examination on surgery and practice of medicine is to be conducted similarly to that of the junior class.—*Third Day:* At the clinical examination, two examiners are allotted to each batch of ten candidates. No candidate is to be examined in the hospital where he has been educated. The name of the hospital where each batch of candidates is to assemble for examination is to be posted in the hall of the College, immediately before the hour of meeting there. Each candidate takes notes of a case allotted to him, is questioned upon that or some other case, and is called upon to bandage or apply some surgical appliance. *Fourth Day—Operative Surgery:* The examinations in operative surgery shall be conducted by the four surgical examiners, who shall meet previously for the purpose of comparing their questions, which are written upon cards, to be deposited in a balloting-box, from which each candidate, as called up, is required to draw his question, and to perform the operation there indicated. Each candidate is required to perform two operations. He is questioned upon these or other operations, and is examined as to his knowledge of surgical instruments and appliances.

No candidate can present himself for examination after the first day who has not satisfied his examiners upon the previous day; but all candidates who have passed any day's examination get credit for same. When presenting themselves upon a subsequent occasion, a former candidate is only required to present himself upon that portion of the examination in which he had failed.

Midwifery.—After passing the L.R.C.S., the student is admitted to examination for the diploma in Midwifery upon producing a certificate of one course on Midwifery and Diseases of Women and Children; a certificate that he has attended a lying-in hospital for six months; and a certificate that he has conducted thirty labour cases at least.

Candidates are examined on the Organisation of the Female, the Growth and Peculiarities of the Fœtus, the Practice of Midwifery, and the Diseases of Women and Children.

The candidate pays £1 6s. for the Midwifery diploma, provided he takes it out within one month from the date of his Letters Testimonial; after that date, £2 2s.

Official information may be had on application to Mr. J. Brennen, Royal College of Surgeons, Dublin.

◆

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

REGULATIONS RELATIVE TO THE LICENCE IN MEDICINE.

Examinations are held on the second Tuesday and [illegible]dnesday in each month, except August and September.

The name of every candidate, together with his schedule and the required documents, must first be submitted to the College on the first Friday in each month, and no name can be received later than the Monday previous.

Candidates who have not obtained some medical or surgical qualification must give proof of four years' study, of having passed a Preliminary Examination in Arts; and of having studied Anatomy and Physiology, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Botany, Medical Jurisprudence, Practice of Medicine, Pathology, Surgery, and Midwifery:

Of having attended a Medico-Chirurgical Hospital, with Clinical Lectures, for twenty-seven months:

Of six months' Practical Midwifery at a lying-in hospital, or other satisfactory evidence of having attended Practical Midwifery.

Testimonials of character from two registered physicians or surgeons are also required.

A candidate who has already obtained a medical or surgical qualification in Great Britain and Ireland is required to produce his diploma or certificate of registration, a certificate of Practical Midwifery, and testimonials as to character.

The examination is conducted partly by written questions, partly *viva voce*, and partly clinical, and divided into two parts:—

First Part—Anatomy, Physiology, Botany, and Chemistry.

Second Part—Materia Medica, Practice of Medicine, Medical Jurisprudence, and Midwifery.

Gentlemen who have passed the first portion of the examination of any University or of any of the Licensing Corporations of Great Britain and Ireland are exempted from the first part of the examination.

Candidates who have been five years in practice are not required to undergo the written or clinical portions of the examination.

REGULATIONS RELATIVE TO THE LICENCE IN MIDWIFERY.

Examinations for the Licence in Midwifery are held on the day after those for the Licence in Medicine, and are open to all Licentiates of the College.

Candidate not being Licentiates of the College will be admitted on the following qualifications:—The Degree or Licence in Medicine or Surgery of any University or of any &c., &c., *vide* supra, with a Certificate of six months' Lectures on Midwifery, and of having attended Practical Midwifery for six months at a recognised lying-in hospital, or other evidence of having attended Practical Midwifery.

FEES FOR LICENCES.

The Fee for the Licence in Medicine is £15 15s.

The Fee for the Midwifery Licence is £3 3s.

The Fee for the Licences in Medicine and in Midwifery, if taken out within one month, £16.

Further information will be found in our advertising columns, and blank schedules may be obtained by application personally, or by letter, to Dr. J. Magee Finny, the Registrar, College of Physicians, Kildare Street, Dublin.

◆

THE APOTHECARIES' HALL, IRELAND.

THE ARTS EXAMINATIONS

Will be held at the Hall four times in the year, viz., the third Thursday in the months of January, April, July, and October, at the hour of twelve o'clock noon.

THE PROFESSIONAL EDUCATION AND EXAMINATIONS.

Every candidate for the Licence to Practise must produce certificates—

1. Of having passed an Examination in Arts previously to professional study.
2. Of Registration as a Medical Student.
3. Of being at least twenty-one years of age, and of good moral character.
4. Of Pupilage to a qualified Apothecary, or of being

otherwise engaged at *Practical* Pharmacy for a period of twelve months subsequent to having passed the Examination in Arts.

5. Of *four* years' Professional Study.
6. Of having attended the following courses, viz.: Chemistry, One Winter; Anatomy and Physiology, Two Winters; Demonstrations and Dissections, Two Winters; Botany and Natural History, One Summer; Practical Chemistry, Three Months; Materia Medica, Three Months; Principles and Practice of Medicine, One Winter; Midwifery and Diseases of Women and Children, Six Months; Practical Midwifery (attendance upon twenty cases); Surgery, One Winter; Forensic Medicine, One Summer; Instruction in Vaccination.
7. Of having attended a recognised hospital during two winters and two summers.
8. Of having performed the operation of Vaccination successfully under a recognised Vaccinator.

The Examination for *the Licence* is divided into two parts:

The First Part comprehends Chemistry, Botany, Anatomy, Physiology, Materia Medica, and Pharmacy.

The Second—Medicine, Surgery, Pathology, Therapeutics, Midwifery, Forensic Medicine, and Hygiene.

THE PROFESSIONAL EXAMINATIONS

Will be held *quarterly*, on the first and second Mondays in January, April, July, and October.

The First Part, on the first Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects:—Chemistry and Botany, Monday; Anatomy and Physiology, Tuesday; Materia Medica and Pharmacy, Wednesday.

The Second Part, or Pass Examination, on the second Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects:—Medicine and Surgery, Monday; Midwifery and Diseases of Women and Children, Tuesday; Forensic Medicine and Hygiene, Wednesday; Clinical Examination, Thursday.

The first two hours of each day will be devoted to writing answers, and, after that, two hours to an oral and practical examination.

Candidates at the examination on Anatomy are liable to be called on to perform *dissections;* and at the examination on Surgery to perform one or more *operations* on the dead subject.

Doctors of Medicine and Licentiates of a College of Physicians or Surgeons who have also spent twelve months at *Practical* Pharmacy, may obtain the Licence by undergoing an examination—the former in Pharmacy and the latter in Medicine and Pharmacy. Licentiates of the London Society of Apothecaries are admitted *ad eundem.*

◆

IRISH PHARMACEUTICAL SOCIETY.

This Corporation was created by Act of Parliament in 1875, and has just completed its first year of existence, its function being to license pharmaceutists and chemists in Ireland, hitherto solely qualified by the Apothecaries' Company. The past year has been a "year of grace," during which candidates have been admitted upon comparatively easy terms. The regulations for the coming year will be as follows:—

PRELIMINARY EXAMINATION.

Latin.—To translate into English, and parse, one or more sentences from First Book of Cæsar or of the Æneid.

English.—To write on a subject selected by the examiner, and to write from dictation.

Arithmetic.—First four Rules, simple Proportion and Decimals, weights and measures of the Pharmacopœia and of the Metric system.

Chemistry and Botany.—(See Roscoe's Chemistry and Browne's Botany.) Candidates must not be under sixteen years of age. Fee, £2 2s. In case of rejection, 10s. 6d. to be retained, and the candidate may not present himself for three months.

The examinations to be held on the first Monday of January, April, July, and October.

PHARMACEUTICAL EXAMINATION.

Candidates must be twenty-one years of age, and have passed the prelim. at least one year previously, and must also have been practically engaged in compounding and dispensing for at least two years under the instruction of a pharmaceutical chemist or apothecary. Examinations on first Wednesday of January, April, July, and October.

Botany.—To recognise the principal indigenous plants used in medicine, to refer them to their natural orders, and to give the definitions and the distinctive characters of their several parts.

Materia Medica.—Recognise specimens of the drugs of the Pharmacopœia, describe their characters and active principles, name sources from which obtained, and the officinal preparations into which they enter, and to detect adulterations.

General and Pharmaceutical Chemistry.—The elementary laws of chemistry and physics, including chemical equations. To recognise the chemical substances of the Pharmacopœia, to describe processes by which obtained; qualitative analysis, including the tests of the Pharmacopœia and volumetric analysis, and to submit to a practical examination in these subjects when required.

Practical Pharmacy.—To translate Latin prescriptions, to detect dangerous doses, to compound and dispense correctly. Explain the processes of making the non-chemical preparations of the Pharmacopœia, and to recognise them. Fee, 5 guineas. In case of rejection, the sum of £2 2s. will be retained, and a candidate may not present himself for six months.

◆

MEDICAL SCHOOLS AND HOSPITALS IN DUBLIN.

The Clinical Hospitals of Dublin are ten in number, exclusive of the Cork Street Fever Hospital, the Children's Hospital in Pitt Street, and other special institutions. To some of these institutions Medical Schools are attached, others, though they have no actual or official connection with any school, are in close affinity with certain teaching bodies, while others again are without any special connection with any school. While, however, such affiliation of a school and hospital may exist, it should be remembered that the Dublin schools and hospitals are open to all comers, and the student is competent to attend any hospital and any school he wishes.

The Names of the Professors, Lecturers, and Hospital Staff of the following Hospitals and Schools are not included in this column, being found in the advertisement of each instituion.

School of Physic and Sir Patrick Dun's Hospital.—The Medical School of Trinity College is one of the largest and most important. It is especially frequented by those students who intend to take the Arts Curriculum of the University, but is freely open to, and largely availed of by other students. It is under the immediate supervision of the Rev. Professor Haughton, the Medical Registrar of the University, and the names of its Professors will be found appended to the advertisement in our journal. Two Medical Scholars are elected annually by the Board of Trinity College, at an examination held at the end of June. Each scholarship is worth £20 per annum, and is tenable for two years. The Professors of the School of Physic give three exhibitions annually, amounting altogether in value to £40, subject to conditions prescribed by the Professors themselves.

Sir Patrick Dun's is the hospital attached by Act of Parliament to the School of Physic, and officered by the Professors of that school. It was for many years a purely medical hospital but is now a large medico-chirurgical hospital, with a Midwifery Maternity attached.

The ROYAL COLLEGE OF SURGEONS SCHOOL is situated within the walls of the College, and is under the superintendence of the Council, who appoint the Professors. The Introductory Address will be given on Oct. 30th, by Mr. Stokes. The Professor of Physiology commences his course with a series of twelve lectures on Comparative Anatomy—free to the public. The dissecting-rooms have been recently much enlarged. Prizes in Anatomy and Physiology, and Surgery, will be awarded at the end of the Winter Session. Junior Exhibition of £15, a Senior Exhibition of £25, and Honorary Certificates will be awarded at the end of the Winter Session.

The CITY OF DUBLIN HOSPITAL has been hitherto more closely connected with the College School than any other hospital. It is situated in Upper Baggot Street, about ten minutes' walk from the Royal College of Surgeons. The hospital contains 104 beds, and accommodates about 800 intern patients annually. There are special wards for ophthalmic and aural diseases (on which subjects a special course of lectures is delivered), and for diseases of children. A new wing has been lately opened for the reception of fever and other infectious diseases. The "Purser" Studentship of £20 per annum (with apartments) is obtainable by competitive examination by all students; numerous prizes and medals are given, and special certificates are granted.

THE CATHOLIC UNIVERSITY SCHOOL is situated in Cecilia Street, about ten minutes' walk from the University itself in St. Stephen's Green. Most of its Professors are physicians and surgeons of the Mater Misericordiæ, St. Vincent's, or Jervis Street Hospitals, and its courses of study qualify for admission to all the licensing bodies. The University itself does not grant degrees in medicine or surgery, being as yet unchartered, but the School is instrumental in the education of a large proportion of the Catholic students of Ireland.

The hospitals most closely connected with this School are St. Vincent's, in St. Stephen's Green; the Mater Misericordiæ Hospital, in Eccles Street; Jervis Street Hospital; and House of Industry Hospital.

ST. VINCENT'S HOSPITAL was established in 1834 by the Sisters of Charity, some of whom had studied the system of the Parisian hospitals, after which it was modelled. The ward for "*Enfans Malades*" is an interesting feature. The hospital has over a hundred beds constantly full, and each sister has charge of about twelve patients. In connection with it is the Convalescent Home at Lindon Grove, Blackrock. The clinical instruction in medicine and surgery is given by Dr. Quinlan, Dr. Mapother, Dr. O'Leary, and Dr. Cryan.

The Introductory Lecture will be delivered by Dr. Quinlan on the 30th of October.

A Special Ward for the treatment of the Diseases of Women has been opened under the care of Dr. J. A. Byrne, Gynæcologist to the Hospital.

THE MATER MISERICORDIÆ HOSPITAL is the largest of the Dublin Hospitals, and is intended to be much extended. It is situated at the northern side of the town.

There are three resident pupils appointed every six months. Good lodgings can be had very cheap close to the hospital. Prizes to the value of £30 are awarded at the end of the winter session for the best reports on the cases under treatment in the hospital.

JERVIS STREET HOSPITAL is one of the oldest established charitable institutions in Dublin, having been founded in 1721. It is situated in a part of the city not otherwise provided with hospital relief, and which, from its commercial character, supplies the hospital with an abundance of surgical cases. Like St. Vincent's Hospital, its nursing arrangements are under the charge of a community of nuns. The hospital, being found inadequate to the demands upon it, is about to be rebuilt.

The LEDWICH SCHOOL was founded in 1810 by the well-known Dr. Kirby, and since then has fully sustained its prestige under the management of the Messrs. Ledwich and Mason, after the former of whom it is named. It is situated in Peter Street, not five minutes' walk from the College of Surgeons, the Meath, Vincent's, and Mercer's Hospitals, and in the same street with the Adelaide Hospital and the Coombe Lying-in Hospital, and ten minutes' from the Catholic University School, the School of Physic, and the City of Dublin Hospital. No Introductory Lecture will be given at this school.

MERCER'S HOSPITAL enjoys a high reputation as a surgical hospital, and is specially resorted to in cases of accident. It is situated equidistant from the Ledwich School and the College of Surgeons, and not far from the School of Physic, and numbers amongst its staff professors in both the former schools. The great majority of the students of the Ledwich School receive within the walls of Mercer's their hospital teaching.

RICHMOND, WHITWORTH, and HARDWICKE HOSPITALS.—Accommodation: Hardwicke Hospital, 120 beds; Whitworth Hospital, 82 beds; Richmond Hospital, 110 beds; total, 312 beds.

TRUSS ESTABLISHMENT.—The Truss Establishment, for the distribution of trusses to the ruptured poor of Ireland, is connected with these hospitals. In the examination of the applicants, the student is afforded the facility of seeing all the varieties of hernia.

CLINICAL CLERKS.—Eight resident Clinical Clerks and the dressers are appointed each half-year, and provided with furnished apartments, fuel, &c., &c. These appointments are open not only to advanced students as formerly, but also to those who are qualified in medicine or surgery. A House-Surgeon for the Richmond Hospital is elected biennially, and receives a salary.

The RICHMOND LUNATIC ASYLUM, containing 1,000 beds, adjoins these hospitals.

The CARMICHAEL SCHOOL is situated in North Brunswick Street.

The various lectures are now delivered, and the dissections carried on in the new building, which the munificence of the late Surgeon Carmichael has given to the proprietors.

The close proximity of this school to several of the Dublin clinical institutions, and its intimate connection through its teachers with the Richmond, Whitworth, and Hardwicke Hospitals, ensures equal opportunities to the pupils of becoming thoroughly acquainted with the more immediately practical part of their profession.

Arrangements have now been completed for rendering more available the Carmichael premium bequest, which enables the proprietors to distribute prizes to the amount of £68 yearly; and the Scholarship, value £15 yearly, which the friends of the late Dr. Mayne founded in his name, is allotted at the termination of the session.

DR. STEEVEN'S HOSPITAL AND SCHOOL are situated close to the Kingsbridge Terminus of the Great Southern and Western Railway, and therefore occupy a position of their own, far removed from the other medical institutions.

Immediately adjoining is St. Patrick's (Swift's) Asylum for the Insane.

There is accommodation for residence of seven surgical and four medical residents; besides whom the resident-surgeon receives house pupils. The fees payable for the privilege of residence are twenty-one guineas, winter; fifteen guineas summer six months. Students have apartments, coal, gas, and furniture.

Accommodation outside the hospital, in the neighbourhood, is arranged by the hospital authorities.

The office of Clinical Registrar, with salary, is reserved for students of the hospital.

The examination for two Midwifery Assistants is held on the last Saturday in November. Salary £30.

Candidates must be in at least their second year, have attended Practical Midwifery in the Maternity Department, and be entered on the books of the school.

Gold medals will be awarded in each year's class.

As we have said, certain hospitals have no special affinity with any college or school. Of these are the Meath and Adelaide Hospitals.

THE MEATH HOSPITAL, which is also the public infirmary of the county of Dublin, containing 120 beds, and now in the 126th year of its existence, ranks among the oldest of the charitable institutions of this city. It is situated on the southern side of the city, upon about three acres of ground, formerly called "The Dean's Vineyard." The original Meath Hospital, situated on the Coombe, was opened in 1753. The foundation-stone of a new Meath Hospital, on the Coombe (now the Coombe Lying-in Hospital), was laid out by Lord Brabazon, 10th October, 1770; this hospital was, in 1774, constituted the County Dublin Infirmary by Act of Parliament. The present building, in Heytesbury Street, was opened in 1822, since which time the building has undergone considerable enlargements and improvements. In 1830 the theatre for operations and lectures was erected. In 1852-3 the Collis Wards were added as a memorial to Maurice Collis, twenty-five years surgeon to the hospital. In 1865 the "Smyly Ward," built for the special accommodation of children, was opened by the Lord-Lieutenant, Lord Wodehouse.

The ADELAIDE HOSPITAL is in Peter Street, next door to the Ledwich School, and within a few minutes' walk of the College of Surgeons and the Universities. From the 1st of October the physicians and surgeons will visit the wards, and give instructions at the bedside, at the advertised hours.

There are fever wards apart from the hospital, and two wards for infants and children. Special hours are devoted to clinical instruction in the Diseases Peculiar to Women, the Diseases of the Eye, and Cutaneous Diseases, and students are individually instructed in the use of the Stethoscope, Ophthalmoscope, Laryngoscope, and Microscope. Two resident pupils are selected half-yearly. Prize examinations are held at the terminatien of the Session; in addition a prize of the value of £5, founded by Dr. Knaggs, of Australia, a former pupil of the hospital, is awarded in June, annually.

COOMBE HOSPITAL.—This hospital was founded in 1826, but it was not till 1867 that it was incorporated by Royal Charter, which enables its medical officers to issue diplomas qualifying the holders to practise midwifery. This hospital is situated in the centre of a district densely populated by the lower orders, and thus affords the amplest opportunities for practice. It accommodates about 600 labour cases within its walls, while those attended as externs amount to nearly double that number. Moreover, the chronic ward for the reception of cases of the diseases of females gives admission to about 80 patients annually. The fee for attendance is £4 4s. for six months as extern, and £10 10s. as intern pupil. During that period the student attends on a given night in each week, or oftener, if circumstances permit, and takes charge in his turn of any cases that may be admitted to the labour wards, or may call for his assistance outside. An annual examination is held in May and November, at which prizes of considerable amount are awarded, and certificates of good answering granted. Two paid resident pupil midwifery assistantships, and a paid clinical clerkship under the obstetric surgeon, are obtainable annually by competitive examination, for which all pupils who have obtained their midwifery diploma are eligible.

THE PITT STREET CHILDREN'S INFIRMARY is situated close to Mercer's Hospital and the College of Surgeons. It was founded to provide treatment specially for children, and to teach that special branch of disease. Dr. Moore and Dr. Churchill, senior, are the medical officers.

ST. MARK'S OPHTHALMIC HOSPITAL AND DISPENSARY FOR DISEASES OF THE EYE AND EAR.—This is the oldest and largest special ophthalmic hospital in Dublin, and was founded by Sir William Wilde. Instruction is given on the mornings of Mondays, Tuesdays, Thursdays, and Fridays, from 11 to 1 o'clock, and operations are performed on Wednesdays and Saturdays from 11 to 1 o'clock. A surgeon resides in the institution, and receives a salary of £30, besides rooms, gas, coal, &c.

SPECIAL HOSPITALS.

The Special Hospitals of Dublin are the Rotunda and Coombe Lying-in Hospitals, the Westmoreland Lock Hospital, Cork Street Fever Hospital, Pitt Street Children's Infirmary, St. Mark's Ophthalmic Hospital, and the National Eye and Ear Infirmary.

THE ROTUNDA HOSPITAL.—The well-known and time-honoured institution possesses a character as a School of Midwifery which needs no comment. It is not as generally recognised as it deserves to be, as also a great school of gynæcology. The institution consists, in fact, of two distinct hospitals, viz.: the lying-in hospital, into which some 1,200 cases of labour are admitted annually, and the Hospital for the Treatment of Diseases peculiar to Women, in which some 500 patients are now annually admitted during the course of the year. The present master, Dr. Lombe Atthill, as is well known, devotes special attention to this department of the charity. There is every facility for the study of the special departments of medicine to which the hospital is devoted, and both students and midwives are granted a diploma on passing an examination.

Clinical Clerkship, value £30 a-year, tenable for six months, adjudged after open examination to any pupil who has attended the full course of instruction in the hospital, but who has not obtained a registerable qualification.

CORK STREET HOSPITAL is the only special fever hospital in Dublin, contains 120 beds, and is mainly supported by Government. One or more medical pupils are elected by the Governors for a six months' residence, for which a special certificate is given. Extern Students are also admitted for the same term. Fee, three guineas. Further particulars of Dr. Atkins, Registrar.

NATIONAL ORTHOPÆDIC HOSPITAL, Upper Kevin Street, recently established, under the care of Mr. Ormsby, of the Meath Hospital for the Special Treatment of Deformities. Students and practitioners are at present admitted without fee.

DUBLIN ORTHOPÆDIC HOSPITAL, 11 Usher's Island, has also been lately established for the treatment of deformities. It is under the surgical management of Messrs. Swan and Bookey, of Steeven's Hospital, and contains six beds.

CORK OPHTHALMIC AND AURAL HOSPITAL is the only special institution of the sort in the south of Ireland, and is under the care of Dr. H. M. Jones. It contains twenty-six beds, and an average exterior attendance of 1,700 patients. A Resident Pupil is chosen every three months.

THE QUEEN'S COLLEGES.

THESE three important institutions are the special schools of the Queen's University, and are situated in Belfast, Galway, and Cork. They receive a large subvention from the public funds, and are provided with every facility for the education of their students. It is essential that every candidate for the medical or surgical degrees of the Queen's University shall have attended courses of lectures in Modern Languages, Natural Philosophy, and at least two medical subjects, in one of the provincial colleges, so that attendance at a Queen's College during one of the years of medical study is compulsory upon all candidates for the licences of this University.

REGULATIONS COMMON TO ALL THE QUEEN'S COLLEGES.

Students.—Students are either matriculated or non-matriculated.

Candidates for degrees, or for scholarships, exhibitions, or prizes, must pass a matriculation examination.

Non-matriculated are permitted to attend the lectures of any of the professors without being required to pass the matriculation or any other examination.

Matriculation Examinations will commence in the third week of October.

The subjects in which candidates will be examined are these:—

Greek—Grammar.

Any two of the following authors:—

Homer—Iliad, Books I. and II. Euripides, Alcestis, Xenophon, Anabasis, Books I. and II., Lucianus, Walker's Selection, or any other two books.

Latin—Any two of the authors:—Horace, Virgil, Cicero, in Catilinam, Sallust, Livy, Cæsar.

English—Grammar.

Outlines of Grecian History. Outlines of Roman History. Outlines of Ancient and Modern Geography.

Mathematics—Arithmetic, Algebra, and Euclid, Books I. and II.

The Matriculation Examination is held at the commencement of the first term of each session; but additional Matriculation Examinations are held.

The last Matriculation Examination is held on the 16th of November.

Fee for Matriculation, 10s.

Students in one of the Queen's Colleges, or in any University, are permitted to take corresponding rank in one of the Queen's Colleges, and to compete for scholarships of the corresponding year.

Medical Scholarships.—Of the eight Junior Scholarships appropriated to the Faculty of Medicine, two will be awarded in each of the four years.

Candidates must be matriculated before they can compete.

Students intending to compete for Scholarships of the

Second Year must have attended in one of the Queen's Colleges the following—viz., Chemistry, Botany and Zoology, Anatomy and Physiology, French and Natural Philosophy.

For Scholarships of the Third Year they must have attended the following—viz., Chemistry, Botany and Zoology, Anatomy and Physiology, Materia Medica and Pharmacy, Practical Chemistry, Practical Anatomy, French and Natural Philosophy.

For Scholarships of the Fourth Year must have attended in their third year two of the following—viz, Medicine, Surgery, Midwifery and Diseases of Women and Children, and Practical Anatomy.

To acquire a year's standing, the student, whether matriculated or not, must attend two of the classes above mentioned.

Examinations.—Junior scholars are exempted from the payment of one moiety of the class fees.

Exhibitions.—The College is empowered to award Exhibitions at the same Examinations as the Scholarships, and to be held upon the same terms.

Exhibitioners are required to pay the whole amount of the class fees.

All junior scholars and exhibitioners must attend lectures, and pass the sessional examinations.

Prizes.—Two prizes for English Prose Composition and two prizes for Geometry have been founded in the College, to be awarded annually at entrance: First prize for English Prose Composition, £3 worth of books; second, do., £2 worth. First prize for Geometry, £3 worth; second, do., £2 worth.

Fees.—The College fees payable by matriculated students are 10s. for the first year and 5s. each subsequent year.

The fees payable for attendance on courses of lectures are £1 for each course of one term only, and £2 for each course of more than one term, when attended for the first time, and £1 for each re-attendance on the same.

This rule applies in all cases except the following:—

The fee for Anatomy and Physiology is £3 for the first time, and £2 for every subsequent attendance; and for Practical Anatomy or Practical Chemistry is £3 for each attendance.

The fees for honour courses are £2 for each course.

This rule does not apply to Practical Chemistry or Operative Surgery.

A detail of the prizes and exhibitions in arts and medicine, the names of the professors, and other information, *will be found in the Advertisements* of this issue, and full details may be had on application to—

Belfast.—Rev. Richard Oulton, B.D., Registrar.
Cork.—Robert John Kenny, Esq.
Galway.—Thomas W. Moffett, LL.D.

◆

RELATIVE COST OF MEDICAL EDUCATION IN IRELAND.

(*Exclusive of private teaching.*)

University of Dublin M.B. and M.Ch.—1. Lectures, £52 15s.; 2. Hospitals, £33 12s.; 3. Degrees, £32—£118 7s.; expense of Degree in Arts, £83 4s. Total, £201 11s.

Queen's University M.D. and M.Ch. (all lectures being taken in the provincial colleges.)—£62 9s.; ditto (two years lectures and hospital taken in Dublin), say, £75.

Royal College of Surgeons and King and Queen's College of Physicians L.R.C.S.I. and L.K.Q.C.P.I, £128 18s.

Apothecaries' Hall, L.A.H., £39.

◆

TECHNICAL EDUCATION IN IRELAND.

THE ROYAL COLLEGE OF SCIENCE.

The educational staff of this institution consists of nine professors, one demonstrator, and one laboratory assistant. It supplies, as far as practicable, a complete course of instruction in science, applicable to the industrial arts, especially those which may be classed broadly under the heads of mining, agriculture, engineering, and manufactures.

The course of instruction extends over three years, each year being divided into two terms. In the first two years the instruction is general. In the last year it is specialised under the heads of mining, agriculture, engineering, and manufactures.

There are four royal scholarships, of £50 yearly each, with free education, tenable for two years; two will become vacant each year. They will be given to students who shall have been a year in the College.

There are also nine royal exhibitions attached to the College, of £50 each, tenable for three years.

The session commences on the first Monday in October, and lasts until 21st June following.

The fees payable are £2 for each separate course of lectures.

(*For further particulars see Advertisement*, or apply to F. Sidney, Esq., LL.D., Royal College of Surgeons, Dublin.

INTRODUCTORY LECTURES IN THE DUBLIN SCHOOLS AND HOSPITALS.

School of Physic—None.
Royal College of Surgeons—Mr. Stokes, Oct 30th, 10 o'clock.
Catholic University—Prof. Campbell, 3rd November.
Dr. Steevens's Hospital and School—None.
Meath Hospital—Mr. Ormsby last week in October.
City of Dublin Hospital—Not fixed.
Sir Patrick Dun's Hospital—None.
Mercer's Hospital—None.
Richmond Hospital—Dr. Gordon, November 2.
Mater Miseracordiæ Hospital—Dr. Cruise, Nov. 6th, 11 a.m.
Other Hospitals and Schools not fixed.

◆

MEDICAL EDUCATION IN SCOTLAND.

THE CAREER OF THE SCOTCH STUDENT.

Towards the end of the ensuing month—as practically medical teaching is not begun until early in November—Scotland will send forth to her three centres of medical education such of her youth as parental frugality and industry may have qualified for entrance upon the study of medicine. A wide-spread ambition has long existed among the middle-classes of Scotland that one member, or more, of their families should be represented in one of the three professions, the preference for the clerical and medical being dominant. This desire has been fostered, no doubt, through the influences of the Parochial School system, to which Scotland has been so much indebted, and the unquestionable respect in which worthy members of these professions are held in, more particularly in provincial towns and country districts. Furthermore, medical education is much cheaper in Scotland than in either England or Ireland; but then medical practice in it is less remunerative. As a rule, then, he who decides in favour of the profession of medicine in Scotland, with a view to practising there, must be content with the prospect of a moderate livelihood. To one of three cities the Scotch student has to direct his attention, as the University of St. Andrews is chiefly a qualifying body; its degree is also conferred by examination on practitioners of a certain age and standing in practice. As a rule, convenience of situation determines the choice of the intending student; the University of Aberdeen being attractive to students from the northern portions of Scotland; that of Glasgow to those from the western, north-western, and north of Ireland; while Edinburgh is supplied mainly by the east coast, and, to some extent, by the wealthier students from the other districts, as well as from the colonies.

Subjoined is a list of the Scotch Schools and examining boards, with other relative information.'

THE UNIVERSITIES.

The fees for the degrees in all four of the Scotch Universities are the same—viz., M.B., £15 15s. (£5 5s. being payable at each of the three examinations); C.M., £5 5s. (in addition to the fees of M.B.); M.D., £5 5s. (in addition to the fees for M.B.); and £10 for Government stamp.

University of Edinburgh.— This is a qualifying and teaching body, and has complete Faculties also of Theology and Law equally with Medicine. Prior to commencing medical studies the student must pass a preliminary examination in English, Latin, and arithmetic, the elements of mathematics and the elements of mechanics. An examination in at least two of the following subjects is demanded before being admitted to a professional examination, in addition to the foregoing subjects—viz., Greek, French, German, Higher Mathematics, Natural Philosophy, Logic, Moral Philosophy. The University confers three degrees—medical and surgical qualifications being granted —M.D., M.B., and C.M. The C.M. is not conferred unless the M.B. be taken at the same time. For the degrees of M.B. and C.M. four years of professional study must be completed after passing a preliminary education recognised by the Medical Council. A degree in Arts of any British University is held to supersede the preliminary examination. Of the four years of professional study, one must be passed in the University of Edinburgh, and another of such four years must be in some other University entitled to grant the degree of M.D. The M.D. degree is conferred on Bachelors of Medicine who have attained the age of twenty-four years, and who present a thesis to be approved by the Medical Faculty. The lectures of several extramural lecturers in Edinburgh, as well as those at the London medical schools, and such teachers in the provincial schools approved by the University Court, are recognised, subject to certain conditions.

University of St. Andrews.—This University confers the degree of M.D. (certain exemptions being made to ten practitioners yearly), M.B., and C.M. Two years of study of each candidate must be in one or more of the following Universities—viz., the Universities of St. Andrews, Glas-Glasgow, Aberdeen, Edinburgh, Oxford, and Cambridge; Trinity College, Dublin; Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway.

University of Aberdeen.—This University is entitled to confer degrees in all the Faculties, and is a teaching body as well. The fees for graduation and the curriculum of study are nearly the same as in the University of Edinburgh. One year must be passed at Aberdeen. Besides the Royal Infirmary, students have the opportunity of attending several other local institutions. Professor Brazier, Secretary to the Medical Faculty, should be addressed for further information.

University of Glasgow.—This is both a teaching and examining body. It confers three degrees, viz.: Bachelor of Medicine, Master of Surgery, and Doctor of Medicine. Before graduating the student must have been engaged in medical study for four years, one of which must have been spent at the University of Glasgow and the others at some university or school recognised by the Glasgow University. A *medicus annus* is constituted by two courses of 100 lectures each, or by one course of 100 lectures and two of 50 each. Two preliminary examinations must be passed, one before commencing study and the other before appearing at the first professional examination. A degree in Arts (not honorary) exempts the student from these examinations. The hospital practice is attended chiefly at the Western Infirmary, to which several of the professors are physicians and surgeons. Numerous other medical institutions exist in the city. The University recognise *one* extramural lecturer.

THE COLLEGES.

Royal College of Physicians of Edinburgh.—This, like the Sister College of London, is exclusively a qualifying body. In conjunction with the Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Edinburgh this College grants a double qualification, and registerable as such. Each applicant for professional examination must previously have passed the preliminary examination prescribed by the General Medical Council. Exemption is made in the case of Masters or Bachelors of Arts of any British University and certain recognised foreign Universities. Candidates who may have already passed the first professional examination of any body approved of by the College will be at once admitted to the second part of the examination.

The Fellowship is conferred only by election, and the candidate must at least have been a member of the College for one year previously, and have attained the age of twenty-five years.

The Membership is conferred on Licentiates of the College, or Graduates of a British or Irish University, with whose knowledge the College may be satisfied, and who has attained the age of twenty-four years.

The Licence.—The regulations are nearly the same as those for the joint examination for the Scotch double qualification.

Qualification in Public Health.—The College now confers a certificate of competency in Public Health. The examinations are held in April and October. Fee, £10 10s.

Fees.—The fee payable by a Licentiate is £10 10s. In the case of unsuccessful candidates the fee is returned, minus £2 2s., retained to defray the expenses of examination.

Royal College of Surgeons, Edinburgh.—Candidates for the diploma of this College must have followed a course of study in some University, or in an established school of medicine, or in a recognised provincial school. Candidates already qualified are admitted on certain exceptional conditions.

Preliminary Examination.—All candidates for the diploma of the College must have passed the complete examination prescribed by the General Medical Council, and have their names inscribed on the register of medical students at the commencement of their medical studies. The preliminary examination of certain recognised bodies is accepted by the College.

Professional Education.—Candidates commencing professional study must have been engaged, during four years after the preliminary general education, in professional study, which shall include not less than four winter sessions, or three winter and two summer sessions' attendance at a recognised medical school.

Professional Examination.—The professional examination is divided into two, the one oral, the other written. The first examination embraces Anatomy, Physiology, and Chemistry. The second examination embraces Surgery and Surgical Anatomy; also Medicine, Midwifery, Materia Medica, and Medical Jurisprudence; and does not take place prior to the termination of the winter session of the last year of study.

The Fellowship is conferred only on candidates who have obtained a diploma from this College or from either of the Colleges of Surgeons of England or Ireland, or the Faculty of Physicians or Surgeons of Glasgow, and who are twenty-five years of age. The election is by ballot, and three-fourths of the votes are required to be in the candidate's favour, and he has to subscribe certain bye-laws of the College. Fellows are forbidden to keep open shops, to be connected with secret remedies, or indelicate advertisements or publications.

The Licence.—The regulations are almost the same as those for the joint examinations conducted by the Colleges of Physicians and Surgeons.

THE SCOTCH DOUBLE QUALIFICATION.

The Royal College of Physicians of Edinburgh, by a certain arrangement, grants conjointly with the Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons, after one series of examinations, a double qualification, two diplomas being given and registerable under the Medical Act as medical and surgical qualifications, thus: Lic. Roy. Coll. of Phys.

Edin. and Lic. R.C.S. Edin., or Lic. Roy. Coll. of Phys. Edin. and Lic. Fac. Phys. and Surg. Glas., according as the case may be.

By the understanding subsisting between these bodies, the College of Physicians take exclusive charge of the examination in medicine; and the College of Surgeons or the Glasgow Faculty of that in surgery; while departments common to both medicine and surgery are examined by a board in which each body is represented. Such arrangements as these were contemplated by the Medical Act, and authorised by Section XIX., and those under consideration were sanctioned by the Medical Council, 7th August, 1859.

Candidates having fulfilled the full curriculum are subjected to two professional examinations. Hereafter the preliminary examination must be passed before commencing professional study, and must be otherwise conformable to the regulations of the Medical Council.

School of Medicine, Edinburgh.—The lectures of this School qualify for the University of Edinburgh and the other Universities, and the Royal Colleges of Physicians and Surgeons, Edinburgh, London, and Dublin, and the other medical and surgical boards.

In accordance with the statutes of the University of Edinburgh, any four of the medical classes required for graduation, or two complete *anni medici*, may be studied at this school, each of which may be constituted by attendance on two of the six months' courses, or on one of these, and two three months' courses. It is always provided, however, that the fee for any class taken for graduation in the University of Edinburgh shall be the same as that charged by the University for the corresponding class.

The whole of the education required for graduation at the University of London may be taken at this school. The minimum cost of the education of this School of Medicine for the double qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons, including the fees for the joint examination, is £90 4s., which is payable by yearly instalments during the period of study; and the minimum cost for the single qualification of either Physician or Surgeon, including fees for examination, is £80.

Royal Infirmary, Edinburgh.—Clinical instruction is afforded at this institution under the supervision of Professors of the University and ordinary physicians and surgeons to the Infirmary. Special instruction is given on diseases of women, physical diagnosis, and diseases of the eye. Separate wards are devoted to fever, venereal diseases, diseases of women, diseases of the eye, &c. The perpetual fee, in one payment, is £10; the annual fee, £5 5s.; half-yearly, £3 3s.; quarterly, £1 11s. 6d. Separate payments for two years entitle the student to a perpetual ticket. No fees are payable for any surgical or medical appointment. The Infirmary appointments are—Four resident physicians and four resident surgeons, who live in the house free of charge. Non-resident clinical clerks are appointed by the physicians and surgeons. Each surgeon appoints from four to nine dressers, the appointment being for six months. The pathologist appoints assistants in his own department.

Anderson's University, Glasgow.—This is exclusively a teaching body. In addition to its offering excellent opportunities for acquiring a good medical education, instruction is given in the other branches of a liberal education, advantage of which might profitably be taken by medical students generally. The expenses of this institution, as already mentioned, are exceedingly moderate. Extensive opportunities for dissection are offered, under the guidance of the very talented lecturer on anatomy. Hospital practice is seen at the Royal Infirmary, an institution with 580 beds, and second to none in the kingdom for this purpose.

Students are also admitted to the practice of the Western Infirmary, close to the University, which has about 200 beds, and an excellent staff. Clinical lectures are delivered by the professors at this institution and at the Royal Infirmary, students having the option of choosing any two whose lectures he will attend.

In connection with this College, there are five Hospitals and Dispensaries for special Diseases, to all of which students are admitted.

DATES AND HOURS OF THE INTRODUCTORY LECTURES AT THE SCOTCH MEDICAL SCHOOLS.

University of Edinburgh—October 31, 2 p.m.—Sir Alex. Grant.
University of Glasgow—Oct. 31, 12 noon—Prof. McCall Anderson.
Anderson's University (Glasgow)—None.
School of Medicine, Edinburgh—Oct. 31, 11 a.m.—Dr. Wyllie.
University of St. Andrews—None.
University of Aberdeen—November 1.

◆

Destination of the Newly-Qualified Surgeon.

THE PUBLIC SERVICES.

ARMY MEDICAL SERVICE.

We cannot compare the Army Medical Service to anything but a series of dissolving views of which we are now in an interval waiting for the next picture.

Within three years we have had—first, the reduction of the medical officers of regiments to one per corps; then the complete abolition of all connection between medical officers and regiments beyond the disagreeable link of the compulsory payment of mess and band subscriptions by those merely attached for duty, about the extreme hardship of which the Secretary of State for War, when interrogated by Dr. Ward, M.P., during the past session, had no reply to offer. And, finally, the most astounding picture of all burst upon the profession when Mr. Hardy, in his speech on the army estimates of this year, announced that he had determined to leave the existing department to die out as it might, and to substitute a short service system in its stead.

A warrant was accordingly promulgated in April last, offering £250 a-year to surgeons who would join the army for ten years, and a bonus of £1,000 on compulsory retirement at the expiration of that time, with certain other contingencies which did not appear at first sight. First, should the surgeon break down in health during his first five years he was to be dismissed without compensation. Should he break down between the fifth and tenth year he was to receive a proportion of the £1,000. When on service in India, where he would doubtless spend most of his time, he was to be paid only *according to the old rates*, and these, now that the value of silver has been so depreciated, would be almost starvation in such a country. And exchanges were to be done away with, so that there was no chance of escape for a medical officer who felt that Indian service would very probably injure his constitution to such an extent as to necessitate a penniless retirement within his first five years.

Mr. Hardy, when introducing this scheme, ostentatiously dwelt on the great advantage of a medical man being able, after ten years' exposure to the vicissitudes of climate and the risk of disease in various parts of the world, *to begin life* by purchasing a practice with his £1,000, and when informed in the House of Commons that to an Irishman the purchase of a practice in his own country was an impossibility, replied that he could no more understand the fact than that "one grocer could not dispose of his business to another." With a sneering allusion to talented Irishmen and their "elegant brogues" all remonstrance was dismissed, and the proposal launched upon the schools for their acceptance.

On the 14th August the verdict of the profession has been pronounced with no uncertain sound.

For the fifty vacancies offered the whole of the schools and all the unsuccessful practices in Great Britain and Ireland could only furnish thirty-three men below the ages of thirty-two years who would take service under such conditions. Of their quality we have already spoken.

Under these circumstances we may fairly conclude that the short-service view has dissolved, and that we shall not have to wait long for the appearance of the rest.

On the reassembling of Parliament there will doubtless be a motion for the appointment of a Royal Commission to inquire into the matter, of which we are quite sure Mr. Hardy will avail himself, and out of which we earnestly trust will come the last picture of the series done in indelible characters, with which there can be no more capricious tampering, and for this we strongly recommend all intending candidates for the Army Medical Service to wait.

CONDITIONS.

The official regulations may be obtained on application to the Director-General, Army Medical Department, 6 Whitehall Yard, London, S.W.

Examinations are held in February and August, but have ceased to be competitive owing to the dearth of candidates.

The candidate must be under thirty-two years of age, but may be married.

The candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer in any climate. His physical fitness will be determined by a board of medical officers, who are required to certify that the candidate's vision is sufficiently good to enable him to perform any surgical operation without the aid of glasses. A moderate degree of myopia would not be considered a disqualification, provided it did not necessitate the use of glasses during the performance of operations, and that no organic disease of the eyes existed.

Having received his diploma in surgery and medicine both of which are essential to his competition, the student is obliged to apply himself vigorously to the study of certain collateral subjects, which he does usually through the medium of a "grinder." He must perfect himself in chemistry, pathology, and comparative anatomy, and if he can throw a proficiency in botany and natural history, and French and German into the scale, he will materially improve his position in the scale of merit, and establish for himself a character with the authorities for industry and scientific attainments.

The surgeon is subjected to two examinations one on admission into the service, and a second six months later on leaving Netley.

For the first candidates will be examined in the following, and the highest marks attainable will be distributed as follows:—1. Anatomy and Physiology, 1,000 marks; 2. Surgery, 1,000; 3. Medicine, including Therapeutics, the Diseases of Women and Children, 1,000; 4. Chemistry and Pharmacy, 100. Examinations will also be held in French and German (150 each), 300 marks; Natural Sciences, 300. The Natural Sciences will include Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with special reference to Materia Medica. The number of marks gained in both the voluntary subjects will be added to the total number of marks obtained by those *who shall have been found qualified for admission*, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of modern languages and natural sciences.

The candidate having sent in his papers, and followed them to London, meets his competitors at Chelsea.

For the first two days of his examination he is employed in penning answers to printed questions; for the third and fourth days he is examined *vivâ voce* on all subjects; and on the fifth and sixth days he is tested by the diagnosis of disease at the bedside in the hospital, by the application of surgical apparatus, and by operations on the dead subject. This trial finished, the successful candidates (varying in number from fifteen to thirty) are selected.

SERVICE ON THE WEST COAST OF AFRICA.

A certain number of candidates, whose answering has been satisfactory, but not sufficiently so to entitle them to a place, were formerly offered appointments on the West Coast of Africa, but recently they have been appointed to the Naval Medical Service, as vacancies on the Coast have not existed for some time. These situations, while they are subject to strong objection on the score of the deleterious nature of the climate, possess some advantages for those whose health can resist its influence. The districts comprised under the West Coast Districts are Sierra Leone, Gambia, and Cape Coast Castle. If the candidate accepts the appointment he is sent out at once, without the period of probation to which others are subjected at Netley Hospital. He is allowed to spend a year at home, on full pay, for every year spent in Africa, and the entire period at home and abroad should count as service for pension.

PROBATION AT NETLEY HOSPITAL.

The competitor who has been so fortunate as to obtain a place in the ordinary Service is not allowed to join a regiment at once. He is obliged to undergo a probation of four months at Netley Hospital, near Southampton, where he is compelled to attend the following lectures: Hygiene, vacant; Pathology, by Dr. Aitken; Military Surgery, by Dr. Longmore; and Clinical and Military Medicine, by Dr. Maclean. The lecturers on Military Surgery include gun-shot and other wounds; arrangements for the transport of wounded; duties of army surgeons in the field, during sieges, on transport, &c., and other special subjects. Those on Military Medicine refer to the tropical and other diseases of the British possessions and colonies, and to the losses by disease. The lectures on Hygiene relate to the examination of water, air, food, clothing, &c., of the soldier, his duties and exercise, and the circumstances affecting his health, meteorology, statistics, and prevention of disease. The lectures on Pathology have reference chiefly to the scientific examination of tropical diseases, and of the other complaints which the army surgeon is especially called on to investigate. The candidates also attend the wards of the hospital under the Professor of Medicine and Surgery, to make themselves acquainted with the system of recruiting, and the modes of keeping the Army Medical Returns. They are also called on to make post-mortem examinations, to operate on the dead body, and to pass through laboratory practice on the modes of recognising the qualities and adulterations of food, and on microscopic examination of morbid tissues, and adulterations of food, &c. During his preliminary training here the student is understood to be in Her Majesty's Service; he wears uniform, is under military discipline, and receives pay at the rate of five shillings per day, and two shillings per day for lodging money, if he be not provided with lodgings in the hospital. A sum of money equal to the half-yearly interest on £1,200, the surplus from the "Herbert Memorial," is at the end of each session awarded to the candidate who has the highest number of marks, the fortunate young man who wins this "Blue Ribbon of Netley" being tolerably certain to be well provided for. At the termination of the four months he is again examined in the subjects in which he has been instructed during that period, his marks are added to those obtained by him at the competitive examination, and his position on the list of merit determined by the total. Successful candidates are now eligible to be gazetted to a regiment, or employed on the staff, and enjoy all the rank and honour, pay and privileges, of surgeons, as provided by the regulations.

Thus it will be observed that the first, or Chelsea examination, simply admits the candidate to the Service, and the conjoint result of it and the Netley examination determines his order of merit.

LIFE AT NETLEY.

The medical candidates, as the surgeons are called until they have passed out of the hospital by their second examination, are congregated at Netley, in addition to the commissioned officers who may be there. During the period of his residence at the Army Medical School each candidate will receive an allowance of 5s. per diem, with quarters, or 7s. per diem without quarters, to cover all cost of maintenance; and he will be required to provide himself with uniform (viz., the regulation undress uniform of a surgeon, but without the sword). Each candidate has to pay £5 towards the mess fund, one-half on his arrival and the remainder when he has passed his second examination. He is then a member of the mess, and entitled to dine at any time during the remainder of his service. The cost of dinner is 2s. 4d. daily, not including wine, and of breakfast from 10d. upwards.

◆

INDIAN MEDICAL SERVICE.

The regulations, subjects, and times for examination are the same as for the Army Medical Department. Passage allowance to India on appointment will be given, or a passage provided. When passages are provided on board the Indian troop ships, a charge for messing will be made at the rate laid down in the Royal Passage Warrant of 1865. Pay at 10s. a day will be allowed from date of passing final examination at the Army Medical School.

Indian allowances and time of service for pension will reckon from the date of arrival in India.

Surgical instruments are provided in India by the Government for the use of medical officers.

The pay of medical officers in the Indian Service is much better than at home, and, if unmarried, the cost of living not greater. Moreover, the medical officer frequently holds lucrative civil medical appointments which afford him a handsome increase of income. Without doubt, to a healthy, temperate, unmarried man the Indian Service is greatly preferable to that at home, but to a delicate person, or one burthened with a wife and children, the advantages are questionable.

For official regulations of the Indian Medical Service apply to the India Office, Whitehall, London, S.W.

◆

NAVAL MEDICAL-SERVICE.

In applying to be admitted as a Surgeon in the Royal Navy it is merely required to address a letter to the Secretary to the Admiralty, stating that you are in possession of a diploma from such a College—naming it; that you are desirous of being admitted as a candidate; when, if there are any vacancies, wou will be informed when you will be required to present yourself at Somerset House, London, for examination.

The subjects and method of examination and the subsequent service at Netley are in all respects similar to those referred to above under the head of Army Medical Department.

Having passed your examination and served your Netley probation you will, in the course of the following day, receive your appointment as acting Surgeon to one of Her Majesty's ships, either for service on board that ship, or for service on shore, at one of the naval hospitals—Haslar or Plymouth. You will ta the same time be informed that you are granted two or three weeks', as you may require, leave of absence, to enable you to provide your uniform and appointments. These you can get at any of the naval outfitters.

The expense of a Surgeon's uniform is about £47 5s. You must also provide yourself with a set of surgical instruments, which will cost you from ten to fifteen guineas. All kinds of underclothing, towels, handkerchiefs, &c., may be purchased much more advantageously from a regular dealer in those things than from any naval outfitter.

PRIZE MONEY.

Medical officers share in the proceeds of all prizes captured from the enemy, of captures and seizures under the several Acts of Parliament passed relating to the revenues of Customs, and of trade and navigation, for the abolition of the slave trade, for the capture and destruction of pirates and piratical vessels, and of the rewards conferred for the same, as also in the awards of all salvage granted to the crews of her Majesty's ships and vessels of war with other officers of corresponding rank.

The full and half-pay of Naval Medical Officers is in accordance with the following scale:—

Full-pay: Surgeon—Under five years' service, 11s.; eight years', 12s. 6d.; under eleven years' service, 14s.; under fourteen years' service, provided he passed his examination for Staff Surgeon, 15s. 6d.; above fourteen years' 17s. Staff Surgeon—On promotion, 18s.; seventeen years', £1; and for each additional year of service, 1s. a day more until the maximum is reached—namely, £1 2s. Fleet Surgeon—On promotion, £1 3s., and up to £1 10s. Half-pay Surgeon—Five years,' 6s.; eight years', 8s.; eleven years', 10s.; above eleven years' service, provided he passed his examination for Staff Surgeon, 17s. Staff Surgeon—On promotion, 11s.; seventeen years', 13s.; above seventeen years', 14s. Fleet Surgeon—On promotion, 16s.; twenty years' service, 16s. 6d.; and for each additional year of service 6d. a day more until the maximum is reached—namely, 18s. 6d.

Retirement is provided for according to age and service, under special regulations.

◆

POOR-LAW MEDICAL SERVICE.

A young qualified practitioner indisposed to be an assistant, and desirous of commencing general practice without investing any money in purchasing a succession, may, perhaps, obtain a Poor-law appointment, though he should scarcely expect to obtain a livelihood from the inadequately remunerated appointment.

ENGLISH POOR-LAW MEDICAL SERVICE.

Prior to the passing of the Metropolitan Poor Act of 1867 the English Poor-law Medical Service may be said to have been in the hands of the guardians, supervised by the Local Government Board. Each parish in England and Wales had its guardians of the poor, and these parishes were grouped together to form unions. The unions were divided into districts for medical relief. Union medical officers, therefore, have the care of a district, or sometimes the care of the workhouse of the union—sometimes of both. The officer was elected by the guardians, and the appointment approved by the Local Government Board. He was required to have both a medical and surgical qualification. In some instances these were specified, but almost always the London College of Surgeons and Apothecaries' Hall were the most favoured diplomas. For this reason London students will still continue to take these qualifications, whatever else they may add to them. But the L.R.C.P. Lond. is now recognised as a full qualification, both medical and surgical. The salaries of Poor-law appointments are very low; in fact, so preposterously inadequate that it would seem as if the medical man were paying the union for the monopoly of doctoring its paupers. £25 a year is a not uncommon salary for attending and providing physic for a large workhouse; but it must be recollected that all capital operations, reduction of dislocations, midwifery, vaccination, and other work outside the strictly medical duty, are paid for by a separate tariff. The system differs in this respect from that of Ireland, referred to below. In English districts, moreover, the practitioner derives much of his income from "clubs," and from attendance on small tradesmen, artisans, and tenant-farmers, who would certainly be recipients of gratuitous relief in Ireland; and therefore the parish work of the English provincial doctor is proportionately much lighter than that of his Irish *confrère*. The sanitary duties of the profession in England are also remunerated at a much higher rate, though by no means more onerous than similar duties in Ireland. Parish appointments are, however, sought after by young men as a means of getting into practice, and are often almost obligatory in the country to prevent fresh opposition being introduced. The Metropolitan Poor-law Act, 1867, assimilates the Poor-law, so far as London is concerned, to that of Ireland, and the Poor-law Board is now merged in the new Local Government Board. It has established in London asylums and dispensaries, and distributed the cost of supporting them over the metropolis. Under the new Public Health Act many Poor-law officers have been also appointed medical officers of health.

THE IRISH POOR-LAW SERVICE.

The newly-qualified medical practitioner who may elect to try his luck in the Irish provinces sets his hopes, in the great majority of instances, upon obtaining one or more Poor-law medical appointments in some district where there is hope of private practice. There are 163 workhouses and about 793 dispensary medical officers, besides apothecaries. The number of vacancies that occur annually averages 100. The average salary in this service is now about £103 15s., and when it is taken into consideration that in the vast majority of rural districts it is necessary to keep a horse, and in some a boat as well, the average area being from forty to sixty square miles, it is plain that there will not be a very large margin left from the public emoluments. The medical officer is also *ipso facto* the registrar of births, marriages, and deaths, and the medical officer of health for the district, under the Public Health Act passed in 1873. The former office, in country districts, seldom yields more than £10 a year, and often not half that amount, and the emoluments of the latter appointment in very few cases reach £20, averaging about £12. The medical officer is also vaccinator for the locality, and is required to vaccinate every one who wishes to come. For each patient his fee of 1s. is paid along with his salary by the guardians, and the sum total of these fees varies, according to the populousness of the district, from £2 to £50, an average for the provinces being about £5. Despite the miserable salary, and the very many discomforts of dispensary life, these appointments are generally eagerly sought for—firstly, because they afford the new comer a certain, though hardly earned salary, to supplement his private earnings; and secondly, because, if not secured by the new comer, they would of necessity bring a competitor for practice into the field, and inasmuch as private income is of far greater import than public earnings, country medical practitioners are obliged to undertake the public duty in order to save themselves the monopoly of their private emoluments.

APPOINTMENT.

The qualifications required by the Poor-law Commissioners are a Licence in Surgery or a Diploma in Medicine and a Diploma in Midwifery; the candidate must also be 23 years of age.

The appointment lies with the Dispensary Committee, who elect by vote. As politics and religious feeling run high in Ireland, these elements enter into the election of Poor-law medical officers. Family interest also possesses great weight.

The candidate will do well to bear these facts in mind, as his personal attendance on the day of election will be required, and whatever other qualification he may have, he will then find that his compatibility in these respects with the majority of the committee is essential; and, accordingly, he had better first make himself acquainted with the local peculiarity, whatever it may be, before he enters on his candidature, otherwise, in all probability, any expenditure that he may make in the matter will be simply thrown away. We may here observe, also, that in very many instances the appointment is virtually made before the advertisement appears for a medical officer, in which case also candidates are put to unnecessary trouble and expense under false pretences.

CONTROL.

Each district is under the direct control of a committee composed of the neighbouring landholders, the appointment of medical and other officers is made by this committee, and the entire management of the district is under their control. Their acts are, however, subject to the approval of the Local Government Board, who have the power either of interposing their veto on any appointment, or even of expelling an officer by a "sealed order," without trial or accusation, or without the resource of appeal or investigation. This salary is paid by the Board of Guardians, and no increase can be made in the amount without their assent and that of the Local Government Board. Under the late Sanitary Act the committee may recompense the medical officer for special services, such as those during an epidemic of cholera, or for sanitary reports. The number of unions in Ireland is 163, to each of which is attached a medical officer, who is appointed and controlled by the Board of Guardians in the same manner as the dispensary surgeon is by his committee. The salary is usually better than that of the dispensary doctor, and the duties of a more easy and satisfactory description, inasmuch as the duties is confined to daily attendance at the workhouse hospital, and no night visits out of doors or any long journeys across the country are involved.

DUTIES.

The duty of the dispensary doctor is twofold. He is to attend his dispensary on a given day or days in the week. Frequently there are two dispensaries in the district, separated from each other by several miles, and he will have perhaps to attend two days a week. He has also to visit at any hour of the day or night a sick person for whose relief a visiting-ticket has been issued by a member of the committee or by the relieving officer, and to continue his attendance as often as may be necessary until a termination of the case. Moreover, he has a great many registry books to keep, and a multitude of returns to make, and in the majority of districts he has to make up all the medicines for the poor.

The pressure of these duties is in the greatest degree dependent on the goodwill of the members of his committee. If the medical man be a favourite with his masters they will give him very little trouble with "scarlet runners," as the visiting-tickets are, from the colour of the paper on which they are printed, humorously called, and will be unwilling to trouble him even with cases deserving of personal attendance.

If, on the other hand, it is his misfortune to come in contact with some of the half-bred committeemen, who know nothing of the treatment fit for an educated gentleman, or cherish a personal spite, the discharge of his duties may become simply unbearable. He may be peremptorily summoned, in any weather, at any hour, and to any distance, to a case which he may probably find to be altogether trivial, or to a person whom he may know to be perfectly well able to pay—aye! even the committeeman's own brother or daughter.

SUPERANNUATION.

By a recent Act of Parliament a Poor-law medical officer may now receive a pension not exceeding two-thirds of his salary on being incapacitated from illness or old age. This grant is strictly at the discretion of the guardians; nevertheless, it has been given in most cases in which physical incapacity has been clearly proved. It is, however, at best a miserable resource, and can by no means be calculated upon as a provision for old age. There are now 53 ex-medical officers receiving superannuation allowance whose average term of service before pension was 20 years, and whose average allowance is £64 15s. Their average age at retirement was 63. All official information may be obtained of B. Banks, Esq., Local Government Board, Custom House, Dublin.

Complete information as to fees, emoluments, duties, and appointment of Irish Poor-law medical officers will be found in the "Irish Medical Directory" for 1876.

MEDICAL OFFICERS OF HEALTH.

A NEW sphere of professional labour has been recently open to medical men whose qualifications render them fit to undertake the necessary duties. We allude to the appointment by the Local Government Board of medical officers of health. At present the only qualification required of the candidate is that he is entitled by law to practise both medicine and surgery in England and Wales. Before long, however, a special qualification in State medicine will be necessary, while even now those who have passed an examination in that department will of course stand the best chance of getting the most valuable posts. The appointment rests with the sanitary authorities of the district in which there is a vacancy, subject to the approval of the Local Government Board, and the appointment first made is for a period not exceeding five years. The duties of the medical officer of health are various and important. He has to inform himself of all the influences which affect or threaten the public health within his district. He has to inquire into the causes, origin, and distribution of diseases that occur, especially contagious diseases, fevers, and epidemics. He is expected to advise the sanitary authorities in respect of any sanitary measures the adoption of which may be thought advisable. He is particularly expected to inquire into the origin and to adopt means to check the extension of infectious epidemic diseases. He has the power of seizing upon all kinds of unsound or unwholesome food that may be offered for sale, and of ordering it to be dealt with by a justice according to the provisions of the statutes applicable to the case. He must from time to time send in a report of his proceedings, and of the measures which ought to be adopted for the improvement of the public health in his district. Books also are to be kept for the registration of his visits, observations, instructions, &c., and an annual report prepared, comprising tabular statements of the sickness and mortality within his district, and other particulars which we cannot here specify.

There are really two chief classes of medical officers of health. First, those for combined sanitary districts, such as Kent, Gloucester, North Devon, &c., and whose whole time is devoted to the office. Secondly, medical officers who are not restricted in any way, but are given either a fair salary or an annual sum, which is in some cases sufficiently remunerative. From this brief sketch of the duties of a medical man holding such an appointment, it is evident he cannot engage in private practice or hold any other post if his district is very large and populous. Science Degrees (Bachelor and Doctor) in the Department of Public Health have also been instituted by the University of Edinburgh, while at Cambridge an examination in so much of State Medicine as is comprised in the functions of officers of health will be held next month. For the conditions on which the Edinburgh degrees are granted we must refer the student to the official regulations—suffice it to say, that for the degree of Bachelor of Science in the Department of Public Health he will have to pass two examinations—the *first* in Chemistry, Physics, Sanitary Law, and Vital Statistics; the *second* in *Medicine* and Practical Sanitation. The examination held at the University of Cambridge is divided into two parts—the *first* comprising physics and chemistry; and the *second* the laws of the realm relating to public health.

THE PROGRESS OF CUTANEOUS MEDICINE DURING THE PRESENT CENTURY. (a)

By Erasmus Wilson, F.R.C.S., F.R.S.,

Professor of Dermatology in the Royal College of Surgeons of England.

Mr. President and Gentlemen,—If we look around on the walls of this apartment, we find delineated on its panels the names of many distinguished associates of the society of former times. Among them is that of Robert Willan, a name of world-wide renown, to whom was awarded the Fothergillian gold medal of this society on the 6th February, 1790; nearly one hundred years ago. "Cuticulam curare paratus" was the triumphant *adsum* with which Willan heralded his labour; and his essay received the approbation of his judges; among whom we find the venerated names of Sims and Lettsom. He describes his essay in these words:—"The outline of my plan for the arrangement and description of cutaneous diseases." We have thus suggested to us the necessity for some arrangement, and are made aware of the disorder which prevailed as to the consideration of cutaneous diseases at that period; and we feel ourselves bound by a deep sense of gratitude to Willan for his effort to extricate them from confusion.

Linnæus had been before him in the classification of the vegetable kingdom, and Plenck (*b*) of Vienna had immediately preceded him with an arrangement of cutaneous diseases, of which his own way was a simplified modification. The age was Linnæan, and every classification of the period was irradiated by the genius of that great naturalist. We can fully realise, even now, the generous enthusiasm with which Willan's classification was accepted, and his breast decorated by this learned society, and especially when we remember the complexity which had prevailed in the subject up to his time—a subject which had been scarcely touched since the days of Daniel Turner in the early part of the eighteenth century, and which was still more or less under the control of the doctrines of two centuries before.

The nurseling introduced into Britain by Willan, with the help of this society, has taken deep root amongst us, and has grown up into a stately and flourishing tree. In his "Description and Treatment of Cutaneous Diseases," the first part of which was published in 1798—consequently eight years after the presentation of the Fothergillian medal by Dr. Sims—he says:—"I propose to arrange cutaneous diseases in seven orders, to be characterised by the different appearances of Papulæ, Scales, Rashes, Vesicles, Pustules, Tubercles, and Maculæ." These primary anatomical forms are now familiar to us all, and we naturally keep them in mind in our present investigation of cutaneous affections.

Upwards of half a century later than the date of Willan's essay—namely, in 1844 (*a*)—Hebra of Vienna, founding his belief on the excellent researches of Rokitansky and that school, proposed for the classification of diseases of the skin, the principles of pathology which were applied to other organs of the body, thereby identifying the skin with the rest of the organism, elevating it from the special and empirical position it had previously occupied, and bestowing on its study a more scientific and philosophical character. Hebra assumes for his classification a pathologico-anatomical basis, and excuses himself where, indeed, excuse is unneeded, for employing the name of a pathological process—an idea rather than a fact—for the title of his different groups.

(a) The Annual Oration delivered at the Medical Society of London.
(b) Plenck's classification bears date 1776.

(*a*) Published in English by the Sydenham Society, in 1866.

Hebra's classification presents to us a series of twelve groups, represented by so many pathological ideas; for example:—hyperæmia and anæmia; altered gland secretion; exudations (corresponding with our inflammation); hæmorrhage; hypertrophy and atrophy; neoplastic and heteroplastic growths; ulcer; neurosis; and parasites.

Thus, while our teachings in England, dating from the time of Willan, have appealed to a practical property of the medical mind—namely, that of observing closely and carefully the object before us—the more modern school taking its rise in Germany, and surging onwards at the present moment a gigantic flood of progress and of light, instructs us to inquire into the processes by which the lesions are produced, and identify the trivial signs taught in our earliest lessons with the more profound researches of a higher class.

Long before the attention of Hebra was directed to the subject of a new classification of cutaneous diseases, Mr. Wilkinson, a London practitioner of considerable experience, writing in 1822, (a) observes—"I would, on no account, attempt to diminish the value of Dr. Willan's classification, which I think not only beautiful, but even useful, as far as it enables us to convey to each other, with facility, without the labour of description, more correct ideas of the peculiar appearance of each eruption; but I cannot admit that it has contributed, in the least degree, to the power of subduing them.

* * * * * * *

Its greatest beauty, the classification of the eruptions, and the division of each into its different varieties, led him away, and has led away most of his readers, from *the sameness of method and remedies* necessary for the cure of such diseases; and induced him and them to think, that not only the different orders, but their genera, and even many of their varieties, required different remedies and different modes of treatment."

A curious illustration of the dangers of nomenclature and classification will be found in the Proceedings of the Medico-Chirurgical Society for 1800. Dr. Marcet presented to that society a paper entitled "An Account of a Severe Case of Erythema, unconnected with Mercurial Action." After alluding to papers by Dr. Spens and Dr. Alley, the well-known writers on erythema mercuriale and hydrargyria, he describes his own case as "a sudden desquamation of the cuticle all over the surface of the body, with an ichorous discharge, and a general redness and tumefaction." From the extreme redness of the skin, and abundant exfoliation of the epidermis, involving even the casting of the nails, we might imagine the case to be one of dermatitis exfoliativa, the so-called pityriasis rubra. But, he observes, "As the ichorous discharge is a constant and prominent feature, I should think the term erythema ichorosum well adapted to distinguish it." And if we take this view of the case we may consider it an eczema; but it is quite obvious that it must have been one or other of these two affections.

Willan was invited to see this case during an attack of moderate activity, and suggested its being an example of the genus *impetigo*, appearing to him to answer very nearly to the impetigo rubra of Celsus; but he says that "disease presents itself in many different forms, none of which, amongst those that he (Willan) has met with, has equalled in extent and severity that which has just been described." In reflecting on this case, which is not very unusual amongst ourselves at the present time, I could not help being struck with the presumed rarity of the disease. Willan was evidently undecided as to a diagnosis, whilst the shrewdness of Dr. Marcet in naming it erythema ichorosum, erythema standing merely for inflammation, brought him instantly to the truth; the man of orders and genera being foiled on his own ground by the man of simple and unbiased observation.

But when we have mastered the anatomical lesions of cutaneous disease and their pathological processes, there is still much, and very much, to be accomplished towards gaining a knowledge of these diseases with a view to their treatment. Let us take our seat in our consulting-room, or by the bedside, and *clinically* inquire what kind of classification will best suit our purpose there. Our book now occupies its place on its proper shelf, and affords us little or no information, and in fact is as likely to lead us into error as to guide us to the truth. Mr. Wilkinson very naïvely and suggestively remarks—"But from the idea I had imbibed from the authors I had read, and particularly from Dr. Willan, that the different orders and genera should be treated in a different method, and with different remedies, I never contemplated the propriety of using the *same means* for the cure of papulous which I had successfully employed for the cure of squamous affections."

Well, our first six patients are adults, say between forty and sixty years of age; some have eczema, moist and dry, recent and chronic; some erythema, some gutta rosea, and some lichen. We inquire into the functions of digestion and assimilation; in the majority we find symptoms of gastric disorder, nausea, loss of appetite, flatulence, distension, constipation, all more or less confirmed. Our pen flies to the paper; we are about to prescribe, and for what?—for indigestion and malassimilation. But our patient consults us for cutaneous disease, not for his stomach, or liver, or digestive organs, with which he finds no fault, and which he is not aware of being in a state of disorder; while we, on the other hand, know the assimilative organs to be the cause of the irritation, and that if they be restored to their healthy function, all the cutaneous symptoms will subside and disappear. Undoubtedly, when the "*force majeure*" has been dealt with, we shall advise our patient as to some local treatment—an ointment, a powder, or a lotion for the immediate relief of the skin; but, practically, we treat the cutaneous affection as if it were altogether secondary in importance; neither need we care to inquire to minutely whether the anatomical lesion is a hyperæmia, a papule, a vesicle, a discharge, or a state of desquamation. And if we be in want of a name to include the cases of this description, we might adopt the word assimilation, and consider this as an *assimilative group* of diseases.

Our next six patients are infants and children; they have brought to us an exuding eczema, a crusta lactea, an impetigo, a tinea, and a lupus. Our attention will now be led into the direction of the nutritive functions of the economy. We begin with food: we endeavour to improve and increase nutritive power by arsenic and iron, and perhaps by cod-liver oil. True, we do not overlook digestion, as we should be unwilling to allow anything to escape our notice which merited attention. But we are, in this instance, dealing essentially with an aberration of nutrition, as, in the former group, our indication was an aberration of digestion and assimilation. In the next place we approach the external treatment—to soothe and to heal in one case, to stimulate moderately in another case, and forcibly in a third. Here then we recognise a *nutritive group* of affections.

Our next patients, who may be of all ages, present us with a neurosis, ranging in variety from the lichen urticatus of infancy to the prurigo senilis of advanced life. Our remedies for strengthening and invigorating the nervous system come next into play; we find our pen, obeying a mental impulse, tracing the characters representative of quinine, iron, arsenic, strychnine, phosphorus, cod-liver oil, and bringing to light those local agents which are capable of checking and arresting pruritis and pain, among which may be named tar, chloroform, hydrocyanic acid, and aconite. Here, then, there is a *neurotic group* of disorders.

And what more remains? There is at least one other group, and, indeed, our only distinctly specific group—namely, syphilis. And here, in the presence of syphilis, we find our thoughts bent, not on malassimilation, malnutrition, and malnervation, but upon the means requisite for the elimination of a poison from the system, and centred in the very narrow but important area of inquiry—the judicious employment of two grand remedies, namely, mercury and iodide of potassium.

(a) "Remarks on Cutaneous Diseases:" by J. H. Wilkinson. London, 1822.

Therefore, if after a preliminary study of the features and nature of cutaneous disease, we seek to determine its therapeutical idiosyncrasies, we shall discover them in the practical effort to strengthen assimilation, improve nutrition, fortify nerve-tone, and eliminate from the system a foreign element in the form of a specific poison. Nearly every known disease of the skin might be comprised, therapeutically, under these four heads; and we should find ourselves adopting an arrangement which has for its intention *the cure of disease* in contradistinction to that of ascertaining its diagnosis and morbid processes.

Or, we might be tempted to view the subject from a strictly therapeutical point of view alone, and go armed for the treatment of all cutaneous diseases with four remedies :—

First, to follow the plan which I have already sketched, we must have *sulphate of magnesia;* this will form the basis of treatment of all our disorders of assimilation, and include an extensive series, embracing nearly the whole of the eczemata of middle life. I need not allude to the adjuvantia and corroborantia with which sulphate of magnesia may be associated: this part of the subject is left to the judgment and experience, I might even say, to the taste and refinement, of the prescriber.

Secondly, let us take *arsenic*, the typical remedy for defective nutritive power in every tissue of the frame—the special agent of cure of the debility of the nutritive period of life; and under this head we may include the eczema of infancy, chronic eczema at every period of existence, the impetigos and ringworms of children, and the lepra vulgaris of all ages.

Thirdly, there is a branch of nutritive diseases which is peculiarly represented by cod-liver oil — namely, struma and lupus. We cannot adopt struma as a group by itself, but only as a sub-group of the much more comprehensive family of diseases resulting from defect of nutritive power; whilst another sub-group of the same great family is one which includes epithelioma and cancer.

As a fourth remedy let us take quinine, which we may justly regard as representing the leading feature of cure in all the neurotic or neuropathic affections.

And, finally, we have mercury and iodide of potassium, which represent another extensive and important group of diseases.

Were I, then, to sum up the necessary qualifications of a good dermatologist on the data I have just enunciated, I might say—that he should observe with Willan, reflect with Hebra, and prescribe in obedience to the clinical requirements of his patient, and his confidence and experience in his remedies. I may say for myself, that although experience has given me a thorough trust in the remedies which I employ, I am, nevertheless, bound to admit that there is still very much more to be accomplished in this department to raise our practice to the level of our theory, to render it, if possible, a science rather than an art. It is here more than anywhere else, at the present day, that we want conscientious and careful work, and I will also venture to say, mutual co-operation.

It would be difficult to praise too highly the Vienna School of Dermatology, or even to do it proper justice, for the valuable instruction it has afforded us during the present and part of the last century. Plenck, the founder of the Willanean classification, was a member of that school; then we have Hebra and his distinguished pupils, Auspitz, Kaposi, Neumann, and others, together with a small host of zealous and industrious fellow-workers following in their footsteps, and aiming to convert Dermatology from an art into an exact science. We may be led by Willan to the diagnosis of a cutaneous disease, and by Hebra to a conception of its pathological signification; but we look from them to Neumann and his colleagues to be instructed in its veritable objectivity.

(To be continued.)

PATHOLOGICAL ANATOMY OF THE BRAIN—LOCALISATION IN CEREBRAL DISEASE.

By Prof. Charcot.

Translated from *Le Progrès Medical.*

I hope that I have, in the preceding lessons, succeeded in convincing you that without having previously acquired a thorough and exact knowledge of normal anatomy of the parts concerned, it would be rash to enter on the domain which we propose to traverse together.

The dependence of pathological anatomy on normal anatomy is especially manifest in all questions relating to cerebral pathology. You will shortly be reminded of this again.

1. In commencing this day's lecture, let me recall the conditions which are essential in handling the problems of localisation of brain diseases in man. These fundamental conditions are—1. Very careful clinical observations made, as far as possible, under the light of experimental physiology; 2. An exact autopsy—that is to say, one made with careful anatomical details.

The topographical studies which we have already submitted to you, have enabled us to make important progress, for they have placed us in a position to determine, better than could have been the case otherwise, the seat, extent, and shape of the lesions revealed at the autopsy. But, gentlemen, it must be acknowledged that for this special subjects of inquiry, the most exact and minute anatomical observations could not always be utilised. It is necessary here, as elsewhere, to learn to make choice among the records, and in this direction we shall find more than one difficulty to be surmounted.

To help you clearly to comprehend matters, I think it will be the best plan to glance over what I will call "the natural history of encephalic lesions."

Firstly, what are the alterations of which the encephalon (the cerebrum especially) is susceptible? At present we are only concerned with the mere common forms of lesion, and with such partial lesions as may be considered most profitably under present circumstances.

Secondly, what are the general anatomical conditions which control the development or the distribution of these lesions? for, gentlemen, none of these things are matters of chance, in the brain or elsewhere.

To attain our ends, I propose again to appeal to that mode of inquiry so important in the natural sciences, the *comparative*. I shall draw a parallel (in the light of pathological anatomy) between the great divisions of the cerebro-spinal axis, or neuraxis, as Mr. Piorry calls it: (*a*) the spinal cord; (*b*) the medulla oblongata; (*c*) the brain proper.

A. One may say that the pathological physiology of the spinal cord is controlled by one great fact, it is the very frequent existence in this part of lesions spoken of as "systematic." By this expression (borrowed from M. Vulpian) we intend to designate those lesions which, *systematically*, (the term is quite appropriate) confine themselves to certain well-marked regions of that complex organ. The diagram before you (a horizontal section of the cord) will remind you of those points which we have already gone over.

As you will recollect, there are lesions which are confined to the anterior cornua of the grey matter; in an acute form, infantile paralysis; in a chronic form, the different kinds of progressive muscular atrophy (spinal amyotrophy). Other lesions, affecting only the lateral columns, are evident in paresis of the limbs, accompanied by a tendency to contractions. You are aware that the columns of Goll may be diseased by themselves, and that the region of the external bandelettes in the area of the lateral columns constitute the anatomical position of "Tabes Dorsalis."

Thus, guided in its preliminaries by experiments on animals, and assisted by clinical experience, pathological anatomy has been able to split up the complex organ which is called the human spinal cord, into a certain number of departments, and of secondary organs. There are certain symptomatic analogies (or *syndromes*) between the "systematic" lesions of these different regions, which have given rise clinically, and in the pathology of the spinal cord, to a class of *elementary affections.*

A method of analysis grounded on a knowledge of these elementary affections, is of great assistance in unravelling the hybrid diseases, the complex forms. Doubtless the examination of these "systematic" lesions has contributed very much towards raising the question of spinal localisations from the chaos in which they have long been.

B. "Systematic" lesions are found in the medulla oblongata, in the Pons Varolii, in the cerebral peduncles themselves. I shall instance, by way of example, secondary degenerations of the cord following lesions of the encephalon, symmetrical sclerosis of the lateral columns, bulbar paralysis arising in local lesions of the origins of the nerves, &c. But above this point (the peduncles) this kind of pathological change appears not to exist, and for the present we may say that the "systematic" lesions are wanting in the brain. Thus, at the present day we do not recognise (strictly speaking) lesions which are systematically limited to the optic tracts, to the diverse nuclei in the corpus striatum, to the various departments of the grey matter; still, this is not because exact localisations, appropriate to anatomical research, *cannot* be made in the encephalon, but they are relatively rare, and to some extent accidental.

What is the real explanation of this singular fact? It is that the encephalon is, if I may so speak, placed under a pathological *régime* different from that of other parts of the "neuraxis." One may say generally that in the encephalon, and especially in the cerebrum, it is the *vascular* system which commands the situation.

On this head I will remind you of the importance of those ruptures of vessels which cause hæmorrhage into the cerebral substance, and of the important part played by vascular obliterations by thrombosis and embolism, leading to ischæmia, which then results in local softening of the brain.

I have now enumerated, gentlemen, the anatomical causes of the more common organic affections of the encephalon.

C. If we now return to the cord and medulla, we have to notice a remarkable contrast with the encephalon. Hæmorrhage by rupture of vessels depending on a change, well known under the name of *miliary aneurisms*, and softening consecutive to arterial shrinking, caused by thrombosis or embolism, are things almost unknown in the spinal cord.

The medulla is, so to speak, the point of transition between the cord and the brain, for there we find on the one hand "systematic" lesions resembling those seen in the cord; and, on the other hand, a certain number of hæmorrhages, softenings, and examples of ischæmia, brought about by *vascular* lesions. These last affections occur most frequently in the Pons, whose pathology in this respect much resembles that of the encephalon. Hæmorrhage from rupture of miliary aneurisms, and softening from obliteration of vessels, are common accidents there.

D. These considerations, gentlemen, naturally lead us to see that the system of the more common anatomical localisations in the encephalon is to be sought especially in the mode of distribution of the vessels. The primitive vascular lesion being known, one can easily trace the limits of the tract involved (as M. Lépine has well said). We have thus to enter again upon normal anatomy, in order to present to you some general views of the vascularisation of the encephalon. Gentlemen, I do not hesitate to say that we have here a subject fully worthy of your attention, especially as all the questions relative to it have been carefully resifted by studies, with which our country has had very much to do.

ON THE DUALITY OF THE SYPHILITIC CHANCRE. (a)

By Charles R. Drysdale, M.D., M.R.C.P. Lond.; F.R.C.S. Eng.

Senior Physician to the Metropolitan Free Hospital; Physician to the Bolsover Street Lock Hospital (Rescue Society), London; Consulting Physician to the Farringdon General Dispensary.

(*Continued from page* 210.)

The physicians of the early days of syphilis were careful not to confound, as has so often been done since, the ulcer of the genital organs already described by the Greeks and Romans, with the livid and callous ulcers of the genital organs already seen by them. The description of the *mal Français*, given by Astruc, comprehends gonorrhœa and soft sore; but that was long after Vella had confounded the diseases, and Nicolas Massa, writing in 1532, had placed suppurating buboes among the symptoms of syphilis. Montanus, writing in 1537, at the age of eighty, describes syphilis without any allusion to the suppurating bubo. Brassavolus was one of the first to confuse the whole question of venereal diseases. He wrote a long treatise in 1551, which influenced Gabriel Fallopius and all succeeding writers.

Fallopius, in 1555, went so far as to say that gonorrhœa had only appeared some fifteen years as a new symptom of syphilis. He thus writes:—"Ultimum signum est gonorrhœa gallica, signum incipientis morbi, quæ nobis indicat istius Protæi naturam." Astruc followed in his wake.

Nicolas de Blegny, in 1673, speaks of the indurated chancre; but he considered it no longer, as the early authors, as a special chancre. Induration, in his eyes, is only a form which indicates the approach of the general symptoms of syphilis. This was—as we know historically—for a long time the creed of M. Ricord. We know, too, that M. Ricord had to devote a great period of his life to proving the complete independence of gonorrhœa from syphilis or from soft sores.

Before 1495, ulcers on the genitals, suppurating buboes, warts and other vegetations, with discharges from the urethra, seem to have been treated by merely local means. But with the appearance of the new disease a new remedy—mercury—was introduced into practice. It was, as it is now at Aix-la-Chapelle, used at first only by the method of friction with mercurial ointment. Unfortunately, this practice was soon extended to patients with soft or local sores, and even to gonorrhœa in some cases, and thus for three hundred years it was the practice to use mercury in thousands of cases where it could not be of the slightest service. For the custom was soon established of giving mercury not only in order to modify existing syphilitic symptoms, but also as a preventive of possible constitutional symptoms, as soon as the first symptoms of contagion commenced to appear.

Thus the doctrine of the unity of nature of all venereal diseases, which commenced to reign before the middle of the sixteenth century, has produced two equally unfortunate results—the first, that affections have been considered identical which ought to remain separate; the second, in having exposed for three centuries, without the smallest necessity, a multitude of patients to all the inconveniences of mercurial treatment for no purpose. The influence of the dominant doctrines held in England by Sir James Paget and Mr. Jonathan Hutchinson are made evident by the fact that Dr. Balfour and his successors, instead of dividing venereal diseases into gonorrhœa, syphilis, and soft sores, as is done in Parisian statistics, has given one column for gonorrhœa and another for secondary syphilis, whilst they have a third column for primary venereal sores—a column which has been the cause of more confusion and bad reasoning than any person with a love for precision can contemplate without dismay. When reminded by myself of this confusion, at a recent debate at the Statistical Society of London, Dr. Balfour explained that he had framed his statistical tables after hearing the opinions of Paget and Hutchinson; and on expressing my opinion that the column of primary venereal sores was utterly valueless as an element of statistics, he asked me if I did not believe that soft sores were occasionally the cause of syphilis. I took the liberty to reply at once in the negative.

As it appears, then, that Mr. Hutchinson is chiefly responsible for the Army Medical Statistical Report, I should be doing wrong did I not advert to the theory—for it is but a theory—put forward by that gentleman to account for the origin of the soft sore. Before doing so, however, I would, following Mr. Henry Lee, point out that it seems to me that there are three forms of sores produced by inoculation. There is an inoculation, when we see new matter deposited perfectly circumscribed, accurately defined, which does not tend for a long time, at least in a healthy state of the body, and perhaps not at all, to undergo ulceration or suppuration. This is the distinct infecting inoculation. In another case, we see that instead of this, the inoculated point suppurates at once, and ulcerates at once; there is no new matter deposited, and there is always a loss of substance which there was not in the first case. There is a third form of inoculation, in which solid new matter is deposited which has not the character mentioned in the first case, but which gradually diffuses itself into the consistency of the surrounding tissues and has a tendency quickly to degenerate.

These are three very distinct forms of action, and they are not only perfectly characteristic, but Mr. Lee believes, and I share his opinion, diagnostic of different affections.

The first is the real infecting sore, which indicates the general infection of the system; the second is the suppurating sore, which always leaves a loss of substance which suppurates and ulcerates, and, as far as any evidence goes which can be obtained, never affects the constitution: then comes the third form, which has caused the confusion between the other two, where a person, having already had syphilis, is reinoculated with that syphilis, and the induration has not then the period of incubation which is natural to acquired syphilis, but comes on at once and rapidly degenerates. This afterwards simulates the soft sore, but is not the soft sore; it has not run its course, but has had solid matter deposited before any ulceration takes place.

Clinical observation has shown clearly, that in the infecting ulcer there exists a period of incubation between the moment of contagion and the appearance of the ulcer, whilst in the soft sore the ulcer takes place in a few hours, or in two or three days at most. Diday, out of 29 cases of infecting sores, found a mean incubation of 14 days. Clerc found it to be 30 days in different cases. Rinecker, in 1852, observed an incubation of 25 days: Bærensprung, in an inoculation made by him in 1859, observed an incubation of 33 days. Danielssen, in 1853, noted an incubation of 14 days. Rollet, in 1856, noted one of 18 days: Gibert, in 1859, noted one of 19 days. Cullerier inoculated syphilis in 1861, and there was an incubation period of 15 days. Waller, in 1851, inoculated the blood of a syphilitic patient, and observed an incubation of 34 days. Pellizari, in 1860, did the same, and there was an incubation period of 22 days. Wallace, in 1835, made three inoculations with the secretions of mucous tubercles on healthy persons, and the incubation period varied from 23 to 36 days. Gibert did the same in 1859 twice, and the incubation period was in one case 18, and in another 25 days. Bærensprung, in 1859, noted an inoculation from mucous tubercles, with an incubation of 30 days: Lindworm in, 1860, one of 26 days: Galligo, in 1861 one of 17 days.

The secretion of pustular syphilitic eruptions was inoculated by Wallace (that great benefactor of his race, who introduced iodide of potassium into the treatment of this disease) in two cases, and there was an incubation of twenty-nine days; Vidal found in a similar case an incubation of twenty-eight days; and Rinecker, in 1852, an incubation of twenty-eight days.

(a) A paper to be read at the Philadelphia International Medical Congress in September, 1876.

I think that Mr. Henry Lee was the first (*British and Foreign Medical and Chir. Rev.*, 1859) to point out how excessively difficult it was to re-inoculate infecting chancres on the patient himself. Fournier produced auto-inoculation once in ninety-nine trials; Puche succeeded twice in one hundred cases; Rollet six times in one hundred cases. As a general rule the infecting ulcer is not auto-inoculable.

Two years after the publication of Bassereau's celebrated treatise on the Duality of the Chancre, Clerc, in a work entitled "Memoire des Chancroides Syphilitiques," written in 1854, whilst confirming the fundamental principle of the theory, added that he believed that the secretion of the soft sore was but a modification of that of the infecting one, from the fact that this sore was inoculated in a person already affected with syphilis; that the said ulcer was then capable of transmitting itself indefinitely, without resuming its infecting power. He found between the two ulcers the same analogy as exists between variola and varioloid diseases, so this he styled the soft sore *chancroid.* But how would this fit in with the facts that the blood and secondary symptoms of syphilitic persons are contagious?

In 1860, Rollet, of Lyons, called attention to another point. He observed that whilst the two ulcers might be both naturally and artificially inoculated, each in its own species, yet their products may occasionally, though very rarely indeed, be found united, so as to form a composite ulcer, which he called *mixed.* There is nothing contradictory of common sense or common experience in this view of Rollet, for every one who has seen syphilisation practised by Bœck, has seen, of course, the two sores co-existing on the same person. The occurrence of such mixed sores will easily account for the rare cases where soft sores appear to indurate later on and produce syphilis. Langlebert, a former antagonist of dualism, who, however, is now silent on this point, used to invoke the experiments of Bœck and Bidenkap, of Christiana, who, irritating with powdered savine an infecting ulcer or mucous tubercle, said that they had often obtained by inoculation of the purulent product a non-infecting sore. To this it may be replied that these experiments were never verified, for the experiments made by others in the same direction (and I have myself made a good many) either failed entirely, or produced only a simple wound caused by the irritation of the pus.

Mr. Jonathan Hutchinson has of late years (*Lancet*, Sept. 18, 1875) written a paper on "Soft Chancres in their Relation to Syphilis," in which he explains that his creed is simply this, "that soft chancre is produced by pus contagion, the other by a specific virus." Mr. Hutchinson considers that the virus of syphilis is of the nature of a yeast. He admits that when syphilis is inoculated there is an incubation of about a month before the sore appears; but, he adds, the qualities in the specific poisons which cause induration in the chancre may also cause inflammation of a more destructive kind, and then the sore, instead of remaining almost free from ulceration and suppuration, becomes deeply eroded by molecular gangrene, and may discharge purulent secretion in some abundance. This view of Mr. Hutchinson's seems entirely to be in contradiction to the clinical facts set forth by MM. Bassereau, Fournier, Caby, and Ricord, and I confess I do not see that he has given sufficient cases to counterbalance their cases of confrontation.

Mr. Hutchinson maintains that "all living pus is contagious," although, he adds, we are not to expect the pus of an abscess which is usually dead, to manifest vital properties. He then proceeds to say: "The bearing of these facts on the theory of venereal sores is obvious. We have seen that the true virus of syphilis may cause inflammation [this, as far as I can see, is an assertion without proof], and thus result in ulceration and the formation of pus. "Let me ask you to believe (he says) that the pus so produced is in itself contagious, and you have my theory of all soft or non-infecting chancres. This pus, although produced by an inflammation caused by the specific germs of syphilis, does not necessarily contain these germs."

According to Mr. Hutchinson, the pus may or may not contain the virus, and mixed chancres are indeed very common.

"If," says this author, "the syphilitic virus and the pus cells produced by it were like each other in any degree comparable to the likeness between two seeds, even of the most widely different plants, there would be some show of reason for the terms employed by the dualists. On the contrary, I hold (he goes on to say) that the dualists have not, and never had, the slightest basis for their creed. . . . The soft sore is not syphilis at all, and cannot produce syphilis, nor is it the offspring of a sister virus."

It will be seen that Mr. Hutchinson is practically a dualist after all, and that he has merely, like M. Clerc in 1854, given a hypothetical explanation of the production of the soft sore.

To express himself more emphatically to his students, Mr. Hutchinson adds, if we could to-day exterminate soft sores, and destroy all the secretion capable of producing them by contagion, you must expect in a few weeks again to see them reproduced. And yet this great writer on syphilis had said a few liens before. "The soft sore is not syphilis at all, and cannot produce syphilis, nor is it the offspring of a sister virus." We see by this that Mr. Hutchinson is a dualist in the ordinary acceptation of the word, except that he, like Clerc has a hypothesis, concerning the origin of the species called *soft sore.*

It seems to me, too, that the assertion that, if we could get rid of the soft sore, it would be reproduced by the secretion from syphilitic persons is very strongly contradicted by facts as at present seen in Paris and other continental cities where laws for the prevention of venereal contagion are vigorously carried out. In Paris, for instance, it appears from the writings of my excellent friend, Dr. Charles Mauriac, one of the successors of M. Ricord, at the Hôpital du Midi, that in 1875 there were seen by him at that hospital only some 50 cases of soft sore entirely, whereas there were 268 cases of primary and secondary syphilis seen. Hence soft sores have been getting nearly stamped out in Paris, whilst hard sores and secondary syphilis, the secretions of which are alleged by Hutchinson, Morgan, and Clerc to be capable of causing soft sores, are greatly increased in quantity.

The pamphlet entitled "Rareté Actuelle du Chancre Simple," by Dr. Mauriac, Paris, 1876, shows that where in 1864 there were treated in the Midi Hospital 822 cases of gonorrhœa, 840 cases of primary and secondary syphilis, and 733 cases of soft sore, there were treated in the same hospital in 1873 no less than 1,402 cases of gonorrhœa, 1,450 of primary and secondary syphilis, and only 625 of soft sore. This soft sore, as I have said, seems to have almost disappeared comparatively in 1875, for if M. Mauriac treated only 50 cases, it is probable that only 150 cases were treated at his hospital, where he has two colleagues.

I know that Mr. Hutchinson has an idea that phagedæna is always the result of syphilis. I do not know whether he in like manner considers the soft sore as being quite in the same category, seeing that it not unfrequently becomes phagedænic. He considers the soft sore as nothing but a poor degraded and unprolific child of the one true syphilis. He, however, adds, "Perhaps some may be saying that I am asking them to believe a great deal on very little evidence. Candidly, I do not think so; for although I admit I offer nothing that can be called proof, yet the probability seems very strong." I, like those persons he was addressing, have grave doubts about this proof.

Mr. Hutchinson acknowledged that the soft sore has no period of incubation, that it is multiple, probably because the first sore is the parent of the other; and that it can be inoculated on the same person any number of times with the greatest ease, the constitution never becoming protected, because the disease is quite local; and yet he will not admit specificity of origin for the soft sore. Bœck was more consistent, for he inoculated with soft sore, in order to cure syphilis, from the idea that the soft sore was the product of the syphilitic virus.

There is a consequence which follows from Mr. Hutchinson's views, which is an awkward one. I will put it in his own words to his students: "If the argument be correct, it follows that, whenever you detect induration, you will be certain that constitutional syphilis will follow; but that, however sure you may be of the absence of induration, you can entertain no security unless a long period has elapsed. You will ask naturally, if this be so, would it not be well, bearing in mind the very serious consequences which syphilis entails, to deal with all soft chancres as if they were infecting ones? Candidly, my belief is that there would be a great wisdom in adopting this rule; at any rate, so far as local applications are concerned. In very many cases, I have no doubt that the soft sore occurs exactly over the site of a coming induration; and, should your patient consult you within a reasonable period of the exposure to contagion, I cannot but think that it is a good practice to destroy it by dressing and free cauterization, rather than to attempt merely to make it heal."

This may be true enough, but how are we to know when we succeed in arresting the entrance of the virus. Or would it ever be of any use to act thus a day after vaccination or inoculation of small-pox?

He further on canvasses the question whether mercury ought not to be given when there is a soft sore. "It is (he says) I am glad to believe, becoming increasingly the rule of English practice to give mercury so soon as ever specific induration can be recognised; but it is quite possible that we may, in the future, go further than this, and think that it is best to prescribe the remedy for all sores occurring within a month of contagion. We should no longer do so under the impression which formerly prevailed that it was necessary in order to make the sore heal, for we now know that the sore is not syphilis and cannot be influenced by its specific. The reason for giving it would be the fear that the patient may be passing unnoticed through the incubative stage of a true chancre. The soft sore proves that he has been contaminated with venereal pus, and shows that it is not improbable that he may have received the syphilitic virus also. It is quite possible that the antidotal properties of mercury may be much greater in the early stage than in the later ones."

I am afraid that, although Mr. Hutchinson himself is not in the habit of prescribing mercury for soft sores, the consequence of his teaching that dualism is dead may be that many persons may again recommence the practice of giving the drug in all cases of sores on the genitals.

Now, although I am a convert to the opinion that mercury is of service in true syphilis, although I find I am obliged to confine my doses to one-sixth of a grain of the proto-iodide twice a-day, and even then I do not often escape slight salivation, I protest against *extending* the limited range of mercurial medication beyond the cases of true syphilis, and hence I am practically, like Mr. Hutchinson, a dualist; but, moreover, I am, after Bassereau and Fournier a believer in a separate poison in the case of the soft sore.

We are informed that the total amount received towars this year's Hospital Saturday Fund, up to ten o'clock on Saturday evening, was £4,430, being £718 in excess of the amount received up to the corresponding period last year.

The plague is reported to have broken out in the Turkish camp around Alexinatz with great virulence. The commander has had all the tents and bedding burned, and has to shift the position of his lines every day or two.

Clinical Records.

INTUSSUSCEPTION IN A CHILD.

The following case of Intussusception occurring in a child six months old, and its successful treatment, as reported by George B. Fundenberg, M.D., in the *Medical and Surgical Reporter*, Philadelphia, is worthy of note, and will be best given in Dr. Fundenberg's own words:—

"Not long ago I was called to see a fat, well-developed child of six months. The mother directed my attention to a purple tumour which appeared at the anal sphincter when the child strained, and disappeared when the straining ceased. This tenesmus had existed forty-eight hours, nothing but a small quantity of mucus being passed. During the last six hours incessant attempts to vomit came on, with the occasional ejection of the stercoraceous contents of the bowels.

Upon introducing the index-finger, it came into contact with a cone-shaped tumour, which was evidently an intussusception, and not of the rectum, for the finger could readily be passed up as far as the colon, and yet not reach the reflected upper portion of the intestine. No opening could at first be discovered at the end of the projecting bowel, but upon a more careful examination, I found an aperture at one side, into which I could pass the tip of the finger. This position of the opening served only to confirm the diagnosis, for, as is well known, the attachment of the mesocolon turns the orifice to one side. The shape of the opening was also characteristic, being more like a slit than a round hole, a fact accounted for by the same traction of the mesocolon. I now prepared to reduce the intussusception by the only method which occurred to me as likely to succeed.

Assisted by Dr. O. M. Schindel, I placed the child under the full influence of chloroform, having previously wrapped the flange of the nozzle of a Davidson's syringe with a roller bandage, an inch and a-half wide, in such a manner that when the nozzle should be introduced into the rectum the bandage, tightly pressed against the nates, would make the apparatus water-tight, and thus prevent regurgitation. My assistant now inverted the body of the child, and while in this position, I injected about two quarts of tepid water, and holding the wrapped bandage tightly against the body of the child, the force of the injection and the aid of gravitation were brought to bear in the most efficient manner, in the return and straightening out of the bowel, the child being at the same time completely anæsthetized, so that no resistance nor tenesmic efforts prevented restitution. After about ten minutes of this kind of effort, the nozzle was withdrawn, and a careful examination made, but no tumour could be felt. A sufficient dose of morphia was now given, before the child had quite recovered from the influence of the chloroform, and successive doses were ordered, sufficiently to keep the child quiet for several days. Liquid nourishment was given, and in forty-eight hours more the bowels moved freely and spontaneously, and there was no further return of the trouble.

The rarity of cases like this may be estimated, when it is stated that the occurrence is rarely referred to in the books. Vogel remarks that "intussusceptions occur frequently in the large intestines, and, when in the rectum, may possibly be felt *per anum.*"

◆

SOCIETY FOR PROMOTING LEGISLATION FOR THE CONTROL AND CURE OF HABITUAL DRUNKARDS.

The Inaugural Meeting of this Society was held last Friday at the Charing-Cross Hotel.

Dr. Alfred Carpenter, who was voted to the chair, opened the proceedings by stating that the object which they had in view was the formation of a society for furthering legislation for the control and cure of habitual drunkards. There was much to be expected from a few earnest workers in this movement, and as "great events from trifling causes spring," he hoped that great results might ensue from the present meeting. That there was need of further legislation had been amply proved. On a former occasion a meeting of medical men had been held, at which Sir Thomas Watson had put the case in a very forcible manner. The report of the select committee of 1872 had recommended a certain course of legislation; but the report of that committee had not as yet met with any response from the House of Commons. But, besides the evidence laid before that committee, they had the testimony of the whole medical profession as to the necessity that existed for legislation upon the subject. The movement also received the support of most of the medical journals, of which the *British Medical Journal* and the MEDICAL PRESS AND CIRCULAR were specially mentioned. But a considerable difference of opinions existed as to the form legislative interference should take, and therefore it was that a society specially devoted to the consideration of the subject should be formed. The great object of the Society was to follow up the action initiated by the British Medical and Social Science Associations, but another object they would have in view was to combat the mistaken notions there were on the subject; while the Society would have the advantage of combining the lay with the medical element, and so of putting the case before the public in such a manner as to gain their support. When all the facts of their case and the objects which they had in view were laid before the public, and the public were properly instructed in the matter, legislation on the subject would then be feasible. The chairman deprecated the practice of sending persons to prison repeatedly for drunkenness, and said that the absurdity and failure of the present primitive legislation on the subject was shown by the habitual drunkard invariably returning to his old habits directly he had gained his liberty. Besides they were sent to prison and treated as criminals for what in their case was a mania. There ought to be proper places where they could be sent until they were cured, and where they would be in the same positions as criminal children who were sent to a reformatory. There were also a great many cases among the higher classes which came before the law courts; and although the former class must be dealt with first, the latter would not be overlooked, as the circumstances which justify legislative control in one case would justify it in the other also, and what would be right in the former must be equally right in the latter. Dr. Carpenter also observed that one good result of the legislation which they proposed would be of a prospective nature, inasmuch as it would greatly diminish the hereditary tendency of drunkenness which existed among children of habitual drunkards.

Dr. Hardwicke, coroner for Central Middlesex, moved, "That this meeting, being convinced of the necessity for further legislation in regard to habitual drunkards, hereby constitutes itself into a Society for the attainment of this object." He said the public had no idea of the enormous amount of disease and death produced by drunkenness that was revealed in coroners' courts such as that over which he presided,

Mr. Harry Chubb seconded the resolution, which was carried. He said he had visited some of the retreats in America, and was convinced that the treatment there adopted was very successful, although the control of the patients was not so great as would be necessary in this country. Dr. N. Kerr, who had resided many years in America, gave similar testimony as to the good results following the plan adopted in some parts of that country. Mr. Safford said that there was a great difference of opinion on this subject between the legal and medical professions. The lawyers looked upon the present movement as the inauguration of a new system of lunatic asylums, whereas they (he among them) regarded habitual drunkenness as a crime and not as a disease. For if drunkenness was treated as a disease, it might then become a plea for all sorts of crimes which the law at present looked upon as being aggravated rather than palliated by the drunkenness.

The following were requested to act as vice-presidents of the Society: the Archbishops of Canterbury and York, the Bishops, the Deans (including the Very Rev. the Dean of Bangor), Cardinal Manning, Sir T. Watson, Bart., Vice-Admiral Sir W. King Hall, K.C.B., and such other gentlemen as the executive committee might select.

An executive committee was appointed, Dr. Carpenter consented to act as treasurer, and other motions concluded the business of the meeting.

WEDNESDAY, SEPTEMBER 27, 1876.

EXCHANGES IN THE ARMY MEDICAL DEPARTMENT.

IT may seem a far too trivial matter to which to attract public interest or official attention, that to the officers of a secondary department of the army is denied a privilege accorded by Act of Parliament to every other branch of the military service.

But if it can be shown that by this arbitrary exclusion many an English family is plunged in sadness and separation; that the delicate wife, or dying child is compelled to bid a farwell to the husband or father, which shall be their last embrace on earth: that the aged parent drawing to the close of life, whose harrowing sympathies centre all the more intensely in his or her surviving son is forced to anticipate the bitter pangs of that hour of parting which humanity softens as it can, and upon which in no other instance would officialism dare to inflict unnecessary outrage, it will then doubtless be admitted that the subject is not too small for public notice.

It may be taken as an axiom that no young man of ample or independent means ever enters the Army Medical Department, since, were the tastes of such an one military, he would assuredly embrace the military profession, in which he would find social distinction and an opportunity of renown, and were his propensities medical he would of course join in the stimulating rivalry of the metropolis, or other large city, in which he could afford to await that class of practice which would be agreeable in its performance and productive of fame in proportion to his merits.

As therefore comparatively poor men enter the Department, it is evident that the luxury of exchange, even if desired in early service, cannot be enjoyed, and that it is only in after years when money has been obtained by long previous residence in India, by marriage, or by inheritance, that the privilege of continued sojourn amid the expenses of England can be indulged in.

It has been proved by Surgeon-Major De Chaumont, that the mortality of medical officers is twice as great as that of their combatant brethren, and it may legitimately be inferred that their health is two-fold more deteriorated, yet when in middle life they seek to avoid a repetition of the injury already received from foreign service, and either from personal delicacy, or family considerations, solicit an exchange. They learn that they alone of all the military bodies are to be debarred from what the English Parliament considered a just concession to the English Army; and that whether the application be on account of previous loss of health, on behalf of a sickly wife, or for the sake of a dying parent, the same inexorable reply awaits the suppliant, "that in the case of medical officers the public service does not acknowledge the existence of family concerns, and that the applicant must either resign with his commission all claim to compensation for his many years of toil, or obey the inflexible command.

Here alone of all the transactions of life is the value of money rendered null and void, and in this service only are men compelled in time of peace to surrender all control over their own careers.

Yet from another point of view is the hardship twofold, for besides the one who pleads for permission to purchase the privilege of remaining in England is he, who, having incurred a debt beyond his means, or having married on too small an income, is glad to obtain a sum which will free him from his difficulty, and enable him to secure on foreign service an increase of pay sufficient to maintain his family in decency and comfort, still he is refused the chance, and is obliged to submit to the cost of English living till his little stock of money and credit is nearly, or quite, expended.

Thus their individual duties are forced upon two unwilling servants, who go forth under a depressing weight of hardship and injustice, sensible that the boon which they so earnestly, but fruitlessly besought, would have been granted to any officer of any other corps without the necessity of a pretext.

Strange to say, no one has yet offered any reason for this summary abrogation of a privilege hitherto enjoyed in common with the rest of the army, beyond an illogical assertion that if A exchanged with B, it in some inexplicable way injured C; but of the nature of the injury no definition can be given, and now that a certain amount of foreign service is held to be an indispensable qualification for promotion to the higher grades, it would not be possible to define how an exchange can in any way affect a third party.

We do not for a moment credit, nor shall we give expression to the insinuations made against those in authority over the Medical Department to account for their action in this matter. We sincerely believe that their conduct has been actuated by a mistaken, though honest, idea that they were distributing equal justice to all, while from pre-occupation with weightier affairs the subject has been but superficially dealt with, and we are just as certain that on re-consideration they will perceive how much it behoves them, more particularly at a time when fundamental changes are being introduced, to see that those whose welfare and interests are committed to their keeping shall suffer no diminution of privileges from what they previously enjoyed, nor in comparison to what are conceded to the other officers of the army, still less is it politic at this very time to add so grave a wrong to the many causes of distrust which have reduced the credit of the Department to such an ebb, that even at advanced ages, and on the lowest marks ever given only 33 candidates can be found for the 50 vacancies offered for public competition.

That an enforced *conscription* for foreign service should be suddenly imposed upon those who entered Her Majesty's Army many years ago under totally different regulations, is an obvious grievance intelligible to the most uninitiated, and can only require to be stated to enlist the sympathies of many who having means of approach to the Secretary of State for War will doubtless use their efforts to obtain redress for those who are powerless in their own cause.

◆

WHAT TO EAT AND DRINK.

"Some people," said Dr. Johnson, when partaking one night of a good supper, "have a foolish way of not minding or not pretending to mind what they eat. For my part, I mind my belly very studiously and very carefully; for I look upon it, that he who does not mind his belly will hardly mind anything else." There is undoubtedly a good deal of truth in this speech, for although many great celebrities, past and present, such as Julius Cæsar, Sir Isaac Newton, and others we might mention, were very indifferent as to what they ate, yet the majority of those who have attained to great eminence, who have worked hard all their lives, and who have, moreover, reached a good old age, are reported to have had a strong stomach, good digestion, and a keen relish for the pleasures of the table. At the same time we think that, were Dr. Johnson alive now he would not have much fault to find with the indifference of the public as to what they ate and drank. For we are rather disposed now-a-days to give too much, rather than too little, attention to the subject of gastronomics.

Very recently the Anatomical and Physiological Section of the British Association was occupied with a discussion on this question. Professor Wanklyn opened the meeting by reading a paper on the effects of the mineral substance in drinking water on the health of the community; and afterwards Mr. Groom Napier read a paper on the unwholesomeness of flesh in tropical climates. There was, however, very little originality in the manner in which either of these subjects was treated, as a glance at these respective papers will show.

Mr. Wankyln drew attention to the large quantity of water consumed daily by man in some from or other—to the nature and qualities of the hard and soft kinds of drinking water—to the great value of the mineral constituents of water, especially lime, in the due nutrition of the body—to the evil results of drinking impure water, and other topics with which we are all more or less familiar.

Nor was there much more novelty in the remarks of Mr. Napier, except where he states that our cattle are habitually over-fed, and are always in a feverish and phlegmonous condition, which tends, he says, to make their flesh a dangerous article of food.

That much animal food is quite unnecessary, or even harmful in tropical countries, and that it is, when aided by other causes, such as the indulgence in alcoholic liquors, a fruitful source of fevers, dysentery and liver complaints ; all this has been shown over and over again, and by observers from all parts of the world. The late Dr. Copland, when travelling in the early part of his career, in the most unhealthy parts of intertropical Africa, met with an Englishman, who had lived there between thirty and forty years, and was even then in the enjoyment of health. "The circumstance," remarks Dr. Copland, "was singular, and in answer to my inquiries as to his habits, he informed me that soon after his removal to that pestilential climate, his health continued to suffer, when, after trying various methods without benefit, he had pursued as closely as possible the modes of life of the natives, adopting both their diet and beverages, and from that time he had experienced no serious illness." In fact, we cannot help remarking, by the way, that the number of facts, theories, and doctrines farbished up in many of the papers read at our different societies and associations, and which get the credit of being new and original, is really surprising, and certainly does not say much for the acuteness of either the writers or the readers of the present day. But, to return to our subject, it is evident that the question as to what is best to eat and drink in tropical climates lies in a nutshell, for both theory and experience show that the diet of the European living in these climates should, as regards both eating and drinking, approxmiate as much as possible to that adopted by the natives themselves ; due allowance, however, being made for the requirements of long established habits, and peculiarities of constitution, as well as for the more active life which is led by the European.

And that is true with regard to diet and regimen in tropical countries is, in a minor degree, equally true in respect of the mode of living most suitable during the short hot summers of more northern climates. He who lives sparingly, eats very little meat, confines his food chiefly to articles of a vegetable or farinaceous nature, and his drink to those beverages which contain little or no alcohol, will be far more healthy, active, and comfortable during the hot weather of this or any other country, than he who lives on a totally different system.

One of our representative newspapers, in commenting on the discussion which took place on this subject at the British Association, regrets that the section was broken up without arriving at any practical result, considering that "if there is one thing which the public wishes to know more than another, it is what it ought to eat and drink." Our contemporary even supposes that the Association could not be better employed than in considering the vital questions of what kind of water is best for drinking purposes, and how many ounces of meat a healthy man requires in the course of twenty-four hours. Now, for our part we are rather glad that the Section, to which reference has been made, did not arrive at any practical result, or lay down a lot of "cut and dried" rules on the subject. The public have been already satiated and too much perplexed with this question. One theorist tells them not to touch any kind of wine, beer, or spirits, as alcohol in any shape or form is nothing less than a poison, and that water is the only natural and legitimate drink of man. But when they rush to the water they are met by another theorist, who says, "now mind, my dear fellow, what water you drink. If you don't boil and filter your water you will be carried off by typhoid fever or cholera." And while the poor scared creature is enjoying his boiled and filtered water he is stopped by another, but more sensible theorist, who exclaims, "What, boiling your water! What do you think will become of your bones and your brain, if you precipitate all the lime and other salts which Nature has kindly provided for you?"

The fact is there is a good deal of twaddle and nonsense talked about this eating and drinking question, and perhaps it would be much better if both patients and those who are well, were allowed, or directed to follow more than they do, the dictates of their own instinctive feelings and experience, provided of course that temperance be the ruling principle to guide them. A healthy man should not be too anxious as to what he ought to eat and drink, but he ought to be able in moderation to eat, drink, and digest whatever comes in his way. "Præterea," remarks Dr. Gregory, "Sani et validi corporis utriusque sexus est, non modo suis, nihil impediente, probe functum esse muneribus, sed, tenacis prosperæ suæ valetudinis, multis, cæli, *victus, vitæ generis, varietatibus semet accommodasse*, et sic plurimas morborum causas impune tolerasse," and if we are not mistaken it was Abernethy, who, in reply to a patient who asked him what would agree best with his stomach, said "anything sir, until it is found to disagree with it." Indeed, there is no part of the body in which idiosyncrasy and peculiarity of constitution are so remarkable as they are in the stomach and digestive organs, but we are all too apt to overlook these conditions in laying down rules as to what people should eat and drink; while, on the other hand, we are, especially at the present day, too much inclined to be guided by certain notions we have respecting the physiology and chemistry of digestion and assimilation, and which although they may be partially true, are not sufficiently well established to be safe guides in practice. Thus, for instance, who would have thought a few years back that Liebig's doctrine as to the part played by oleaginous articles of food in the nutrition of the system would ever be assailed. For years it was taught in our text books as one of the best established facts in physiology, and which no one, one eminent physician excepted, ventured to refute. That physician was the celebrated Graves. From the very beginning he exposed the weak points in Liebig's theories, but these had taken such a strong hold of the medical profession that his protest was hardly listened to. Now, opinions on the subject have very much altered, and consequently we find a corresponding change in our principles of dietetics.

Instead, therefore, of framing a series of strict rules the observance of which might be found impracticable, we would rather say, be not over careful as to what you should eat or what you should drink; partake of all things in moderation; but be careful to eschew what ever your natural instinct or aversion prompts you to avoid, and whatever past experience has shown to be prejudicial.

◆

THE VISIT OF THE BRITISH ASSOCIATION TO DUBLIN.

We congratulate the profession as the most important section of the scientific community in Ireland, upon the acceptance of the proferred hospitality of the City of Dublin by the British Association for the year 1878. The proposal that the Parliament of Science should be invited to the Irish metropolis, which had originated with the University of Dublin and the Council of the Irish College of Surgeons, was warmly received by the Dublin Town Council, and the invitation itself was courteously and effectively communicated to the Association by the Lord Mayor of the City. Our *confrère*, Dr. G. B. Owens, who—as was proper—preceded the Provost of Trinity College, and Professor Haughton in urging the claims of the City of Dublin to the honour of a visit. The eloquence of the Lord Mayor and the University representatives was the more needed, inasmuch as a strong counter-claim was put in by Leeds, whose representative pressed its title to the honour with great emphasis and eloquence. The Irish speakers represented that Dublin had a strong claim on the Association, it not having met there for twenty-one years. There was much (the Lord Mayor said) to interest the Society. By that time the great telescope manufactured for the Austrian Government by Mr. Grubb will be erected at Rathmines for approval. Lord Rosse's new telescope will also be finished and can be seen at Parsonstown Observatory. The new Anatomical museums of Trinity College and the new museums and library of the Royal College of Surgeons will be finished. Trinity College Building, in the centre of the city, would accommodate within its walls (he observed) all the sections with ample committee-rooms and lecture halls. The Exhibition Palace would afford full accommodation for promenades, concerts, and lectures, and the country around afforded most favourable opportunities for enjoyable excursions.

We regret that Dr. Owens will not have the opportunity of carrying into effect his hospitable intentions in the capacity of chief magistrate, as a member of a scientific profession would aptly receive the Association in the Mansion House.

The vote of the committee (65 to 63) in favour of Dublin, may, we trust, be accepted as evidence that any prejudices which have hitherto existed in the "Saxon" mind in regard to Ireland and the Irish are wearing off, and we hope that Dublin will spare no effort to eradicate them by showing the Association that Ireland can show sterling scientific work proportionate to the brimming hospitality which, without doubt, it will extend to its visitors.

Appropriately to this subject, we publish the following letter:—

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—As we have been heretofore made aware before this time of year of the names of the Fellows who seek the Vice-Presidency in June, I write to ask if any have declared their intention of seeking that honour. Let me add one suggestion. The British Association meets in Dublin in 1878, and the Vice-President of next June will then be our President. That he should be a man worthy of the respect of that great scientific body, and one prepared to offer hospitality to distinguished visitors, will clearly appear to others besides

Your obedient servant,
A Provincial Fellow.

We very cordially endorse the suggestion of our correspondent, and trust to see in the occupancy of the Surgical Presidency of Ireland a Fellow who can do honour to the profession and his college both as a man and a savant.

◆

A DOMESTIC TRAGEDY.

"We know what we are," says Shakespeare, "but we know not what we may be;" and never is this truism more forcibly illustrated than in those terrible domestic tragedies which happen from time to time, and which must, unfortunately, be regarded as one of those calamities that are almost inseparable from our modern civilisation. We refer to the shocking and sudden acts of wholesale murder and suicide which have recently occurred within a very short time of each other, and of which a terrible example was recorded a few days ago in the daily papers.

A respectable man, living at Edinburgh, and described as a slate and marble merchant, is considerably worried about some business matters; but his behaviour does not to all appearances betray any feelings of either extraordinary excitement, or of depression. On the contrary, after dining with his wife and family, he proceeds to play with his children. To a sick baby in a crib by the side of the drawing-room fire he gives a number of toys, and with his boy, a child of about five years, he romps apparently in a spirited and happy manner. But no sooner does his wife leave the house than he sends his son for a hatchet that was used for breaking coals, with which he immediately murders him, and then rushes to the cradle and kills the infant in a most frightful and barbarous manner. Finally, after committing this terrible crime, he runs off to a branch line of the North British Railway, where he puts an end to his existence by throwing himself in front of a train. Such are the main features of a tragedy which we should be glad to speak of as one of rare or unprecedented occurrence. In this case, the man was about thirty-six years of age, and by those who knew him well he was supposed to be the last person in the world who would have been the chief actor in such a tragedy. He was looked upon as being remarkably calm and self-possessed, and invariably kind and affectionate in his family relations. It is, however, stated that he was very "retentive about his affairs," that he allowed them to prey upon his mind, and that there was an hereditary predisposition to insanity in his family.

This case is a striking example of the surprising suddenness with which an attack of homicidal and suicidal mania may come on, and without the least warning of the tragic consequences to which it leads. In the recent inquiry into the death of Mr. Bravo it was thought highly improbable, indeed, almost impossible, that a man should commit suicide, who had been known to be in good spirits shortly before the supposed act, and who had even made engagements for the day following that on which he had taken the poison. But the weakness of such an argument is at once shown by the occurrence of such unforeseen and unavoidable tragedies as that to which we are now drawing attention. That attacks of either homicidal or suicidal mania may happen without any warning whatever, or without any premonitory symptoms recognisable by ordinary individuals, is a circumstance which is pretty well known to those who have much to do with the insane. Nor is the occasional occurrence of a sudden and uncontrollable impulse to commit murder or suicide wholly unaccountable. There is no part of the body the health and strength of which can be accurately measured until it has been actually gauged or tested; but with regard to the brain, it often happens that its inherent weakness, or the condition, whatever that may be, to which this form of insanity is due, is not manifested by any outward signs until that organ has been exposed to a test which completely overwhelms it. It is sad to think that this should ever be the case, as where there is no warning there can be no protection, but, nevertheless, it is so. He who hangs from a precipice by a rope, the threads of which are rotten or badly spun, may fall at any moment in which additional weight is brought to bear upon it. And he who is by nature weak minded, or whose cerebral organisation, either from acquired or hereditary causes, predisposes him to insanity, may, while in the enjoyment of health, suddenly succumb to the most uncontrollable impulses or to the worst form of suicidal mania. Nor can we point out any remedy, or show how such frightful occurrences may be prevented. This tragedy in real life is, unfortunately, one of the debts that society has to pay for its high state of civilisation, and for the great competition that exists amongst all classes of the community. All that medical men and morality can do is to impress upon every one the responsibility of his position as a member of society, and to show him that it is his duty to put all the restraint in his power upon his passions and impulses, and not to allow misfortune to prey upon his mind to such a degree as might lead to far more serious results than could arise from the most irretrievable losses.

◆

THE SPIRITUALIST FURORE.

Professor Barrett and Mr. Wallace are overwhelmed just now by the odium which the prejudiced invariably display towards those who differ from them, and which "Britishers" have through all time manifested towards the promulgators of any theory difficult of belief. We firmly believe that both Mr. Crookes and Professor Barrett have been hoodwinked by the spiritualists, but that is not the question at present in issue. The controversy rages as to whether the British Association should or should not have listened to a communication on mesmerism and spiritualism or should condescend to exercise itself upon an inquiry into the subject. In our opinion the admitted phenomena of mesmerism and the asserted cognate phenomena of spiritualism are well worthy of the investigation of the Association. The former class of observation, though they were at the time of their first introdution to the world scouted as impostures just as spiritualistic performances now are, have been long since accepted as real, very remarkable and possibly very important evolutions of the nervous system. They have nevertheless, been shunned by scientific men as a dangerous and unpopular subject of examination, and have remained neglected—though they might probably throw most valuable light upon nerve physics—simply because the stupid British public has chosen to look upon them as little better than chartalanism. That phenomena so inviting to the psychologist and biologist have been thus shunned in deference to popular prejudices, speaks little for either the courage of investigators or the good sense of Englishmen. They asserted phenomena of spiritualism have been now placed on the same footing as those of mesmerism originally occupied by the writings of Crookes and Barrett—men whose special trade in the searching out of obscure physical phenomena and whose minds are presumed to be trained to observe in a perfectly calm, observant, and unbiased spirit, to assume nothing and to believe nothing but that which they have the closest scientific proof. They may have been, and, we believe, were deceived, but what they testify of assumes at once great gravity, and it is simply puerile to assail them with abuse because they have honestly stated what they believed that their eyes saw, their ears heard, their fingers felt, and their brains accepted; and equally puerile to say that thinking people have a duty to refuse to see, hear, or think, and are therefore bound to assume the whole affair to be a swindle, without permitting themselves to ascertain whether it be so or not.

We of course do not suggest that the British Association ought to employ itself on all occasions with the incredible, especially when the incredible is a trade driven by persons of more than doubtful repute, not when a remarkable and inexplicable manifestation is lifted from the region of quackery into that of apparent fact by investigators of undoubted character, no scientific body can afford to refuse to see and pass judgment upon it. Whether the dictum of Barrett and Crookes have yet raised it to such a dignity is a debateable question; but those who think that it has cannot be satisfied with abuse of those who want to know all about it as a substitute for thought and enquiry.

◆

Notes on Current Topics.

The Alleged Prevalence of Typhoid Fever at South Kensington.

Dr. T. Orme Dudfield, Medical Officer of Health for South Kensington, has just issued a special report on the alleged chronic prevalence of typhoid fever in his district, and we are glad to find that he has most satisfactorily refuted the statements and arguments which have been brought forward by Sir Henry Cole, with the intention of affixing a stigma of special unhealthiness on what, after all, appears to be one of the most healthy parts of the metropolis. The absurdity of the arguments made use of by that gentleman showed that people of influence should be sure they have a case, and that they thoroughly understand the subject they are dealing with before they take upon themselves the responsibility of aspersing the public conduct of local authorities, who seem to know what they are about, and who are doing all they can to perform satisfactorily the duties imposed upon them. Because a certain number of deaths occurred in a parish extending so far as from Kensal Green in the north, to the Fulham Road in the south, and because South Kensington is a part of this large parish, therefore, argues Sir Henry Cole, deaths from fever have occurred in South Kensington. This is certainly a curious syllogism, but it appears, moreover, that Sir Henry Cole's facts are as defective as his logic; for Dr. Dudfield shows that the number of deaths from fever in the Kensington Town and Brompton district for the thirty-three weeks ending August 15th is much less than that given by Sir H. Cole; and that the death rate from typhoid fever in South Kensington was actually below the average rate in all London, being only 1·4 to 10,000 persons living, the rate in all London being 2·4 per 10,000. It is even plain that not one death from "fever" occurred in South Kensington, while the statement that "deaths have been occurring without the knowledge of the vestry or its medical officer" is also shown to be without foundation. With respect to the general healthiness of the large district above-mentioned, statistical facts show that its sanitary condition is the very reverse of that described by Sir H. Cole, for whereas the death rate in all London last year was 22·5 per 1,000 persons living, the rate in the parish was 19·4 per 1,000 (or 18·5, after deducting the deaths of non-parishioners in the Consumption Hospital), while the rate in the Brompton registration sub-district, including South Kensington, was only 16·6 per 1,000.

It was stated in a leading contemporary journal that "the zymotic death rate of the South Kensington district is steadily increasing, and that a death rate from zymotic diseases of more than two per 1,000 persons living is absurdly high for such a suburb as South Kensington." To this "I would reply that the zymotic death rate quoted is not that of 'South Kensington,' but of the Brompton registration sub-district; and that in order to form a just notion of the proper or usual zymotic death rate of any district, it is necessary to take into the calculation a sufficient number of years. The reason is obvious, and is so well expressed by a recent writer, that I cannot do better than quote his words: 'In attaching importance to an increased death rate from zymotic diseases during any period reference must be made to prior conditions. A prolonged immunity from measles, whooping-cough, or scarlet fever is sooner or later certain to be compensated by an increase proportionately great, because during the years of immunity the population susceptible to such diseases has continued to increase.' This fact should have been borne in mind in considering the present case; for though it is true that the zymotic death rate was higher last year, and is higher this year than in the year 1874 (with which the comparison is made to the disadvantage of the district) this higher rate, which is still not above the decennial rate, 'has,' to again quote the same writer, 'been caused rather by an increase of population susceptible from prior immunity than' (as assumed) 'from insanitary conditions.'"

It further appears from a table of death rates from seven principal zymotic diseases in 1875, and for eight different districts or parishes, that the respective death rates of Kensington and Brompton are lower than that of any other parish, the parish of St. George, Hanover Square, excepted, a fact which shows that South Kensington is not open to the reproach levelled against it.

When Dr. Dudfield published his reply in the *Times* to Sir H. Cole's letter, he forwarded to that gentleman documentary proofs of the statement he had made in refuting Sir Henry's assertions. Sir H. Cole has not returned to challenge this reply, and we have no doubt he had very good reasons for not doing so. It is more easy to get into difficulties than to get out of them.

Medical Education in Ceylon.

On the 12th ult. the Ceylon Medical School commenced its sessional work with the distribution of prizes to the successful students. At the same time, and in the presence of the Governor of the colony, the new buildings opposite the General Hospital were opened. His Excellency, accompanied by his aide-de-camp and other officers, was received by the medical staff, and his entrance was the signal for an enthusiastic reception by the students. Dr. Kynsey, addressing the Governor, said: "I have, in welcoming you among us, to offer you the hearty and grateful thanks, not only of the Civil Medical Department, but of the profession to which I belong, for the unceasing efforts you have made since your arrival in the colony to advance the cause of medicine by sanctioning the building of hospitals, and the opening of out-door dispensaries, so as to afford ample medical and surgical relief to the poor; and also for erecting at considerable cost the building in which I have now the honour of addressing you." Dr. Kynsey then entered into the history of the formation of the school of medicine, which, it appears, was founded in 1870, with twenty-five students, and at the present time there are thirty-eight pursuing their studies. During the present year the session has been divided into two parts, a winter session, with a couple of months interval between the second. Briefly to recapitulate the work of the school from its beginning in 1870 to the present time, ninety-five students were enrolled; of this number thirty-nine, or little over 41 per cent. left or retired for various reasons; forty-one, or 20 per cent. obtained diplomas, and thirty-eight are at present pursuing their studies. The numbers turned out as sub-assistant surgeons are not large, but it must be borne in mind that the school is still young, the standard has been raised, and that the class is now composed of an intelligent and hardworking set of young men, who are fully determined to work and eventually do credit to the teachers who take so much trouble in their education, and to the Government that has gone to so much expense in providing the means for their acquiring a useful and honourable profession. The Ceylon Medical School is designed to impart to the native youths a practical, sound, and safe knowledge of medicine and surgery, such as will enable them to engage in private practice, or fill subordinate posts in the public service. It was in reality founded with a view of introducing the blessings of European medicine in place of the grossest and most superstitious practices of the Vederales, or native medicine men of Ceylon, who possess no medical system at all, and who live on the credulity and ignorance of the people. The absence of all scientific knowledge of disease amongst the people of this country is the more surprising when we consider the very advanced information possessed by them on many other subjects far less important. Medicine in Ceylon, as practised by the native Vederale of the present day, holds the same position as it did in Europe during the middle ages, when it began, like most other callings, as an art based on purely empirical data, not founded on rational principles derived from the facts, but simply consisting in the facts. And it may here be asked what would be the present condition of European medicine if the purely empirical method had been followed? It would have been in the condition native medicine is now, or as it was in England centuries ago, but owing to the inculcation of principles it has become an art (imperfect, indeed, owing to its manifold difficulties), but which, to those who know the wonders of modern diagnosis, is simply marvellous by its completeness.

We heartily wish Dr. Kynsey and his colleagues the success their efforts deserve in so laudable an undertaking.

Bequests for Hospital Wards.

Sir William Fergusson, Bart., as one of the executors of the late Mrs. Nasmyth, has just proved the will in a personalty of £30,000, the whole of which is left to London charities. The most notable bequests are those to St. George's Hospital, £6,000; and to University College Hospital, £5,000; and in doing so she trusts that it will not be inconsistent with the rules and regulations of the governing bodies of such hospitals to establish with these sums in their respective hospitals a ward to be called "Mrs. Marian Nasmyth's Ward." Whether the authorities at these institutions will be able to build new wards with the money, or whether they may find themselves driven to the expedient of re-christening, or appropriating existing rooms to the purpose of the bequest remains to be seen. In any case the gifts are not likely to be "white elephants," nor need the executors to the will fear that the money will be thrown on their hands for disposition elsewhere. Whilst on the subject of charitable gifts, we may add that an anonymous donor, "F. C. J.," has sent £500 to the Seaford Convalescent Hospital, and "A Suffolk Rector" has forwarded £500 each to the Hospital for Sick Children, Great Ormond Street, London, the Seaman's Hospital, Greenwich, and the Margate Sea-Bathing Infirmary.

The Irish Registrarship-General.

The appointment of Dr. Malachy Burke to the office of Registrar-General for Ireland, which we announced in contemplation a couple of months since, has been gazetted, and we congratulate the profession and Dr. Burke on the placing of this important office under the guardianship of a medical man, which will not only guarantee efficiency of working of the department, but will save the country £700 a year.

As the office of Medical Superintendent—which was held by Dr. Burke—has been abolished, and as, manifestly, the department of Birth and Death Registration cannot be worked successfully, except by a medical man, who will be acquainted with the nature and nomenclature of disease, we look anxiously for some alteration in the law, which will make the Registrarship-General an essentially medical office. We presume it is the intention of the present Government that it shall be so, but Ministers are mortal, and the next occupants of the Treasury Bench may perhaps find in some half-pay officer or electioneering lawyer a special capacity for the classification of deaths and their causes. We therefore submit to Sir M. H. Beach—whose sole object, we are assured, is the effective and economical working of the department—the propriety of inserting a clause in the Irish Registration Bill just introduced by Lord Donoughmore, under the auspices of the Irish Medical Association, a clause to provide for the permanent occupancy of the office by a medical man.

The American International Medical Congress.

The formal opening of the sessions of the International Medical Congress took place on September 4th, in the hall of the University of Pennsylvania.

At noon precisely the session began with prayer. Professor Samuel D. Gross of this city then delivered the address of welcome to the delegates.

The address of Dr. Gross was followed by an address on medicine by Dr. Flint, Professor of Medicine in Bellevue Hospital Medical College, New York. The committee on nominations previously appointed presented a report recommending as President Dr. S. D. Gross, Philadelphia.

Amongst the names of the Vice-Presidents appear those of Dr. Joliffe Tufnell, of Dublin, Mr. William Adams, of London, and Professor Simpson, of Edinburgh.

The Chairmen of Sections were as follows:—Medicine, Professor Stillé; Biology. Professor J. C. Dalton; Surgery, Professor Joseph Lister; Dermatology and Syphilology, Dr. J. C. White: Obstetrics, Professor Barnes, of London; Ophthalmology, Dr. R. Brudenell Carter; Otology, Dr. L. Turnbull; Sanitary Science, Dr. Stephen Smith; Mental Diseases, Dr. J. P. Gray.

In the evening there was a public reception by the medical professors of this city in the Judges' Hall on the Exhibition grounds.

The Army Medical Department again.

The military correspondent of the *Irish Times* says that the greatest annoyance has been caused among medical officers in consequence of the steps which were lately taken for filling the appointment of surgeon of the 2nd Life Guards. "To say," he remarks, "that the appointment of Surgeon-Major Hensman was a 'wretched job' would be to speak of it in mild terms. It has been condemned on all sides, and it is one more nail in the coffin of Sir William Muir, who is assuredly earning for himself a most unenviable reputation. The doctors complained of the administration of Sir Thomas Logan; but I fancy they would give their head and ears could they see that gentleman again filling the seat which he vacated in April, 1874, in favour of the present Director-General. Personally, I respect Sir William Muir, as I believe him to be a man eminently conscientious, and most anxious to do that which he thinks will tend to promote the well-being of his department. I cannot conceive, though, how an officer of his experience can possibly be in favour of a system so utterly at variance with every principle of common sense as that known as the 'Unification,' which has now been in operation for three and a-half years, and which every officer one comes across condemns in the most unmeasured terms."

At the Antipodes the army medical powers that be do not seem to have achieved a much higher popularity than our own Director-General. The *Madras Times* notices the retirement of Surgeon-General Balfour in the following terms:—"We might 'improve the occasion' by reviewing Dr. Balfour's career, but we refrain. We have criticised him sharply while he held a position to which he ought never to have been appointed; and now that he is a private individual we are willing to let him depart in peace. At the same time, we cannot, knowing as we do what is the general departmental and professional estimate of him, express regret that in the course of nature he has become officially a thing of the past. Time may perhaps soften the asperity of the present criticism, and assist those who are now rejoicing at his departure as a great personal relief, to discover that there were compensations in even Dr. Balfour's administration."

In reference to a proposal to testimonialise Dr. Balfour, the same journal says—"Dr. Balfour is probably as well aware as ourselves that a public demonstration to a retiring head of a department which is conspicuous by the holding aloof of almost every officer of such department is not very valuable, but it is better than nothing, and as the strenuous endeavours of one of Dr. Balfour's subordinates to get up a testimonial or farewell dinner among his brother medical officers have met with hardly any encouragement, we do not deny his right to adopt another means of gratifying his late chief. If the committee succeed in writing an address that will not insult the understanding of the officers of the Medical Department, or send the rest of the community into fits of laughter at their expense, they will all deserve to be made Companions of the Star of Balfour for their pains."

The Late Dr. Laycock.

INTELLIGENCE has just reached us of the death of another eminent member of our profession in the person of Dr. Thomas Laycock, physician to Her Majesty the Queen in Scotland, which took place last Thursday at his residence in Edinburgh. Deceased, although apparently older, had only reached the age of sixty-four. Unflagging zeal in whatever he undertook, uncompromising in his views, and a resolute determination to carry opinions he had honestly formed at any risk, were amongst his most prominent characteristics, and which gained for him the respect alike of friends and foes. As a writer he is well and favourably known. "Mind and Brain; or, the Correlations of Consciousness and Organisation," was his best known contribution to medical literature. He translated for the New Sydenham Society, "Unzer's First Principles of Physiology," and "Prochaska's Dissertation on the Nervous System;" and was the author of "The Nervous Diseases of Women," "The Physiognomy of Disease," "Lectures on the Principles and Methods of Medical Observation and Research," besides numerous small treatises and papers in medical journals. Dr. Laycock's diplomas were F.R.C.P. Edin., L.R.C.P. Lond., M.R.C.S. Eng., and at the time of his death he was Professor of Physic in the University of Edinburgh.

Revision of the United States Pharmacopœia.

THE Committee of the American Pharmaceutical Association, who have in charge the revision of the United States Pharmacopœia for the next edition, recommend the following changes:—

1. That all measures of capacity be abandoned.
2. That all substances be weighed, and that the quantities be given in parts.
3. That all substances in the United States Pharmacopœia be arranged alphabetically.
4. That the botanical descriptions be made more exact and complete.
5. That the formula for the manufacture of chemicals which are recognised as produced entirely by manufacturing chemists be omitted, and that a description of the chemical be substituted, with such tests as shall be conclusive as to its identity and purity.

An Irish Fever Nest.

AT the meeting of the Castletown Board of Guardians last week, the relieving officer reported that a man named Michael Connor and his family lay in fever. They wanted relief and refused to come to hospital.

The medical officer said the barn in which they lay was only 9ft. wide. They suffered from typhus fever, but the place where they lay was so filthy and dark, being only 9ft. square, that it was hard to tell. A cow was in the house when he went there with the sewage flooding. He used all kinds of persuasion and unless he used force they would not come into hospital. The law would not permit them to use force unless a second family were living in the house as in the case of lodgers. The friends of the family feared to nurse them. There being no fever nurse an inmate volunteered to go as nurse.

After some discussion the care of the family was entrusted to the relieving officer, the doctor being in attendance already.

The case thus reported is but one of very many and it will be evident that a change in the law is absolutely requisite. It is obvious that medical treatment has no chance with a disease attended under such circumstances, but it is still more important that the disease is most likely to be communicated to the neighbours and thus beget an epidemic.

PROFESSOR SCHIFF, of Florence, has demonstrated that the non-edible mushrooms have a common poison, muscarina, and that its effects are counteracted either by atropine or daturine.

Parliamentary Representation of the Scotch Universities.

A CONTEMPORARY says that a vacancy must shortly be announced in the representation in Parliament of the Universities of Glasgow and Aberdeen, and believes that numerically, the medical element is sufficiently strong to turn the scale of the election; and if the medical electors will, sinking party feeling, combine to support a candidate belonging to their own profession, they will constitute a force far greater than any other candidate can hope to obtain outside purely political influcnce. Our contemporary names Dr. Farquharson, lecturer on Materia Medica at St. Mary's Hospital, as likely to come forward. Dr. Andrew Clark, who is one of the most distinguished sons of the University of Aberdeen, has declined to stand. The *British Med. Journal* gives a rumour that Dr. B. W. Richardson, F.R.S., is disposed to offer himself as a candidate, if formally invited by persons of sufficient influence. Dr. Richardson has no local or other connection with the counties or with the Universities, nor is he a Scotchman by birth; but his general claims are well known, and we imagine that his influence in Parliament would make itself felt advantageously.

The Poor Medical Student.

OUR readers may recollect that some few months ago we alluded to the hard case of a medical student who had for some years past completed his studies, including hospital attendance, as well as the necessary curriculum in one of the Dublin medical schools, and that owing to want of funds he was obliged to accept a situation in a respectable apothecary's establishment, the emoluments from such, small as they were, afforded him only the opportunity of assisting his aged and delicate mother and sickly brother. This poor medical student is, we can vouch, a member of a most respectable family, who owned considerable land and house property in Connaught, but like many others, lost all in the famine of '47 and '48. As he is now ready to present himself for the examination for the Letters Testimonial in Surgery, he only requires the necessary funds to pay up the balances due for lectures and hospital attendance. A few of his medical friends met last week to confer as to the best means to be adopted to advance the interests of this deserving young man, whom we can confidently recommend to our professional brethren as being thoroughly deserving of their pecuniary support; Dr. Davys, of Swords, has kindly consented to act as secretary and treasurer. We shall cheerfully acknowledge all subscriptions in our columns.

Of the deserving character of the poor medical student whose cause we plead, reference can be made to Dr. Lyons, Merrion Square; Dr. Mapother, Merrion Square; Dr. Jacob, Harcourt Street; Dr. Craeg, Harcourt Street; Dr. J. A. Byrne, Westland Row; Dr. Davys, Swords; Dr. McSwiney, Hume Street; Dr. Finnegan, Glasnenin, &c.

A MILK SALESMAN in Glasgow was fined last week £10, or forty days' imprisonment, for adulterating cream to the modest extent of 80 per cent. This is the highest fine we remember to have been inflicted for this offence.

Dr. Slade and Spiritualism.

IN our issue of the 13th inst. we endeavoured to expose the trickery being practised in London upon the credulous by a person styling himself "Dr. Slade." Since then this individual has attracted considerable attention; large audiences, drawn chiefly from the upper and middle classes, having attended his *séances*. The lay press has now taken the matter up, and notably *The Times* has opened its columns to a correspondence on the pretensions of "Dr. Slade." It will be remembered that during the recent discussion before the British Association, Dr. Carpenter stated that he had arranged for a sitting at his own house, as the result of his visit to Dr. Slade's had left him in doubt as to the *bona fides* of the so-called "manifestations" exhibited on that occasion. At this arranged sitting, Dr. Carpenter undertakes to subject Dr. Slade to such tests as he believes will either confirm the genuineness of the phenomena, or show that they are merely the tricks of the conjuror. In the meanwhile Mr. Ray Lankester, of University College, London; Dr. Donkin, assistant physician to the Westminster Hospital; and Mr. John Algernon Clarke, the joint inventor with Mr. Maskelyne of the automaton "Psycho," have given the public the benefit of their personal observations. These gentlemen, who may really be considered as experts, concur in declaring their conviction that the manifestations to be witnessed at Slade's are purely mechanical tricks combined with sleight of hand such as any clever conjuror could perform. If this conviction be as well founded, as it appears to be from the separate accounts given by the writers, it is not improbable that the medium will shrink from the tests which Dr. Carpenter will apply in his own house, or that there will be no "manifestations." The spirits have the knack of being dumb at critical moments, and mediums always fall back upon the explanation that the disturbing elements introduced have prevented the exhibition of the desired phenomena. It is to be hoped that the investigation upon which Dr. Carpenter has entered will be sufficiently exhaustive to remove all doubt from the minds of thoughtful people, and if we may be allowed to make a suggestion, it is that this *soi-doisant* medium be prosecuted for obtaining money under false pretences; a successful case would doubtless have a deterrent effect upon the assumption of future impostors.

Wine-Colouring.

THE "silent-spirit" fraud by which the worst sort of Scotch whiskey is sold under Custom House patronage, as the best Dublin whiskey, came before Parliament, as our readers remember, last session, at the instance of the distillers, who are defrauded. It seems that the wine merchants of Paris have been obliged to make similar representations to the French Government as to the colouring of wines.

Since the vintage of 1875 this proceeding has attained such a development as to raise fears not only for the good name of French wines, but also for the public health. The Syndicate of wine merchants of Paris has taken the matter up and urged it upon the attention of the French Government in a vigorously written memorial, in which it is roundly asserted that the sole object of the colouring is so to treat a wine, at an insignificant cost, that it may be sold considerably above its real value. Formerly colouring was only done to a small extent and with vegetable and comparatively inoffensive matters, but now, it is stated, hundreds of kilograms of arsenical fuchsine and other equally poisonous substances are used for the purpose, and the sale of such preparations is openly advertised. The Syndicate urges that it is useless to discuss in chemical laboratories whether fuchsine itself, or arsenical fuchsine when diluted to a certain extent, is poisonous or not, there being no guarantee against the greediness of the wine colourer. One result of the agitation has been that the officers of octroi have been ordered to take samples, for analysis, of all red wines coming into Paris.

Verdicts by Intuition.

Last week an inquest was held in Kilkenny, before the coroner, into the circumstances attending the sudden death on Saturday evening of a butcher.

After the hearing of certain evidence, the foreman of the jury asked if there was a medical gentleman to give testimony. The constable who was in charge said that it was for the coroner to say if a doctor was required, but the foreman said that unless the juror had taken out the degree of M.D. he did not think the jury were competent to form such an opinion.

The coroner said it was not necessary to go to the expense of a doctor, and

The jury thereupon returned a verdict, "Died from natural causes."

Referring to these proceedings, the *Kilkenny Moderator* asks: "Has a coroner the option of calling in the services of a medical witness at an inquest or not, according as his own sense of duty to the public may dictate? It is for the advantage of the administration of justice that even in the case of sudden death, under the most unsuspicious circumstances, the only person who could place the cause of death beyond reasonable doubt in the minds of a jury, should be called in, although it would entail the expense of a guinea on the public if his services were brought into requisition. Economy of the public money is a virtue, but economy in this, as in most cases, may be pushed to an extremity. There are higher considerations than those of public economy to be regarded here, and we trust that a desire to effect a paltry saving will not stand in the way of a coroner's jury again in coming to a satisfactory conclusion whenever the painful necessity should arise to call them together."

As corollary to this report we note a similar investigation by Dr. Hardwicke, as to the death of a man who had eaten a quantity of cheap pickles. In this case medical evidence was had, and gastric inflammation was proved, but no analysis of the pickles was obtained, and no one knew, or could possibly know, whether they were or were not deleterious. Nevertheless, we have the usual slap-dash verdict formally recorded and advertised through the papers, and a conclusion arrived at for which there is very little scientific ground, and which may be misleading to the public, and most unjust to innocent traders.

It is really quite time that the inquest system throughout the United Kingdom was reconstructed. Every detail of the present system is bad, and the pretension of coroner's courts to investigate the causes of death not only produce, in difficult cases, no good result, but produce positive harm to the community. Lord Francis Harvey has turned the first sod of a Parliamentary agitation on the subject, which we hope to see followed up, until some reliable court for the investigation of suspicious deaths is established.

By latest telegram we learn that yellow fever has appeared in an epidemic form at the seaport of Brunswick, in Georgia, United States. 600 persons are reported to have been attacked, and a frightful condition of affairs exists in the town.

The South London School of Chemistry and Pharmacy, under the principalship of Dr. Muter, opened its winter session last week with a hundred students on its books. We hope the Medical Schools which recommence on Monday next will be equally fortunate.

The London Hospital, the Surrey Ophthalmic Hospital, and the Earlswood Asylum, have each received a bequest of £200, from the will of Mr. W. Howell, late of Lambeth; and the Suffolk Hospital, Ipswich, receives £1,000 by the will of the Rev. C. B. Elliott, late rector of Lattingstone.

A certain doctor named Cleary, formerly of Collon, in the county Louth, now of Nenagh, in the county Tipperary, has long struggled for distinction as a politician and an administrator. At length he has succeeded, because he has occupied himself with dirty work which no one else would undertake—to wit, the clipping of the emoluments of his medical brethren. This gentleman was the mover of a proposition in the Local Board of Guardians to reduce the salaries of all the medical officers to £60 a-year, and in a large, and—as we suppose—not too liberal Board, he could not obtain a seconder for his motion. We cannot but entertain some regret that a medical man should occupy so discreditable a position, for if the ex-Mayor of Nenagh has not achieved a more reputable notoriety than that which his last move can give him, we advise him to rest content with his obscurity, and not attempt to make himself famous by be-fouling his own nest.

A discovery which reminds us of the Wainwright murder case has been made at Rome. A box forwarded to the railway station there from Naples lay for such a length of time without being claimed that the officials of the company began to suspect that something was wrong, and they proceeded to open it, and were shocked to find that it contained the remains of a young woman, but the body had been embalmed in such a manner that, although death had taken place long before, there were no signs of decomposition. Diligent inquiry led to the discovery that the corpse had been preserved and packed by a master baker occupying a good position in Naples, who had maintained the girl as his mistress. Traces of poison had been found in the body of the deceased, and little doubt is entertained that she met with her death by foul means. Great sensation has been created at Naples by the disclosure of these facts, and the trial is looked forward to with anxiety.

◆

Literature.

DR. TILBURY FOX'S ATLAS OF SKIN DISEASES. (a).

Of the various departments into which medicine is divided, there is perhaps none the study of which is so much facilitated by the pencil of the artist, and by the graphic description of a skilful writer, as that which deals with diseases of the skin. To the student or young practitioner, dermatology is often a medical *pons asinorum*, over which he has much difficulty in passing, and which is usually as much a bugbear to the student in practical medicine as the structure of the internal ear is to the student in anatomy. The many and conflicting methods of classification that have been adopted by different authors, the fine shading off of the characters of one disease into another, the complications that are met, and the frequency with which a skin disease is modified by treatment, by its chronicity, or by the habits and diathesis of the patient, are only some of the circumstances which puzzle the inexperienced practitioner, and make it difficult for him to form a correct diagnosis. But whilst the diagnosis of diseases of the skin by students is attended with difficulties, yet that class of affections necessarily admits much more of demonstration by means of coloured drawings than those which embrace diseases of the internal organs. It is indeed surprising how much may be learnt from graphic descriptions and correct illustrations of cutaneous diseases. We have a vivid recollection of the great assistance we got from works of this kind, when as a student we not only went direct from college to the hospital, but to a hospital where we had not much opportunity of studying the subject practically ; and we remember how easily we recognised the nature of the more common cases of skin disease which we afterwards met with at a special dispensary merely from the descriptions which we had read. There are many practitioners who, either from want of opportunity, or from having devoted their attention wholly to the other department of medicine, go into practice with a very meagre knowledge of dermatology. To such practitioners a work like this is invaluable. It is a true *vade-mecum*, a very fair guide upon which, if they make allowance for the little exaggerations and slight errors incidental to all coloured illustrations, they can implicitly rely. Such works are also very useful for the purpose of reference, especially to those who are practising in the country, who cannot call in the assistance of a specialist. The diagnosis of a doubtful case of skin disease may be often cleared up by a reference to an Atlas in which the illustrations and the accompanying descriptions are alike truthful and natural. At the same time it must be admitted that there are several forms of eruption the pathognomonic appearances of which can be more correctly described than illustrated, while in all cases the student must remember that more is to be learnt by studying a disease of the skin in the living subject, than from the most accurate description or most faithful illustration.

The Atlas to which we are now drawing attention is the more welcome, considering that no similar work has been published in this country for many years. It is based upon Willan's and Bateman's well known "Delineations of Cutaneous Diseases," but remodelled so as to represent the Dermatology of the present day. Of the seventy-two plates which this work will contain, more than half will be original, and have been made from original drawings satisfactorily executed from life. The work will consist of about eighteen parts, each of which contains four plates with descriptive letterpress and notes of treatment, and no small recommendation to it is its comparatively small and handy size, for the atlases of skin diseases that have been hitherto published are so large and unwieldy as to render their perusal troublesome and inconvenient. One of the faults which have usually characterised works of this kind, whether on dermatology or general pathology, is that the drawings are too highly coloured, and sometimes even a caricature of the affection delineated. From this error we are glad to see that the Atlas now under review is free, and that the drawings are for the most part a very faithful representation of what we see in the living subject. For example, we might point to the very excellent delineations of Strophulus albidus, Roseola æstiva, Lichen urticatus, Lichen planus, and several other eruptions which it is very difficult to illustrate in such a manner as will convey to the reader a correct impression of the real character of the disease.

The order in which the plates are published is a very practical one, proceeding from the more simple and more common forms of cutaneous disease to those which are more rare or complicated. The first eight plates, forming Parts 1 and 2 of the Atlas, represent the chief forms of the Erythematous eruptions, namely, Erythema, Urticaria, Strophulus, and Roseola. Of erythema there are five illustrations, corresponding to as many varieties of that disease, and all of which are well executed.

On the other hand, the two illustrations of Urticaria (*U. febrilis et chronica*) are not so successful as the appearance of the wheals in the plates is very different to that which obtains in nature. But to show how well even insignificant eruptions can be represented we would draw particular attention to the small figure by which Strophulus albidus is illustrated, and in which the eruption, although merely consisting of minute, slightly elevated and whitish specs, is delineated with photographic accuracy. Strophulus is not a serious disease, but here we are furnished with four varieties of it. Roseola æstiva is also very well done, but this disease is so often mistaken by beginners for measles and the latter for roseola, that we should like to have seen illustrations of these eruptions contrasted together side by side. The varieties of Roseola described are R. *æstiva autumnalis annulata*, and *infantilis*. In Parts 3 and 4 we have illustrations of nine varieties of Lichen, (Lichen *urticatus*, *simplex*, *agrius*, *circumscriptus*, *pilaris*, *lividus*, *planus*, *ruber*, and *scrofulosorum*,) and three varieties of Eczema. In the figures which illustrate Lichen urticatus, and which are original, we have another example of the admirable manner in which the artist may be able to represent an eruption which is by nature faint and comparatively invisible. Lichen lividus (a modification of purpura) and Lichen pilaris are equally well portrayed, while in the two figures of Lichen plaaris we have an illustration of an eruption which has only been recently recognised as a distinct disease, and which is scarcely yet known to the bulk of practitioners.

(To be continued.)

Correspondence.

INDIAN MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I know that your influential columns are never closed to any matter that concerns professional or public welfare. I may therefore ask you to insert a few remarks upon the Indian Medical Service which is gradually, and, I grieve to say, justly losing its *prestige*. In the Southern Presidency ("benighted" Madras) is this especially the case. The head of the Medical Department of this Presidency (who this day retires after a very successful administration), a man of untiring, though too often misdirected, energy, has succeeded during the five years of his official tenure in producing universal discontent in his department without even earning the confidence of Government. On the contrary, it is well known that the local Government frequently disregarded his advice. When the larger wheels of the official machine cannot move without jarring, it cannot be expected that minor ones will revolve smoothly. I shall here notice but two of many causes of discontent in the service—firstly, deficient supply of medical stores, and, secondly, "jobbing."

All the civil and military hospitals derive their supplies from the principal medical stores at Madras, but it is a fact—noticed on many occasions in the local press—that hospitals are habitually under-supplied, and frequenly run short of medicines, sometimes very important ones, and that the most common and necessary instruments cannot be obtained because there are none in store at the principal medical stores! "None in store" is the stereotyped reply to all inconvenient requests. *Why are there none in store?* This is a question not purely professional, but one of public importance, for most people in India are entirely dependent on Government for their supplies of medicines. It is hard to expect medical officers not to flag in their zeal when they find their work impeded at every step by a niggardly supply of hospital requisites, and are obliged to shape their prescriptions not according to the requirements of their patients, but according to the state of their hospital stores. Too often do they find their hands, which they would fain extend for the relief of suffering humanity, rendered powerless and bound down by the intricate knots of ubiquitous red tape.

This cheeseparing in the Madras Presidency is the more inexcusable because the hospitals which derive their stock from the Bombay stores are liberally supplied.

Another cause of discontent and heart-burning in the service is the manner in which officers are sometimes "pitchforked" into appointments. I do not mean to indicate that very eminent merit is not appreciated; it will assert itself anywhere; but the grievance is that men are too often placed in responsible positions, not because of professional merit or suitability, or of their standing in the service, but because they happen to be gifted with certain social accomplishments, have slipped into "the presidency clique," or have "a friend in Council," and nowhere is petticoat influence so powerful as in India. A notable instance has lately occurred in which a very young medical officer, whose professional merit is far from high if judged by the result of his examinations at Somerset House and at Netley, was gazetted to the civil surgeoncy of one of the most important military stations and largest towns in Southern India—a responsible and lucrative position—over the heads of many officers senior to him who were without any permanent appointments. This is a most unusual step even in the case of individuals of extraordinary merit. The wonder is explained by the fact that the gentleman in question had a very good opportunity of dancing into favour at the local court. His Grace of Buckingham did not see fit to appoint this officer to his personal staff, which would have done no injustice to the service, but he places him in a much more responsible, if not socially so good a position, and appoints a member of the *British* Medical Service to the "Surgeoncy to the Governor," which has always been looked upon as one of the few remaining prizes of the Indian Service. So much for the honour of a duke at the helm.

It is sometimes ludicrous to watch the changes of professors at the Madras Medical College. The system is this, an acting professorship becomes vacant, and may be filled up by an individual who is well, perhaps particularly, qualified to hold it. He becomes a member of the "presidency clique," and is considered to possess all the qualifications necessary to hold any appointment at the presidency, and any other professional chair, and it is not improbable that he may at different times be called upon to fill each professorship in turn. The sacred circle is thus saved from the intrusion of a better qualified outsider. This is alike unfair to the College and to the Service. It is at least unlikely that a man who is in the first place selected for his peculiar fitness to teach anatomy or surgery, is equally qualified to hold the professorship of chemistry, botany, hygiene, or materia medica. Yet this is constantly assumed to be the case.

I may here allude to a decided injustice which is now being done to the Madras Medical Service. British Burmah is entirely garrisoned by Madras troops, who have not shown the same mutinous objections as their Bengal brethren to cross the "black water." The civil appointments in that province, therefore, rightly and obviously belong to the Madras Service. Of late, however, Bengal men are being introduced. This is only one of many instances in which Madras has to play the part of Cinderella without the hope of relief by any benevolent fairy, unless the Marquis of Salisbury should assume that rôle.

Now, Sir, permit me to address a few words of advice to intending candidates for the Indian Medical Service. I shall put to them three questions—1. Are you possessed of extraordinary ability? Then don't come to India. You will, no doubt, do well here provided you keep your health; but you are certain to do better at home. 2. Are you a hard-working man of moderate ability? Still I say stay and work at home, where you will find abundant soil for work and a certain harvest. 3. Are you an indolent student, careless of your profession, but a man of pleasure? Are you an accomplished singer, dancer, actor, and anecdotist? And last, not least, are you the happy spouse of a beautiful, fashionable, and worldly wife? Then by all means seek out the best "crammer," and "cram" for the Indian Medical Service. You will be a light in the East, and one of the ornaments of Anglo-Indian society, and will be planted in almost any appointment it may be your pleasure to desire.

I fear, Sir, I have spun this letter to an undue length, but I cannot conclude without quoting the *Indian Medical Gazette* on an address by Dr. (now Sir Joseph) Fayrer to the "medical candidates" at Netley last year:—"The address dwells exclusively on the bright side of an Indian career, and the prizes of the service are promptly exhibited. A curtain is drawn on the dark side, unemployed poverty, officiating appointments, frequent and expensive moves, not a little favouritism and jobbing, confused administration, depreciation of the value of salaries" (now amounting to nearly 25 per cent.), "increasing expenses of living, bad health, separation from wife and children, domestic troubles and trials."

I am, Sir, your obedient servant,

TAMIL.

Madras, 15th August, 1876.

HEALTH AND SEWAGE OF TOWNS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the general interest of public health, the Council of the Society of Arts appeal to the public generally to send to the Society evidence of cases showing the various evils which have occurred from the present imperfect system of the drainage of houses. At the Conference on the Health and Sewage of Towns, lately held at the Society, and attended by numerous representatives from various towns and localities in the kingdom, the importance of greater attention to the house drainage as distinct from the sewerage was especially brought to the notice of the Society.

It was pointed out that however good the general sewerage might be, unless the drainage proper of the house and its connection with the sewers were carefully planned, executed under due supervision, and maintained in proper order, there was imminent danger of typhoid and other diseases from the imperfect exclusion of sewer gas.

The Council are well aware of the extensive powers which are given by Act of Parliament to vestries in the metropolitan district to deal with this matter. As regards buildings erected and in course of erection since 1855, the date of the Metropolis Local Management Acts, no doubt a large amount of supervision is exercised; plans of the house drainage are frequently deposited, and are open for inspection to the ratepayers. But the powers of the local authorities are rather remedial than preventive of disease, and are more or less imperfectly exercised. The evidence already collected shows that in most of the metropolitan parishes, a small proportion of the total number of the houses in them has been properly dealt with, and consequently the plans of house drainage are, on the whole, comparatively few even in parishes on the outskirts, where a considerable extension of building has taken place in the last few years. Neither owner nor lessee, nor intending purchaser, as regards houses built previous to 1855, unless in some few exceptional and accidental cases, has any means of ascertaining whether the house is or is not well drained or properly connected with the sewers, and, if defective, how or in what direction amendment is to be sought. It is with a view to remedy this admitted evil, which reduces the usefulness of the main sewers on which millions have been spent, that the Council of the Society of Arts, in the interests of improved public health, have taken up this question. They have already memorialised the Metropolitan Board of Works on the subject, and they propose to address the President of the Local Government Board in reference both to the metropolis and to localities in other parts of the kingdom. The Council have sought for information and suggestions from the various metropolitan authorities having such matters in charge. They appreciate the valuable labours of these bodies, but they desire to draw public attention to what it appears to the Council needs further action on their parts, and they suggest that Parliament should be moved, if need be, to confer additional powers and responsibility on local authorities.

Under these circumstances, the Council invite communications both as to cases of evil arising under the present state of things in the metropolis and in the country generally, as well as any suggestions for remedy, and they will be glad to receive any such communications before the 20th October next.—I am, &c.,

P. Le Neve Foster, Secretary.

Society of Arts, Adelphi, London, W.C.

DR. BLACK ON THE FUNCTIONAL DISEASES OF THE URINARY ORGANS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The question raised by Dr. Black in your issue of September 13 is one which has always deeply interested me. I may say that I agree with every word of the following which emanates from Dr. Black:—"What I have maintained, and what I still maintain, in common with so many others, is that the normal exercise of all the functions of the body must be conducive to the health of the organs themselves and the system generally, and I cannot by any logical or reasonable possibility escape from the conclusion in the case of the generative organs. In what manner or under what contract the end is to be accomplished is a question on which I have never presumed to dictate, and I must therefore repudiate the libel that I have ever given countenance to or recommended fornication."

Dr. Black is here merely saying what all medical men of experience will endorse, that human beings are so constituted that in many cases (not in all by any means) they *cannot* remain in health unless they are united to the other sex. Some medical men, and Sir J. Paget among others, would have us believe that such is not the case, and that a life of celibacy is always healthful and possible. The records of our lunatic asylums, however, let us see too clearly what happens to very many celibate persons. Too often masturbation and mania are their lot.

For my part, as I had the honour of stating in a letter in your issue of September 6, it seems to me that as Mr. Hutchinson cojently remarks, the question of early marriage is the most important point of social well-being in this country of our day. Without early marriage we are sure to have prostitution (with gonorrhœa and syphilis), masturbation, and impotence prevailing.

I would like to ask Dr. Black whether he does not agree with me that it might be just possible to have marriage more universal were parents taught to be more solicitous (as they are generally in that great country, France) as to the numbers of their offspring? This, I confess, is almost my only humble contribution to the debate. I have been occasionally asked by young gentlemen with frequent seminal emissions whether they ought to marry, and have sometimes replied, "Yes, if you can be prudent and take care to proportion the number of your family to your income—not otherwise."

Hoping that these few hints may be taken as meant, in all gentleness and charity,

I remain, Sir, your obedient servant,

Charles Drysdale, M.D.

17 Woburn Place, London, W.C.,
September 13, 1876.

PHARMACEUTICAL SOCIETY OF IRELAND.

According to the Irish Pharmacy Act, seven of the Council of twenty-one selected by Government retire in October. They are, however, eligible for re-election. The retiring members are: Dr. A. Smith, Vice-President; the Right Hon. the Lord Mayor, Dr. Bourke (Limerick), Dr. Frazer, Mr. Wm. Goulding, M.P. (Cork); Mr. J. T. Holmes, and Dr. Whitaker (Belfast). All these gentlemen have taken great interest in the Society, and will probably be re-elected. To Mr. Holmes' exertions the pharmaceutical chemists are indebted for exemption from service on juries.

◆

Medical News.

Vital Statistics.—From the Registrar-General's report we learn that during last week 5486 births and 2944 deaths were registered in London and twenty-two other large towns of the United Kingdom. The mortality from all causes was at the average rate of 19 deaths annually in every 1000 persons living. The annual death-rate was 18 per 1000 in Edinburgh, 23 in Dublin, 21 in Glasgow, and 18 in London. The rates of mortality during the same period in the other large towns were—Bradford 17, Norwich 18, Brighton 16, Wolverhampton 22, Birmingham 20, Sunderland 17, Portsmouth 26, Sheffield 20, Plymouth 13 Nottingham 18, Liverpool 21, Bristol 21, Leicester 20, Oldham 22, Newcastle-upon-Tyne 23, Hull 22, Manchester 24, Salford 26, and Leeds 23. The annual death-rate from the seven principal zymotic diseases averaged 3·7 per 1000 in these towns, and ranged from 2·1 and 2·5 in Brighton and Norwich, to 8·3 and 11·7 in Salford and Portsmouth. In Portsmouth 20 deaths from scarlet fever were returned (equal to an annual rate of 8·4 per 1000), raising the number of fatal cases in this borough since the beginning of the year to 304. Small-pox caused 14 deaths in Manchester and Salford, 4 in Liverpool, and 16 in London.

The Death-rate in Foreign Cities.—The annual rates of mortality, according to the official return of the Registrar-General, like those of Great Britain and Ireland, show a marked improvement. Calcutta shows a mortality of only 25 per cent., Bombay 31, Madras 36, Paris 26, Brussels 19, Amsterdam 20, Rotterdam 24, The Hague 36, Copenhagen, 34, Stockholm 33, Christiania 18, Berlin 41, Hamburg 33, Breslau 34. Munich 34, Vienna 21, Buda-Pesth 37, Rome 20, Alexandria 51, New York 28, Brooklyn 28, Philadelphia 23, and Boston 28. Typhoid fever caused 72 deaths in Paris, against 78 in each of the two preceding weeks. Typhoid fever and diphtheria each caused 22 deaths in Berlin, and 37 deaths resulted from small-pox in Vienna. The rates in Berlin and Alexandria are still excessive, but in most of the other cities, notably New York, the statistics are highly satisfactory.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Law respecting Periodicals, Newspapers, &c.—1. Subscribers who do not give express notice to the contrary, are considered as wishing to continue their subscriptions. 2. If subscribers order the discontinuance of their periodicals or newspapers, the publisher or publishers may continue to send them until all arrears are paid up, and Subscribers are held responsible for all numbers sent. 3. If Subscribers neglect or refuse to take the periodicals or newspapers from the office to which they are directed, they are held responsible till they have settled their bills. Sending numbers back, or leaving them in the office, is not such notice of discontinuance as the law requires. 4. If Subscribers remove to other places without informing the publisher, and their periodicals or newspapers are sent to the *former* directions, they are held responsible.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be

THE PROGRESS OF CUTANEOUS MEDICINE DURING THE PRESENT CENTURY. (a)

By Erasmus Wilson, F.R.C.S., F.R.S.,

Professor of Dermatology in the Royal College of Surgeons of England.

(Continued from page 253.)

If we inquire into the present state of dermatology, it may be said that we have outlived leaders, that we can no longer range ourselves on one or on the other side: we accept all; for we find that truth converges to a single and very narrow point. Willan is not the less great because he followed and perfected the plan laid down by Plenck. Hebra is not the less great because he so brilliantly applied the teachings of Rokitansky and his school. Neither need we compare the unborn with the born: Willan flourished successfully before Hebra saw the light; and without concerning ourselves with the special excellences or defects of these good and great men; without discussing the relative value of objective and subjective, but rather inclining to prefer both, we are ready and willing to accept the instruction of all who have gone before us, and endeavour to profit, and even to improve on our instruction. It was said of Cuvier that he harvested and co-ordinated the labours of his contemporaries; that every diligent worker of his time became the husbandman of Cuvier. Let us honestly endeavour to do the same, and glean and co-ordinate the labours of those who have gone before us, for the instruction and benefit of those who must be our successors.

We cannot too much admire the careful and diligent work prevailing in the rising school of objectivity at present in operation at Vienna; the seemingly exhaustive subordination of the microscope to pathological histology. Already we experience its beneficial tendency as contributing to exactness of research; and in course of time its results will, no doubt, take a prominent place amongst those data which are the essential foundation of our therapeutical practice.

If we wish further to ascertain in what dermatology has advanced, at the present day, beyond the limits known to our predecessors, I would in the first instance, answer —in the recognition of the importance of the skin as an individual organ closely allied with the rest of the organs of the economy; subject to similar laws of health and disease, and requiring to be treated therapeutically on similar principles. Inflammation, irritation, and debility of the skin must be controlled in a manner similar to that adopted for the treatment of those same conditions in other parts of the economy. We must recognise the local wants of the part as well as the general implication of the whole system; and we must be careful to distinguish affections of a decidedly local nature from those which primarily or secondarily are identified with the general constitution. For, even in some local affections, constitutional treatment is almost as essential as local treatment itself. A striking example of this kind is presented to us by the lepra of the Greeks, or lepra vulgaris, the psoriasis of the foreign schools. Now, lepra is especially a local affection, a manifestation of a congenital debility of the skin, to be cured by local remedies alone, when properly applied; and yet we should be neglectful of our duty if we failed to administer a constitutional remedy—namely, arsenic—for its treatment. Lepra is supposed to be consistent with a perfect state of health of the individual; that is, as far as the rest of the organs of the body are concerned: for it admits of doubt, whether a whole can be considered sound, when a part, and so essential a part as the skin, is defective. Again, in its normal state, lepra gives so little notice of its presence, that it would remain undiscovered if it existed on a hidden part instead of one exposed to view; but its relation to the rest of the economy is manifested by its symmetrical distribution, which must be due to an inward vital force; by its frequent outbreak like an ordinary exanthema, and by its aggravation in states of disorder of the economy due to malassimilation, and particularly to the lithic acid malassimilation denominated gout.

(a) The Annual Oration delivered at the Medical Society of London.

Another example of a local affection of the skin is met with in the epiphytic diseases, ringworm and versicolor: both of these affections are removable, if not curable, by local treatment; and one of them, like lepra vulgaris, is symmetrical in its distribution. Nevertheless, it cannot for a moment be doubted that a general feebleness must be present with the local affection, and that it would be imprudent to neglect a constitutional as well as a local treatment. This is rendered more evident by the recognition that the soil which receives the seed must be favourable for its development and growth; while it is clear that a soil favourable for the development of a disease, under these circumstances, must be a morbid soil; the practical corollary being—improve the soil, and the disease will cease.

A strong evidence of the progress of dermatology is manifested by the precise differentiation of the principal cutaneous diseases, and their elevation as landmarks by which other affections are to be recognised and distinguished. Let me take, as an illustration of the most prominent of these affections, the giant of the skin diseases of this country—eczema, the great leprosy of modern society, adopting the term leprosy in its original signification of a disease of roughness or irregularity of surface, and not as one of vastness and universality of pathological destruction like the leprosy of exotic origin; neither as a sudden achroma of the skin like that which pervaded the leper of the Scriptures. To the Fathers of medicine, eczema was known by a name indicative of one of its symptoms, a symptom common to every stage and modification of its progress—namely, *psora*, from ψωειν, to scratch, in allusion to its itching property; whilst its chronic and squamous stage was denominated *psoriasis*.

Now, in eczema we recognise an inflammation of the skin; I might almost say, from its universality, *the* inflammation of the skin, generally consequent on internal causes, and sometimes on external causes. The manifestations of that inflammation vary very considerably, vary in obedience to the violence of the predisposing and exciting causes, and the constitution of the patient; but their limits are well known and familiar to us all. There may be redness, with more or less infiltration, congested and prominent follicles, minute vesicles, extensive vesication, serous and sero-purulent exudation, incrustation, desquamation and condensation, and thickening, with cracks or fissures of the skin.

Now, in this series of symptoms, which we can produce artificially upon the skin by any irritant, we recognise eczema; but eczema, like other diseases, has its degrees, and the whole of the symptoms here enumerated may not be present at the same time; indeed, several may be absent; but the case is none the less one of eczema, of greater or less severity. And here it is that I claim progress for dermatology, in showing that one and the same disease may put on a considerable number of forms without losing its identity.

In the picture I have just sketched, Willan, in pursuance of his classification, would have found material for five of his seven genera; there would have been examples of exanthema, papulæ, vesiculæ, pustulæ, and squamæ. For him, that part alone of the eruption in which vesicles were discoverable would have been a genuine eczema; the prominent follicles would have been termed lichen, and the squamous exfoliation of its chronic stage, psoriasis. Indeed, in his group of squamæ, he has so mingled together lepra and eczema, that, as I have already had occasion to deplore, the term psoriasis has been torn from its parent psora, and unwarrantably given to lepra. Here, also, you will perceive more clearly the point of my observations with regard to Dr. Marcet's case of eczema, which he denominated erythema ichorosum; but for which, when Willan was called in to see the case, as he was unable to find vesicles, he could not suggest any other name than impetigo, with a reference to an ambiguous description of that disease by our ancient Roman colleague, Celsus.

To the pathologist, it is naturally very interesting to observe the modifications of one and the same disease when spread more or less extensively over the surface of the body; its modification by age, constitution, and duration, and its modification in the different regions of the body—for example, the joints, the scalp, the face, the axillæ, the pudendum, the hands, and the feet; but whatever amount of variation may be discoverable, the disease is identically and everywhere the same. And to the practitioner, the inference is equally forcible, that a similar principle of treatment must be applicable in every instance; or, as Wilkinson ingenuously expressed it, we must submit ourselves unresistingly to a very "*sameness of method and remedies.*"

To a good general knowledge of the landmarks of dermatology, must necessarily succeed a progressive and more exact understanding of other cutaneous diseases. Let us take for illustration an important and very interesting anatomical component of the skin, its follicular or gland-system. Physiologically, the follicles of the integument are known to us as the sources of the sebaceous and sudatory secretions, and the seat of development and growth of the hairs. Pathologically, we recognise in them a vast expanse of highly organised vascular and epithelial structure, peculiarly susceptible of pathological change, and in fact, taking a share, to a greater or less extent, in the morbid processes of almost every disease of the skin. Having disposed of the whole, we are privileged to take cognizance of the parts; and there is no part more interesting and important than the one under consideration at present, nor one which would better reward the labours of investigation and research. The phenomena of congestion and inflammation of the follicles, the aberrations of secretion and transmission of secretions, and the degenerative and plastic transformations occurring in their component structures, constitute a subject of most attractive interest.

When the skin is emptied of its blood by the stimulant action of cold, and a state of spasmus periphericus is induced, we find the follicles projected beyond their normal level, and giving rise to the appearance known as goose-flesh, or cutis anserinus. When, on the contrary, in obedience to any cause of irritation acting from within, the blood is driven impetuously to the surface of the body, the follicles are the first to tell the tale, and redden under the inward shock: in this way they become the monitors of measles, scarlatina, small-pox, and syphilis. It was they that first suggested to the poetic mind of our forefathers the idea of bursting into bloom like a flower, the exanthem of the Greeks, the efflorescence of the Latins, and so also, but more recently, the bubbling up and bursting forth of eczema.

When, in addition to mere punctation, the blush of the follicle, the capillaries of their walls become dilated and distended with blood, we have not mere congestion alone, but a real swelling of the summit of the follicle, and the production of a conical pimple of greater or less magnitude. In every instance of congestion of the integument there is a tendency to papulation, for which the follicles are solely responsible: hence the papulæ of rubeola, scarlatina, variola, syphilis, eczema, and scabies, and the more independent and permanent papulæ which, since the time of Willan, have been denominated lichen.

When congestion of the follicles ceases to be transient, and assumes a permanent character, we then have established a state which may be termed folliculitis; and a quasi-specific character is, in some instances, given to folliculitis by the nature of its cause: thus, I may enumerate the folliculitis of acne, of gutta rosea, of certain remedies, such as iodine, bromine, and tar; and proceeding onwards, we may take in variola, syphilis, ecthyma, hordeolum, furunculus, and even anthrax. These are all examples of inflammation of the follicles of the skin; and the material difference between them relates simply to cause and degree.

Let me say a few words with regard to acne, as being a common and well known affection, and presenting several striking points of curious physiological and even historical interest. Acne is the acme, or rather the acmai, of the Fathers of medicine. How, in the course of transmission from them to ourselves, it lost its *m*, and received the unmeaning substitution of an *n*, I need not here discuss. Now, acne obtained its name from its occurrence at the acme of life, and the Latins represent it by the words *flos ætatis*, the flower of age; or, more correctly, the opening blossom of youth or manhood. The study of anatomy by dissection had not then come into use, and we therefore find our early Fathers intent observers of that which alone was within their reach—the external form and appearance of the body, and its varied modifications; and we are led to admire their justness and accuracy of observation, as represented by the names of cutaneous disease handed down from them to ourselves. When internal anatomy became the fashion, the old learning fell into the shade according to the custom of fashions in all ages; and hence the nomenclature of the ancients will still bear the test of the most rigorous criticism, and is deserving of our study and respect.

But the ancient Greeks had another name for acmai; they termed it "ionthos," which signifies the root of the hair; and we are thereby led to infer that they intended to imply a relationship between the papule of acne and the development of the hair—a fact which modern knowledge has fully confirmed; for the eruption of acne is essentially one of puberty, of the period when the hair of manhood is in course of development and growth. In this sense we recognise a resemblance between the congestion which accompanies the cutting of the teeth and that of the production of the mature hair—a resemblance which is curiously corroborated by the discovery, in modern times of the analogy subsisting between the tooth and the hair.

Now, that an enfeebled follicle, possibly the offspring of an enfeebled organ, should fall into a state of congestion when called upon to perform the elaborate function of new hair development and more powerful growth, is exactly what might have been predicted; and we are also thereby enabled to comprehend why the function of the entire follicle, as well as its sebaceous gland, should be disordered, and that the epithelia lexuviæ of the follicle, as well as the inspissated secretion of the gland, should become condensed and impacted. The accumulation of the contents of the follicle being, in this view of the case, the effect and not the cause of the folliculitis, as, at the present day, is very generally believed.

In later times, and as a consequence of what, in my devotion to this branch of medical research, I must denounce as a heedless and slovenly nomenclature, the word *acne* has been bestowed on nearly every papular folliculitis of the skin that comes under our observation; thus the gutta rosea of the Latins, the product of a reflex irritation of the gastric-nerves, and an eruption of the mid-period of life, when no association of flos ætatis and acme would be possible, has been denominated acme; as also have the instances of folliculitis produced by iodine, bromine, and tar.

As a type of folliculitis we can have no better example than acne, which may be simply congestive, or it may be pustular. Similar pathological forms are met with in gutta rosea, in mentagra or sycosis, and in the kerion or pustular folliculitis of the hairy scalp; while in certain other forms of folliculitis, there may likewise occur necrobiosis and gangrene, as in the instance of furunculus and carbuncle.

Ringworm, again, is a folliculitis, but with a low degree both of congestion and inflammation—a hyperæmia, with nutritive growth and development taking the form of a phytiform production, which has been regarded as a parasitic fungus. My views with regard to this matter are known to be opposed to those of the majority of dermatologists, and our practice is mutually at variance; for whilst I treat the chronic inflammation which is the cause of the phytiform growth, my opponents treat the phytiform growth as being the cause of the inflammation. Time, no doubt, will settle this question, and some others at some future day.

To this long but interesting series of affections of the follicles of the skin I must add two more examples. One of these is lupus erythematosus, which, beginning as a chronic folliculitis, ends in the destruction of the more highly organised tissues of the neighbouring skin, and leaves nothing behind it but cicatrix tissue and atrophied glands.

The other disease possesses a plastic character, beginning as a hyperplasia of epithelial cells, and ending in ulceration of various extent; sometimes creeping along the surface in the form of a rodent ulcer, and sometimes sinking into the tissues and destroying everything in its way, and constituting a real epitheliomatous cancer.

Gentlemen,—I feel a conscious warning that I have occupied your attention for more than the full time allotted to your orator of the year; and I will conclude by observing that every step taken by science may be made progressive if we be careful to select and grasp its points of real instruction, and accumulate them as progress advances. As medical men, we are devoted to a cause which is essentially one of humanity, and we must endeavour to subordinate our knowledge to the proper treatment of disease, and thereby to the relief of human suffering. Such are the objects which I have endeavoured feebly to bring under your notice this evening: such are the objects to which the discussions within these walls, on our pleasant Monday evenings, are devoted: and of such, for a period of upwards of a century, (a) the London Medical Society has been the faithful and steadfast patron.

◆

THE ADDRESS IN OBSTETRIC MEDICINE. (b)

By Lombe Atthill, M.D.,

Master of the Rotunda Hospital, Dublin; President of the Section.

I think, gentlemen, I may safely assert that the proceedings of this section of the British Medical Association, which is devoted to the consideration of the subjects comprised in the term "Obstetric Medicine," attract, on the whole, more general attention from the great body of our profession, than do those of any other section. The reason for this is sufficiently obvious, for while the busy practitioner may be wholly unable to devote time or attention to the study of the important subjects included under such heads as those of "Physiology" and "State Medicine," or find that in practice cases of operative surgery are comparatively rare, he is certain to discover that the conditions and affections brought under discussion here, are of daily occurrence amongst his patients; hence he seeks to improve his acquaintance with the nature of the conditions, and to learn the best means of successfully treating those affections, which are peculiar to women; more so, as the study of these diseases has probably been neglected, possibly entirely overlooked by him, during his student's career.

Another reason for the interest evinced in the proceedings of this section is this, that marked and rapid progress has of late years been, and still is being, made in the department of obstetric medicine. The very name of the section proves this. A few years ago the term "obstetric medicine," if used at all, would hardly have been understood. This section of the British Medical Association was until very recently termed that of "midwifery." Consider for a moment what this change of nomenclature implies—it implies this, that the study of the process and phenomena of parturition, important though they be, is by no means all that is now required of the obstetric practitioner; that is, not of those alone who make obstetrics their special study; but of all, and their name is lesion, who are called upon to treat the diseases of women.

(a) The Society was founded 1773.

(b) An Address delivered at the opening of the Section of Obstetric Medicine at the Annual Meeting of the British Medical Association in Sheffield, August, 1876. By Lombe Atthill, M.D., Master of the Rotunda Hospital, Dublin; President of the Section.

This section then includes subjects of a most varied and extended nature; it includes midwifery proper, the diseases of the puerperal state, and those incidental to pregnancy, the considerations of disease of the vagina, bladder, and uterus, of the breasts, and last and not surely least, of the ovaries. Diseases of these latter organs are doubtless, in one of their aspects, within the domain of surgery proper; but that condition which demands the performance of the capital operation of ovariotomy, is by no means the most common of those requiring treatment, and, moreover, not a few able and successful ovariotomists are to be found amongst the ranks of obstetric surgeons. Some such I have the pleasure of seeing around me here to-day.

Gentlemen, we deem the practice of midwifery to be in no way derogatory. It is our honourable function to succour woman in her hour of trial, to shorten or relieve her sufferings, often to save her life or that of her offspring; to meet with promptness and decision the numerous dangers and difficulties which frequently and unexpectedly occur during labour, and which tax to the utmost our courage and endurance and skill; but these duties, though most important, form but a small portion of those which now devolve on us daily. The affections I have already indicated as coming within the province of obstetric medicine are so numerous and of such constant occurrence, that the right treatment of them is all important, as well for the sake of the sufferers as for the reputation of the practitioner.

The truth of this is now on all sides admitted, and the study of uterine disease, in its protean forms, is consequently steadily becoming more general; but unfortunately our knowledge of the pathology of these important affections is as yet imperfect, and our treatment consequently in many respects empiric and unsatisfactory. Still, great strides in advance are steadily being made, and we may look forward hopefully to a time not far distant when phenomena and symptoms at present overlooked or misinterpreted will be explained, and our treatment consequently become more scientific and efficient.

To the late Sir James Simpson, without doubt, is due the credit of inaugurating an era which has been marked by great and rapid progress in the department of obstetric medicine. His master mind perceived how vast an amount of unrecognised disease, and what an extensive field for pathological investigation existed with reference to the reproductive organs of women; before his day little was known of uterine disease, and as to treatment, it consisted of little more than in exposing the cervix uteri, and applying to its vaginal surface, if it happened to be abraded, a solution of nitrate of silver, or of some other mild caustic. Of disease of the body of the uterus almost nothing, of its interior absolutely nothing was known. A morbid, and as we now know, an unfounded dread existed of attempting to interfere with, or to investigate the condition of the cavity of the uterus. All this is now changed. We know that disease of the cervix uteri is of less frequent occurrence, and of less serious import than that of the body, and that its cavity may with impunity be trespassed on, and disease occurring within it successfully combated. Without doubt the most important practical result of the teachings of Sir James Simpson is this, that we do not now hesitate to dilate the uterus and investigate the condition of its interior, when symptoms indicative of serious mischief within the organ require us to do so.

I am well aware that by some practitioners the dilatation of the uterus is still looked on with dread, and that the attempt, if made at all, is undertaken with the greatest hesitation. I can only say that I believe these fears to be groundless, and that, if due care be taken to select suitable cases, and proper methods of carrying out the process be adopted, the treatment is a safe as well as a justifiable one. My own experience in the dilatation of the uterus has been great. I have practised it very frequently indeed during the last ten years, and as yet in no single instance has a bad symptom followed, nor have I even once been compelled to abandon the attempt. But I am far from throwing doubt on the accuracy of the statements made by others, who have recorded the occurrence of alarming symptoms, or even of death, as consequent on the attempt to dilate the cervix uteri; and I am quite prepared for the possible occurrence of such, for all are aware that cases must occur in which the most trifling exciting cause will be followed by serious symptoms, though no grounds existed beforehand for anticipating the occurrence of such. But these are exceptional, and I believe, as a rule, that when serious symptoms arise, either during the process or in consequence of dilatation of the cervix uteri, they do so either because an unsuitable subject has been selected in whom to practise the treatment, or an unwise method adopted for carrying it out. On examining the records of the cases in which serious or unpleasant symptoms followed the attempt to dilate the uterus, I find they have generally occurred when practised.

1st. Either for the relief of dysmenorrhœa depending on the existence of a narrow cervical canal;

2nd. When the cervical canal is encroached on by a fibroid of large size and unyielding structure;

3rd. When the process has been attempted to be carried out rapidly by means of metallic dilators; or,

4th. When it has been protracted over several days.

I have, therefore, in order to guard as far as possible against the serious results recorded by others as following attempts to dilate the uterus, laid down for myself the following rules, which I can recommend with confidence to others.

1. Never to dilate the cervix uteri for the cure of dysmenorrhœa or sterility depending on a narrow cervical canal or conical cervix.

2. Never to dilate in cases in which a large and dense intramural fibroid presses on and partially obliterates the cervical canal.

3. Never to use metallic dilators of any kind, but to choose for the purpose either sponge, or sea-tangle tents, which expand slowly and gradually.

4. Never to continue the process of dilatation for more than forty-eight hours. I prefer, in the few cases I have met with in which, after the lapse of that time, the cervix was not sufficiently open to suit the purposes I had in view, to postpone all operative interference for some weeks, rather than risk the result by prolonging the dilating process.

With respect to the first of these rules, I look upon the treatment of what is termed "mechanical dysmenorrhœa" by dilatation as being altogether a mistake. I doubt if any permanent benefit has ever resulted from it; while in several cases grave symptoms, and in one death, has to my knowledge followed the attempt. Equally, it is of importance not to prolong the dilating process. My own experience in the treatment of uterine disease requiring dilatation leads me to this conclusion, that unpleasant symptoms are likely to occur in a direct ratio to the length of time over which the process of dilatation extends. Again, I have known death to follow the attempt to dilate the uterus in a case where a large fibroid of dense structure, giving rise to menorrhagia and causing intense pain, was developed in the uterus, and encroached on the cervical canal. In such cases, dilatation is doubly objectionable, because the process is useless as well as dangerous: useless, because you will generally find that any attempt at operative interference from the interior of the uterus will be impossible; and dangerous, because inflammation is liable to follow, and that too in patients in the worst possible condition for resisting the attack.

Hardly second in importance to the knowledge that the uterus may be with safety dilated to an extent sufficient to enable us to remove large tumours, is the fact of which we are now certain, that remedies of even a powerful nature may, not alone with impunity, but with the greatest advantage, be applied to its interior. But at this point our knowledge becomes defective. Some practitioners prefer one, some another agent, for intra-uterine application. It may be carbolic, chromic, or nitric acid, or iodine, or the solid nitrate of silver; but as yet there has not been, it seems to me, sufficient care exercised in watching the action of these various agents, or in recording the effects they severally produce. Hence we are without data on which to base our treatment, or to guide us as to the agent to be selected in the treatment of the various forms of disease requiring intra-uterine medication. It is evident that no one of them can be suitable to all cases. For myself, I prefer carbolic acid in mild, and nitric acid in severe ones; but I freely admit I have much to learn on this point, and I look to others to aid me with their experience in deciding this important question. But it seems to me that, as with the dilatation of the uterus, so it is with respect to the application of agents to the interior of the uterus: that a groundless dread prevails as to their use. Here, too, as in the former case, the treatment is safe if carefully conducted, and if only practised in suitable cases and at the right time. Thus, if a caustic be applied through a narrow cervical canal, trouble is likely to occur. Equally will it probably follow if the fundus be tender to the touch, and chronic inflammation present; but, if the tenderness be first mitigated, and the inflammation lessened or removed, the application will, in all probability, prove beneficial.

In the treatment of uterine fibroids, too, we have made progress, but not as yet to a satisfactory extent. This much we know for certain, that many such cases, if menorrhagia be not excessive or pain intense, are best left alone; and it is astonishing in how many instances, even where menstruation is profuse, this course proves to be a wise one, treatment being restricted merely to what is absolutely necessary to prevent the flow being excessive. But, unfortunately, exceptions are of but too frequent occurrence; and how are we to treat these? The removal of large fibroids by abdominal section has been successfully practised, but the risk of life involved in the operation is great; and the attempt to remove smaller ones by means of the *écraseur*, after dilatation of the cervix is, I can vouch from personal experience, a difficult and eminently hazardous process. Again, enucleation is tedious, unsatisfactory, and often dangerous.

We have, however, at our command a resource which, if not all that we desire, is still generally efficient in controlling hæmorrhage, often sufficient to arrest the growth of the tumour, and sometimes apparently capable of reducing its size. I allude to the hypodermic injection of ergot, which, if it has failed in this country to produce the almost marvellous results ascribed to it by Hildebrand, is, if properly carried out, a safe as well as an efficient remedy. In my first cases, the results obtained were not only uncertain, but unsatisfactory, for troublesome sores sooner or later formed at the seat of the injection. Of late, however, I have obtained much better results. In not one of ten cases recently under my care, in which I fairly tested this treatment, has the hypodermic injection of ergot been followed by the formation of an abscess or sore; in all it had more or less effect in restraining hæmorrhage; in one, the injection was repeated almost daily for five months, with the effect of absolutely restraining excessive menstruation, but with no other beneficial result, for the bulk of the tumour remained unaltered, and the pain was as intense as ever. Still it was no small matter to have transformed a profuse and exhausting flow, which formerly lasted for twelve or fourteen days, into one of moderate character and of but two or three days' duration. It is evident, then, that in ergot, employed hypodermically, we have a powerful agent, one capable of exerting a marked influence on uterine fibroids, but still uncertain in its action, and not altogether to be relied on.

Again, with reference to displacements and flexions of the uterus, much still remains unknown, and authorities seem to be as far as ever from agreement as to the important question of cause and effect. It is much to be desired, that the pathology of these conditions should be carefully investigated, and the obscurity which surrounds some of them at least, if possible, cleared up. In fact, to whatever subject we turn, we see that, great as are the grounds for satisfaction at the advancement made in the knowledge of uterine disease, much remains to be done, and much careful observation is still needed, if this department is to hold its position as one eminently progressive. The great obstacle which retards the investigation and consequent elucidation of many points of interest and importance connected with the study of obstetric medicine is doubtless this, that comparatively few patients afflicted with chronic uterine disease die actually of these affections. They may be doomed to a life of constant suffering, and existence itself may become an actual burthen; but most probably they will be carried off by some intercurrent disease; and, if a *post-mortem* examination be made at all, the investigation will be directed to other organs than those of the reproductive system. It would be of the greatest advantage to us, if those gentlemen who have the good fortune of being attached to large general hospitals in the capacity of obstetric physicians would direct their clinical clerks to attend all *post-mortem* examinations made in the hospital on the bodies of females, and record the condition of the uterus and its appendages, and especially of the ovaries; for though doubtless, in the absence of clinical records of the history of the patient with reference to her uterine functions, much of value will be lost, still from time to time facts of great importance will be ascertained, and valuable information gained.

Information is specially needed with respect to some forms of ovarian disease. Some patients suffer for years from pain and tenderness of the ovary, from mammary pain and nausea of a most distressing character. Such I have seen reduced to a condition of actual despair; for all treatment seems useless, so utterly inefficient does it prove. In these cases, the ovaries are in general plainly enlarged, but the exact pathological condition of them is in many cases unknown. Here is an affection most deserving of investigation, both as to its causation, pathology, and treatment. I know of no form of disease which produces more real suffering, equally of mind and body. An American surgeon, Dr. Battey, of Georgia, convinced of the inadequate results produced by ordinary treatment, has recommended the extirpation of the ovaries in such cases, arguing that, from the results on animals, the operation would be safe as well as justifiable in the human female. I confess that to my mind his views contain much of truth, and that, were I satisfied that I did not endanger life, I would in some cases sanction the operation; and I think we may possibly yet see it practised even amongst ourselves, as I believe it has been in America. But such a practice would, after all, be a lamentable confession of the inadequacy of medicine to cope with what should be a curable disease. Let us hope that, as light is let in on these obscure questions, this reproach will be removed.

Gentlemen, I have I fear exceeded the limits of the time allotted to each paper, and it would ill become one who has to enforce a rule, to break it himself; but I cannot conclude without some allusion to what has been termed "the burning question" of the day. I have no intention here of discussing the advisability or otherwise of the admission of women into the profession of medicine; but I must refer to the course proposed to be adopted by the College of Surgeons of England, which on granting their midwifery diploma to persons but partially and most imperfectly educated; a step than which I cannot conceive one more retrograde, or so calculated to lower the profession in public estimation, or to inflict injury on the poorer classes among whom such persons would necessarily practise. I am happy to say that the example set by the College of Surgeons in England has not been imitated by any other licensing body, though more than one had the power of doing so; and to the credit of the University of Dublin, be it said, that it has recently been decided to grant a special degree in midwifery to persons who have previously obtained one in medicine or surgery, being thus the first British University which has recognised the position gained by obstetric medicine, an example which I trust will yet be imitated by the sister universities.

Gentlemen, I believe I am but expressing your unanimous opinion, when I say that the best thanks of this section are due to those eminent men, Drs. Barnes, Alfred Farre, and Priestley, who by their courageous conduct have compelled the Council of the College of Surgeons to reconsider, if not to retract, the rash step they were about to take.

◆

ABSTRACT OF
INTRODUCTORY LECTURE
DELIVERED OCT. 2 AT
UNIVERSITY COLLEGE.

By Henry Maudsley, M.D., F.R.C.P.Lond.,
Professor of Medical Jurisprudence in University College.

The lecturer commenced by stating that he thought he might most fitly use the occasion to endeavour to satisfy his hearers that they had made a good choice of a profession for their life's work. This he would do by pointing out the intrinsic nobility of their direct function as healers of disease, the excellence of the method of medical study as a means of intellectual and moral training, and its fruitfulness in benefits to mankind, and the grandeur and the reach of its aspirations for the future. There was no profession which, looking to the higher aims of it, afforded so many and constant opportunities of doing good in the hourly routine of its work, and no profession, therefore, which so little needed extraneous titles of honour to give it dignity and respect. So far from regretting, as some did, that peerages were not conferred upon it, he was glad that they were not, for he feared that there would not be the strength of mind to reject them; that a pitiful social ambition might cause the simple nobility of the vocation to be spoilt by decorations which had their origin in, and belonged properly to, a childish stage of human progress.

He went on next to show how well the training through which the student must go was adapted to make the most of his intellect. He was brought into direct contact with the facts of Nature from the first, had to advance step by step in the practice of observation and reflection from more simple to more complex phenomena, using the lower as a ladder by which to mount up to the higher, and so learned to make the order of his ideas conform to the order of Nature. That was real instruction; moreover, it was instruction at first hand. Coming to his work with a fair knowledge of mathematics and physics, he proceeded to the study of chemistry, and passed on thence to the study of physiology; so he laid deep and firm the groundwork for the study of the disorders of the structure and functions of the body and mind, which was his ultimate special work. A knowledge of the simpler and more general science was an essential pre-requisite to the study of the more complex and special science. It was impossible to enter the chamber of the mind without going through the antechamber of the body; impossible to understand the body without understanding the physico-chemical processes which lay at the foundation of physiology. To proceed in this way was to train the mind systematically in conformity with the order of Nature through patient observation and careful induction, to know Nature by becoming her servant and interpreter. And to know man finally through Nature, of which he was the present culmination, the thorough knowledge of his environment and of those his relations to it which constitute his life, must be the foundation of a scientific medicine. Prevision for the purpose of action was our aim here as in other sciences; and observe in order to foresee, and foreseeing, to modify and direct; gaining a knowledge of the phenomena of life in order to make ourselves master of them, just as we gain a mastery over physical nature through a knowledge of physics and chemistry. Formerly it was the practice to treat the body as if it were an entirely independent kingdom, without regard to its essential relations with what was outside it, and to try to drive out the enemy which was supposed to have taken possession of it by pills and potions, as barbarous nations do by charms and ceremonies. Now, however, all this was changed. Through recognition of the relations of the organism to its environment we had risen to a conception of the prevention of disease—the great purpose of medicine, which it was earnestly prosecuting at the present time. It was probable we should attain earlier and larger success in preventing the diseases of communities than in curing the diseases of the individual. To show what encouraging success had already been gained, several diseases were enumerated which, very fatal 200 years ago, were now harmless, or extinct, and others which would probably soon be almost extinct. One might, without being absurdly hopeful, foresee a time when the occurrence of epidemic disease would be felt as a gross reproach to the community, and there would be comparatively little for the practitioner to do in the treatment of particular diseases.

To some this prospect might appear fancifully bright, and it might be said that from the beginning men had, through the unrestrained indulgence of their passions, engendered disease, and, however pure their surroundings, would go on doing so; that were a clean sweep made of all disease from the face of the earth to-morrow they would breed it afresh before to-morrow's to-morrow. No doubt, as constituted and trained at present, they would. But it must be the aim of the medical science of the future to give them such an exact knowledge of their own nature and relations as will teach them to know and conform to the laws governing health and development, which they now violate habitually in ignorance and indifference. This was to be done by the patient and steadfast application of the method of observation and induction which had been so successful in the subordinate sciences, to the highest phenomena of man's nature—his thoughts, feelings, and conduct. The problem was the same here as in the lower sciences, to observe in order to foresee, and to foresee in order to modify and direct, and the method was the same. It could not be doubted scientifically that a process of evolution had gone on in Nature, and that man, as he now is, is a product of the past carrying on this process in his progress to a higher purpose in the future; he must, as a part of the order of Nature, be studied by the same positive method as the rest of Nature. When the origin and development of his higher nature was investigated by observation and induction, it was seen that the highest faculties of his mind had not been implanted ready made in his nature at any period of its history, but had been the slowly won results of the accumulated experiences of the race transmitted by hereditary action. The problem to-day was no longer the schoolman's vexed question of the origin of evil, but a question of the origin and growth of good. And our plain duty was to search and find out the laws which have been at work in this process of human evolution and to continue it—to carry on by deliberate method, with conscious purpose, what has been going on through past ages irregularly and blindly. It was truly amazing what recklessness men exhibited in regard to the power which they had over their own destiny, acting entirely as if they had no responsibility in the matter. In face of constant observation of the important modifications in the constitution and character of animals which were effected by selective breeding and training, and of positive knowledge of hereditary action in human development and retrogression, it was the rarest thing in the world to take the least thought in marriage of the ills which might be entailed upon children. Disease was propagated as if disease were a supernatural affliction which arose and spread by no natural laws. Men behaved in relation to the laws which govern human evolution very much as primeval savages behaved in relation to the laws of physical nature, were content with superstitions where they ought to get understanding, and put up prayers where they should exert intelligent will. It was an immediate task of medical inquiry to find out exactly the laws of heredity, mental and bodily, in health and in disease, and to apply the knowledge to promote the welfare and progress of mankind. Its large function in the future was indeed to discover those laws which have been in operation through the past to make man the superior being which he is, and to determine future action in intelligent conformity with them; not only to cure disease of body and mind, as it had aimed always to do, and to prevent disease, as its larger aim was now, but to carry on the development of his nature, moral, intellectual, and physical, to its highest reach. Clearly they had chosen a profession which yielded the fullest gratification to high aims and the largest scope to good work.

In pursuing the course of scientific inquiry indicated, one cannot well help coming into collision with some of the prejudices and traditions of mankind. It is not possible, for instance, to prosecute the physiological study of mind to its furthest reach without shaking the metaphysical notions of it, and with the fall of these notions other notions closely bound up with them may totter to their fall. But if this must be, we shall do well to acknowledge it more in sorrow than in anger. Let us not rush with eager clamour to the work of destruction; it behoves us as products of the past who will one day ourselves constitute the past, to deal gently and even reverently with it; we cannot break with it if we would, nor should we if we could; the very language which we use we owe to the slow acquisitions of generations which have preceded us; we cannot pity or despise them except in words for which we are indebted to them. As he who has been the best son is in turn the best father, so the generation which guards with respect the good which there is in the past and puts gently aside that which is effete will make the most stable progress in its day and transmit the best inheritance to the generation which follows it. One may esteem science sufficiently without feeling sympathy with the aggressive delight with which some persons accentuate its hostility to expiring beliefs: a scientific discovery is only a means to an end. The cultivators of science seem oftentimes to forget that its end must be constructive; that, after analysis must come synthesis; that all the analytical work in the world will leave matter in a chaotic state until the constructive spirit shall organise the incoherent results and make them serve for a higher social development. The problem is to make straight in the future a highway over which mankind may pass to a higher life. The philosopher, the poet, and the moral teacher have not been rendered superfluous by science; on the contrary, it will have need of them to attain to its own perfect working to the bettering of man's estate; and it may well seem to some that the time has come now when its manifold scattered and somewhat anarchical results should be penetrated by the synthetic insight of the philosopher, be embodied in forms of beauty by the poet's imagination, and utilised by the moral teacher to guide and promote the progress of mankind. So long as man sees splendour in the starry heavens, beauty in the aspect of Nature, grandeur and glory in self-sacrifice, so long will he feel that his brief conscious life is but a momentary wavelet on the vast ocean of the unconscious; that there is in him something deeper than knowledge, which "cometh from afar," and which the laboured acquisitions of science will ever fail to satisfy.

ABSTRACT OF
INTRODUCTORY LECTURE
DELIVERED OCT. 2 AT
THE MIDDLESEX HOSPITAL,

By Dr. G. H. Evans.

After a few preliminary remarks, he commenced by comparing the course of the medical student to that of a traveller along a road, straight at first and easily followed, provided along its course with establishments where travellers could be furnished with merchandise of various kinds, and with instructions how best to dispose of it. This portion of the road ended in turnstiles where tolls had to be paid, which gave admission to an open country with roads more or less plainly indicated, leading in various directions, from which roads each traveller might choose that which seemed most likely to lead him to a good market for his wares. After a few words on the subject of the selection of the ultimate road, he proceeded to give some advice as to the conduct of the students during the course thus described; laying great stress on the necessity, during their hospital education, that they should take every possible opportunity of doing practical work; "there is," he said, "not one of the subjects with which you have to make yourselves acquainted, which can be learned only from books and lectures; but you must in the case of every one of them familiarise yourselves with the practical application of the principles laid down in books and lectures." He especially urged upon them the importance of making themselves well acquainted with their fellow-men. "Remember," he said, "that in the exercise of your profession you will have to treat individuals, not diseases; that in no case which you may be called upon to attend will you find a cut-and-dried method or a hard and fast rule of treatment available. You will have to exercise your own judgment on each individual case, and you will be guided by the knowledge and experience which you will have acquired of your profession and of your fellow men." Here he took occasion again to urge them most strongly to make themselves well acquainted with various descriptions of cases by frequenting the out-patient's rooms and the wards. Speaking of their actual entry on a professional career, he suggested that in all probability there was a brighter prospect for the coming members of the medical profession than had been open to those of the preceding generation; that their services were likely to become better appreciated for their value with regard to the public as well as with regard to private individuals. He quoted some observations made by the late Lord Herbert of Lea, in 1860, to the effect that it was not by any means to the interest of the medical man in civil life to prevent disease; that it was only the sick man who sent for the doctor, and not the man that was well; and he compared with this statement Dr. de Chaumont's words in 1875, that we had "the spectacle of hundreds of educated gentlemen who, as officers of health or public analysts, were profitably devoting the whole of their time to that very duty which, fifteen years ago, his lordship thought so unpromising a branch of our art." Further, he quoted recent statements of Mr. Disraeli and Mr. Gladstone to similar effect. He then shortly described some of the changes which had taken place in the direction of improving the position of the medical profession; how the State had gradually and slowly been recognising the value of medical science in the prevention as well as the cure of disease, this recognition having been first evinced in the appointment of a medical member on the General Board of Health in 1848. "Since that time," he said, "an immense amount of good work for the public has been done, initiated, and until very recently superintended by Mr. John Simon, whose masterly and noble efforts, though rather frequently hampered by what we may perhaps call unappreciative administration, has succeeded in starting the science of public health on a sound and firm basis." He then reminded his hearers that there was yet much to be done, and that all the medical profession could in one way or another contribute to the advance of sanitary knowledge. He then made some observations on the alleged (in some quarters) inferiority in social status of the medical as compared with other professions. He considered that where the opinion existed, it was partially due to unfair comparisons between individual members of different professions. He admitted, however, that there were instances of a kind of deterioration in some cases where want of means, want of opportunity of mixing in good society, and other causes, had combined to drag a medical man in general practice in a provincial town down to the social level of the tradesmen who formed the majority of his clients; "and, undoubtedly," he said, "the unwillingness of the public to appreciate properly, and to remunerate sufficiently the services of medical men, has had a good deal to do with the difficulty experienced by some members of our profession in keeping themselves clear from some of the lowering influences to which I have alluded." He, then, in support of his theory that the profession had not really to any extent deteriorated, referred to the number of its members who were working unselfishly, conscientiously, and honestly, with very little substantial reward, believing that there is no profession in which so much good unpaid work is done by men who can ill afford to give their hardly gained experience for no return but the satisfaction of knowing that they are benefiting their fellow-creatures.

He then urged that if any improvement were required in the social status of the medical profession, it must be made by increasing the number of well-educated gentlemen in that profession, defining well educated as having had a good general education, not by any means confined to the acquisition of technical professional knowledge, and with this view suggested that many medical men commenced their practice too early in life, and that an ordinary university career was an extremely useful preparation for a course of medical study, as giving, at all events, some of that knowledge of men and of things in general, which was so essential to the education of a medical man.

His further advice to the students consisted in bidding them not to consider that their education is completed when they start in practice, seeing that our education is never completed. He bade them take every opportunity of getting information from the cases they attended, and from the recorded experience of others, saying: "Give your whole undivided attention to every case that is brought before you, and do not leave it till you have really satisfied yourself that you have ascertained all that is to be ascertained about it. Give your skill and experience as freely to those who cannot afford to remunerate you, as to those who can and do. Always bear in mind that you have to keep up your own reputation and that of the noble profession to which you belong; treat every one with whom you come in contact with the courtesy and kindness with which you would like to be treated yourself; and, even supposing that you do not meet with much substantial reward, you will yet have the satisfaction of feeling that you have done your duty fearlessly, honestly, and unselfishly."

In conclusion, he made a few remarks on the loss the medical school and hospital had sustained in the death of Mr, Campbell de Morgan. "A few months ago their passed away from among us one who for some forty years had adorned, aided, and supported this hospital and its medical school; one whose skill and varied acquirements had earned for him the admiration and respect of a circle far wider than that of the medical profession, and whose kindness, whose gentle simplicity, whose intense sympathy with, and thoughtfulness for, his fellow-creatures necessarily endeared him to all who came in contact with him. He was always ready to bring his remarkably clear and accurate judgment to bear on any difficult questions which might come before him, as we who were in the habit of meeting him in the board-room of the hospital have very good reason to remember. He is gone, but his memory remains. Let us endeavour, by making use of, and following, as far as we can, the noble example he has left us, to cause his loss to be less severely felt, and his influence to be, as far as possible, perpetuated amongst us."

◆

ABSTRACT OF INTRODUCTORY LECTURE

DELIVERED OCT. 2 AT

ST. THOMAS'S HOSPITAL.

By Mr. Francis Mason, F.R.C.S.,

Senior Assistant-Surgeon and Lecturer on Anatomy at the Hospital.

The lecturer commenced by referring to the curious coincidence that he happened to be the only surgeon who had been selected this year to address the students at the commencement of their hospital career. He related an amusing anecdote to illustrate the kind of discord that was so rife a century ago between the physicians and surgeons, which, he added, happily does not exist at the present day. He was unwilling to draw any invidious comparison between the work done at this and at other hospitals, when there was so much evidence that all were working so nobly for the general good of mankind; but in reflecting on the antiquity of the hospital, and in contemplating the names of the many eminent physicians and surgeons who in former years laboured so gloriously in its suit and service, he had no difficulty in finding a suitable theme for consideration. He then gave a brief, but nevertheless a very interesting, account of the rise and progress of the hospital. It was one of the royal hospitals, and was established as an alms house in the eleventh century, on the site of the present Charing-cross Railway at London Bridge. He then referred to the fact that the distinguished anatomist and barber-surgeon, Cheselden, was a pupil, and afterwards was appointed surgeon to the hospital in 1719. Alluding to Cheselden as a barber-surgeon, he stated that in the eleventh century medicine was entirely in the hands of the clergy; for example, William the Conqueror was attended by a bishop and an abbot, and the surgeons to King Henry VI. were barbers, and his physicians priests. The barbers were, indeed, originally introduced to surgery by the priests, whose heads they shaved. He then referred to the relic of the barber-surgeon as seen at the present day, in the pole which is observed outside the hair-dressers' shops, where they profess "easy shaving." The pole represents the staff which the patient grasped in order to accelerate the flow of blood in the operation of venesection. The stripes, red and blue, which decorate it, are symbols of the venous and the arterial blood, and the white line indicates the bandage that was applied to arrest the hæmorrhage. He then spoke of the Act of Parliament passed in 1714, by which the barbers and surgeons became two distinct corporations. On the separation, the barbers retained the old Hall, books, paintings, and records, and thus the surgeons were left homeless, and without property. They even had to borrow money to build a hall in the Old Bailey, on the site of the present Sessions House, and subsequently they removed to their present abode in Lincoln's-inn Fields. Reverting to Cheselden, Mr. Mason stated that the celebrated John Hunter was one of Cheselden's pupils, and that Dr. Edward Jenner's grand discovery of vaccination was first performed in London, by Mr. Cline, senior, at St. Thomas's Hospital, in 1798. Mr Mason then referred to other illustrious men who had been connected with the hospital, including the names of Dr. Richard Mead, Sir Astley Cooper, Dr. Mark Akenside, the poet, the renowned Dr. John Lettsom, and others, men who have proved themselves benefactors to science and mankind, and whose self-reliance, industry, and perseverance, all might well emulate. Both Mead and Cheselden, said the lecturer, attended Sir Isaac Newton, and "won golden opinions of all sorts of people," but by none were their talents more appreciated than by Pope, the poet, who referred to them in the complimentary terms:—

> "Weak though I am in limb and short of sight,
> Far from a lynx and not a giant quite,
> I'd do what *Mead* and *Cheselden* advise,
> To save these limbs and to preserve these eyes."

Addressing himself then more especially to the pupils who were commencing their studies, he reminded them that the student should at once be imbued with the all-prevailing truth, that there is no royal road, either to learning or to success in the medical profession. Money might assist to a certain extent, but it was of little value to further the progress of science, without the closest application and persevering and sustained industry. Work was all-important in every calling. "We listen," he said. "with wrapped attention to the learned divine. We marvel at the brilliant oratory of the illustrious statesman. We gaze in wonderment on an historical picture, in which all the details, withappropriate costumes, are depicted by the artist with the utmost accuracy and precision. We admire the actor, who 'holds as 'twere the mirror up to nature,' and places before us the characters of England's mighty dramatist with vigour and truthfulness, representing the 'very age and body of the time.' But such conquests were not won, such triumphs were not achieved, without incessant labour and unflinching perseverance."

The lecturer then referred to the labours of John Hunter, of Michael Faraday, and of Harvey, the discoverer of the circulation, and impressed upon his hearers the importance of being self-reliant, and of being accurate in their work. Truthfulness and good principle, purity of motives, and prompt decision were imperatively demanded for success in any walk of life. Great wealth and high honours, although open to all, were, he said, practically given to few in our profession; yet he expressed his own honest opinion that there was no calling in which a fair competence is so speedily acquired as in the medical profession.

"Let me add, in conclusion," said Mr. Mason, with much earnestness, "to all who are now studying here, that whether your life be a success or a failure, I confidently hope you will never lose sight of the moral influence and discipline inculcated at this hospital. In life's campaign you will necessarily meet with many vicissitudes to impede your progress, and you will have to contend with and conquer numberless difficulties; yet when the fiery fight is o'er, and you bear away the emblem of your victory, you will, I feel sure, look back in your leisure moments with pride, reverence, and thankfulness to your Alma Mater, gratefully remembering the happy days you have spent here, and recognising with intense satisfaction the many lifelong friendships that you have had the opportunity of forming."

Clinical Records.

NORTHERN HOSPITAL, LIVERPOOL.

Under the care of Dr. Dickinson.

[For the Notes of the following cases we are indebted to James Barr, M.B., L.R.C.S. Ed., late House-Surgeon.]

Case I.

Case of Uræmic Intoxication.—Non-Albuminous Urine, with Numerous Hyaline and Granular Casts.—Recovery.

Capt. B., æt. 30, single, German, admitted Sept. 3rd, 1874. When carried into the hospital he was in a state of delirious excitement, tossing his limbs about, and resisting all efforts to control him, so that it required two men to hold him in bed.

The history obtained from his friends was that on his last voyage he had been at St. Thomas, where he suffered from "fever and ague," and lost two of his officers from dysentery. Since his return, about ten days ago, he has been suffering from general *malaise* and depression of spirits. This attack came on rather suddenly this morning, but previously he was confused, and transacted his business in an irregular manner.

Present condition.—There seems to have been no convulsions, but only this jactatation of the limbs, and great excitement. There is no evidence of alcoholic intoxication, and his friends say that he is a teetotaller. There is no paralysis. Pupils are rather dilated, but sensitive to light. Nothing can be detected wrong with the lungs or heart, except the rapid action of the latter. Hepatic and splenic dulness somewhat enlarged, but nothing otherwise abnormal can be discovered. The skin has a distinct yellow tinge, but there is no marked jaundice, nor any staining of the conjunctiva. His resistance to any interference was so great, that in order to draw off his water he had to be chloroformed. With the catheter I removed ten ounces of urine of a deep amber hue. Sp. gr. 1023. No albumen by the heat and nitric acid tests. The deposit wa afterwards examined microscopically, and found to contain numerous large hyaline and granular casts. Many cells of renal epithelium, some apparently healthy, and others in various stages of degeneration, from that of cloudy swelling to a highly granular condition, also amorphous urates. Breathing hurried, but not stertorous nor cerebral. Pulse quick and weak. Temperature in the groin 103 0° F. He was ordered a chloral draught and sixteen grains of calomel, to be followed by a large dose of sulphate of magnesia. A sinapism to nape of neck. He was put in the straight jacket, and as he kept his teeth firmly clenched, he had milk administered through the nostrils.

Sept. 4th.—He was rather better this morning, and passed a small quantity of urine for the first time since it was drawn off yesterday. It was an amber hue, acid; sp. gr. 1019; contained about one-sixth albumen, and the deposit presented the same microscopic appearances as before. The nurse got him to take a little milk, and he said he had "enough." This is all he spoke, and soon afterwards relapsed into the same state he had been the day previously. There was great excitement, which was quieted by an hypodermic injection of morphia. As his bowels were only moved once, he had another brisk saline purgative.

Evening.—He is greatly improved, being now able to speak, and he is quiet, so that the straight-jacket was removed. The temperature still continued very high, the thermometer registering 104·0° F. in the axilla. Pulse quick, small, and feeble.

℞ Vini antimonali, fl. ʒj.
Liq. opii sedativ., fl. ʒj.
Spiritus etheris, nit. fl. ʒvj.
Liq. ammoniæ acetat., fl. ʒxij.
Aquæ, ad. fl. ℥vj.

Misce. sumantur cochlearia magna duo, secundâ quâque horâ.

He was also ordered a teaspoonful of brandy every half-hour, but during the night he refused to take it.

Sept. 5th.—He is very much better this morning. He talks freely, and considers himself well. He has not the slightest idea of anything that transpired since, or shortly before the onset of this attack. When shown the straight-jacket, he asked what it was for, and on being told, laughed. His skin is cool, bowels loose, urine more abundant, sp. gr. 1023, acid, non-albuminous; microscopical appearances as before noted. Ordered his mixture to be given only every fourth hour, and an ounce and half of compound senna mixture at bed time.

Sept. 6th.—He feels pretty well. Bowels have been freely moved; skin is cool and moist; urine, amber; sp. gr. 1021, acid, non-albuminous. Slight deposit, which on examination was found to contain large hyaline and granular casts, renal epithelium, and crystals of the triple phosphate.

10 *p.m.*—Temperature 104·6° F., skin dry. He is perfectly conscious, but feeling much worse. Ordered his medicine to be given every two hours, also fifteen grains of quinine and another black draught.

Sept. 7th.—Feels much better. Temperature 100·2° F.; sweating profusely. Bowels have been freely moved. The diaphoretic mixture was discontinued, and the following substituted:—

℞ Quiniæ sulphatis, ʒj.
Acidi suldh. dil., fl ʒj.
Infuse gent, co., ad. fl. ℥vi.

Misce. sumantur cochlearia magna duo quantâ quâque horâ.

Sept. 8th.—In every respect better to-day. Urine yields a slight cloud of albumen, and presents the same microscopic appearances as before.

Sept. 9th.—Urine, amber; neutral sp. gr. 1022; phosphatic deposit; a cloud of albumen. The microscope showed granular and hyaline casts, granular cells, triple phosphates, and amorphous matter.

Sept. 11th.—The urine to-day is feebly acid, sp. gr. only 1008; a very slight trace of albumen. Microscopic characters same as those noted on the 9th. The patient is very anxious to leave to-day, as he wishes to get back to Fatherland, and accordingly he is discharged.

In this case there was nothing like complete suppression of urine, and that secreted was of a deep colour, high specific gravity, contained abundant urates, and was free from albumen, so that in the first instance the case appeared very unlike one of uræmia, but then the urine was much diminished in quantity, gave evidence, in the form of very granular casts, of advanced kidney disease, and was occasionally albuminous. Also the progress of the case, and the absence of any other cause to account for the symptoms, left us no doubt as to the renal origin of the affection.

Your readers will find a valuable paper "On the Occurrence of Renal Tube Casts in Non-albuminous Urine," by Dr. James Finlayson, in the *British and Foreign Medico-Chirurgical Review* for January, 1876.

Case II.

Tubercular Disease of the Kidneys, Bladder, Prostate, Bowels, and Lungs.—Death.—Autopsy.

E. H., æt. 20, office-boy, admitted Oct. 26th, 1874, complaining of "swelling of the feet and general debility." He has always been a very weakly boy, but he has never suffered from any complaint prior to the present one, which he reckons of only four months' duration. The first symptoms noticed by him were severe pains in the ankles, especially in the right, which soon extended up to the knees, and were often on movement of an excruciating character. In the course of two or three weeks these pains ware replaced by œdema of the feet and ankles. About two months ago he began to be troubled with cough, which, however, has never been very annoying, and the expectoration has been always scanty. For the last month he has suffered from diarrhœa, and the emaciation has progressed rapidly. During the last fortnight he has had a frequent desire to micturate, and the urine has been "scanty and scalding."

Family History.—One of his brothers died of the "evil," and another has suffered from suppurating sores in the parotid region. His father died a short time since, after an illness of six months, from disease of the lungs, but prior to this he had been always healthy. His mother and four sisters are alive and healthy. This boy was kept close at his employment, and his habitation was in the lower part of the town.

There is extreme emaciation of his body and limbs, the outlines of nearly every bone being well-defined. Tongue slightly coated, appetite fair. Bowels very loose, fæces liquid and of a pale clay colour. Urine, acid; sp. gr. 1011, slightly albuminous, and contains a deposit of pus. Pulse 90, small and feeble. Perspiration 22. There is scarcely any cough, and no expectoration. He never spat blood.

Physical Examination.—The movements of the right side of the chest are defective. The percussion note is deficient in tone throughout, and the comparative dulness is specially marked over the right back, and at both apices, especially the right. Right lung: Over the upper lobe the breathing is very tubular, and inspiration is attended with very coarse crepitant, or gurgling râles. The whispered V.R. is very distinct; over the lower and middle lobes there are numerous coarse crepitant râles and snoring rhonchus. Left lung: Over the upper lobe there is fine crepitus, and considerable rhonchus. On October 30th his voice became very feeble, and on November 5th his pulse was 120, very weak. Pupils much contracted, and there was a tendency to stupor. From this state he gradually passed into a comatose condition, and expired on Nov. 10th.

Post-mortem Examination Twenty-four Hours after Death.—There is great emaciation, fat is almost absent. Both lungs are affected with caseous degeneration, though in different degrees. The right lung is affected in its entirety, and that in a pretty advanced stage, and at its apex there are some small vomicæ. The left upper lobe contains a great quantity of caseous deposit, and some small cavities at the apex. The left lower lobe is congested, and studded with numerous small grey granulations.

Heart small, soft, pale, and flabby. Semilunar valves competent but very thin and thready.

Liver large, pale, and infiltrated, with a considerable amount of fat. There are a few small tubercles on its under surface. Spleen, normal. Both kidneys are very large. Capsules are easily torn off, surfaces at many points, are studded with cheesy tubercles. Nearly all the pyramids are almost entirely destroyed by caseous degeneration. Some of these masses were in a more advanced stage than others, and breaking down into pus. It seemed to be primary disease of the kidneys, as the degeneration was here in the most advanced stage, and the pelves were not specially affected. Ureters large. Bladder deeply congested, and presented some ulcerated patches, one of which communicated with an ulcer at the lower part of the bowel. Nearly tho whole of the prostate was eaten away. Near the lower part of the bowel there was a patch of deep ulceration, which communicated with the base of the bladder. There were several small ulcers in the large bowel, one on the ilio-cæcal valve, and another near the lower end of the ilium.

Vital Statistics.—From the Registrar-General's report we learn that during last week 5668 births and 3146 deaths were registered in London and twenty-two other large towns of the United Kingdom. The mortality from all causes was at the average rate of 20 deaths annually in every 1000 persons living. The annual death-rate was 21 per 1000 in Edinburgh, 25 in Dublin, 20 in Glasgow, and 19 in London. The rates of mortality during the same period in the other large towns were—Bradford 19, Norwich 21, Brighton 19, Wolverhampton 27, Birmingham 21, Sunderland 15, Portsmouth 21, Sheffield 23, Plymouth 19 Nottingham 18, Liverpool 24, Bristol 21, Leicester 17, Oldham 30, Newcastle-upon-Tyne 15, Hull 16, Manchester 23, Salford 29, and Leeds 10. The annual death-rate from the seven principal zymotic diseases averaged 3·6 per 1000 in these towns, and ranged from 0·7 and 1·1 in Plymouth and Hull, to 8·1 and 9·4 in Salford and Woiverhampton. In Portsmouth 13 more fatal cases of scarlet fever were recorded, raising the number since the beginning of the year to 317, 48 are recorded in London. Small-pox caused 14 deaths in Manchester and Salford (including 5 in the Monsall Hospital), 8 in Liverpool, and 11 in London.

LEGISLATIVE RESTRICTIONS FOR HABITUAL DRUNKARDS.—II.

THE recent inauguration of a society for the purpose of promoting legislation for the control and cure of habitual drunkards, and an account of which will be found in our last issue, reminds us that in a former article on this subject, we were obliged to postpone the consideration of several important questions.

In that article our remarks were only of a general nature, and were confined to the consideration as to whether there is really any *raison d'etre* for this movement, or for the society, whose object is to promote it, but we shall now, and on a future occasion, endeavour to see what advantage may be reasonably expected to result from the legislation proposed, and how far the scheme is practicable.

At the outset, however, we must bear in mind that we have to deal with two very different classes of cases, and two very different classes of people. On the one hand, we have the low, ignorant, and almost savage bricklayer or navvy, who revels in his drunkenness, and who repeatedly comes before the police courts for disturbing the public peace, or for some brutal assault upon his wife, or something worse. On the other hand, we have to deal with cases which the public seldom hear of, and which never come before the magistrates. It is now the refined, educated, and perhaps high-born lady to whom our attention is called. She does not revel in drink, but is a slave to it. She commits no crime; she does not break the law, nor does she commit any offence against decency; and the misery she causes is known to her family alone. Now, some of the gentlemen who have taken a prominent part in this movement seem to have had chiefly the former class in view, while the attention of others appear to be directed to the latter. There is also a third party which refers sometimes to the one, sometimes to the other, according to the suggestions of the moment. Dr. Alfred Carpenter, and other gentlemen whose magisterial duties bring them into contact with the working classes have in view the reclamation of a very different sort of drunkard to that which elicits the sympathy of the medical practitioners, who practice among the middle and higher classes of society. We do not, however, have one law for the rich and another for the poor, and the question will arise whether any legislative restrictions can be placed upon the conduct of the poor drunkard which will not hold good in the case of the rich dipsomaniac. Nevertheless, in discussing the subject, it will be more convenient and practical to take these cases separately, and to see how far the advantages and disadvantages, the practicability and impracticability of the proposed scheme are affected by the class of people to be dealt with.

And, first with regard to the working classes, we shall find that while the results of establishing reformatories for the compulsory care of the habitual drunkard would probably not be so satisfactory as those which would obtain among the middle and higher ranks of life, the obstacles in the way of carrying out the provisions of such an Act as that proposed would be very great indeed. We must bear in mind that most of the habitual drunkenness among the lower orders of society is not of that secret and uncontrollable nature which characterises the drunkenness as observed among the educated classes. In one case it is more public, in the other more private. In one case it arises from a habit of low depravity, from a sort of voluntary giving up of the evening hours to the pleasure of indulging in intoxicating liquors in the presence of a lot of boon companions, and amid the gaudy attraction of the gin-palace. In the other it is a secret drink craving, indulged in out of an infatuation for the drink itself, and quite irrespective of the convivial circumstances with which drinking is usually associated. Lastly, in one case it is more a crime, or a vicious habit, in the others more a disease. Consequently, the inebriate workman, or his wife, as the case may be, would probably return to his former habits very soon after he was surrounded by his old associations, or was exposed to his old temptations. It may be said that this would not often be the case if he were detained in a reformatory for some considerable time, inasmuch as the fear of being again confined for some years in such an institution might act as a very wholesome deterrent, and might at least make him for the future keep his drinking propensities out of reach of the law. But then it is very doubtful how far the detention of the habitual drunkard for two or three years in a reformatory would be practicable. This class of people is, among our working population, unfortunately a very numerous one, and independently of the enormous expense their maintenance would entail upon the Government, it would be difficult to find room for them all. Besides, what is to become of the wife and family of the drunkard who is, for a period of one or two years deprived of the opportunity of supporting them. This perhaps is a difficulty which might be surmounted by the inmates of a reformatory being obliged to follow, as far as possible, their usual occupation, and by Government making the family an allowance out of the proceeds of their labour. But still it is a difficulty which will have to be met in any future legislation on the subject. For it must be borne in mind that the pauper, drunkard, or drunken labourers, would not have the *entrée* into the well conducted and attractive establishment of the private proprietor, but would be consigned to public reformatories to be kept up at the public expense.

It is, moreover, by no means certain that the system of treating this class of adult inebriates in reformatories in the same manner as criminal children are dealt with, would be so successful as some suppose. Statistical evidence has been brought forward to show that a large percentage of the inmates of inebriate asylums are cured, but we must remember that nearly all the persons referred to belong to the middle and not to the lower ranks of life. The reformatory treatment of the habitual drunkards furnished by the masses has never yet been tried, for the simple reason that the law is, as it at present stands, merely punitive, and only sanctions very short and useless terms of imprisonment, and because there are social reasons why such persons could not, even were they willing, voluntarily enter such institutions. We have, moreover, to look at this contingency, namely, that after a Bill has been passed for the compulsory control of this class of habitual drunkards, and after board, lodging, and supervision, &c., have been provided for them at a very great expense to the country, the system would after all turn out to be a failure. Then there is another aspect in which, and another reason why we should, in considering this question, regard this class as requiring special consideration. It has often been asked: What is habitual drunkenness? Is it a vice, a habit, a crime, or a disease? On this point there is great difference of opinion, a difference which particularly obtains between the legal and medical professions respectively; and it is also one of the points in which many of the principal promoters of the present movement have mixed up in their minds one class with another. At the inaugural meeting of the Society abovementioned, Mr. Safford, referring particularly to this class, remarked that the law regarded habitual drunkenness as a crime and not as a disease, and there can be no doubt that serious results would follow if the law ever came to look upon it as a disease, inasmuch as the drunkard would be continually making his drunken habits a plea for all sorts of crimes. Indeed, by whatever name we may call it when occurring amongst a class of people which will, on another occasion, receive our consideration, we must admit that nine-tenths of the cases that occur among the masses, drunkenness is nothing more nor less than a depraved and vicious habit, a vice, and not a disease—although in some cases of long standing it may run into disease.

Another important circumstance to be taken into consideration is, that while in one class of cases habitual drunkenness is so largely associated with crime, in the other, criminal offences are of very rare occurrence. In fact, such a fruitful source of crime is drunkenness among the working class, that a large percentage of the murders, brutal assaults, and other minor offences which occur, have been very generally attributed to this cause. And while this circumstance alone is sufficient to justify some further and more successful interference on the part of the Legislature than that which now exists, it must necessarily embarrass any action that may be taken in the matter, and must at all events make the Government hesitate before it adopts any measures that may have the least tendency to lighten the responsibility of the criminal classes.

◆

THE IRISH LUNACY PROGRAMME.

In the *Limerick Reporter* we find the following:—

> "The Resident Medical Superintendent, Dr. Courtenay, informed the board of governors that, being indisposed, he should ask the board to appoint an assistant for a short period; but he apprehended that, from the large numbers in the house and heavy duties to be discharged, it would become necessary to have a permanent assistant employed. There was only one asylum—Omagh—in Ireland having as large a number of inmates where an assistant medical superintendent was not employed.
>
> "Mr. M'Donnell said that some time since the question of appointing an assistant superintendent was mooted, but the feeling was unanimously against it, as there was an efficient visiting physician, who was always ready to give his assistance.
>
> "Dr. Courtenay said he would ask them to appoint a temporary assistant for two months. He knew an Irishman *in an English asylum who would come over.* He would give him his board and lodgings if the governors agreed to pay him at the rate of £100 a-year.
>
> "Archdeacon Hare asked Dr. Courtenay whether visiting physicians were employed in other asylums?
>
> "Dr. Courtenay: Not in England, but they are in some Irish asylums. *However, after some time I believe the office will be abolished.*
>
> "Mr. M'Donnell said he saw they could appoint a medical pupil at a salary not to exceed £60 a-year.
>
> "After some desultory discussion, it was agreed to appoint a temporary assistant."

We have italicised two phrases in this report, which we look upon as significant, and worthy of the cautious attention of the profession in Ireland, and especially of the Visiting Physicians of Lunatic Asylums. Dr. Courtenay, some time the assistant in an English asylum, is so obliging as to recommend to the governors another assistant in an English asylum, to the exclusion of Irish professional men, who not only have, we venture to observe, as strong claims as any of that gentleman's friends, but who, being probably acquainted with the Irish Lunacy regulations, and certainly not prejudiced in favour of the opposite system, are much more likely to make efficient officers than any gentlemen pitchforked into office from the other side of the Channel.

The Resident Medical Superintendent of the Limerick Asylum gained his experience of the administration of Irish lunacy by a three years' apprenticeship in the Derby and the West Riding Asylums, where the principle and system of management is entirely different from that in Ireland. Under the patronage of the Castle office—whose instinct it seems to be to destroy the system which it is entrusted to administer—he was selected, in preference to many equally deserving candidates, to rule over the Limerick Asylum. We use the word "rule" because we do not doubt that he was placed in office advisedly for the purpose of carrying out in that asylum the long-tried policy of annihilating the board of governors and ousting the inconvenient inquisitiveness of visiting physicians, because in that very asylum the independence of the governors in reference to the murder of the lunatic Danford by a keeper, which the inspector's office attempted to hush up, but which the governors insisted on ventilating, had made them very unpleasant to the Castle.

True to this policy, Dr. Courtenay "manages" the importation of another English assistant; and we are surprised to find the governors, hitherto so watchful, caught napping, especially as the Resident Medical Superintendent's purpose escaped him in the course of the conversation. Dr. Courtenay evidently thinks the visiting physician an incubus, because he is not employed in English asylums, and he "believes that after some time the office will be abolished." Does he? "The wish is no doubt father to the thought;" but this part of his programme shall certainly not be carried out if protest and energetic opposition on the part of the public and the profession can prevent it, nor if our influence can make public the nature of the job.

It may be considered that we have attached undue emphasis to the strong utterance of an obscure Resident Superintendent; and it is, therefore, necessary for us to explain that Dr. Courtenay's straw is the indication of a very dangerous wind. That gentleman is the Secretary of the Committee of Resident Superintendents, he is the *protegé* of the inspector who dictates the Castle policy, he is the colleague of officials whose anxiety to emasculate boards of governors and visiting physicians is well known—and, lastly, he is the oracle which inspired a recent very notable editorial in the *British Medical Journal.* This enunciation may be taken as the proclamation of Dr. Courtenay's party, and we are therefore not surprised to find that it pooh-poohs the claim of the visiting physicians to a contingent increase of salary—represents the Resident Medical Superintendent as the supreme ruler and animating mind of asylums—demands for them a wholesale appointment of well-subordinated and humble medical assistants, and winds up by an audacious protest against newspaper publicity respecting the doings within the walls of such institutions. This is the programme of Dr. Nugent and the Resident Medical Superintendent, but it is by no means the programme of a vigilant public or a cautious Government; and a hint of the Resident's policy more ruinous to their cause could not have been given than the proposal to shut the doors of Government asylums against external inspection and public watchfulness. A semi-responsible control of a mysterious institution, with an obedient assistant, a deaf and dumb board of governors, and the door locked against inquirers, whether they be physicians or reporters, would suit the Castle office and the autocrat of the institution very nicely, but would by no means satisfy the public, Parliament, or the pauper lunatic.

We warn the profession, the board of governors, the visiting physicians, and the people that such is the object aimed at, and that it will not be attained by a sudden *coup d'état,* but by a silent and insidious change of a word here and there in the law and the regulations. By these means Dr. Nugent has steadily and gradually, but certainly ruined the Irish Lunacy system, and has accomplished half his work; and the moment has, we think, arrived when the interference of Parliament should be invoked to declare whether it prefers the well-proved Irish system or the inspectional idea of asylum administration. If an appeal to the House of Commons be longer delayed, we shall have further changes effected, and the "Nugent" system will appear before the bar of public opinion as the established usage, when it may be too late to reverse the policy.

◆

Notes on Current Topics.

International Hygiene.

There is a universal language which lends itself to our aspirations and to our relations with each other; it is the language of the heart. National barriers are lowered before our fraternal legions, for the work of hygienic life saving, and social economy extend to a federation of peoples, which is called humanity, and humanity recognises no frontiers.

These were the words with which the opening of the International Congress at Brussels on Thursday last were ushered in by its President, and assuredly no greater or more fitting aphorism could have been propounded to the civilised world at the present moment. Most opportune, indeed, is this meeting, when the war in the East is fraught with anxiety to every thinking man, and great powers and great statesmen are quivering for fear of a European conflagration. International hygiene, like international war, will then possess a terrible significance, and the red cross become almost the only consolation for suffering humanity.

The Congress now sitting has a variety of topics to discuss, and as one of immediate importance, the position and action of civil surgeons and volunteer helpers on the battle-field was discussed at its first meeting, when it was decided that their proper position was not on the battle-field, but with the second line, or reserve, in order to render more effectual aid to the wounded. Quarantine regulations were also discussed, and many valuable suggestions and amendments in the present mode of administration decided on. Amongst those present, the well-known names of Professors Esmarch and Virchow, Drs. Appia, Langenbeck, and Merchie as foreign representatives appear, whilst Great Britain is represented by Sir Harry Verney, Mr. Chadwick, C.B., Captain Douglas Galton, Major Burgess and Mr. J. Furley, Members of the Council of the British National Aid Society; Surgeon-Major Porter, M. Phené, Mr. Collins, delegates of the Association for the Promotion of Social Science; Dr. Richardson, F.R.S.; Dr. Hardwicke, &c.

Verdicts by Intuition.

The two cases in which, last week, we noticed that coroners' verdicts had been returned without any reliable evidence whatever respecting the cause of death, the cases being, in each instance, both obscure and suspicious, are but examples of a most objectionable practice, which has crept into the inquest system. In many investigations it would seem that, either from confidence in his own omniscience, or from a desire not to trouble the relatives of the deceased with impertinent inquiries, the coroner takes upon himself to give the jury his own views of the probable cause of death, which he puts in such a way as to amount to a direction to them to find a verdict upon his opinion; and they, being for the most part, obfuscated by the novelty of their position, and almost always, of the most ignorant and illiterate class of the people, are glad to get out of the responsibility of forming an opinion for themselves, and, accordingly, without more ado, register the decree of the coroner without asking a question, or troubling themselves with the evidence. It is, in fact, in most instances, the coroner who gives the verdict, not the jurors, and it is not unjust to these gentlemen to say that the legislature by no means contemplated entrusting such a power to them. Another such case crops up this week. The apothecary of the Roscommon Infirmary was found dead in his bed-room at one o'clock in the day. It was known that he was addicted to drink—that he was expecting dismissal in a few days—that he was under vexation and irritation at some alleged want of attention to him by the infirmary sub-officers—that he distinctly told the nursemaid that "she would find him dead on her return"—that a bottle of prussic acid was found beside him—and, lastly, that he must have died within an interval of one hour and a-half. In spite of this evidence, the jury returned a verdict that his death was caused by an attack of spasms of the heart, in accordance with the medical testimony." The medical testimony consisted in the evidence of one witness, who swore positively that he believed the cause of death was prussic acid, and another who thought he had died of spasms of the heart, and a third who expressed no opinion, except that he believed he "acted under the influence of some drug." No post-mortem examination was made, and, of course, no examination of the contents of the stomach, and the only ground upon which the verdict could have been found, was an examination of the outside of the body. If the published reports of the inquest are to be credited, the probability is overwhelming that the deceased poisoned himself, and a verdict arrived at without proper examination is only a disreputable farce, to which professional men—not to say coroners—ought not to lend themselves. It is nonsensical to say that in plain cases, such examination is unnecessary, for if the causes of death be evident, no inquest need be held, and if they are not, the jury ought to be in possession of the means of forming a judgment. A verdict contrary to the sworn facts is worse than foolish.

The Forthcoming Dairy Show at the Agricultural Hall.

A dairy show will be opened on the 24th of next month at the Agricultural Hall. There is one thing, remarks the *Farmer*, which the promoters of the show might do, but which we suppose they wont; they might make collection of the false butters of trade, and exhibit the processes of their manufacture. As a rider to the above very good suggestion, and which, by the way, we heartily endorse, we append the following extract from the *Iron* newspaper, containing a description of a process for manufacturing butter adopted in a well-known manufactory in Glasgow. There seems to be no secret about the process, which is as follows:—Good beef suet, carefully picked, which is torn to pieces in a machine, a sort of devil, heated by steam, with the view of removing the membranous parts of the suet, which, with the heavier fat, fall to the bottom, the rest passing off as fine rich oil. This is churned with milk, in the proportion of about eleven gallons to thirty or thirty-three gallons of the fat. The whey is next driven out, and the residue kneaded by hand, cured with the usual proportions of salt and saltpetre, coloured with annatto, packed into tubs, and branded as best cork or fine Jersey, is ready for the market.

A New Test Paper.

A NEW test paper, invented by Waller, is, says the *Chemical News*, prepared by soaking strips of white paper in a solution of coralline. It is exceedingly sensitive to the action of alkalies ; very dilute alkaline liquids instantly turn it a beautiful red colour. Acids turn it yellow ; but, as the reaction is less striking, Dr. Waller proposes to use it only for alkalies, as a substitute for red litmus.

Large Doses of Opium v. a Large Gall-Stone.

IN a recent volume of Virchow's *Archives*, and quoted by the *Glasgow Medical Journal*, there is an interesting account of the passing of a very large gall-stone. There was first great pain and enlargement of the gall-bladder and liver, followed by relief, and the passing of a gall-stone. This stone was so facetted that it had evidently existed along with another, and so the medical attendant anticipated a return of the symptoms. This did occur, and on the occurrence of relief the other gall-stone was passed. Together they form an oval body the size of a small hen's egg, their circumference being three and three-quarter inches round the short axis, and six round the long. The case was treated chiefly with opium, and during the intense agonising colic he got as much as 6·5 grammes (102 grains) in the twenty-four hours without signs of poisoning.

Irish Sanitary Administration.

THE character of the conclaves to which Parliament has been foolish enough to entrust the custody of Irish public health may be judged by a note of the proceedings of the Drogheda guardians last week anent the putting down of a pump recommended by the sanitary officers for the purpose of giving the people an alternative from sewage drinking. One of the precious administrators of the sanitary law burst out into a tirade in which he protested against the board putting down "Saxon" pumps into the Drogheda wells, on the ground that these receptacles were holy, having been blessed by the saints, and should not be polluted by anything "Saxon." In our experience one lunatic is to be found at every board, and may be regarded as an inevitable nuisance, but the strangest fact is, that the chairman—the elect Nestor of the Drogheda guardians—quite sympathised with the anti-Saxon on this occasion, and thought that pumps, in the abstract, were an unnecessary refinement which Drogheda had done without long enough and *well* enough. Such are the persons whom Parliament expects to know all about zymotic-antiseptics and the germ theory.

The Working of the Sanitary Acts in Ireland.

THE Irish Local Government Board, who evince so much anxiety to convey the belief that the Irish Public Health Act is everything to be desired, and that Ireland is undergoing rapid expurgation of foul smells and zymotic disease, will learn something from a perusal of the evidence given by the sanitary officers and other medical men before the Irish Municipal Bodies Commission, which sat at Ennis last week, to investigate the corporate management of that town. Be it remembered that Ennis is an urban district, under a Town Council, with abundant taxing powers, and, therefore, it may be presumed, exceptionally well placed for sanitary improvement. Here is what the L.G.B. considers sanitary progress :—

Dr. Green, sanitary officer, sworn, stated that in his official report on the sanitary state of the town, he called special attention to the want of privies, but no action was taken by the commissioners to remedy the great defect; many of the houses have no yards, and very few have water-closets ; the excrement and other filthy matter are thrown into the streets at night, and removed by the carters in the morning ; it can not be seen, for there is no light, but the horrible effluvia can be felt, and in his opinion such a state of things is detrimental to the public health ; the sewerage is very defective ; he considered it would be very desirable to have a supply of pure and wholesome water.

Dr. P. N. Cullinan, swore that since the Act of 1874 he saw no improvement in the sanitary state of the town. It was discreditable to the commissioners, and especially detrimental to the health of the poor. There can be no second opinion as to the requirement of a water supply, which should be of good quality and abundant.

Dr. William Cullinan, surgeon of the County Infirmary, gave corroborative testimony as to the defective scavenging of the poorer districts of the town, the inefficiency of the staff, and the general neglect of the sanitary requirements by the commissioners. They allowed for selfish ends monthly fairs in the town, although having a splendid green in the immediate vicinity. For days after the accumulations of filth were allowed to remain on the thoroughfares.

The Midwifery Chair at Galway College,

vacated by the sudden death of Professor Doherty, has been in abeyance for many months, in consequence of the postponement of the election of the Senate. The day of meeting to fill the vacancy was, however, fixed for Monday last, the 2nd. We understand that there are no less than 62 candidates.

Death from Ear-piercing.

IN the county Tyrone the death took place last week of a strong healthy girl, of 22 years of age, from erysipelas, consequent upon the piercing of her ears by an amateur.

Dog's Milk in Rickets.

THE *Gazette Hebdomadaire* states that it is the custom among the women of Monttrun, in Dauphiné, to continue suckling for two years and a half to three years, with the idea of preventing another pregnancy ; and if the infant dies, the mother either adopts another, or takes a puppy into her family to carry on the process. All these puppies suffer from rickets, which resembles exactly the rickets of children, except that the deformity is never afterwards remedied. These observations, and the fact that the dogs always recovered under the influence of their own mother's milk, induced M. Bernard to submit a rickety female child of twenty-six months to the dog's-milk cure. A powerful bitch was provided to act as wet-nurse for the child, and after from two to three months of this method of imbibing nourishment, the swelling of the epiphyses and the bending of the bones had notably diminished, the muscles were stronger, and at the end of the time the child could stand and take a few steps. The health of the patient was, at the end of 100 days, extremely good; a slight curve of the femur and sternum being the only remains of the deformity, and the cure was permanent. He has adopted the treatment successfully in six other cases, and he expresses the belief that it will give encouraging results.

Vaginal Poultices.

At a late meeting of the Société de Therapeutique, Paris, M. Bucquoy related that while an *interne* of Louis he had seen true cataplasms applied to the vagina. They were made thin and rolled around a small stick, which, having served as a means of introducing them, was withdrawn. This practice, which was an excellent one, seems to have entirely fallen into neglect, M. Fournier, of the Lourcine, being the only person who now employs vaginal cataplasms. M. Fournier makes use of voluminous cataplasms which quite distend the vagina; and he states that he was first induced to resort to this practice by having observed the effects which had several times resulted from his pupils having forgotten to remove large wadding plugs that had been introduced. In each instance these, so far from having acted prejudicially, had proved of service in treating vaginitis.

First Conviction under the Vivisection Act.

We learn from one of our contemporaries that there has been a conviction under the Cruelty to Animals Act, 39 and 40 Vic., c. 77, which came into operation on August 15th. Three days later Dr. Abrath, of Sunderland, issued a large placard headed "The Balham Mystery," announcing his intention to deliver a lecture at Sunderland on "Antimony," when he would perform experiments on animals to show the effects of poisons, and to demonstrate his theory that Mr. Bravo was not killed by that drug. The branch of the Royal Society for the Prevention of Cruelty to Animals at Sunderland immediately reported the matter to the Secretary in London, and prompt measures were taken to prevent the learned gentleman from performing his experiments. According to the sixth section of the statute named above an offence had already been committed by the announcement of a public exhibition of experiments on animals; and Dr. Abrath having spoken contemptuously of the new statute at his lecture, instead of apologising for his projected defiance of the Act, was summoned to appear before the Sunderland Borough Bench at the instance of the London society, when he was fined 1s. and costs for publishing the illegal placard alluded to, the society asking only for a nominal penalty in vindication of the law.

The above conviction seems to be as ludicrous as was the agitation which led to the passing of the Act. We have no doubt this first conviction will be very disappointing to the anti-vivisectionists, inasmuch as they would wish that much better game had come under the clutches of the law than the comparatively obscure Dr. Abrath, of Sunderland. If they could have seen some well-known physiologist caught in the meshes of the net which they have so industriously woven, they doubtless would have been more pleased. At the same time the conduct of Dr. Abrath is highly censurable, and cannot be too strongly denounced. It is evident that the real motive of this gentleman was to throw ridicule upon and to openly defy the Act, which no one who had any respect for the law—even the most enthusiastic physiologist—would ever think of doing. Besides, although we joined with others in opposing the absurd and unjust outcry there has been on this subject, we always deprecated the wanton performance of experiments on animals, either for the sake of demonstration or merely to gratify the curiosity of the public. But we are much mistaken if the movement that created such a sensation previous to the passing of the Act, has not rather aroused the public curiosity, and if we shall not still hear of many infringements of the new statute which would never have occurred had vivisection and similar experiments been left quietly alone in the hands of true physiologists and of men who were really desirous of adding to our stock of physiological science.

Quacks, and their Indecent Pamphlets.

The other day a man who calls himself "Dr." Godfrey, brought an action for assault against one of his patients—or victims we should say—at the Bow Street Police Court. While the case was going on, Mr. Abrams put in a little pamphlet, entitled "Vices of the Age, by Dr. W. R. Godfrey." This pamphlet, said Mr. Abrams, had been handed about the streets, although it was of a most indecent nature. A copy of it had got into the hands of the defendant, who, unfortunately for himself, was induced to place himself under the treatment of this quack. Instead of getting better, the defendant found his case getting more and more serious, and that he had been taking antimony. (Some of this was produced in court. He grew enraged, and asked that some of the money (£3 15s.) that he had paid should be returned to him.—Mr. Flowers observed that he might almost as well ask a lawyer to return his fee.—Mr. Abrams said no doubt a lawyer dipped deep into the pocket, but still he did not ruin the system and shatter the health of his client. He had told the defendant that, although he had been shamefully treated, still that did not justify the assault. It could merely be urged in extenuation. Mr. Abrams concluded by asking his worship to deal as lightly as possible with the defendant.—Mr. Flowers said he noticed that the defendant was 26 years old. He should have thought that anyone of that age reading the pamphlet produced would have known very well what sort of man "Dr." Godfrey was, and would not have been so imprudent as to go to such a place to be cured. It was a scandalous thing that men like this Godfrey, with no degree at all in this country, should be allowed to practice. These men ruined, for aught that was known, the constitutions of many young men, who, in order to keep such things secret from their families and friends, would not go to the family practitioner.

We feel sure our readers will heartily appreciate the very just and indignant remarks of the magistrate. To practice without any qualification whatever is bad enough, but to scatter broad-cast indecent publications in order to catch hold of those whom disease and fear have deprived of ordinary discretion and common sense is so vile that it is difficult to understand how such things can be tolerated. Unfortunately, the great aversion which, for obvious reasons, the victims of these harpies have to prosecute, the uncertainty of being able to prove their case, and the great disproportion of the punishment inflicted to the heniousness of the offence, are quite enough to deter those who have been unfortunate enough to fall into the hands of the quack from publishing their grievances, and from thus losing their character, as well as their money and their health.

And then with regard to the virtuous indignation of the magistrate at men being allowed to practice without any diploma whatever, we feel somewhat ashamed at reading his remarks, inasmuch as we are ourselves a good deal to blame in the matter. Our great medical corporation have been very lax in this respect, and for the sake of the public health, it would be as well if some steps were taken to do away with this anomaly in our social system. Perhaps a "society for the suppression of illegal practitioners" would not be amiss. At all events, its *raison d'etre* would be as reasonable, its object as commendable, and its work as useful as many that now exist

Supposed Remedy for Hydrophobia.

Whether or no dogs "go mad to serve their private ends" more frequently in spring than in winter is a disputed point. Talk about hydrophobia, however, generally begins in May, and thus it is interesting to learn from the *Journal des Débats*, which reserves its own opinion, that a specific for this terrible disease has been discovered. M. Gubler, Professor of Therapeutics in the Faculty of Medicine of Paris, has been favoured with a letter from Dr. Grzymala, of Krivoe Ozero, in Podolia, whose name and address will interest the topographer and the friends of phonetic spelling. Dr. Grzymala announces that "the sovranest thing on earth for dog-bites is not, as has been thought, a red-hot poker, but the leaves of the *xanthium spinosum*." These may be administered immediately after the bite, or at least as soon as may be. The doctor has cured over 100 cases with these alone, never uses cautery, and never fails. A grown person's dose is sixty centigrammes of the powdered leaf, to be taken thrice a day for three weeks. As a proof of his theory, the doctor mentions the following case: A dog of his went mad, and bit a bull, a pig, a cat, another dog, and a tame crane. The bull, the pig, and the dog were treated with xanthium, and suffered no evil effects. The crane and the cat were left to nature, and died of hydrophobia—the one after four, the other eleven days' illness. Moreover, out of twelve persons bitten by a mad wolf during the Crimean war, the six who were attended by the doctor recovered; the other six in spite of cauterisation, cantharides, and faba tonco died. These are only a few out of many instances of the marvellous effects of xanthium. The plant is common in Southern France: it is a mild sudorific; and it will be the greatest boon to humanity if it proves to be a specific for the most terrible of known diseases. It may be added, as a proof of the doctor's good faith, that he has sent a packet of his preparation to his friend in Paris.

Spiritualism in the Dock.

We are well satisfied that spiritualism will at length be brought within the judgment of the world, if not before the scientific tribunal which would be most capable of deciding upon it, at least under circumstances which cannot fail to elicit a distinct declaration of rival opinions, and a full record of personal observations. Professor Lankester, it is plain, has confidence that he can prove before the public that he has detected a nefarious trick, and the fact of his forcing an investigation will give the public confidence in what he states. The presiding magistrate is the actor in the transaction most deserving of pity, for it will be indeed difficult for him to form a judgment upon the spiritualistic phenomena to the reality of which an army of willing dupes will be ready to swear. Meanwhile, it seems to us from his letters in the *Times*, that Slade has already lost his cause, for he admits that he can do nothing with locked slates or any others which are not open to his own manipulations, and can give no better reason for this incapacity than that he does not choose to be tried by such tests as if he were an impostor. If he were, as he claims to be, only a scientific inquirer and not a manipulator, he would be anxious to submit his phenomena to every or any experiment. His virtuous indignation is not consistent with his character as a student of spiritualism. If we gain no more decisive advantage from the prosecution of Slade, we shall at least be able to judge whether spiritualism is a transparent swindle, or something worth looking deeper into.

Small-pox at Islington.

The outbreak of small-pox in the neighbourhood of Caledonian Road is assuming a serious character. No less than fifty-two cases have occurred, and already six deaths are reported. Yesterday the Islington guardians at their usual weekly meeting had under consideration a report by the vaccination officer, Mr. J. Broome, stating that during the past week twenty-nine fresh cases had occurred, all, with one exception, being in the same locality. The majority of them had been sent to Homerton Hospital, and some were being treated privately. Mr. Broome submitted two specimen handbills calling attention to the epidemic, and the necessity for vaccination; one for circulation in the infected district, and the other for the remainder of the parish. Mr. Furlong said that small-pox was not, unfortunately, confined to the neighbourhood of Caledonian Road—a case had occurred in Windsor Street, Essex Road, and another in Halton Road, Canonbury. Mr. Young hoped the bills would not be published, as it was not necessary to alarm people. After some further discussion, it was resolved not to publish any handbills or notices on the subject at present.

The Maturity of Domestic Animals.

An interesting discussion is going on in the *Veterinary Journal* respecting the period when live stock ought to be considered as having reached the adult state. This period, it is asserted, commences when the animal has achieved its dentition—that is, when the milk incisors in the lower jaw have been replaced by permanent teeth. But at what age, with the horse and ox for example, do all the teeth become replaced? Before races of animals were improved, development was slower, and dentition consequently took longer time for completion. But since cattle, sheep, and swine have been ameliorated, the result has been to hasten the arrival of the adult state, considered as precocity. At agricultural shows prizes are awarded to cattle twenty-five months old, to sheep ten or fifteen, and to pigs twelve months of age. It is alleged that the meat at these ages not only possesses all the maturity equal to that of animals arrived at double the age, but also that dentition is advanced, and even the perfect knitting of the bones. On the other hand, it is maintained this precocity cannot take place in the case of horses, whose vitality is concentrated in locomotion, energy, and the power of endurance.

We were the first, and we believe the only, journal to protest against the "testimonial craze" some few weeks since; it gives us, therefore, much pleasure to be able to announce that Mr. Simon, late medical officer to her Majesty's Privy Council, has declined the testimonial which some well-meaning but indiscreet gentlemen were anxious to raise for him.

It is reported that terrible and most disastrous floods have just occurred in India, with the loss of 1,500 lives. We fear that the source from which the information is derived leaves no hope that the case is exaggerated. The cause of this melancholy loss of life appears to have originated in the sudden and rapid rise of the great river Nerbudda twenty-five feet in one day, almost precluding the possibility of those in the immediate vicinity to escape.

A "PECULIAR" people, or rather person, has gone to gaol for three months, with hard labour, for the manslaughter, by neglect, of his daughter. The elder, who was called as a witness, had also "served his time" for a similar crime. Is it not a great waste of time trying such cases in detail? If an amalgamation could be effected between the anti-Vaccinationists, the Contagious Diseases fanatics, the contra-Vivisectionists, the Spiritualists, the Infinitesimalists and the Peculiar People, an infinitude of trouble and discrimination would be saved.

The Dublin Corporation have, after many postponements arising from the carelessness and unpunctuality of members, voted to promote a bill to take St. Stephen's Green from the Commissioners, and open it at the taxpayers' expense. The matter is in a peculiar position. The Commissioners who have custody of this square are anxious to have it thrown open to the public—so are the citizens, with few exceptions—so is the city member, Sir Arthur Guinness, who has offered a contribution of £4,000 for the purpose—so is the Board of Works and the Government, who are ready to vote £600 a-year towards its maintenance, if opened. But with unanimity every voice declares that the Corporation shall not be allowed to lay a finger on the funds, or to extend their jobbing propensities to its management. Their maladministration of every department under their control is so notorious, that all concur in preferring exclusion from the park to admission under the *regimé* of the Town Council, and the Green must therefore remain closed until the Corporation is expurgated, or until the Government throws open the gates under the control of the Board of Works.

◆

THE PIONEER OF DEEP-SEA EXPLORATIONS.

The recent return of the *Challenger* from her three years' cruise has, natually enough, excited a good deal of interest among *savans*, and, as was expected, became a prominent feature at the Glasgow meeting of the British Association. We learn also, through the pages of a contemporary, *Nature*, that congratulatory addresses have been pouring in upon the chief of the exploring party, Sir Wyville Thomson. All honour be to him to whom honour is due. But amidst congratulations and rejoicings we are unpleasantly reminded of our neglect of duty; that the pioneer of deep-sea explorations has for many long years been allowed to remain in cold obscurity, unacknowledged and unrewarded, and almost forgotten by the scientific band who at one time must fain have acknowledged the scientific skill and acumen which "revealed a new world of biological science, and opened a new and most important field for physical research."

In the history of deep-sea explorations, Dr. Wallich stands out beyond all competitors. From the time of his dredging operations on board *The Bulldog*, in the North Atlantic, 1860, were made known, and which, as Sir Roderick Murchison truly said, "extended the limits of animal life in the ocean to a depth of a mile and a-half, and worked out accurate data as to the varied conditions of the sea bottom at different depths;" and throughout his subsequent labours to bring the subject into notice and public favour, it was recognised that "new" fields of research would be opened up to science. In 1863 Dr. Wallich laid before the Council of the Royal Geographical Society a perfect scheme for the systematic survey of the sea and the sea-bed, embodying all the most important propositions contained in the report drawn up by Dr. Carpenter and others, for the information of the Council of the Royal Society in 1869, and which was subsequently submitted to the Government for adoption. In this scheme Dr. Wallich laid down definite rules and conditions under which deep-sea explorations should be conducted. He also insisted that before telegraphic cables were lowered into unknown depths, and laid across submarine hills and gorges, and the irregularities of whose forms might enormously vary, a much closer search should be made than had heretofore been made. He argued that a full and proper survey is an essential preliminary to a rational scheme of laying down telegraphic wires, as much so, as a survey of the outlines of land is requisite and essential for the engineer before he can accurately define the best and safest line to be followed for a railroad. This, and much more not before thought of, was insisted upon as an important element in submarine investigations. Dr. Wallich projected a number of ingenious dredging appliances, which he exhibited at one of the meetings of the Geographical Society in 1863, and which met with general approval. The complete scheme devised by him was for a time put aside, because the Government alleged *two* steamers would be required for its effectual prosecution, and *two* vessels could not be spared from the naval reserve force! Subsequently the undertaking was more forcibly pressed upon Government by the Council of the Royal Geographical Society, and it was urged that such an inquiry was one which, for many reasons, might be attended with considerable advantage to the country, since it was intimately associated with physical geography, meteorology, and the various departments of natural science.

The plea of utilitarianism was wisely raised in connection with the scheme; for by so doing, Dr. Wallich saw he should enlist public opinion in his favour: and his suggestions have been the means of conferring, indirectly, an incalculable amount of benefit upon oceanic telegraphy and the commercial intercourse of nations.

It would occupy more space than we have at command to enumerate all the advantages that have accrued from Dr. Wallich's devotion to this branch of scientific observation. The facts gathered by him as to the temperature of the ocean, from the surface downwards, have thrown light on the mutual operations of terrestrial heat and surface radiation, and have certainly added to the permanent safety of submerged cables. It also settled a question of importance—that of the effect of pressure upon animal life, and about which up to the period of Dr. Wallich's investigations, considerable misapprehension prevailed. Nothing of any importance has been added to his observations of 1860, and which were fully discussed in the "North Atlantic Sea Bed," published two years afterwards.

It is perfectly clear upon an impartial examination of the question as it stands, that subsequently deep-sea researches in no way greatly added to the facts gathered in the North Atlantic; they certainly show more clearly the wide distribution of Globigerna, under what laws these and other organic deposits were being laid down, and what the relations of modern deposits might be to those ancient deposits forming the solid crust of the earth.

The *Challenger* cruise has undoubtedly brought out in stronger relief the value and originality of Wallich's researches, and has verified what he believed, that "instead of being barren, the sea bottom contains a very wonderful and beautiful fauna." It is with feelings of shame we add, that men of science have refused Dr. Wallich justice in this matter. The Fellowship of the Royal Society was denied him because at one time, and smarting under the wrong committed by certain wire-pullers, who persistently determined to deprive him of his hard-earned scientific reputation, he wrote of them in a somewhat bitter spirit. As to the Admiralty, proverbially unjust to the members of our profession, my lords accepted his scheme, and having determined to act upon it refused his proffered services, and awarded him, as a recompense! a hundred pounds towards the expense of publishing "The North Atlantic Sea Bed." This sum Dr. Wallich generously handed over to the publisher to meet the extra outlay incurred in producing the engravings which adorn the volume. From that moment he was relegated to the bitterness of neglect, cut off from all active service, and from all participation in subsequent deep-sea explorations.

Literature.

THE NATURAL HISTORY AND RELATIONS OF PNEUMONIA. (*a*)

Pneumonia has ever been rather a favourite disease with physicians—definite physical signs to be demonstrated to students—a fairly clear prognosis to be given to the patient and his friends. But the writer of the present work materially lessens the number of cases which are to be considered "Acute Pneumonia"—devoting his ninth chapter to eliminating the forms of lung consolidation which are not truly pneumonic.

Thoughtful students of medicine will read this book with much pleasure, especially as Dr. Sturges has written honestly, clearing away such matters as have been puzzling to thinking minds. A good instance of this is given in the second chapter, which treats of the forms of pneumonia. "First we are told at length of a disease which is characterised by certain well-defined symptoms. It is next intimated that these symptoms undergo modifications under various circumstances; that, in fact, the modified disease is far more common than the simple one." "All these forms of lung consolidation alike are called pneumonia; the description applies only to the least common." And again the author objects to a classification (lobar and lobular, inter-alveolar and intra-alveolar), "which is hardly possible till the death of the patient."

When medicine is taught in this last style, the student soon learns that text-book medicine and clinical medicine are different things, and his faith in the science is shaken.

The general arrangement of the work is as follows:—Chapter the first gives a history of pneumonia; the earlier accounts of the disease, and the forms under which it has occurred in epidemics.

The second chapter, dealing with the forms of pneumonia, is full of original ideas—some of which have been quoted above.

In the third and fourth chapters there is a careful clinical description of the symptoms, including the microscopical character of the sputa, and the physical signs." "The minute crepitation of pneumonia may be closely imitated. A piece of quite dry tissue paper, pressed up into a ball and squeezed into the hand, will represent the character of fine crepitation exactly." As to the value of this sign, the author says—"it is a sign-proper not so much of pneumonia, as of capillary bronchitis, or of the œdema preliminary to pneumonia."

It is interesting to remark indications of a reaction from relying on instrumental aid in medical diagnosis, in such a sentence as the following—"The first asserted value of the thermometer, as applied to pneumonia, is hardly maintained," and lately in a work on "Diseases of the Heart," Dr. Balfour showed the fallacy of *relying* on the stethoscope for the most serious cardiac lesions.

This part of the work ends by describing the disease as "both a local inflammation and a special form of fever."

The varieties of pneumonia form the subject of the next two chapters. The first is the disease at the apex, which is attended with much lowering of vitality, which Dr. Sturges regards as an accompaniment of any "pneumonia that spreads." Cerebral pneumonia—pneumonia occurring with acute rheumatism, or with pericarditis, with renal disease (in which case it is not to be confounded with hypostatic consolidation), with alcoholism, with starvation, with specific flows, and lastly, as a pythogenic disease—all these forms are shown in their relations to the genuine affection. Speaking of those causes in which lung consolidation arises in connection with acute rheumatism, the author says—"They are instances of a sudden transudation of fibrin into the vesicular structure of the lung: the result, it may be, of a slight exciting cause acting upon ready material—a weakened patient, with blood in a highly fibrinous condition, and a damaged organ with which to propel it." This affection and pericarditis "represent the same material result; the particular locality is determined by the genius of the disease."

The prevalent idea that pneumonia frequently complicates continued fever is at variance with the statement that "the sequence is less spoken of and less known in the post-mortem room than in the wards. My belief would exclude pneumonia altogether from the history of these affections." The condition generally found in typhoid is "pythogenic lung congestion," "sometimes hypostatic," "sometimes with collapse, or in detached nodules."

The morbid anatomy occupies two chapters, and in introducing this part of the subject, the writer remarks that the disease, pure and simple, is not so fatal as to afford large opportunities for pathological examination. The wood-cuts, few in number, are good, and well illustrate the most important points in these clearly and fully written chapters.

Acute alveolar catarrh, lobular collapse (with or with-

(*a*) "Natural History and Relations of Pneumonia." By Octavius Sturges, M.D., Physician to the Westminster Hospital. London: Smith, Elder and Co. 1876.

[illegible] inflammation), cardiac induration of lung, consolidation from imperfect elimination, and hypostatic congestion, are all considered anatomically, and the points indicated by which they are to be distinguished from pneumonia. The general belief that pneumonia has originated in "a chill" is in opposition to the evidence of the chapter on climate influence (Chapter XI.), which goes to show that "neither extremes of temperature, nor damp, nor moisture," *of themselves*, are favourable to the disease in question.

The main interest of the work seems to come in the next chapters, which are devoted to the pathology of pneumonia, and its relation to phthisis. "Increasing hyperinosis, and a special tendency of its own for some particular seat of inflammation," points to an analogy between it and rheumatic fever." With relation to phthisis, Dr. Sturges objects to admitting pneumonia as one feature or stage in the disease; they may exist together, but a patient suffering from the former, may pass through an attack of the latter "without affecting the chronic element." Now this is a finely drawn pathology to which, many practical physicians will find difficulty in subscribing.

After showing the errors which may arise in comparing different plans of treatment, the author (in Chapter XIV.) summarises the numerical results of the most important assaults by medical art which pneumonia has undergone. The conclusion is, that the less physic pneumonics take out of the bottle, and the less blood is taken out of pneumonics, the more likely they are to recover. And in the last chapter a line of treatment is indicated which is in accordance with these views.

"Stomach tonics," "the pill and colocynth," to combat the liver symptoms which often appear early in the disease, alcohol as may be necessary, warm applications for pleuritic stitch, opium to promote sleep, but not in constant small doses—are the chief suggestions which the author gives for the treatment of pneumonia. Bleeding is to be resorted to about the third or fourth day, if "a large area of the lung is now solid, and the dyspnœa which the patient has had from the beginning is still extreme"—the amount of blood taken being eighteen ounces—and if the relief is marked, the operation may be repeated upon a recurrence of the dyspnœa.

The appendices are very full, containing temperature tables, illustrative cases, statistics of treatment, and short notes of ninety-four classified autopsies of cases ascribed to pneumonia.

It is difficult in a short review to give a just representation of a careful and philosophic study, such as this book is. Not the least recommendation of the work is, that it is *written for the profession.*

LECON SUR LES LARYNGOPATHIES SYPHILITIQUES GRAVES COMPLIQUEES DE PHLEGMON PERI-LARYNGIEN. (a)

This is a very interesting clinical lecture delivered at the Hôpital du Midi, of Paris, by Dr. Charles Mauriac, a gentleman who is rapidly becoming one of the greatest European authorities on the subject of that important disease, syphilis. At the commencement of the lecture our author notices that very many syphilitic affections of the larynx came into the wards of the Midi Hospital whilst the patients are in the early period of syphilis, and that these, whether treated or not, got well without leaving any trace after them. The redness and thickening, with circumscribed or diffused hypertrophy, the sero-hyperhasiac beneath the mucous membrane, the erosions, ulceration, opaline mucous patches, whether ulcerating or vegetating, which are seen on the epiglottis, on the ary-epiglottidian folds, or on almost all the parts of the mucous membrane of the larynx, but principally on the superior vocal cords, may keep on persistently for several months; may disappear, return, and combine in every possible way; evolve simultaneously or by successive outbreaks; yield more quickly or slowly, or obstinately resist all internal and local therapeutics. These lesions do not alter irremediably the constituent parts of the larynx, they attack only the most superficial layers of the mucous membrane, and have no tendency to attack the subjacent tissues. The sphere of their morbid activity is always of feeble extent, and as to their process, it remains habitually confined within the limits of a simple congestive vascular movement, or cellular proliferation, which never goes the length of necrobiosis.

Hence, says Dr. Mauriac, complications which may endanger life directly—such as œdema of the glottis, for example—are excessively rare in these kinds of affection of the larynx. He has never met with such a case. In all the cases noticed by him, the respiratory functions have been left untouched. The circulation of air through the larynx has always been sufficient to furnish amply all requirements of the blood making in the lungs. As to functional disturbances, the only symptom produced has been hoarseness and roughness of the voice, all varieties of aphonia, intermittent or cutaneous, primitive or consecutive.

After thus showing that the larynx is so slightly affected in secondary syphilis, Dr. Mauriac proceeds to relate a severe case of tertiary disease of the larynx recently under his care in the hospital wards.

In page 11 he has the following interesting remarks: "You see, gentlemen, that if this case of syphilis was not malignant from the first, it offered at its very commencement, and in its successive manifestations, a gravity which, far from diminishing, as we sometimes observe, only increased with time. What do we, indeed, remark? After a primary sore, which was ulcerated, but was rapidly cured, there arose a generalised eruption, which simulated small-pox—that is, which was pustular: at the same time the throat, and especially the larynx, were gravely affected. Then, almost without interruption, a new eruption arose. It was circumscribed, but ulcerated the skin deeply and attacked the testicles. I put myself in the position of giving a prognosis in judging of such a process as this. Well, I tell you that syphilitic determinations of an ulcerative nature, which attack time after time the skin and mucous membranes, ought to make us generally foretell a long future of deep lesions and grave accidents, even when they may have been rapidly amended, or cured by specific treatment; even when, as is the case here, the general strength of the organism have been respected.

"You will object, perhaps, that medication by means of mercury and iodine commenced from the beginning of the disease would have doubtless put to flight these accidents. I agree to this to a certain degree, but I have so often seen cases of syphilis treated in the best manner only be superficially cured, and pursuing these evolutions in spite of all our therapeutic tentatives, that I believe in the fatality of the eruptions in the benign forms, as well as in the grave forms of the disease. This is a way of looking at affairs which is, I confess, but little reassuring; but, at the risk of passing for a pessimist, I frankly confess to you, because I am convinced that this is the expression of the reality. Our patient will furnish a proof of this. As he had done so well under treatment during his stay in hospital, he did not fail to continue it after his departure. If his syphilis had been ill-treated, and even rather abandoned to its natural evolution during the thirty first months, it had been attacked since that time on all its manifestations by mercury, and especially by considerable doses of iodide of potassium. The use of this latter remedy had not been abandoned for the last year. Our patient has only abandoned it from giving up the war in despair, and when he saw he could not regain his voice and right testicle in their normal condition."

(a) "Leçon sur les Laryngopathies Syphilitiques Graves Compliquées de Phlegmon Peri-Laryngien." Par Charles Mauriac, Médecin de l'Hôpital du Midi. Paris: Masson. 1876. Pp. 30.

This pessimist view of Dr. Mauriac is, unfortunately, but too often the real view which experience teaches; for, notwithstanding it may be true what is so strenuously taught by Dr. Alfred Fournier, that the main cause of tertiary syphilis is the omission of long courses of mercury in the early period of the disease, it is yet also true many most carefully treated cases seem to go on from bad to worse in spite of all treatment, and to cause the patient to "lose his health for ever," as Professor Bœck once truly remarked to us.

On page 19, Dr. Mauriac combats the assertion that in tertiary afflictions of the tongue the peri-maxillary glands never enlarge. This is, he remarks, far too absolute a law. "Some authors attribute to the presence or absence of maxillary adenopathy in stomatitis and in afflictions of the tongue, a considerable and even absolute diagnostic value. Enlarged glands would, according to such authors, indicate always the existence of an epithelial transformation of the tongue. I recognise that, when the glands indurate in certain cases of psoriasis of the tongue, that is an important event, and have insisted on the fact in my work, and given examples of it. But that does not imply that the glands must always remain untouched in syphilitic disease of the tongue. It is undoubted that they sometimes become hard, but this induration has no character of gravity, and however little we attend to it, we shall easily distinguish it, especially in a few days, from malignant induration. However this may be, our patient, although his tongue was syphilitic and not epithelial, had a specific engorgement of the peri-maxillary glands."

It is clear from these remarks of Dr. Mauriac that he is a keen observer, and that he does not hesitate to overthrow all general laws, however useful these may sometimes prove as aids to mercury, whenever they run counter to experience. Like all that emanates from Dr. Mauriac, this pamphlet is most instructive.

◆

HOW TO USE THE OPHTHALMOSCOPE. (a)

A LAUDABLE and in some respects successful effort has been made by the author of "How to Use the Ophthalmoscope," to bring together, in the shape of a moderate-sized manual, a number of elementary facts for the student in ophthalmology. Of the first five-and-twenty pages we would simply remark, that, as medical students are now expected to be well grounded in something more than an elementary knowledge of physics, when they enter upon the more arduous nature of their professional studies, the author has somewhat unnecessarily circumscribed his work by entering so fully as he has done into the consideration of the nature of light, its reflection, refraction, the formation of images by lenses, &c. This to the student will sure to be a matter of regret when he comes to the practical application of the instrument and finds but few pages devoted to this most essential part of the subject, the particular form of ophthalmoscope is a matter of no great moment, and we observe, on turning over the pages of a more recent work by Galezowski, wherein he figures and describes no less than thirty modifications of the instrument, no mention is made of the form Mr. Browne strongly recommends, and wrongly ascribes to Leibriech. If we were to venture to offer advice on the choice of an instrument, we should say to the student get Oldham's, which is arranged with a set of movable discs, to enable him to compare an uninterrupted succession of images of the fundus oculi. With it he can also detect anomalies of refraction, and compute the exact amount of ametropia in cases of either hypermetropia or myopia. A slight modification of this ophthalmoscope, proposed we believe by Mr. W. L. Purves, has an additional series of lenses, which enables the ophthalmic surgeon to readily determine the degree of astigmatism. Cretes, of Paris, also offers a modified Stokes' lens for the same purpose. An indicator is made to rotate on its axis, and in this a clue is obtained of the amount of ametropia, and the meridians of greatest and least curvature. As to the examination itself, we consider the *direct* method to be in every way the best; the virtual enlarged image of the fundus is seen in its true colours and position, and the changes are rendered more striking and conclusive; indeed, no diagnosis can be considered complete, unless it has been determined by this method of investigation. A darkened room is not so necessary as the author seems to think; any consulting-room can be readily darkened for the purpose by the simple addition of a dark-green window blind in place of the ordinary white-holland. The plan of examination recommended will materially assist the student in learning "the shape of the letters before it is possible for him to understand their combined powers of forming words," and which can only be fully accomplished by resorting to a teacher, who is at the trouble of employing a demonstrating-ophthalmoscope. Mr. Browne's Manual, however, supplies a want much felt among students, since Mr. Hogg's Manual of Ophthalmoscopic Surgery has been out of print.

◆

Testimonial to Dr. Ryder.—Having occupied the post of medical officer to the large number of *employés* of the London General Gas Light and Coke Company at the Shoreditch Station Branch for eleven years, Dr. Ryder was presented with the following testimonial, handsomely illuminated on vellum, on resigning his appointment on Thursday last:—The Gas Light and Coke Company, Shoreditch Station, Great Cambridge Street, Hackney Road, E. The committee and members of the above fund desire to hereby convey to Richard Ryder, M.D., their regret at losing his able services. They also tender him their sincere thanks for the assiduous and kindly manner in which he for eleven years has discharged to themselves and families the duties of medical officer to the above fund. Signed on behalf of 300 members, T. H. Cowe, Chairman, JOSEPH JACKSON, Secretary.

The Death-rate in Foreign Cities.— The annual rates of mortality, according to the official return of the Registrar-General, like those of Great Britain and Ireland, show a marked improvement. Calcutta shows a mortality of only 23 per cent., Bombay 32, Madras 30, Paris 24, Brussels 22, Amsterdam 20, Rotterdam 26, The Hague 24, Copenhagen, 26, Stockholm 29, Christiania 20, Berlin 33, Hamburg 27, Breslau 27, Munich 40, Vienna 24, Buda-Pesth 33, Rome 25, Naples 25; New York 30, Brooklyn 23, Philadelphia 22, and Boston 27. Enteric fever caused 61 deaths in Paris, against 78 and 72 in the two preceding weeks; and 27 deaths were referred to small-pox in Vienna.

◆

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

SUBSCRIBERS who have not yet sent in their subscriptions for last year are respectfully reminded of the omission.

DR. BLAKE.—We entirely disapprove of the doctrines propounded by the correspondent referred to in your note. In our opinion his views are wrong, both in theory and practice, and wrong morally also. We have stated this on more than one occasion.

SALE OF POISONS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would you be kind enough to inform me in your next issue whether or not I am entitled to hold in my possession, for sale or prescription, hydrocyanic acid, strychnine, nux vomica, and such medicines as are included within the Act recently passed for the better regulation of the sale of poisons? My father, who was a surgeon, died recently, and by his death such medicines as he was in possession of (and amongst others, though more securely placed, I see the above) become my property. I am studying medicine myself in the veterinary department, whilst I have a brother residing with me who has passed his first professional examination, and who in the course of a short time expects to be in possession of the M.D. M.Ch. qualification. Under such circumstances, together with the fact that certain officious members of the community in which I reside threaten me with prosecution in case I either sell or prescribe, do I ask you the above question.

Yours, &c.,

X Y Z

IRISH POOR-LAW INTELLIGENCE.

DROGHEDA UNION.

MEDICAL FEES.

In reference to an application for payment of a fee to Dr. Adrien for attending with the medical officer of the district, a serious midwifery case in St. Peter's West.

Mr. Mangan was opposed to the payment on the grounds that he believed an order was made that the doctors of the town districts should assist each other, when required in these cases without incurring further cost to the ratepayer.

The Chairman said he recollected that the matter had been discussed on a claim coming up for fees to some of the doctors of the town districts. As the result it was understood that they should assist each other in the town districts in such cases without further expense to the board.

Mr. Dowdall said there was no resolution come to on the point.

Mr. Coddington said he had objected to certify for paying a doctor for only looking at a lunatic. The doctor had no trouble whatever only to look at the party, and for doing so that a man should get a guinea or two, if he could, he thought was rather too much of a good thing and unjust, and he therefore refused to certify.

Mr. Dowdall—That was in reference to a lunatic case, but before that there was a discussion in reference to doctors being called in in midwifery cases. It was considered that the doctor of one district should call in the other. The doctors sent in a strong statement against that. It appeared to be the view of the board that they should assist each other free of cost to the union. There was no resolution passed by the board.

Mr. Mangan—Only in town districts where the doctors are close at hand. In the country districts it would be a different case. Was the woman very bad, doctor?

Dr. Adrien—The woman had been in labour three days. Dr. Kelly called me to go up with him to see the case. I assisted in consultation with him. It was a most difficult and serious case that no man could undertake without qualified assistance. The woman's life was in imminent danger. It was a most critical case of cross birth. I generally get 5 or 6 guineas for the same attendance. These are cases that no man would attempt by himself.

An order for payment of fee to Dr. Adrien was made.

CORRESPONDENCE.

THE EXAMINATION OF DANGEROUS LUNATICS IN IRELAND.

TO THE EDITOR.

Sir,—The Medical Press and Circular so rarely contains an inaccurate statement, that I venture to hope you will allow me to point out a mistake in which you have inadvertently fallen in your excellent article upon the examination of dangerous lunatics in Ireland.

The Act 30 and 31 Vict., c. 118, which caused dispensary medical officers to examine dangerous lunatics "without fee or reward" was introduced into the House of Commons and passed by the late Earl of Mayo when Chief Secretary for Ireland, and not by Lord O'Hagan.

I am, Sir, yours, &c.,
AN EX-MEDICAL SUPERINTENDENT.

18th September, 1876.

VITAL STATISTICS OF IRELAND.

Quarterly Return.

During the quarter ended 30th June last, there wer *registered* in the 794 Registrars' Districts in Irelan 37,398 births—28·1 in every 1,000 of the estimated population—and 25,602 deaths, 19·2 per 1,000.

In England, during the same quarter, the birth-rate was 37·4, and the mortality 20·9.

In Ireland, tte birth-rate was somewhat under, and the death-rate slightly over, the average for the second quarter of the preceding five years. The mortality from the principal zymotic diseases was considerably under the average, and only equalled an annual rate of 1·6 per 1,000 of the population. There was a further decline in the mortality from scarlet fever, and an almost complete immunity from small-pox.

From returns furnished by the L. G. B., it is seen that there was a considerable decline in the average number of workhouse inmates, and an increase in the number of persons receiving out-door relief, last quarter, compared with the corresponding quarter of 1875.

Births.—The ratio of births registered during the quarter in Leinster was 27·1 per 1000; in Munster 30·5; in Ulster 28·0; and in Connaught 25·9.

The rate was highest in the following counties:—Kerry, 35·9; Antrim, 32·3; Limerick, 31·1; Waterford, 30·6; Cork, 30·1; Cavan. 29·6; Kilkenny, 29·2; and King's County, 29·0 per 1000. The counties having the lowest birth-rates were—Mayo, 23·4; Queen's County, 23·7; Monaghan, 24·6; Wicklow and Donegal each 25·0; Fermanagh, 25·2; Meath, 25·3; Tyrone, 25·4; and Roscommon, 25·9 per 1000.

Deaths.—The deaths registered in Ireland during the quarter ended 30th June last amounted to 25,602—19·2 per 1000 of the population.

The deaths registered in Leinster were 21·9 in every 1000; in Munster 19·1; in Ulster 19·2, and in Connaught 15·5.

The counties having the highest death-rates were:—Dublin, 24·3; Wexford, 23·5; Waterford, 23·4; Kilkenny, 23·3; Down, 22·0; Louth and Westmeath each 21·4; Meath, 21·2; and Armagh, 21·0 per 1,000. Those having the lowest death-rates were:—Mayo, 13·6; Leitrim, 14·1; Fermanagh. 15·3; Roscommon, 15·4; Sligo, 15·6; Clare, 16·1; and Kerry 16·9 per 1000.

Ages.—The number of deaths returned as having resulted from old age was very remarkable. Thirteen persons were stated to have attained the age of 100 and upwards; of the latter, 1 death was registered at the age of 113, in the Anascaul District, Dingle Union; 1 at Roscrea, No. 1., 109; the Registrar of Broadford, Newcastle Union, reports the death of a woman at Glanduff, "a widow of the labouring class, at the advanced age of 108 years; she was of temperate habits—neither smoked nor snuffed; she maintained her intellect unclouded to the last, and walked a mile in perfect health a week before her death." Of the 11 deaths registered in the Tuosist District, Kenmare Union, the ages of 5 ranged from 80 to 90 years. In Belfast, where the deaths of children under 1 year of age registered during the quarter amounted to 223, and of persons 60 years of age and upwards to 199, the registrar of No. 10 District states that "the action of the burial societies makes the *return of the ages of the old* untrustworthy to a very serious extent. In order to obtain insurance at a low rate the age of the party insured is, I believe, in many cases grossly misrepresented."

Health of the People.

The state of the public health during the past quarter may be considered satisfactory. There has been a considerable diminution (764) in the number of deaths from the principal zymotic or so-called preventable diseases, compared with the corresponding quarter of last year, and this decrease may, to some extent, be attributed to the improvement in the sanitary condition of the country.

Small-pox.—Two deaths from small-pox occurred in Castlebar. The registrar of Waringstown District, Lurgan Union, reports 1 case of small-pox imported from Salford, near Manchester :—"The patient, a girl 13 years of age, had been vaccinated when young, but I could not find any scars. She came over in the Friday night's boat from Liverpool, and the eruption was out on her on the following Tuesday. The case has gone on favourably, and there has been no new case yet." The registrar of Maryborough District, Mountmellick Union, refers to a case of small-pox imported from Manchester, which was sent to the infirmary; no fresh case in the district. The number of deaths from small-pox registered during the corresponding quarter of last year was 225; of these deaths 204 took place in the province of Connaught, where inoculation had been practised. Four deaths from small-pox were registered during the March quarter of the present year.

Measles.—The deaths from this disease amounted to 156, showing a decrease of 74 as compared with the March quarter, and of 46 as compared with the second quarter of last year. Eight of the deaths registered in Roundstone, No. 2 District, Clifden Union, resulted from measles.

Scarlet Fever.—Four hundred and eighty-five deaths were caused by scarlet fever, being 156 less than in the first quarter of the year, and a still further decline (428) as compared with the corresponding period of last year. Of the 43 deaths registered in Malin District, Inishowen Union, 13 were caused by scarlet fever. A like number occurred in Moville District, in the same union, 8 having taken place in two families; the registrar states that "the disease has not been very prevalent, but the cases that did occur were of a most virulent type, causing death in most cases within the first three days."

Diphtheria.—The deaths from diphtheria amounted to 76 against 105 in the March quarter, and 111 in the second quarter of last year.

Whooping-cough.—To this disease 343 deaths were ascribed, against 409 in the preceding three months, and 305 in the second quarter of last year.

Fever.—The mortality from fever was somewhat greater than in the preceding quarter, the deaths having amounted to 679 against 634; but as compared with the corresponding quarter of last year there was a decrease of 77 deaths. The distribution of the deaths from fever among the four provinces was as follows :—Munster, 238; Ulster, 188; Leinster, 164; and Connaught, 89.

Diarrhœa caused 395 deaths, and *simple cholera* 15.

The total deaths from the eight principal zymotic diseases, 2,151, contrast favourably with the corresponding quarter of last year and the first quarter of the present, when the deaths from these diseases were 2,915 and 2,434 respectively. During last quarter in 100,000 of the population 40·4 died from the principal zymotic diseases, the mortality from which formed 8·4 per cent. of the total deaths registered.

One death from hydrophobia, caused by the bite of a dog, was registered in No. 9 District, Cork Union.

In Abbeyfeale District, Newcastle Union, pneumonia or inflammation of the lungs "proved a regular epidemic during April and the beginning of May." In the Portlaw District of the Carrick-on-Suir Union the registrar reports "10 deaths from acute pneumonia, chiefly of a typhoid character, in some cases traced to special unwholesome localities.

Of the thirty registrars who have furnished reports as to the sanitary condition of their several districts, twenty have reported favourably and have also testified to the benefits resulting from the successful working of the provisions of the Sanitary Act.

Reference to a few of the favourable reports may be advantageous. For example, the registrar of Clogh District, Ballymena Union, says, "I very seldom need to report any sanitary cases; I have merely to let the people know, and the nuisance is removed sooner than the Board could have them noticed."

In Stewartstown, Cookstown Union, since the sanitary condition of the town has been improved, a new pump erected, &c., fever, which had been always present, has completely disappeared.

The registrar of Clonmel District says that "no cases of zymotic disease were registered during the quarter, and this happy state of affairs I am inclined to attribute to sanitary progress."

The registrar of Kilmacthomas District says, "Sanitary reform is extending here; the village has been well supplied with pure water. The Lodger Act, under which the village is now placed, is beginning to check overcrowding and promote domestic cleanliness in many houses which much required it."

Though the improvement in the sanitary condition of the country has been material, yet it must be a subject of regret that many districts still remain in a wretched condition as regards sanitation, and that so many of the cottages or cabins of the poor are unfit for human habitation.

As an instance of an unhealthy locality, Achill, in the Newport Union, may be cited; at page 87 may be found the registrar's graphic description.

The registrar of Roscommon District complains of the sewerage and water supply of the town, and adds, "The defective sewerage of Henry Street has been repeatedly brought under the notice of the Sanitary Commitee, verbally and by official report, yet no steps were taken to remedy the evil."

The registrar of Rathmore, Naas Union (page 66) refers to the neglect of the sanitary authority.

◆

EXCERPTS FROM THE REGISTRAR'S NOTES PUBLISHED IN THE REGISTRAR GENERAL'S QUARTERLY RETURNS EOR IRELAND.

No. 1.—*North-Eastern Division.*

Antrim; *Crumlin.*—Sanitary matters are fairly attended to, vaccination regularly carried out, and I do not believe there has been a case of small-pox in the district for several years.

Ballycastle.—Of the deaths, 3 were caused by scarlatina, 3 by phthisis, and 2 each by whooping-cough, enteritis, and bronchitis, and 1 by diphtheria. The latter disease has originated in a house surrounded by foul cesspools; 3 children have been attacked by the disease in a very virulent form.

There has been a very severe form of scarlatina in this district for the last 3 months, 5 cases having proved fatal, but during the last month the disease has become much milder and looks as if we were near the last of it. I very seldom need to report any sanitary cases; I have merely to let the people know, and the nuisance is removed sooner than the Board could have them noticed.

Banbridge; the people evince great willingness to carry out sanitary orders.

Belfast, No. 10.—Any sanitary defects to which I have called attention, have been promptly attended to. The action of the burial societies makes the return of the *ages of the old* untrustworthy to a very serious extent. In order to obtain insurance at a low rate, the age of the party insured is, I believe, in many cases grossly misrepresented.

Cough.—Two deaths from typhus in the same family, the house in which they occurred being in a most unsatisfactory state as regards cleanliness. The sanitary condition of the district is much improved.

Stewartstown.—One part of the town, known as the Hill Head, since I came to the district, never was without 1 or 2 cases of fever in it, but since the pump has been erected there, I have not had a single case of fever in it; formerly they used the water out of an old sewer.

Dungannon.—The sanitary condition of Dungannon is not in a satisfactory state, as there are several houses inhabited which should not be so, but this, for the present, is unavoidable, owing to the great scarcity of proper house accommodation for the poorer classes.

Ballylesson.—Scarlatina having been introduced into a farmer's family in this district, either in manure obtained from Belfast, or by the carter who brought the manure, caused the death of a young married woman, who was confined during the progress of the disease; her infant also succumbed to a like attack; perhaps also her grandfather, aged 83, whose death was uncertified. This epidemic spread, as I have since learned, into a neighbouring district. Typhoid fever proved speedily fatal to a young delicate man, who had been employed in a pawnshop in Belfast. The deaths of 2 old persons in one family, and probably of a third, "uncertified," were also due to fever—source of infection not ascertained.

Newry, No. 2.—I have great pleasure in referring to the small number of deaths, a fact which must be attributed in a great measure to the thoroughly practical effects given to the Sanitary Act throughout the district. It is a fortunate circumstance for us, and one which I, as Sanitary Officer of the district, am bound to record with pleasure, that our Local Authorities and the Press have evinced, not only willingness, but the greatest anxiety to carry out in their fullest entirety the provisions of the Act, and that I have always found them ready to accomplish any recommendation forwarded to them which had for its object the advancement of sanitary reform. And this fact is the more gratifying, when I find that in many other districts the labour of the Sanitary Officer has been rendered futile in some cases by the want of sympathy, and in others by the direct opposition of those from whom he should obtain support. There have been a few cases of fever in the district during the quarter; but owing to the facts above referred to, the number of cases has been limited as compared with similar outbreaks in neighbouring districts at the same time, although we laboured under the disadvantage of overcrowding in many of the poorer districts of the town.

Greyabbey.—The sanitary state of the district, on the whole, pretty good. The water supply here has not been improved yet.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING SEPT. 23, 1876.

Total registered deaths in Dublin and suburbs *	... 150	
Ten years average of same week	... 140	
Excess of mortality above average	... 10	
Ratio of deaths, suburb of Rathmines	... 24·3	per 1,000
" " " Donnybrook †	16·7	"
" " " Blackrock	... 14·4	"
" " " Kingstown	... 39·3	"
" " Entire Dublin district	... 24·8	"
COMPARATIVE RATIOS—London ...	... 19·1	"
" " Glasgow...	... 20·0	"
" " Edinburgh	... 21·0	"

* District extends over 10,050 acres, and contains 314,666 Persons.

† This district includes City of Dublin and Incurable Hospitals.

The deaths from zymotic diseases registered during the week numbered 33, against an average of 43·6 for the corresponding week of the preceding ten years. Of these deaths 7 resulted from fever (3 typhus and 4 typhoid), 2 from whooping-cough, 1 from scarlet fever, and 16 from diarrhœa, &c.

Twelve children died from convulsions.

Four deaths each were caused by bronchitis and pneumonia, 1 by laryngitis, and 4 by lung disease unspecified, 8 by heart disease, 2 by liver disease, 1 by jaundice, 1 by ulceration of the intestines, and 1 by kidney disease unspecified.

Three deaths were referred to apoplexy, 2 to cephalitis, 1 each to paralysis and epilepsy, and 2 to brain disease unspecified.

Twenty-six deaths were ascribed to phthisis, 7 to hydrocephalus, 2 to scrofula, and 4 to cancer.

Nine violent deaths were registered—6 were accidental, 1 homicidal, and 2 suicidal.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTHS OF AUGUST AND SEPTEMBER, 1876.

AUGUST 1st.—**Ryan, Walter Henry, Scarteen, Knocklong, co. Limerick, Lic. R. Coll. Surg. Irel.**

9th.—**Lawless, Edmund, St. Patrick's Hospital, Dublin, Lic. 1875, and Lic. Mid. 1875, R. Coll. Surg. Irel. 1875, Lic. 1876, and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.,**

11th.—**Dickson, John Dunbar, 74 Leinster Road, Rathmines. co. Dublin, M.D. 1876, and M.Ch. 1876, Q. Univ. Irel., Lic. R. Coll. Surg. Irel. 1876.**

11th.—**FitzGerald, Dudley Loftus, St. Ives, Cornwall, M.B. Univ. Dub. 1876.**

11th.—**Callan, Michael, Tymullen, Monasterboice, co. Louth, Lic. 1876, and Lic. Mid. 1876, K. Q. Coll. Phys. Irel. Lic. R. Coll. Surg. Irel. 1876.**

12th.—**Finigan, Laurence Patrick Joseph, Navan, co. Meath, Lic. R. Coll. Surg. Irel. 1876.**

14th.—**Jackson, Henry Stewart, 44 Morehampton Road, co. Dublin, Lic. R. Coll. Surg. Irel. 1876.**

15th.—**Minchin, Robert William, 56 Lower Dominick Street, Dublin, Lic. R. Coll. Surg. Irel. 1876.**

21st.—**Keays, Samuel, Toreen Lodge, Louisburgh, co. Mayo, Lic. R. Coll. Surg. Irel. 1876. Lic. 1876, and Lic. Mid. 1876. K. Q. Coll. Phys. Irel.**

21st.—**Mullan, Andrew, Ballymena, co. Antrim, M.D. Q. Univ. Irel. 1866, Lic. R. Coll. Surg. Edin. 1866.**

21st.—**Fox, Charles Nugent, Killucan, co. Westmeath, M.B. and M.Ch. 1876, Univ. Dub.**

21st.—**Spearing, Andrew, junior, 123 Huidpool Road, Barrow-in-Furness, Lancashire, Lic. Apoth. Hall. Dub. 1876.**

22nd.—**Hamilton, James Alexander Greer, Drumcree Rectory, Portadown, co. Armagh, M.B. Univ. Dub. 1876.**

24th.—**Hoey, John, Drumwhinney, Kesh, co. Fermanagh, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876 and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.**

25th.—**Blacker, Edward Joseph, 3 Longwood Avenue, S. Circular Road, Dublin, M.B. Univ. Dub. 1876.**

28th—**Duff, Arthur, Castlerea, co. Roscommon, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876 and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.**

29th.—**Barrington, Henry Ernest Walter, Sedburgh, Merrion, co. Dublin, M.B. 1876, and M.Ch. 1876, Univ. Dub.**

SEPTEMBER 1st.—**Cahill, James, Church Street, Kells, co. Meath, Lic. R. Coll. Surg. Irel. 1874.**

1st.—**Fetherston, H. Charles, Grouse Lodge, Moate, co. Westmeath, M.B. 1875 and M.Ch. 1876 Univ. Dub.**

5th.—**McKeogh, Thomas, Ballinrobe, co. Mayo, Lic. and F. Phys. Surg. Glas. 1875, Lic. Apoth. Hall, Dub. 1876.**

7th.—**McCarthy, Michael Joseph, St. George's Terrace, North Road, Plymouth, M.D. 1876 and M.Ch. 1876 Q. Univ. Irel.**

8th.—**Wright, W. McDowel Aikin, Braganza, Dalkey, co. Dublin, M.B. Univ. Dub. 1876, Lic. 1876 and Lic. Mid. 1876 R. Coll. Surg. Irel.**

14th.—**Shorten, James, Enniskean, co. Cork, Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876.**

20th.—**Hamilton, James, Coolaghy House, Raphoe, co Donegal, M.D. 1875, and M.Ch. 1875, Q. Univ Irel.**

20th.—**Hartigan, William, Limerick, Lic. 1876, and Lic. Mid. 1876 K. Q. Coll. Phys. Irel., Lic. R. Coll. Surg. Irel. 1876.**

RUPTURE OF THE UTERUS; ESCAPE OF CHILD INTO THE RECTUM; DELIVERY BY FORCEPS PER ANUM.

DR. FITZEK, of Lispitz, relates the following case (*V. Med. Chirurg. Central-Blatt*, Ap. 14, 1876, and *Algem. Wien. Med. Zeit.*, No. 17). The patient, a small, weakly person, was delivered of the first child at 24, by perforation and forceps, owing to contracted pelvis. After one and-a-half years her accouchement again came round. Dr. Fitzek was summoned, and informed that on Nov. 8 the pains began, that they increased in intensity up to the 11th, and disappeared on the 15th. The waters escaped on the 12th; from that day the bowels did not act, in spite of enemas, and the urine only passed dropwise. The patient exhibited all the symptoms [illegible] being in a most critical condition. The vaginal examination was difficult, as the finger could only pass about 2 in., the space being occupied by a large round substance in the posterior part. Careful examination enabled the suture of the head to be felt, and when the finger was passed about 4 in. up the rectum it ascertained that the head lay in it, and was colder than the surrounding parts; the face being directed forwards. After drawing off a large quantity of urine, an endeavour was made to push the head back into the uterus, but as it was fast this was impossible. Ultimately the forceps were applied, and the child extracted per anum, a serious rupture occurring during the operation. The placenta was expelled after an hour by the same way. The wound was united by suture, and after twelve days seemed healed, during which time the patient improved. The lochia flowed both by vagina and anus; after an injection of arg. nitr. they lost the unhealthy colour they had assumed. In six weeks the patient was convalescent. The child was at full term, but had evidently been dead some time. Dr. Fitzek considered the case undoubtedly one of rupture of the uterus, at the place where the uterus is connected with the rectum by the peritonenm (ligt. recto-uterin.) a very rare occurrence. [It is not stated that the seat of rupture was actually ascertained, or that it did not occur through the vaginal wall into the rectum, at a high point.]

COMPRESSION OF THE ABDOMINAL AORTA IN POST-PARTUM HÆMORRHAGE.

IN the *Aerz. Intelligenzblatt*, March 21, 1876, Dr. H. Bekler relates a case in which he successfully employed compression to check violent post-partum hæmorrhage. The patient was in an extreme state of collapse (no hæmorrhage) when the child was extracted by the forceps. Hæmorrhage succeeded the expulsion of the placenta. Cold injections were useless, combined with ergot. The patient was utterly helpless and motionless when the hæmorrhage became most violent. Only some instantaneous and complete mode of arresting the bleeding could save her life. He determined to try compression of the abdominal aorta, which he had never seen resorted to. It was easily effected, and the artery could be distinctly grasped. The bleeding immediately stopped, but the compression was continued for a quarter of an hour. The other means employed were quite useless, and the compression alone stayed the bleeding.

GLYCERINE AS A THERAPEUTIC AGENT.

DR. C. H. LIDD (*Baltimore Phys. and Surg.*) recommends the administration of glycerine instead of sugar to children brought up by hand as a means of adverting many of the ills to which they are specially subject. He gives from 4 to 6 drachms daily, and states that in those cases where the bowels are irritable glycerine should always be substituted for sugar.

THE ACTIVE CONSTITUENT OF ERGOT.

THE active constituent of ergot, according to R. Buckheim (*Arch. Pharm.*), is a substance resembling gelatine. It is easily soluble in water, and hence a cold infusion of ergot contains it. He considers that it is formed by the action of the mycelium of a fungus upon the gluten of the rye, the decomposition resembling that which albumen undergoes in the process of putrefaction.

ON THE TREATMENT OF INFANTILE CONGENITAL CLUB-FOOT.

By W. J. Little, M. D.

(Continued from page 268.)

I here summarise the principles of correct treatment of congenital club-foot.

1. Whether the case promises favourably for mechanical treatment only, or needs, as the majority of cases do need, operative interference, commence the treatment as soon after birth as practicable.

2. Reduce the distortion from the state of a compound one (varus) to the simplest form (equinus), by first curing the inversion of the foot, and the tendency to involution of the sole.

3. Avoid the slightest undue pressure upon prominent points of the leg and foot, by careful padding of the hollow parts, and by using only gentle pressure with any bandage. Avoid obstruction of the returning blood from the limb.

4. Remove splint and bandage daily, practice gentle movement of the foot in the desired direction, endeavour to prevent the part remaining for an instant unsupported and liable to fall back into the deformed position, until it is found that the foot, on removal of bandage, retains a perfectly good position and flexibility.

5. Never permit the infant to be placed on the feet, or to walk until the form and movements are complete, whatever may be the age.

Be convinced that by carefully following these recommendations, the robust child will, before the age of thirteen or sixteen months, stand and walk without instrumental aid: that the muscles of the leg will be fairly developed, and a bystander have difficulty in discovering that any distortion formerly existed.

I do not forget that I am addressing members of the Association, many of whom practice in small centres of population, where, from necessity, during a long lifetime, they may not bring into the world or meet with, more than three or four cases of congenital foot deformity. It is, therefore, practically impossible that all should previously be experts in the management of these cases. I recommend such members of the Association to commence the treatment of infantile club-foot within the first day or two after birth, by means of the splints I offer to their notice, and in the manner I propose to demonstrate, acting upon the principles laid down in this paper. By means of the amount of improvement in form and mobility which may reward their exertions during a period of one or two weeks, they will be enabled to judge of the probability of success without operation. So long as almost daily improvement is visible and palpable, they may safely proceed on this method. If the case dose not adequately progress within the first month or two, if the foot, when removed from the splint, springs back actively into the inverted position, it is probable that division of one or more tendons and fasciæ is required. If the surgeon be certain on this point, he should either operate without further delay, or obtain the assistance of the most available surgical expert, and with his aid continue the splint treatment until perfect form and mobility are obtained. He should well remember that, unless he has been able, by means of splints and daily gentle manipulations, thoroughly to evert the foot and convert it almost into a vulgus, in which case the internal margin of the foot will be presented to the ground, proving entire conquest over the formerly tense structures on the inner side of the limb, the operation he will have to perform will be that of division of the anterior and posterior tibial tendons. He will extend his section to the prominent internal portion of the plantar fascia and the tendon of the long flexor of the great toe, if they be very tense. He must resist the temptation of severing at this time the apparently more easily accessible achilles tendon. Abundant experience shows that if the achilles be divided before the first stage of treatment has been thoroughly accomplished, the connection of the tuberosity of the os calcis with the leg will be weakened, this bone will be drawn towards the toes by the now preponderating influence of the plantar muscles, while the long flexor of the toes will also tend to increase the consequent tendency of the sole to contract. The ankle-joint may further be so affected, that subsequent attempts to overcome the resistance still offered by the anterior and posterior tibial muscles and of the plantar tissues, will be spent rather in elongating the severed tendon achillis than in overcoming the tendency of the inner margin of the foot to continue raised by their contraction. A much happier result follows the postponement of division of the achilles tendon to a subsequent stage.

As recommended in 1839, the straight splint to be applied to the outside of the limb in varus, may in the case of infants under the age of three or four weeks, be composed of thin card or pasteboard, or of a thin strip of flexible hat-box wood, whalebone, or shaving of a lath. Some material more resisting, gutta-percha, or any thin flexible metal may be used. At two months or upwards, the splint may consist of thin flexible sheet iron. In all cases a soft cushion should be introduced between the metal and the member, and the splint should be bent before its application, so as to be adapted almost to the full extent of the inward curvature. Every two or three days the splint may be slightly straightened. It may almost be said that the splint should be adapted to the deformed part rather than that the deformed part should be roughly forced outwardly to the splint. Those unaccustomed to such very gentle usage as I am recommending, will be surprised that no appreciable force is necessary. Before the child is a month old it may be found that the foot has acquired an everted or valgoid form, and that when the splint and roller bandage are removed the foot exhibits little or no tendency to revert to the original form. If the directions given have been properly carried out, and no hindrances have occurred, the surgeon may exchange the outside splint for one of "Dr. Little's adjusting foot-splints," adapted to the degree of extension of the actual foot. This adjusting splint may be very gradually raised to a more bent position at the ankle, in proportion as the foot progresses. In the progress of the foot upwards it may be noticed that flexion favours a preponderating action of the anterior tibial muscle and a return of a tendency to characteristic varus, elevation of the inner margin of the foot. This may best be combated by daily manipulations in the direction of valgus, and by the application for a few hours now and then of the simple straight outside splint, so as to give the foot a renewed equino-valgoid form.

It is almost unnecessary to add that if, when the child is two or three months old, the mechanical treatment having been diligently and skilfully employed, and the operation for severing the anterior and posterior tibials having been done, the foot, although capable of full eversion whilst in the splint, springs back actively into the varus position, it becomes doubtful whether the anterior and posterior tibials or the plantar structures were properly severed. In this case the surgeon should persevere with the mechanical treatment for a month longer. Should the inversion still be active—not a mere passive falling inwards of the foot, owing to want of support—he may then repeat the operation for division of the posterior tibial, the division of which at the first operation may not have been complete. This can, however, rarely happen to the competent surgeon.

Cases approaching in severity those represented, "Treatise on Deformities of the Human Frame," 1853, pp. 264 and 265, require operation as soon as it can conveniently be done.

After tenotomy the foot should, during the three or four weeks' process of union of the tendons, be only gradually everted or flexed. I am aware that some surgeons continue to advocate prompt or rapid elongation of the interval between the ends of severed tendons. Time and space will not permit of my describing the evils of this practice. (See "Treatise on Deformities of the Human Frame," p. 305.)

When the club-foot infant is only a few weeks or months old it is necessary to deny the nurse the pleasure of putting it, quite naked, into a bath of the whole body and limbs, for the reason that unless the foot, whilst in the bath, can be held by the nurse or by a splint in the best possible position, it is harmed by being allowed to revert, even for a few moments, towards its original evil position. But when the foot has been held for some weeks in the position represented, the following test as to the sufficiency of the efforts made to overcome the morbid inversion of congenital varus, or rather a test measure of the progress the child's nervo-muscular system of the foot is making towards *cure* may be resorted to:—

The infant is to be held in the sitting position in a bath of lukewarm or cold water. If during the first moments of immersion the limbs are thrust straight out in the water, without inversion of the front of the foot, we may conclude that all physical obstacles to natural play of the ankle-joint have been definitely removed—that the shock given to the cutaneous surface of the child has been carried to and reflected from the centre of the nervous system by a vigorous equal action of the adductors and abductors, so that no trace of varus is visible, as was still the case before the infant was placed in the water, and as may be the case when the child returns to the nurse's lap.

The physician is reminded by this test of an analogous phenomenon sometimes displayed by the distorted hand in the early stage of hemiplegic paralysis, in which, whilst the patient yawns, the hand returns to a natural position. The reflex function which follows upon the uneasy or languid condition of the central organs of respiration and circulation preceding the "yawn" and "stretching" of full oscitation, excites equally the extensors and supinators as well as the flexors and pronators of the wrist, and temporarily removes the distortion of the hand.

The will of the infant and the will of the hemiplegic patient have nothing to do with the temporary improved position excited by the water, or by the languor which excites the yawn.

It is scarcely necessary to remark that when the hemiplegia has long existed, and molecular, *structural*, or adapted shortening of the muscles has taken place, the reflex operation upon the hand during yawning is not observed.

The production of a blister, excoriation, or superficial slough should be considered as a reproach, and a proof of the bandage having been too tightly or too hastily applied. It is thirty years or more since I witnessed such occurrences in a patient treated by my own hands. If prominent parts be injured by overpressure, the difficulty of future treatment is greatly enhanced.

As a disposition to inversion of the knee sometimes coexists with varus, it has been recommended that any splint or apparatus should extend above the knee to the upper part of the thigh. I find this inconvenient and unnecessary except where the inversion is strongly marked. As already stated, congenital club-foot, treated in infancy, and thoroughly combated before the age at which children usually walk, needs no irons or supporting instruments to aid walking or turning out of the toes. If such appear requisite, proof is thereby afforded that the cure is incomplete. The surgeon must *rebrousser chemin* in his treatment, and permit no walking or even attempts at walking until free motion in all natural directions has been obtained. The child will then be able to stand naturally, and will speedily obtain voluntary power over his movements. It is necessary that the surgeon should insist that the child be not placed on the feet, or be allowed to move upon them before correct form and mobility have been obtained. Disobedience to this injunction has often been a stumbling block in the cure. The child should, for some months, continue to wear the splint at night time, to correct any morbid direction observable during the day. If the parent or nurse will take pains, whilst the child grows, to watch the occurrence of any tendency to relapse, and educate it by the example and movements of their own feet how to correct the tendency, it will be overcome.

Whatever be the remote or predisposing causes of ill success attending the treatment of varus, I may lay down as a matter of anatomical and physiological fact that whatever may be the tendons divided, the apparatus used, the age of the patient, and the general mode of treatment pursued, the full measure of success will not attend the surgeon's efforts unless the patient be prevented using the member until the natural form and the full range of natural movement are obtained. Proper use does not come by instinct or intuition, as in those children who were originally well formed. The patient is not secure from relapse until, in addition to proper shape and range of motion of the ankle, fair muscular development has been acquired, and a natural equilibrium on the part of the various muscles has been established. So long as this equilibrium is wanting, it will be readily understood that no guarantee against recurrence of predominant action and shortening of some muscles, and consequent relaxation and weakening of other muscles and ligaments will necessarily result. All walking irons and instruments being dispensed with, it is not an indifferent matter what kind of shoe the child shall use. In fact, the child of thirteen or fourteen months learning to walk after the thorough rectification of congenital club-foot, acquires a facility of correct walking more rapidly when moving about bare-footed, or with a worsted foot covering, furnished with a soft leather sole of a width quite equal to that of the foot. When the child moves about bare-footed on an even floor, each part of the sole normally touching the ground, is equally supported by the ground, and the foot is not exposed to any extrinsic cause of rolling or yielding to either side, as is to a varying extent the case when the child is raised from the ground by a more or less thick stiff sole, which, moreover, in a boot constructed in the ordinary way, is often less wide than the foot. Any anatomist with strong limbs, remembering his experiences when using the ordinary skates, not the modern wheel ones, and the altered leverage to which the ankle-joint then is exposed, will appreciate the correctness of the statement above made that any increase of the leverage of the ankle caused by a raised sole may in the case of the young child learning to walk after varus be a cause of instability and strain to the muscles, which are then so little subject to the influence of volition. An ordinary plain broad-soled boot without heel is all that is required.

If I shall have succeeded in conveying to my hearers the experience I have acquired of the *curability* of every degree of ordinary infantile congenital varus (*a*), by the means I have here indicated, before the age at which a sound child may be expected to walk, and that no leg irons, steel or india-rubber springs, bandages, supports or peculiar stiffened boots are needed to turn the feet out or assist in walking, my task will be ended on this occasion, and I shall have no reason to regret your attendance here, or the thought and labour I have spent in the development of the treatment of this very important class of cases.

On a future occasion I hope to offer some additional remarks on imperfectly cured, relapsed, and neglected cases, and on the surgical and mechanical measures necessary for their recovery.

PATHOLOGICAL ANATOMY OF THE BRAIN—LOCALISATION IN CEREBRAL DISEASE. (*a*)

By Prof. Charcot.

Chapter VIII.

Gentlemen,—It will suffice for the moment to state the fact that lesions of the venous system, as well as those of the arteries, have a great influence on the production of cerebral changes.

The next point is to show, by means of some examples, how far an intimate knowledge of the normal state of the cerebral circulation is necessary to a right understanding of a large proportion of lesions of the nervous centres.

You recollect how the great arterial trunks, the two carotids, and the two vertebrals join to form the arterial circle at the base of the brain. The two vertebrals placed behind, and running obliquely forwards, converge towards the median line, and unite in a single trunk, the basilar artery. Near the anterior edge of the pons varolii this divides into two branches, named the posterior cerebral arteries, which pass, as you are aware, to the posterior part of the cerebrum—the occipital and sphenoidal lobes. In front each of the internal carotids forms by division two trunks. The one going forwards, the anterior cerebral artery, ascends over the corpus callosum, and is distributed to part of the anterior lobes, to a considerable portion of the internal surface of the hemispheres, and to the subjacent white matter of the centre of the cerebrum. The other is the middle cerebral or Sylvian artery. It is distributed over the inferior frontal convolutions, the median convolutions, the parietal lobe, and in the subjacent parts of the grey matter of the centres. Lastly, it furnishes branches to the ganglionic masses, the thalami optici, and corpora striata. It is unnecessary to dwell on the anterior or posterior communicating arteries. The diagrams will show you at a glance what is important on this point.

Such is the general distribution of the arteries which supply the internal, external and inferior surfaces of the cerebrum.

In order to understand the circulation of the interior of the brain, we must refer to the sections. In a section made in the region of the Sylvian artery we find the vascular supply of the grey nuclei apparently mixed up with that of the grey cortical matter and *white* matter of the subjacent centres, but that is an illusion which we will get rid of in the next lesson.

I propose to-day to resume the subject only touched upon in our last lesson, and to go more deeply into it. If I have been successful in showing you that the arterial system "commands the situation," so to speak, in the domain of cerebral pathology—if I have done this I should have convinced you at the same time of the necessity for previous investigation into the physiological relations between this system and the different parts of the brain proper. How, indeed, is it possible to consider rationally the localisation of the centres of hæmorrhage or of softening, which form some of the most interesting matters for study in cerebral pathology, if one is not well up in the distribution of the arteries—the points of departure of these lesions?

And it must strike you at once that, even in the normal anatomy of these parts, we should be in danger of error. I will again point out to-day what I have already shown before—and I stop the more willingly on this point of the anatomy of the cerebral circulation because you will find, even in the most valued of our text-books, information on this point so vague as to be quite insufficient for the pursuit of our studies—all that is known precisely is of recent date, and is the result of inquiry called forth by the needs of pathological anatomy and physiology.

I shall borrow especially from the important labours of our compatriot, M. Duret, which labours were carried on in the laboratory of the Salpêtrière. His fellow-labourer

---

(*a*) I exclude from this positive assertion cases in which some malformation of bones, *fusion*, *deficiency*, *excess*, or *absence* of parts coexists with congenital varus.

(*a*) Translated from *Le Progrès Médical.*

is Dr. Heubner, of Liepsic. These two observers have carried on their researches simultaneously, but without being aware of the fact, and have arrived at similar results on all essential points. That is, assuredly, a guarantee of the exactness of all the new details they have given us. In a recent treatise on "Syphilitic Disease of Cerebral Arteries," Heubner claims precedence of M. Duret, but this cannot be sustained. Duret's first researches on the circulation of the pons and medulla were communicated to the Société de Biologie, Dec. 7, 1872. By a remarkable coincidence, an abstract of Heubner's investigations on the cerebral circulation were published at Berlin in the *Centralblatt, on the very same day.* One month later, Duret published in the *Progrés Medical* that part of his studies which had relation to the cerebrum itself. Dr. Heubner insinuates that Duret's investigations are two years later than his, but this cannot be true, for they were exactly contemporary. Dr. Heubner might have easily learnt the exact truth from the *Archives de Physiologie* of 1874, with which he was acquainted, and which contained the question in all its details.

I have insisted on this chronology in order to expose the "mania for annexation" which has caused injustice to our compatriot.

But I must come to the peculiar object of our studies. You know how the three trunks, the anterior, middle, and posterior cerebral arteries, arising from the circle of Willis share the arterial supply of the cerebral hemisphere.

(*a*) Each of these vessels commands, so to speak, its own domain in the hemisphere, and I have already demonstrated (briefly) to you the general topography and limits of these great vascular territories. These territories must not only be considered superficially, but in their deeper relations, by the aid of sections.

We must carefully attend, in the first place, to the surface of the cerebrum, in order to take into our minds its external, superior, internal, and inferior surfaces. In the second place, we will study its frontal sections, which will prove the importance of the "Sylvian (middle cerebral) territory." We shall see, at the same time, that these arterial provinces can be subdivided into a certain number of departments corresponding to the distribution of the secondary arteries.

(*b*) We will not linger longer on this general view, but will enter into the details. Each of the three principal arteries gives rise to very different systems of secondary vessels. The *first* of these systems may be called the "system of the cortical arteries." The vessels composing it spread in the substance of the pia mater, and divide in a peculiar manner before supplying little vessels which pass into the cerebral substance, which are, strictly speaking, the nutrient vessels of the cortical grey matter, and of the subjacent medullary substance. The *second* is the central system, or that of the central ganglia. The vessels constituting it arise from each of the three principal arteries near their origin, and in the form of arterioles, dip at once into the ganglionic masses. These two systems, having a common source, yet are quite independent, and at the periphery of this domain do not anywhere communicate.

Dr. F. B. Nunneley, formerly assistant physician to St. Mary's Hospital, Paddington; the Hospital for Sick Children, &c., and author of various contributions to the medical journals, was admitted as a clergyman of the Church of England, at the Archbishop of Canterbury's last ordination.

In our last we congratulated Mr. Simon upon having declined the proferred testimonial. The committee now find themselves in a somewhat ambiguous position; they have however deferred to his wish and abandoned the intention of founding the proposed scholarship; but they have referred to a subsequent meeting the consideration whether it is advisable to present a marble bust of Mr. Simon to the Royal College of Surgeons.

ABSTRACTS
OF THE
INTRODUCTORY LECTURES
DELIVERED AT THE
OPENING OF THE MEDICAL SESSION,
Oct. 2, 1876.

LONDON HOSPITAL.

Dr. Andrew Clark, Senior Physician to the Hospital, delivered the opening address. After dwelling upon the ground covered by medicine in its relations to the individual, to society, and to the State, he said,—"Medicine not only involves vast interests—it establishes, and for its existence it must maintain, and for its progress it must continue to multiply, the most intimate relations with every other form of knowledge. There is none into which it does not lead us; none with which it does not necessitate some degree of acquaintance; none which does not lend it aid. Nor is the entire domain of the physical sciences sufficient for its needs and purposes. With the facts of the mental and of the moral worlds it seeks as close and holds as necessary a relationship. And thus throughout the whole realm of Nature medicine lays down its lines of inquiry and establishes its channels of communication. It is the metropolis of the world of knowledge, and we are the privileged denizens thereof. Here we are brought face to face with the mysteries of Nature, of life, of man, and of the Eternal which enfolds them. Here, in the light collected from every lamp of science and converged into a focus upon them, we may discuss the loftiest problems which can engage the mind of man. And here, in the seeking after truth, and in the doing of good, we may open for ourselves sources of interest and of happiness greater and more enduring than any other that the world can supply." The lecturer then treated of experimental inquiry as a necessary and, for the present, the chief means of advancing both the science and the art of medicine. After enumerating the functions of experiment and showing the necessity of checking its results by clinical observations, he adverted to the suffering inflicted upon animals, and the responsibilities which it imposed upon experimenters. Touching upon recent legislation and its probable effects upon education and science, he expressed his alarm at the prospect of a fresh crusade in which "no quarter was to be given and no peace concluded until the liberty of experimenting upon animals was unconditionally extinguished," and continued:—"It is hard to understand the reasons of such a passionate antagonism, and still harder to believe that it has no other foundation than the desire to protect inferior animals from unnecessary suffering. For, if this be so, why do our antagonists confine their warfare within such narrow limits? The infliction of suffering for ulterior ends—everywhere visible in nature, now adjusting the balance of nations, or settling the autonomies of peoples—pervades the whole structure and relations of civilised life. What are all the sufferings inflicted by all the vivisectionists of all the world in comparison with the hecatombs of suffering which political experimenters have inflicted upon mankind in their attempts to settle the question of the balance of power in Europe? Are the sufferings of men of less account than the sufferings of brutes? Or is their blood less precious? Are the countless woes of countless human hearts to be reckoned but as dust in the balance against the wounds of guinea-pigs and frogs? Why is it, then, that the assault is not co-extensive with its object? Or, if it is the plan of our assailants to defeat their enemies in detail, why are we to be made the first and bitterest objects of attack? It is not from wantonness, it is not for ease, or pleasure, or gain that we make the subjects of our experiments suffer—it is assuredly for the advancement of science, and it may be for the good of mankind. Surely the love of knowledge is as true a human desire as is the love of sport; and while the fruits of this die with the individual and his interests, the fruits of that live for ever in growing uses to the race. If this question is to be reopened, it must no longer be confined within the narrow limits which our adversaries desire. But if it be otherwise, if hostilities are to be renewed on the old lines with the old tactics—if again the freedom of experiment is to be the sole object of attack, then I trust that every member of this great profession, and every thoughtful man beyond its pale, will make this cause his own, and will offer to threatenings of fresh legislation such a united, earnest, and implacable opposition that the Statute Book of England shall never again be sullied by penal enactments against the just liberties of men. The highest heritage of humanity is in our keeping. All the past and all the future conspire to make us loyal to the sacred charge; and at whatsoever cost of whatsoever kind we must hand down the freedom of experimental inquiry unmortgaged to future generations."

The rest of the address was taken up with practical suggestions to the students as to their studies, and directions how to elevate and ennoble their professional life.

CHARING-CROSS.

The Introductory Address at this Hospital was delivered by Dr. Mitchell Bruce, and referred to the present system of medical education, preliminary and professional. With respect to the first it was urged that the standard of admission is so low that a number of young men are permitted to begin their studies totally unfit to prosecute them with any hope of being licensed. It was shown by statistics that no less than 20 per cent. of registered students never become practitioners, and that beyond the cases otherwise accounted for the majority of those who thus fail are rejected as unfit by the examiners. The chief cause of this failure, he said, was not lack of industry or want of opportunity, but simple incompetency. Such being the case, the General Medical Council were charged with the responsibility of annually admitting hundreds of young men to study medicine who were doomed to certain disappointment and its results. The obvious remedy was to raise the entrance standard, and thus diminish the whole number of students without lessening the number that would certainly pass. Dr. Bruce found the cause of rejecting really good students in the "abuse of the tutorial system." The present system of "practical cram" did not teach a man to think; and the result was the deplorable amount of hasty and ill-considered matter produced, and too frequently published by the professional papers. As a remedy for all this, Dr. Bruce urged the students to learn anatomy and physiology more in their scientific aspect; and, at the expense of part of the time at present spent in the dissecting-room, to pay more attention to lectures and sound literature, and to the practical application of these sciences in the wards. Above all, he insisted upon the necessity of the student being more independent in his work—of his using his own eyes and intellect, and keeping clear of the professional "coach." What was wanted in the medical profession was thoughtful men and thinking capacity. Sufficient education was the sole qualification necessary for admission to practice, and the country properly insisted upon this before a licence was granted; for medicine watched over all other professions, and over the whole community, and it was its glory that its members exercised their intelligence for the good of those who could not pay for it. It was no exaggeration to say that those who directed medical education in England held in their hands the health and happiness of the generations that were to come.

ST. GEORGE'S.

Dr. Blandford, after bidding in the name of the committee of the St. George's School a hearty welcome to the old and new students alike, said that when the committee did him the honour to invite him to deliver the introductory address he considered for no little time what the subject of that address should be. Should he, looking back to the shortcomings of his own student days, advise the first year's men what to do and what to avoid? Should he contrast the studies of the present day with those of the past, or address them generally on the present state of medical science? For various reasons none of those would do, for inasmuch as his connection with the school of St. George's Hospital was due to a special subject, it seemed fit that something in respect of that subject should be the theme of his discourse (cheers). Leaving, therefore, the science of medicine in general, or surgery in general, or physiology in general, he would say a few words about nervous diseases. They would all necessarily be psychologists in a certain sense as well as physiologists. There was a mental side in all diseases, and they would have to study the mental peculiarities of patients both in sickness and in health. But his subject would neither be so special as the consideration of insanity only, nor so wide as that of mind in general, its nature, composition, or growth. He would direct their attention to the circle or group of neurotic diseases which, under one form or other, afflict a great number of our fellow beings. He had heard it said that, according to the evolution and development of our organisation it was to be expected that the most highly developed portion of all, viz., the brain and nervous system, was that which in the future would give them the most trouble, and make the greatest demands upon their skill. Other diseases, it was said, would be stamped out which formerly taxed their care and treatment. Cholera was to be kept out of the country, typhus and typhoid were to flee before advancing hygiene, and retire before sanitary inspectors and cold water, whilst the nervous system was to be the weak point. There might be some truth in all that. According to the last report of the Commissioners in Lunacy there were in the asylums and workhouses, or otherwise under restraint, on the 1st January last, 64,916 patients, being an increase of 1,123 over those of the preceding year. There was also discharged and recovered during the year 4,909, and 4,592 died. So that during the year no less than 74,417 insane persons were under restraint. To those they must add a great number who were treated at home. But irrespective of these latter the number of insane persons increased at the rate of 1,500 a-year. That number represented the last result and termination of the various nervous disorders, and included idiots, imbeciles, chronic epileptics, the victims of alcohol, those suffering from paralysis and all kinds of brain diseases, the great majority of whom were hopelessly incurable before being placed under legal restraint. Some of the causes of the nervous degeneration of the human race would come before them in their social rather than their medical experience. For instance, long continued want of food, or unwholesome food, must necessarily produce its effect upon descendants (hear, hear). It might show itself in various ways, but inasmuch as the nervous system was the most complex and specialised, the inference was that there they would first find the results of insufficient nutrition. In the work of M. Morel, the eminent French physician, on "The Degenerations of the Human Race," much stress was laid on defective food, and he enumerated various disorders due to the exclusive use of maize, or rye or potatoes, especially in a diseased state. It certainly was a fact that the largest amount of insanity in this country was found in the agricultural counties, where the rate of wages had been so low that the labourers rarely tasted meat. They read that another predisposing cause of nerve degeneration was unhealthy habitations, and it required no statistics to prove that crowded and unwholesome dwellings, as they sowed the seeds of diseases of all kinds, must bring about degeneration in the organisation of the offspring. Dwellings into which the sun never penetrated were likely to produce that effect. And occupation no less than residence must have its effect upon offspring. That which made a great and incessant call upon the nervous system, which shortened the hours of sleep and relaxation, entailed perpetual worry and responsibility, must have its effect upon children as well as adults. On the other hand, there was the blank idleness of the mind which rusts from want of occupation, and this was nearly as bad (hear, hear). There were minds which were never developed, because fortune had placed the owners above want, and they had not the energy to strike out a career or a pursuit for themselves. They were the brainless swells so often and so well depicted in the pages of *Punch* (laughter). And there was the agricultural labourer who for generations had been totally without education, to the shame of our legislators, and whose vacant mind was almost as lacking and devoid of ideas as that of an idiot. But in truth much that might be said with regard to the evil effects of bad food, bad lodging, harassing occupation, or mindless and monotonous work, might be summed up in one word, and that was poverty. So they found that the great increase in the insane in England was amongst the pauper and not amongst the well-to-do class of society. Their efforts, however, would be ineffectual to alter all this, for doctors could not make men rich or take away the load of poverty which weighed down the spirits of so many, and brought in its train, along with countless other ills, so much degeneration of nervous energy and strength. There were, however, some causes of that degeneration which concerned them more nearly. There was the health of the mother, especially during pregnancy. They would have something to say concerning that. If Christians were bred with the care that was bestowed upon racehorses and shorthorns, mothers would lead very different lives to those they led now (cheers and laughter). It was quite certain that if there was a great demand and drain made upon the nervous energy of a woman who had a child *in utero* the nervous system of the child would of course suffer. Then fright, an accidental shock, long continued emotion, and brain work would have a baneful effect on the offspring, and it was impossible for a woman to breed healthy children and devote herself to other and harassing pursuits. Another great cause of the degeneration of nerve tissue and nerve force—one that was so unfortunately potent and prevalent in the present day—was intemperance. It might be accident, or it might not, but year by year he was brought into contact with a greater number of persons in the upper as well as amongst the labouring classes whose whole lives were blasted by habitual drinking (hear, hear). There was, he believed, a great deal more private and secret drinking now than formerly—more partaking of sodas and brandies, and glasses of sherry between meals. He had no doubt whatever that there was more secret drinking now amongst ladies than there used to be in the days of the Georges. They could not be too careful how they ordered stimulants to a large section of people who were tainted with nerve disorder—to the hysterical, the hypochondriacal, the neuralgic—for many of them owed their condition to the intemperate habits of their ancestors, and there was a proneness in those habits to recur in the offspring. In conclusion, the learned professor again urged his auditory to give much thought and work to the study of the nervous system (cheers).

KING'S COLLEGE.

THE inaugural lecture at this college was delivered by Professor E. B. Baxter, who, in the course of an interesting address, referred to certain changes that had occurred in the constitution of the medical staff. He then proceeded to urge upon the students the necessity and importance of acquiring a scientific habit of mind rather than the mere acquisition of a certain number of facts and theories during the first few years of a student's life. He dwelt at length upon the three stages of scientific method—(1) observation, (2) hypothesis, (3) verification. With regard to the qualities necessary for observation, he said that they were technical skill, accuracy, discrimination, and curiosity. The second stage required imaginative power, and the third required the same qualities as the first, together with caution and impartiality. Dr. Baxter then proceeded to show that the same qualities as those required in the process of scientific discovery were habitually exercised in the practice of medicine and surgery. In conclusion, he referred to the present exaggerated system of competitive examinations as it affected the interests of medical education. Competitive examinations, he said, were now upon their trial, and those present might probably live to see the day when their evils were put an end to.

ST. MARY'S.

THE introductory lecture at this hospital was delivered by Dr. Wiltshire, joint lecturer on midwifery and the diseases of women and children. Dr. Wiltshire stated that the work of medical education was of a solemn character, and that rightly to appreciate the value of medical studies it was necessary to understand what were the aims and objects of medicine, and the relation it bore to other callings. It was only by judicious comparison that the true proportion of things could be estimated, and it was the want of, or neglect to use, the comparative faculty that brought so much trouble on communities and on individuals. Their first aim and paramount duty was to prevent disease, and, failing that, to cure or relieve it. The two great branches of medicine were, then, preventive medicine (hygiene) and curative medicine. In the former the relations of the profession, as a body, were with the State; in the latter they were with individuals, and were personal. In public health they had been the pioneers, and almost the sole workers, though they were the only losers by promoting healthiness. Great triumphs undoubtedly awaited them in the noble field of sanitary science. In curative medicine they could point to past achievements with pride and satisfaction. The progress their professional knowledge was making every year was immense, and had been especially great during recent times. He lamented that the benevolent work of the profession had been so gravely misrepresented, and science hindered, by recent agitation respecting vivisection, and he demonstrated the injustice of the accusations brought against the profession as a body, no doubt in ignorance, by many whose generous sympathies had been misled. He claimed for the members of his own calling no less tenderness of feeling than other persons possessed, with which was coupled a greater knowledge of, and at least equal sympathy with, human suffering, which was in amount stupendous, and in character awful. Dr. Wiltshire next pointed out how great an influence on the welfare of mankind, especially town dwellers, the preventive branch of medicine was capable of exercising. In its fullest development it was capable of making mankind healthier in body and in mind. The tendency to sin, vice, and crime might therefore be diminished by attacking it at its inception, for the hereditariness of moral defects was as abundantly clear as the inheritance of proclivities to physical disease. What each one of us was morally and physically was very much the product of ages. Still we were powerfully influenced by our environments, and being thus susceptible, it behoved each generation to pay great attention to all that affected our mental and physical well-being, so that as clean a bill of moral and physical health as possible might be handed down to posterity. Lord Beaconsfield's celebrated paraphrase, "Sanitas sanitatum omnia sanitas," embodied objects which, in future years, must become the care of statesmen, for a healthy and vigorous population formed the most valuable wealth of the State. The curative branch of medicine, which engaged the energies of the bulk of the profession, afforded scope for the exercise of the noblest qualities, and to stand by the bedside of the sick and sorrowing, not idly, but helpfully, both able and willing to relieve, was as great a privilege as it was an abiding pleasure. The study of medicine, and the many sciences that were ancillary thereto, greatly illuminated the mind. They exerted a corrective influence on the judgment, and enabled us to survey and contemplate life and its environments from a lofty sphere. Above all, they engendered a love of truth, and that for its own sake. Dr. Wiltshire believed there was a noble future in store for medicine. This had been recognised by Mr. Gladstone in his recent address to the students of the London Hospital. In the future certain municipal laws would have to be ordained in accordance with the teachings of science. The Mosaic code had done much for the Jews, and similar hygienic laws, expanded and corrected by the light of science, might, under divine guidance, still do much to promote the healthiness of all the nations of the earth. Illustrations of the importance to society, of both the preventive and curative branches of medicine—which in practice were closely interwoven—were given. Dr. Wiltshire then addressed words of welcome to the freshmen, of exhortation to the advanced students, and of counsel to those who were about to embark in practice. He entreated all of them to work earnestly and honestly, to observe carefully and closely, and to reflect upon their observations; to leave nothing undone in order to become masters of their calling; and lastly, remembering the dignity, the responsibilities, and the sacredness of their profession, to practise it only as highminded and honourable gentlemen, taking care that its fair fame was not sullied in their keeping, and that they did not pursue it in a mercenary spirit.

WESTMINSTER HOSPITAL.

THE address here was delivered by Dr. W. H. ALLCHIN, whose subject proper was the nature of the medical art as a commodity, the character of the public as buyers of it, and the qualification of the doctors for supplying the same. As regards the art itself, it was shown to be based upon a vast number of distinct, though allied, sciences, each of which is far from perfect in itself, and is in a progressive state. This explains the necessarily inexact condition of the medical profession as it is now practised, but at the same time indicates that time alone is wanted to remove such a stigma from it. Medical men may be looked upon as "the vendors of an article which it has cost them time and money to prepare, which is certainly not of the best quality, as it is hoped in time to make it, but still one that is much better than it was, and one even in its present imperfect condition that is well worth having," The lecturer proceeded to enumerate the general directions in which changes are being made, and notably in the different aspects in which disease is viewed in relation to the body at the present day from what it was a generation or two ago. Looking at disease as being altered function dependent on altered structure, however obscure the alteration might be, rather than that the body is possessed of some entity which has to be removed by exorcism or by purge, there is at once indicated the paths along which advancement is being made—viz., in anatomy, the science of structure; and physiology, the study of function. As they progress, so will pathology, and it in its turn will suggest a rational system of therapeutics. The present position of medical science, its deficiences and its capabilities, being thus defined, it is probable that no scientific or intellectual pursuit which practically concerns the community rests on so uncertain and insecure foundation as it does; and, though much is being done to replace this uncertainty by fact, there is in the meanwhile the gravest responsibilities imposed on the practisers of it, Of the public, who buy this article of them, it was shown that they present two marked characteristics in their relation to the healing art—first, their absolute ignorance of the exact nature of that art; and, next, their almost blind faith in the medical man. This ignorance, far from being culpable, is rather unavoidable. While the amount of instruction necessary to make a man understand what medicine can and what it cannot do would be sufficient to make a doctor of him; and again, it is more than probable the patient's comfort is enhanced by his ignorance, just as the sick man with a little knowledge is a greater difficulty to his physician. With an all-demanding public asking too often in their suffering for impossibilities, with most limited though extending means at the doctor's disposal, how imperative it is that there should be no failure on his side, no diminution through unpardonable ignorance on his part of the too small meed of relief which it is in his power to bestow. How necessary, with such issues at stake, that each and every doctor be at the best, aye the very best!

In considering how far the doctor is equal to the demand made upon him, it must be remembered that he is to a very great extent what the public make him. The profession, conferring as it does a certain social position, and offering a means of honourable livelihood, it is not always that the natural qualifications of the student receive their proper consideration, and thus it is that many enter the ranks who are themselves conscious of their unsuitability for them. The more uncertain an art is, the more does it rely for a successful practice of it on the natural capabilities of its exponent, and if these capabilities, however great in any other direction, be inferior in respect to the art in question, such art must suffer.

After some further remarks on the present system of medical education and the evils of "cramming," the lecturer concluded by bidding welcome to the fresh men, for whom he said there was plenty of room.

OWEN'S COLLEGE SCHOOL OF MEDICINE, MANCHESTER.

THE opening address here was delivered on Monday by Dr. JOHN ED. MORGAN, F.R.C.P., his subject being "Medicine in 1876, an Inquiry into the Effects of Experimental Researches on the Principles and Practice of Medicine." We quote the lecturer's remarks on vivisection:—"The physiologist in his quest after discoveries that may be useful, not alone to the human family, but to every species of animal trifles not with the existence of the meanest reptile, but he feels that, can he but discover the laws which regulate the growth of tissue, the repair of injured structures, or the production of disease, the sacrifice of a single life may prolong the years and ease the miseries of countless thousands. I have directed your attention to this subject because I think it important that you, who are associating yourselves with the medical profession should be able to join us with clean hands and a good conscience—satisfied that as humane men you can approve the methods by which the science of medicine has been advanced. That those who have carried on these investigations have as a rule evinced sentiments of humanity towards the lower animals it is impossible to deny. Many of them have felt reluctance in carrying on the most important researches because they occasioned a certain amount of pain. But how have these disinterested labours been appreciated by those whose infirmities they were intended to relieve? How have the persons benefited by chloroform, and ether, and chloral, and nitrate of amyl, rewarded the men who in many cases endangered their own lives, and in more than one instance actually perished themselves, that they might assuage the sufferings of others? Such persons greedily avail themselves of the balm that ministers to their pain, while they scruple not to vilify the hand that won them relief. In this free land, where freedom, alas! is too often abused, many people—well meaning doubtless, but fussy and self-opiniative—hesitate not to denounce in the severest manner the men to whom science is so deeply indebted. By banding together and making the question of vivisection a political watchword, they succeeded in putting such pressure on the Government of this country, that a Royal Commission was appointed specially to investigate the "practice of subjecting live animals to experiments for scientific purposes.' Among the members of that commission were several distinguished statesmen, and at least one name well known to science. After a protracted inquiry into the whole question, these commissioners came unanimously to the conclusion "That it is impossible altogether to prevent the practice of making experiments upon living animals for the obtainment of knowledge applicable to the mitigation of human suffering or the prolongation of human life;" and again, "the greatest mitigations of human suffering have been in part derived from such experiments." They further expressed the opinion that "a general sentiment of humanity on this subject appears to pervade all classes in this country." If, then, it was apparent, even to men of no scientific attainments, that such experiments are of the greatest value—if it was shown, moreover, that they are at the present time carried out in a humane and merciful manner, why was it deemed necessary to inflict on the great profession of medicine such an insult as that to which it was subjected by the provisions of the Bill introduced into the Upper House by the Secretary of State for the Colonies? Mankind had benefited by these researches, misery had been relieved, science advanced, no charge of cruelty could be brought home to the experimenters? and yet, forsooth! these men were to be dogged and baffled in their beneficent labours by the common guardians of public order, as though they were cock-fighters or bull-baiters? The second reading of this Bill, modified somewhat it is true, but still most objectionable in its enactments, was carried through the House of Commons on the 9th of August. The next day, one of the last of the Session, the Cruelty to Animals' Bill was hurried through Committee, and on the 15th received the Royal assent,—as sorry a piece of legislation as has been turned out of the House of Commons for many years. Introduced, doubtless, for party purposes, it was altogether unworthy of a strong Government. This question has excited a very general feeling of indignation in the medical profession. If any men have a prescriptive right to consider themselves the special guardians of our common humanity, those men are the physicians and surgeons of England. During the still hours of night, while the followers of other callings enjoy their well-earned repose, the hard-worked disciples of Æsculapius keep their weary watch by the sick man's pillow, and render him succour with no grudging hand. Their motto is 'Work, not talk;' they have no leisure for the seductive harangues of platform oratory. I feel persuaded that many of our lawgivers must feel that their conduct in the matter of this Cruelty to Animals' Bill has been, to use the mildest expression, somewhat inconsistent. As English gentlemen they are generally familiar with the phases of cruelty inseparably associated with the sportsman's life. A large proportion of them, at stated periods of the year, indulge in the time-honoured custom of killing game. They hunt and they shoot. But in a day's sport, every creature that is shot at is not necessarily killed. The wounded likewise claim our sympathies. Could the maimed survivors of some lordly battue respond to the roll-call, and compare experiences with the rabbit or the dog experimented on by the physiologist, it is possible that the balance of suffering inflicted might rest with the man of the gun. Others of our senators, staunch patrons of the turf, who close the halls of St. Stephen's that their undivided attention may be given to the Derby, must be aware that the keen edge of the spur, driven into the flank of the sorely-pressed steed, occasions as keen a pang as is inflicted on the web of the frog by the needle of the physiologist."

Clinical Records.

NORTHERN HOSPITAL, LIVERPOOL.

Under the care of Dr. Dickinson.

[For the Notes of the following cases we are indebted to James Barr, M.B., L.R.C.S. Ed., late House-Surgeon.]

Case III.

Phthisis Pulmonalis, with Amyloid Degeneration of Kidneys and Spleen.—Death.—Autopsy.

H. H., ÆT. 59, shipwright, admitted November 17th, 1874, with well-marked signs of phthisis pulmonalis.

He always enjoyed good health up to two years ago, when the present complaint began, and he believes it to be the result of "a cold," brought on by exposure. Twelve months ago he suffered from slight hæmoptysis, and since then the disease has made rapid strides. For the last nine months he has been unable to follow his employment. Family history satisfactory.

He is very much emaciated, tongue slightly furred, appetite fair, bowels regular, cough troublesome, expectoration profuse, purulent, and nummular; pulse weak, urine albuminous. There are the usual physical signs of phthisis with excavation in both upper pulmonary lobes. There is a well-marked "crack-pot" sound under the left clavicle.

Cardiac percussion is rather large, sounds feeble, hepatic and splenic dulness normal.

The dull percussion in the region of the kidneys is large, but these organs cannot be made out by palpation.

The downward progress of this case was steady. His chest symptoms increased. His urine was scanty; sp. gr. 1017-1020, of a deep amber hue; it contained from one-third to three-quarters of albumen, and the microscope revealed numerous waxy casts, and crystals of the oxalate of lime and urate of soda. At the end of November he suffered from diarrhœa, which was checked by an astringent mixture.

Dec. 12th.—His feet and legs have begun to swell. The daily quantity of urine ranges from twelve to thirty ounces. Sp. gr. 1017-1014.

Dec. 26th.—The daily quantity of urine since last note has varied from twelve to twenty ounces. Sp. gr. 1024-1015. It contains half to two-fifths of albumen, and the microscopic characters are the same as before noted. On cooling there is generally a considerable deposit of urates.

Jan. 4th.—The daily amount of urine has varied greatly of late. On the 27th ultimo it was eight ounces; on the 28th, forty-two ounces; 29th, twenty-six ounces; 30th, twelve ounces. Yesterday and to-day only four ounces each. The sp. gr. has ranged from 1013 to 1025.

From this date till his death, on the 27th, he passed from twelve to twenty-four ounces of urine daily. Sp. gr. 1018-1012.

Post-mortem Examination Forty Hours after Death.—The body is very spare, the paruniculus adiposus being almost absent. Both pleura are very much thickened, and at many points firmly adherent to the chest walls, especially at the apices. The upper lobe of left lung is very firm, being thickly infiltrated with caseous deposit. There are many small cavities, from the size of a pea to that of a walnut, and the larger ones are lined with a smooth, thick, fibrous membrane. The lower lobe is congested, and contains numerous miliary tubercles.

The right lung is even in a more advanced state than the left, but the distribution of the disease is similar.

Heart weighs eleven ounces. Both ventricles are somewhat dilated, and the walls of the left are hypertrophied. There is slight fatty degeneration of the muscular fibre. There is a firm calcareous nodule in the anterior cusp of the mitral valve. There is slight atheroma of the mitral and aortic valves, and of the aorta.

In the aortic wall, in front of the origin of the left subclavian artery, there is a calcareous plate of the size of a fourpenny piece. At a point almost opposite this, in the lower part of the arch, there is another plate of an oval form, three-quarters by three-sixteenths of an inch. The rest of the aorta is very atheromatous, and contains many small calcareous plates of the size of a split pea.

Liver, weight two and a-half pounds, of a firm, consistence, greasy feel, and the right lobe especially is considerably infiltrated with fat.

Spleen, weight nine ounces, of a firm, fleshy consistence, and gives the characteristic amyloid reaction with iodine.

Kidneys, weight thirteen ounces. Capsules very thin and easily torn off. Surface pale and smooth, and its venous radicles are very apparent. The corticle substance is greatly increased, and is very pale. The malpighian bodies, as discernible by the unaided eye, are few and shrunken. These bodies, and the *arteriolæ ascendentes* are well brought out by iodine and sulphuric acid.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 11, 1876.

THE INTRODUCTORY LECTURES: OUGHT THEY TO BE DISCONTINUED?

The annual delivery of the Introductory Lectures at our medical schools comes round as regularly as the shooting of grouse on the 12th of August, or of partridges on the 1st of September; but there are not wanting signs that ere long this time-honoured custom may be discontinued, as it already has been at two or three of our largest metropolitan hospitals. We shall therefore take this opportunity of considering the reasons why this opening of the schools with an Introductory Lecture has lately fallen into discredit, what ought to be the object and character of these inaugural lectures, and whether it is advisable that the practice be discontinued?

There can be no doubt that one reason why these lectures are not so popular as they formerly were, is that they are looked upon by many as of no practical use; and in this utilitarian age the inutility of a thing is often but another term for its extinction. It must, however, be remarked that the objections that have been raised against them have not proceeded from the students, that is to say, from the very party to whom they are addressed, but from the teachers and lecturers themselves. We need not remind our readers that never are the benches of the lecture theatre more densely crowded both by new and old students than on the occasion to which we are now referring. But along with this crowd of curious and attentive listeners there are always the several members of the medical and surgical staff of the hospital, who are supposed to sit beside and support the lecturer, and to listen to discourses which they have heard over and over again. Nor is it to be forgotten that the composition and delivery of these lectures have been always felt as an irksome task by men whose time was already fully occupied by their hospital work, and the exigencies of private practice. But the circumstance which has more than anything else led in some quarters to their discontinuance was that the hospital authorities, and even the lecturers themselves have got tired of the common-place remarks, and the wearisome platitudes, which year after year characterised the generality of these discourses, and which were necessarily more wearisome to those who were permanently attached to the staff of one hospital or another, than to those whose connection with the schools was only of a brief and temporary duration. Hence the introductory lecture lost a good deal of its original features. Disregarding in a great measure the wants of the student it became the chief aim of the lecturer to infuse into his discourse as much novelty as the occasion permitted, and he was the more induced to take this course inasmuch as the more interesting his remarks, the more notice was taken of them by the profession, by the lay press, and the public in general. Most of the addresses that have been delivered at the opening of our medical schools within the last two or three years will forcibly illustrate the truth of these remarks. Sometimes a large portion of the discourse will be taken up with a disquisition on some topic that has been exciting particular attention. One year it is cremation; another it is vivisection; next year it will be something else. One lecturer confines his observations chiefly to a history of medicine, or of great discoveries, or even to a history of his own particular medical school; another dilates on the merits of some "special" line of practice, of which he may happen to be an eminent representative, or takes up some particular branch of study, such as botany, or physiology.

But what these lecturers have gained in interest they have lost in utility, and when our teachers either advocate their discontinuance altogether or fall back upon such subterfuges as will add to their *éclat*, and to the admiration in which they are held by the public, we cannot avoid coming to the conclusion that the interests of the lecturer are much more consulted than those of the poor student. It does not follow that because the subject of these introductory lectures is pretty well exhausted, and comparatively uninteresting, that they are therefore useless and unnecessary, any more than it follows that because the subject of a sermon is trite and divested of all novelty, therefore the preaching of the Gospel leads to no good, and should at once be given up. The main object of these lectures is, or should be, to introduce the student to the work that lies before him, and to show him how he may best accomplish that work; but it must be admitted that, for several years past, this object has been in a great measure lost sight of. We are therefore not surprised that an able lay contemporary asks—"But is the fact that it interests the general public a sufficient proof that a hospital introductory is a good and useful discourse? Would it not be better for the orator to think a little more about the student before him, and a little less of the audience outside of the walls of the lecture theatre, to whom next day's newspaper reports will convey a *précis* of his utterances? . . . If medical teachers must deliver inaugural orations, the object of which is to give the student advice, they would do well to consider what practical hints they themselves would like to have if they were students now bound to satisfy a more exacting standard of examination in theoretical matters, and at the same time find a sufficient amount of leisure for acquiring the practical skill which alone satisfies that ultimate court of examination—the public. We cannot but think that it ought to be the primary aim of every introductory address to indicate the relative importance of the conventional lines of study, and to warn men that in the battle with death the knowledge based on the realitie of nature, not that crammed up from the reading of books or lecture notes, is what will stand the doctor in best stead.".

These remarks are particularly worthy of notice not only because they are warranted by the circumstances to which we have just called attention, but because they show that the progress of medical education, and the doings of the medical world in general, do not escape the observation of those who reflect the general opinion of the public. We should not, however, have so readily alluded to the animadversions of our lay critics did we not think that, so far from being a useless formality, these introductory addresses are of more value to the student than half a dozen of the other lectures which he is expected to attend during his curriculum. A good introductory lecturer may be said to stand to his auditors in the same position as a good general to his army. For just as the general, before entering upon a campaign, maps out the plan by which it may be best conducted to a successful termination, and disposes of his forces in such a manner as to make the most of them, and lead them to victory, so should it be the aim of the lecturer to map out a plan of that great intellectual campaign on which the young student has set out, and to show him how he can best overcome the obstacles which lie in his path, and ultimately gain the prize that is within his reach. And if there was ever a time when the student stood in need of such a guide, it is at the present day, when all branches of medical and scientific knowledge are so much more advanced than they formerly were, and when, moreover, the majority of students come to the schools ignorant of the details of the great task they have undertaken. Formerly the standard of medical education was much lower than it is now. Formerly the medical and collateral sciences were so comparatively backward, that a subject which was then fully exhausted in a text-book of a hundred pages, now monopolises a bulky volume of five or six hundred. And, whereas formerly, nine out of ten students had served an apprenticeship to some surgeon, and had already gained some insight into the duties and qualifications that would be afterwards required of them, and even into some of the subjects of their future study, the student nowadays walks directly from his Virgil and Homer to a totally different sphere of education, and to a school where, amid the novelty and multiplicity of subjects, he has to master, all appears to him confusion and chaos. One or two courses of lectures on a dozen different subjects so many months diligent attendance in the dissecting-rooms, and so many more in the medical and surgical wards of the hospital, frequent visits to the operating theatre, the out-patients' room, and the dead-house,—to know how to use the microscope, the stethoscope, the ophthalmoscope, and the laryngoscope,—these and many other things besides, all to be acquired within the short space of three or four years, are quite enough to appal any student who is desirous of doing his duty, and to make him welcome the advice of any one who will assist him in threading his way through the labyrinth of studies in which he is placed at the outset of his medical career. We, therefore, hope that the introductory lecture will not be entirely dispensed with; provided, however, that it returns more to the form which originally characterised it, and that it be so constructed that what it loses in ornament or in popularity it may gain in utility, and in its adaptation to the wants and peculiar position of the student. It is quite evident from what we have just said, that the more the legitimate object of the "introductory" is kept in view, the duller it will be to all except those to whom it is specially addressed; but this circumstance should not lead the lecturer away from his subject, or induce him to court popularity at the risk of sacrificing the interests and expectations of his pupils.

◆

THE MEDICAL COUNCIL EXECUTIVE.

The Executive Committee of the General Medical Council will reassemble on Friday, the 20th October, at 2 p.m.; and, in the first instance, will proceed to elect a "Registrar to the General Medical Council," in the room of Mr. Hawkins. The salary attached to the office is £500 a year, for which a daily office attendance, and the entire administrative duty of the English branch are required. We understand that twenty-one candidates have sent in their printed testimonials, of whom one is the nephew of a baron of the United Kingdom; and it has been stated that some members of the Council are favourable to the election of a non-medical man to the office, a proposal which we are confident that the Executive Committee will summarily dispose of. As a matter of professional privilege, such an appointment would be equivalent to a vote of want of confidence in the administrative capacity of medical candidates. As a matter of business, it would be stupid to disregard special acquaintance with the registration system as a qualification for the office.

Having disposed of the appointment of Registrar, the Executive Committee will do well to consider carefully the time to be fixed for the annual meeting of the full Council, and to give effect to the suggestion, its assembly should take place within the first few weeks of the meeting of Parliament. Year after year the deliberations of the Council are, for no reason whatever, saving the convenience of a few of the Irish, Scotch, and provincial members, postponed until the eve of the dog days, when doctors are weary of medical controversies, and legislators are overwhelmed by claims upon their attention, and by demands for Parliamentary interference.

The last session of the Medical Council was a striking exemplification of the unwisdom of putting off its meetings. The Government wanted to know what was likely to be done about conjoint examination. Mr. Russell Gurney wanted the decision of the Council upon the woman-doctor question. Mr. Cowper-Temple desired to be informed as to their objections to the recognition of foreign medical degrees. Mr. Gibson was anxious for their approval of his Bill about Irish county infirmaries, and the Registration of State medicine degrees; and the corporations were waiting to hear their opinion on the Visitor's Reports. To none of these inquiries could any one give a satisfactory reply, and week after week the meeting of the Council was deferred, until at length all these measures had to all intents and purposes become law, without either their consideration, or the expression of any opinion upon them, of the medical Parliament.

Of course the Council could not, at the period at which they met, initiate any legislation. Conjoint schemes, enabling Bills, amendments of the Medical Act, all were neglected, or dealt with by private hands, simply because the Council had not arrived at the moment for awaking to thought or action. It would almost seem as if the majority of the Council were adherents of the principle that queries unanswered, sooner or later, answer themselves; and as if they accordingly relieve themselves of the trouble of thinking for themselves, or for the profession, by leaving the current of events to flow in its own direction, and calmly accepting the situation as chance or private action may have created it.

This method, however comfortable, is not to the taste of the profession or the public, and the Medical Council has purchased its irresponsibility at the cost of its popularity. It has, by its indifference, lost all claim upon our confidence in its energy, or in its earnestness for the cause of professional reform; and it has exchanged its high function as the medical legislature for the position which it has long occupied, that of an incubus upon the resources and aspirations of medical men.

We trust that the Executive Committee will not separate without giving sufficient consideration to this view, and that, if they still think it worth discussion, they will remember that the personal convenience of half-a-dozen provincial members is a weak counterpoise with which to outweigh the urgent needs of the profession and of the public, to whose wants the Council was once expected to minister.

◆

CRAMMING AND EXAMINING.

The *Times*, as is usual, devotes a leading article in its issue of the 2nd instant to the London introductory lectures. It notices that in several of the addresses an attack was made on the system of cramming, and that the lecturers cautioned their hearers against seeking the aid of a "coach." The *Times* takes a very sensible view of the question, and its remarks are worth quoting. It says, "The complaint is so common that we may be sure the fault which gives occasion for it is in some sense natural and not easily to be got rid of as long as crammers are to be found to prepare pupils for passing them. We will not praise either the tutor or his pupils, or the examiner who cannot find them out. We scarcely think, however, that the evil is quite as grave as it is commonly thought. To cram means often to administer knowledge in the best arranged form, with the least extraneous matter, and most capable of being reproduced with little trouble." There is some fallacy, yet a great deal of good sense in these remarks. We are not partial to "grinding" as a substitute for finger, aye, and ear study, and we have discouraged and will continue to discourage a resort to cramming by students as *the* means to learn their business, but we want to know why students should be blamed for availing themselves of the "ready method," or grinders blamed for administering that method? Is it reasonable to expect students to look beyond the necessities of the moment, and to undertake much greater labour for a distant and contingent benefit, or is it reasonable to expect teachers to assume a Puritanism in affairs of medical education out of respect to colleges and professional ethics? Certainly not; students resort to grinders because they can give them most readily and speedily the sort of knowledge they most require, although that may not be the sort which is of the most advantage to themselves or their patients in the long run. Who, then, is to blame? Certainly it is those who determine the sort of knowledge of which the student is at the moment in greatest necessity. In other words, it is the colleges and courts of examiners, not the students or grinders, who deserve the opprobrium of the cramming system. Licensing corporations and their examiners have not yet appreciated the wants of the profession, and they look coldly upon what is most urgently required, a scrutiny of the actual finger and brain work of the student, derived from practice over the sick patient and beside the operating or dissecting tables, while they attribute supreme importance to book "tips," and a minute knowledge of the "authorities" for every surgical procedure or medical formula. If they made it their business to administer only a strictly practical workingman's examination they might be guilty of neglecting much that is worthy of knowing, but they would ensure that the candidate was competent to face a sick man without blushing, and they would make grinding or cramming absolutely impossible and unremunerative. Why courts of examiners and college councils should proceed in this groove we leave our readers to argue out for themselves. Perhaps it may arise from the fact that examiners are usually well-informed but unpractical men, who have not succeeded as physicians or surgeons, but who have established a character for intelligence and erudition.

We regret to state that Surgeon Dean Philip Palmer, **M.D., attached** to the 18th Bengal Cavalry, Allahabad, **son of Dr. Palmer, of** Dublin, was drowned while boating **on the Ganges last** month.

Notes on Current Topics.

Preventive and Curative Medicine.

There can be no doubt that, in the race which is going on between preventive and curative medicine, the former is taking the lead. Twelve months ago we noticed at length the respective merits and progress of these two great departments of medicine, and we now find that Dr. Maudsley has, in his Introductory Address at University College, been calling attention to the same subject. "I am apt to think," he remarks, "that we shall attain to earlier and larger success in preventing the diseases of communities than in curing the diseases of the individual, as men who had been seeing heavy bodies fall to the earth every moment of their lives discovered the law of gravitation for the first time when they began to observe the grand general motions of the heavenly bodies." The truth of this observation is well illustrated by the great success which has attended our efforts in this direction, and we think Dr. Maudsley is quite justified in complaining "that just when we see before us a fair prospect, and when an encouraging beginning of progress has been made under the auspices of Mr. Simon, and his well-organised staff, he should have been driven from office, and his office abolished." With regard, however, to the future of State Medicine, Dr. Maudsley is almost too sanguine. He looks forward to the time when "preventive medicine shall have realised such a degree of perfection that the occurrence of epidemic disease will be felt as a gross reproach to the community, and when there will be comparatively little for the practitioners to do in the treatment of particular disease." On the occasion above referred to we drew attention to "the impolicy of being so wedded to the advancement of preventive medicine, as to neglect that equally important branch of practical medicine—therapeutics." We have no wish to recapitulate all we then said on this subject, but that there is some need for such a caution is shown by the general tenor of Dr. Maudsley's remarks, by the large share of attention which is given to public hygiene both by the profession and by the State, and by the comparative indifference with which we are apt to regard any endeavours that are made to advance the science of therapeutics.

Influence of Pine Forests on the Rainfall.

Some interesting observations have lately been made by M. Fautral on the influence of pine forests on the quantity of rain received by a country, the hygrometric state of the air, and the state of the ground. It is proved that pines have the property of condensing vapour, and that in a much higher degree than leafy woods. Thus, the quantity of rain which fell over a pine forest during fourteen months was 840 70mm., as against 757·75mm. on the open ground three hundred metres off, showing a difference in favour of the forest of more than 10 per cent. of the latter quantity. In the case of oaks and witch-elms the difference was only 5 per cent. The mean saturation of the air above the forest was ten-hundredths more than at the other station (63 against 53). The quantity of rain received by the forest ground was 471mm., while 369mm. was interrupted by the trees—*i.e.*, 0·43 of the water precipitated. Now, though the open (sandy) ground received 757mm., there is reason to believe that the forest ground really conserves more water. These data show what services may be rendered by pine forests on burning, sandy, or chalky plains, which the want of water renders unproductive. Such forests, too, are a powerful remedy against inundation.

Another Form of Tea Fraud.

To the meeting of the British Pharmaceutical Conference a paper was communicated by Mr. Groves, F.C.S., "On Flower of Tea or Pekoe Flour," which shows the extent to which trade roguery is permitted to go under the patronage of the Custom House, and the protection of Mr. Sclater Booth's Adulteration Bill.

Some time in March this year was received at Weymouth Custom House for export to Jersey a package containing 100 lbs. of a substance bearing the above appellation, and purporting to be a variety of tea.

Its unusual appearance at once aroused the suspicions of the "authorities," who ordered it to be detained for inquiry. A portion having been sent to the London Custom House for report, an answer was returned *that the substance was really tea, and must therefore be allowed to pass*; that it was not the leaf of the tea plant, but the pollen of its flower; that it was of rare occurrence in the market, and was obtained indirectly by sweeping and screening the dusty matters that collect on the extensive floors, where in China teas in large quantity are "bulked." Mr. Groves, thereupon, determined on making a few inquiries respecting its origin, nature and properties; and learned that it was purchased in London of a well-known firm of brokers in Crutched Friars.

That it was not the pollen of the tea flower, or of any other flower, was evident to the naked eye. It proved on submitting it to the microscope to be composed of simple unicellular vegetable hairs, mixed with small fragments of tea leaves, together with sand, and probably other extraneous substances.

Inquiries were made at Kew and elsewhere, and by actual comparisons the fact was established that the pekoe flower was really the hair of the leaf buds of the tea plant.

The analysis showed that the extractive or tea principle was only 14 per cent., against 34 per cent. in real tea, while the silicious matter, *vulgo* sand, was ·13 per cent., against ·30 in the genuine article. Almost all the extractive which it contained were the produce of pieces of broken tea leaves which had become mixed with it, and the whole product was simply the sweeping of lofts from which every grain of real tea had been carefully winnowed.

Nevertheless, the Custom House authorities were quite willing that it should be sold to the unwary and unhappy consumer for "Pekoe."

Statistics of Deaths from Anæsthetics.

The Surgical Society of Paris has recently discussed the question relative to the best kind of anæsthetic to be employed in dental surgery. The general opinion inclined to the choice of protoxide of nitrogen (laughing gas) in preference to chloroform or ether. In support of this choice the following statistics were cited:—Causes of death—Chloroform, 5·3 in 152; ether 4 in 92; protoxide, 3 in 300.

We "demur to these statistics." The mortality from ether is not, in British hands, as it is represented by the Society, and we know that the nitrous oxide is said by its advocates never to have caused a death.

An Habitual Drunkard.

One of the weekly papers observes that the Society for Promoting Legislation for the Control and Cure of Habitual Drunkards, which has just held its inaugural meeting, is not likely to languish for want of "awful examples." On the morrow of its inauguration a case of dipsomania of the most deplorable kind, in which all the common consequences of intoxication in women were illustrated, came before the magistrate at Greenwich Police court. Elizabeth Perrett has a home, a respectable husband, and a grown-up daughter. In consequence of her incurable drunkenness the home and family are made miserable, and kept in constant peril of violence. At length her daughter is compelled to charge her at a police-court with an assault; and her husband reluctantly stands forward to bear witness against her. He says she has stripped his house, and pawned everything to buy drink. The landlord of the house, in corroboration, testified that Elizabeth Perrett had been drunk fifty consecutive days! The magistrate felt bound to protect husband and daughter against this incurable drunkard; and he required her to find a surety in £10 for her good conduct during three months—advising the husband, at the same time, not to be the surety. So Elizabeth Perrett was carried away to prison. The husband observed that it was impossible to continue to live with her, and that he should be glad if she could be sent to the workhouse, and he would pay for her support there.

This is a good example of cases that are constantly coming under the notice of our magistrates. Our contemporary calls it a case of dipsomania, but we are rather disposed to call the drunkenness of this woman a vicious and criminal habit. At all events it is a case which shows how careful we should be in using the term dipsomaniac. Had this woman committed a great crime instead of a common assault, no one would have thought of acquitting her of all responsibility on the plea that she was suffering from disease, and whether this so-called "dipsomania" can be truly regarded as a form of insanity is a question that requires very grave consideration. But whether we call such an instance of habitual drunkenness a vice, a habit, or a disease, few will question the propriety of urging the Government to adopt some measure by which such persons could be removed to some place where they could be lawfully detained until they are cured. How far such cases are amenable to curative treatment remains to be proved. Still, the trial should be made. No doubt, nothing less than confinement in a reformatory for two or three years would be sufficient to cure Mrs. Perrett of her drunken habits. Short terms of imprisonment in such cases are simply useless.

We understand that it is intended to increase the medical staff of the Mater Misericordiæ Hospital by the addition of a physician; the appointment will be shortly announced.

The London Medical Societies.

THE London Medical Societies will this month be in full session. The Obstetrical Society was the first to commence on Wednesday last. The Royal Medical Chirurgical Society held its initiatory meeting last evening. The Clinical commences on Friday evening, the Pathological on Tuesday week, the Harveian on Thursday week, and the Medical Microscopical on the following Friday. The delivery of the Lettsomian Lectures at the Medical Society devolves on Dr. Wiltshire, whose subject is "Vascular Rhythm as Exemplified in Periodical Hæmorrhages, General and Local; and on the Treatment of Hæmorrhages of the Female Generative Organs."

The New Edition of the "Pharmacopœia."

THE preparation of the new edition of the "Pharmacopœia" is progressing under the editorship of the Pharmacopœia committee, and specially of Dr. Richard Quain, the chairman, and Prof. Redwood. Under the arrangements which have been resolved upon the work will hardly deserve the title of a new edition, for it will be a verbatim reprint of the book as it now stands, saving the correction of a few patent errors of typography and phraseology. No effective attempt is being made to revise objectionable formulæ, of which the work contains not a few; and not even will the "Additions" which were appended to the edition of 1867 be incorporated in the body of the work but will be reprinted in the present supplemental form. Seeing that the Council has made a clear profit of £558, and that an editor is paid for the work of revision, it seems to us that something more in the way of improvement in the standard medicine book of the United Kingdom might reasonably be expected. In ten years the Council has got rid of no less than 29,000 copies of the work, and is still selling it at the rate of 1,000 annually, and the public has a right to expect from it as much as our reviewers would expect from a private author, that the work should be, as nearly as possibly, quite perfect, and that when once made thoroughly reliable it should not be again altered or re-issued, unless for the insertion of well-approved and tested remedies. Ten years will be a short enough period of probation for new medicines, especially as their omission from the "Pharmacopœia" for a time will not prevent them being used as largely as may be desired by those who approve of them.

Registry of Druggists in Ireland.

THE Irish Pharmaceutical Council had a meeting last week at which a resolution was adopted that the Council should take steps to obtain power to license druggists to sell poisons in Ireland but not to dispense medicines. It will be recollected that at the first organisation of the Society a proposition was made to constitute a grade of chemists and druggists subordinate to the pharmaceutical chemist, but permitted to dispense prescriptions. The influence of the Apothecaries' Hall whose licentiates had, hitherto, held a monopoly of pharmaceutical functions defeated this effort though the Irish Government was favourable to it, and though the necessities of the country plainly demanded the creation of such a class.

The Irish pharmaceutical licence is now in a very anomalous position. It is neither of a high enough standard to give it any scientific character, nor of a cheap enough character to make it attainable by the village dispenser, and if the Council persists in its intention not to allow druggists to dispense, the provincial parts of Ireland must continue to be unsupplied with competent non-practising pharmaceutists.

The Factory Act.

NOT long ago we called attention to the hard work and late hours enforced upon many shop-women, dressmakers, and the like; but how difficult it is to proceed against the parties who infringe the Factory Act, appears from a letter which has been addressed to the *Echo*. "For some time past," says the writer, "I have noticed a dressmaker in Islington working illegal hours, and, as it was continued and the inspectors did not find it out, I wrote to Alexander Redgrave, Esq., the head inspector. That gentleman said it should receive immediate attention; but after waiting near three weeks I wrote again, and received answer that if I would send the precise points of which I had to complain, he could make further inquiry. I complied; the inquiry was made, and it was found that the Act had been infringed. I have Mr. Redgrave's writing to that effect. I wrote again to know if he intended to prosecute; but he would not; it had been compromised. The reply I got from Mr. Redgrave was, "The mode of dealing with such cases is determined by myself."

The Vacant Chair of Practice of Physic at the University of Edinburgh.

WE understand that Dr. George William Balfour is a candidate for the above honourable post. Nor are there many whose claims upon the attention of the Curators of the Edinburgh University will be greater than those which Dr. Balfour has put in. Dr. Balfour is a graduate of the University of St. Andrews', and a Fellow of the Royal College of Physicians of Edinburgh, one of the Physicians to, and lecturer on Clinical Medicine, at the Royal Infirmary, Edinburgh; and one of the Examiners in Medicine at the Edinburgh Royal College of Physicians; as well as to the University of St. Andrews. Dr. Balfour's contributions to medical literature have been numerous, but he is best known by his "Introductories to the Study of Medicine," and his "Clinical Lectures on Diseases of the Heart and Aorta." He has also very ably translated and edited for the Sydenham Society, "Casper's Handbook of Forensic Medicine"; and an article from his pen on "Diseases of the Pericardium," will shortly appear in Dr. Quain's forthcoming "Dictionary of Medicine." Dr. Balfour's contributions to our periodical literature, many of which appeared in the MEDICAL PRESS AND CIRCULAR, have also been very favourably received by the profession and we have no doubt but that his literary reputations and his experience as a clinical teacher may greatly contribute to the success of his present candidature.

THE death-rate of Dublin and its suburbs for the week before last was as high as 23·8 per 1,000 of the population, while that of London was only 18·4 per 1,000, of Edinburgh 16·0, and of unhealthy Glasgow, only 19·6.

The Medical Element on the Local Government Board for Ireland.

The Irish Local Government Board give utterance in their official report to a self-congratulatory enunciation respecting the circular letter which they issued to all sanitary authorities in Ireland, accompanying a copy of the report of the medical officer of the English Local Government Board, which report detailed the experience of the English branch for a period of five years past, in regard to the causes of filth diseases and to their prevention. "We have," say the Irish Board, "in this country, no corresponding means of inquiry, our medical inspectors being, like the other inspectors, confined to administrative functions altogether; and we therefore thought it desirable to distribute as many copies of that most valuable report as we could prevail upon the Lords Commissioners of Her Majesty's Treasury to permit the Stationery Office to supply us with. Upon the whole we obtained for this purpose 220 copies, which enabled us to supply one copy to each of the 203 sanitary authorities, and to reserve for our own use a supply of 17 copies, hoping by such means to promote a knowledge and consideration of the important results obtained from the researches of the English medical inspectors. We are enabled to say that the report so distributed has been received with satisfaction, and is likely to be of much practical benefit. We should have been glad to have sent a separate copy to each of the sanitary officers in Ireland, that is, to each medical officer of a dispensary district."

It must, we imagine, have cost the Board no slight a pang of humiliation to confirm this paragraph of their report, for it contains very unpleasant admissions of subordination and inferiority to the English department. If the public belief be not mistaken, the Irish Board which bewails the fact that it has "no corresponding means of medical inquiry" to that possessed by the English Board has long been devoted in its policy to the extinction of the medical element which it does possess. It took powers a few years ago to oust its medical inspectors and appoint laymen in their stead, and its most influential member on the recent occasion of the appointment of Dr. Croker King as Medical Inspector, was active in the effort to substitute a non-medical man, and might have succeeded but for the protests of the colleges and of the Irish Medical Association, to whose notice the job was brought by ourselves. The story of the 220 copies of the English letter is discreditable to a great department, and respecting it no more need be said.

The School Board and the Blind, and Deaf and Dumb.

The *Times* last week, in a leader on the past work of the School Board of London, betrays unusual ignorance on the question of existing means for the education of blind, and deaf and dumb children. On more than one occasion we have pointed out the helpless and neglected condition of the children of these afflicted classes, (*a*) and directed public attention to the several Acts of Parliament passed in their favour. Withal, how much remains to be done, either by voluntary means or compulsory, or by both? The hands of the School Board have lately been much strengthened by the legislation of last Session, and in a direction which we indicated, and expected would be much for the advantage of the afflicted classes of children. It was high time the managers of School Boards saw fit to put enactments into force, and apply them to the relief and educational wants of the sadly neglected blind and deaf and dumb children. As to the work of charitable societies, which the *Times* thinks might be left to pursue the even tenure of the way, we have already shown that they are incapable of dealing with a tenth part of these afflicted classes; and, moreover, it will be observed that each is acting for and by itself, and without united action, and on no fixed principles. They have hitherto shown themselves scarcely capable of being moulded and adjusted to the wants of the classes with which they profess to deal. It is, therefore, the more incumbent on the School Board, or at least some independent body, to undertake the work they have so ill-performed, and educate the blind and deaf and dumb children, and make them useful and productive members of society. But chiefly owing to the apathy or ignorance of the several benevolent agencies at work, hundreds of blind and deaf and dumb children are growing up in ignorance, to be a burden on the ratepayers; and although some of them at the present moment are provided for and maintained by special charities, or in our workhouses, they are for the most part left without those absolute necessaries of civilised life—*education and suitable training.* The *Times* thinks it unwise on the part of the School Board to step in between voluntary agencies and the ratepayers, but will not the ratepayers in the end be the gainers by the movement? Expenditure on the education of the blind and the deaf and dumb will diminish pauperism. In proportion as we are successful in lifting these classes from the depths of misery and dependence in which they at present exist, so shall we reap our reward in reducing pauperism and crime, and by an extra expenditure incurred the ratepayers will be eventually rewarded by a diminution of rates. Of the seven or eight hundred destitute blind and deaf and dumb children in this metropolis, not half of them can be traced to any of the existing charitable institutions, while the rest are thrust aside in our dark corners, scarcely cared for as human beings. The existing provision for blind children under fifteen years of age may be taken to be as follows:—

In Poor-law Institutions	16
Indigent Blind School	80
Blind Visiting Society (not given) ...	—
Blind Institution, Avenue Road ...	33
School Boards (about)	40
Ordinary Schools	15
Total	184

As against upwards of three hundred indigent blind.

The educational requirements of the deaf and dumb are even in a more neglected state, and of the six charities maintained by the benevolent for their relief—one of which has an income of upwards of ten thousand a-year—only about three hundred children are distributed among them. The youngest and most praiseworthy, the Association for Oral Teaching of the Deaf and Dumb, in Fitzroy

---

(*a*) See Medical Press and Circular, March 1 and April 26.

Square, efficiently instructs fifty boys and girls. It has been shown by this method (lip teaching) that the deaf and dumb can take their places by the side of other children, read the same books, and receive instruction from the same teachers, and therefore there is no longer any excuse to be urged on the score of additional expense, and no class of the community so much require good and efficient instruction while they are young. Blind children can equally take their places in the School Board schools, and every encouragement should be given to the laudable endeavour to bring them all into the fold. We learn from the last report it has already succeeded in rescuing from the gutter and the workhouse no less than eighty-two of the deaf and dumb and blind children, and at an age when teaching is most required, and will effect the greatest amount of good. The task of instructing the afflicted classes is clearly beyond the efforts of private charity, and we cannot afford to allow the beneficent Acts of the Legislature to remain any longer a dead letter. It is not enough to seek to ameliorate the physical wants of the blind and deaf and dumb, as they, above all other classes, require mental culture, as well as domestic and social intercourse with their fellow-creatures.

The Fothergillian Gold Medal of the Medical Society of London, value twenty guineas, has been offered for the year 1877 and 1878. The subject selected for competition is on "Pyæmia;" in March, 1878, on "The Antagonistic Action of Therapeutic Agents."

Precautions have been taken in connection with the visit of the Duke of Connaught to Dublin, to make sure that the water-supply of His Royal Highness's quarters at the Royal Barracks is perfectly pure. Instructed by Sir Howard Elphinstone, Surgeon-Major Ramsay, who is attached to the 60th Rifles, and Professor Cameron, have analysed the supply, and reported to Sir William Jenner that the water is of the purest quality as it leaves the Vartry reservoir.

The new and enlarged buildings of the Bristol Royal Infirmary were opened last week just in time to receive a terrible contingent of patients, numbering twenty-five, from an accident at a neighbouring factory. Fortunately for the sufferers the whole of the beds were unoccupied, and the staff were enabled to proceed with each case without difficulty. Three of the injured men died either before or immediately on admission, and many of the others are in a precarious state.

The notorious quack "Dr. Khan" who left this country some four or five years since with, it was currently reported, a fortune of £40,000, has again honoured England with his presence. Since his departure his wax-work museum has been closed by the police and the filthy models destroyed. Notwithstanding the earnest protestations of the medical press and the profession against the laxity of our laws, this vagabond meets with no more opposition than formerly; and has quietly settled down in the neighbourhood of King's Cross, to practise upon the credulity and weakness of those victims whom our laws are insufficient to protect.

Is it true, as currently reported in the Irish military-medical circles, that several of Mr. Gathorne Hardy's thirty-three, for whose accommodation the standard of the Army Medical Competitive was lowered last August, backed out after their examination had been passed, and, instead of going to Netley, returned home to look for a more attractive and lucrative berth than Her Majesty's Military Service? Although we have the statement on good authority, we hesitate to give credit to it, knowing that the thirty-three were not the sort of gentlemen likely to be punctilious about social position or likely to command a remunerative market for their services elsewhere. Probably an emigrant ship, that *refugium peccatorum* of the Bob Sawyers of our day would be the only alternative open to one of the rejected of the Army Medical Service.

The Irish Local Government Board seem to be easily satisfied with sanitary progress in their dominion, for they congratulate themselves with great warmth on the fact that the payment of the sanitary salaries is nowhere now resisted, and the expenditure on this head in the year ended September 29th, 1875, in both classes of sanitary districts, viz., the urban and rural, was £24,758, in aid of which £12,172 has already been recouped by the Treasury in accordance with the provisions of the 10th section of the Act.

During the same period the sanitary authorities have, for the most part, been discharging their duties satisfactorily and with great benefit to the population situate within their respective districts, the rural authorities alone having expended on sanitary purposes, apart from salaries, in the course of the year, £10,490 for supply of water, improvement of the sewerage, and for the removal of nuisances.

A corresponding degree of activity has been shown by the urban authorities, more especially in the larger class of towns, which most readily avail themselves of such assistance as it is in the power of the Local Government Board to afford them.

◆

Literature.

HAY-FEVER, OR SUMMER CATARRH. (a)

Hay-Fever seems to prevail more extensively in America than it does in this country. According to Dr. Beard, there are in the United States not less than twenty-five thousand persons who suffer from hay-fever in one or both of its phases — the asthmatical and the catarrhal. In that country the disorder shows itself at three different periods; in the first, which corresponds to that of the English hay-fever, the attack commences in May or June, and is termed "Rose cold," or "June cold." The second form of attack, which the author believes he is the first to describe, commences in July, and is by him termed "July cold." The third, which had been previously described by Dr. Wyman (of Cambridge, Mass.), comes on in August or September, and is called by the latter author

---

(a) "Hay Fever, or Summer Catarrh: its Nature and Treatment; including the early form or 'Rose Cold,' the later form or 'Autumnal Catarrh," and the middle form or 'July Cold,' hitherto undescribed." By George M. Beard, A.M., M.D., &c. London: Sampson Low, Marston, Searle, and Rivington. New York: Harper and Brothers.

"an autumnal catarrh." Though appearing at different times, these three phases of the malady are considered to be one and the same disorder, and due to the same causes.

So extensively does the disease pervade many of the Northern States that it has been thought well to form an association among those who are troubled with the malady for the purpose of collecting and diffusing information upon it. Dr. Beard looks upon the disorder as being largely, if not entirely, dependent upon a peculiar condition of the nervous system, which renders the respiratory tract and some other portions of the mucous membranes highly susceptible to the influence of a large number of external stimuli. This condition of the nervous system he considers will justify us in placing the disorder among the neuroses. In respect to the large number of exciting—or, as the author terms them, secondary and tertiary—causes to which hay-fever is said to be due, he differs very materially from Dr. Blackley, of Manchester, who, after a long course of experimental research, came to the conclusion that the principal, and probably the only, exciting cause of hay-fever is the pollen which floats in the atmosphere.

Upon the various phases of the malady as it exists in America, the author has collected a large amount of information by means of a series of questions furnished to, and answered by, hay-fever patients. In this he has followed the plan previously adopted by Professor Phœbus, of Giessen, and by Dr. Blackley. The list comprises fifty-two questions on a variety of details, some of which have no special relation to hay-fever. Some of the queries refer to the time of life at which the disease came on, to sex, occupation, condition—whether married or single—hereditary character of the complaint, tendency to other forms of disease in the patient or in his family, symptoms of the disorder and peculiarities of the attacks. One of the most important questions is that which inquires into the exciting causes of the disorder in each case. The patient is asked to say which in the following list of causes, in his opinion, brings on the attack :—Cinders ? Out-door dust ? In-door dust ? Roses ? Other fragrant flowers ? Fresh hay ? Old hay ? Smoke ? Gases ? Foul air ? Pollen of corn ? Bright sunlight ? Bright gaslight ? Camphor ? Night air ? Perfumes of any kind ? Over exertion ? Brimstone matches ? Indigestion ? Romanworm wood ? Other causes not specified ? The remaining questions relate principally to circumstances which seem to influence the disorder in various ways ; such as, for instance, the time of day at which the attack comes on ; the influence of atmospheric conditions in modifying the character of the attacks, and particularly on the change produced by a removal from a catarrhal to a non-catarrhal region. In the course of the work the statistics of two hundred cases are given, the effects of treatment are inquired into, and finally some particulars of a number of illustrative cases are given. These are mostly given in the words of the sufferers themselves, and often in a very graphic and interesting manner.

Dr. Beard's treatment of hay-fever is preventive, curative, and palliative. As he believes the disorder is not due to any one cause, so he does not believe that any single specific will ever be found for it, and so far as we can judge by the account given of treatment, it is, in his hands, mainly palliative, unless we consider the sending of the patient beyond the reach of the cause as treatment in the proper sense of the term.

The best means of preventing the disorder in any one season is a sea voyage. In this the author follows the opinion held by every previous writer on hay-fever, except perhaps Bostock. A residence in a mountainous region is also an excellent means of escape from the annual trouble (but some of these elevated regions are said not to be as efficacious as others at the same altitude). Much useful information on this point is given by the author. As a rule, however, the higher the region the greater the immunity. A residence at the sea-side is an lmost perfect safeguard, so long as a sea breeze is blowing, but the moment a land wind begins to blow, the attacks may commence.

The experiments of Dr. Blackley are cited to show that the air of cities contains far less pollen than the air of the neighbouring country, and that for this reason "a certain proportion of the cases are benefited by spending the season of their annual visitation in the centre of some large city."

The medicinal treatment of hay-fever consists in the administration of a great variety of drugs, and in topical applications. Among these quinine takes, in the estimation of the author, a foremost place, and should he thinks be administered in full doses, for several weeks, before the time of the attack.

Arsenic, in the shape of Fowler's solution, also holds a high rank as a prophylactic, and is usually given in combination with belladonna. Alcohol, in the form of whiskey, is recommended to procure sleep, but only during the time of the attack; "but there are," the author says, "some persons who will get no good, and sometimes positive injury, from the use of whiskey."

"Electricity, in the form of the galvanic current, centrally and locally applied, has proved of immediate and most grateful service in two cases" in which the author has tried it.

Other remedies which are recommended on theoretical grounds, but have not as yet been tried to any considerable extent, are strychnine and iron, phosphorus and cod-liver oil, Turkish and Russian baths, the hypodermic injection of opium, camphor mixture (cold powder). Bromide of potassium, with hydrate of chloral, is recommended to produce sleep. Iodide of potassium is considered worthy of a trial, as an old remedy for asthma. Aconite, digitalis, veratrum and gelsemin, "are all, under the advice of a physician worthy of a trial, especially aconite." Of that drug the author observes that "Dr. Ringer remarks that we are just beginning to know the value of aconite."

Amongst other external remedies a trial of which is recommended, are guarana, caffeine, muriate of ammonia, prussic acid, nitrate of amyl, iodoform, ergot, ipecacuhana, ether, or chloroform—by inhalation ; apocynum andromifolium and grindelia robusta.

For local application various solutions are recommended in the form of injection or inhalation; for a knowledge of the ingredients and proportions in each of these we must refer our readers to the author's work.

(To be continued.)

◆

IRISH PEDIGREES. (*a*)

Mr. O'Hart's book is one which we can hardly undertake to review in the accurate sense of the word, for no criticism is open to us in regard to its contents, inasmuch as being entirely incapable of verifying any of the statements it contains, we must take the work on the authority of the author, and content ourselves with noticing its object and character. The Irish Pedigrees of which Mr. O'Hart gives us an account of, are those of the old Septs, classes and families, many of whom have almost disappeared, and he follows these families back in most cases to their origin, in one or other of the ancient Irish kings, and through them, again, further even to Adam.

When we say that the Milesian line of kings alone comprised 183 monarchs, commenced their rule 1,700 years before Christ, and ended it in the year A.D. 1166, the magnitude of the task of tracing the ancestry of each great Irish family may be readily conceived. The research necessary in the compilation of the book must have been therefore very great, and the result seems to us very creditable to Mr. O'Hart, and of great interest to Irish readers

---

(*a*) "Irish Pedigrees, or the Origin and Stem of the Irish Nation." By John O'Hart, Associate in Arts, Q.U.I., author of "The Last Princes of Tara," &c., Dublin : McGlashan and Gill. Royal 8vo., pp., 411.

and historians. Without entering at any length into an investigation which is foreign to the purposes of a medical journal, we may observe that, the author traces the genealogical descent of the old Irish families from Adam to Noah and his son Japhet, and through *his* son Magog (from whom descended the Parthians, Bactrians, and Amazons, to Bartholinus, the first planter of Ireland, 300 years after the Flood. The Nemedians who arose from this Bartholinus occupied Ireland for 270 years, and were displaced by the Tua-de-Danains, who possessed the country for 197 years and gave place at the end of that time to the Gathelian, Milesian, or Scottish nation, whose descendants remained as Ireland's rulers for 2,885 years, until the conquest of the country by England. Milesius was the grandson of Breoghan or Brigus, who was the 22nd generation from Japhet and who colonised Spain, where his name is perpetuated in the city of Braganza in Portugal. His grandson, Milesius, was the Alexander of his day, and acquired world-wide distinction as a general, a king, and a diplomatist. Having defeated the Scythians, he was created a general by Pharaoh Nectonibus, the king of Egypt, and, in his service, reduced the king of Ethiopia to subjection. He then returned to his own country, Spain, which he found harassed and overrun by strangers, with whom he engaged in warfare and defeated in fifty-four battles, and finally drove them all out of his country. Shortly afterwards —to comply with a Druidical prophesy, to the effect that his family should ultimately settle in a western kingdom—he sent his uncle Ithe or Ithius on an exploring expedition, and he, arriving at Ireland, landed in Munster. In Ireland, the Milesians were hospitably entertained by the reigning king and allowed to depart, but their too-enthusiastic praises of the country aroused the suspicions of their entertainers, who followed them on their departure, routed them in one engagement and killed Ithius. The son of the slain general having escaped to Spain, incited Milesius to revenge, and he forthwith despatched eight of his sons to Ireland to punish the slayers of his uncle. Out of the eight, five were lost in a storm which overtook the expedition, leaving three only, Heber, Heremon, and Amergin, who carried their victorious arms throughout Ireland and completely subjugated the country. The two brothers first named, governed Ireland jointly, and were the first Milesian kings of Ireland, and the pioneers of the race who held sway for 2,885 years, from the year of the world 3500 (the year after the founding of Solomon's temple) until the year of our Lord 1166, when Henry II. of England conquered the country. The foregoing sketch is the briefest epitome of the opening chapter of Mr. O'Hart's book, and from it, it may be conceived that much historic interest attaches to the work, and that it will well repay perusal on the part of any Irishman. The authority upon which Mr. O'Hart's history is founded is principally the "Annals of the Four Masters," a translation from extremely ancient Irish manuscripts, contained in the libraries of Trinity College and the Irish Academy, which manuscripts embody a circumstantial history of Ireland, from the earliest ages to the year A.D. 1616. The facts stated in the "Annals" having been amply corroborated by manuscripts of the same date, and these records have been therefore accepted by the most cautious archeologists as accurate and authentic. Mr. O'Hart's genealogical deductions are by no means mere speculations, but rather the records of facts, of which there exists good evidence. Mr. O'Hart is evidently an ardent student of the history of his country, and he has done much to create an interest in the subject by placing the outlines of that history within the reach of the dilletante and unlearned. The book is, on the whole, an interesting and valuable contribution to Irish historical literature, and creditable to its writer, to whom we wish success in his first effort of authorship.

The Journal of Psychological Medicine.

THIS journal, which was resuscitated about two years since by Dr. Lyttleton Forbes Winslow, promises to maintain the reputation it had many years since, when first started, under the able editorship of the late Dr. Forbes Winslow. The half-yearly part of the new series now before us is a portly volume of nearly 200 pages well turned out by the publishers, who have introduced an improvement upon previous parts by having the edges cut—a great boon to the busy physician. Dr. Winn's essay "On Nightmare and Dreaming" is a most interesting contribution to psychological knowledge. Of course it contains much which is necessarily theoretical, but there are suggestions and hints thrown out which we should be glad to see taken up by other investigators. The article on Skae's Classification of Mental Diseases is a most able and exhaustive *exposé* of the hollow and untenable theories propounded by the late Dr. Skae, which Dr. Crichton Browne, and other eminent authorities, have upset in the rudest and most complete fashion.

Drs. Davey, Boyd, Gairdner, Semple, and Treves also contribute to the present volume, and the now celebrated Bravo case is commented upon at length in its aspect with psychological science, and there is much other valuable matter, which we hope will be thoughtfully and attentively perused by those who are especially engaged in the treatment of the insane.

The Medical Students' Guide, by W. Douglas Hemming, M.R.C.S., is a reprint of the special number of the *Students' Journal*, which was originally compiled by that gentlemen, and now appears in pamphlet form. As the advice contained therein is intended specially for students, it will scarcely be expected that we should refer to it at length. Suffice it, that having taken a glance at its well-filled pages, and read several paragraphs, we are satisfied with its accuracy, and with the advice it gives.

◆

Correspondence.

VERDICTS BY INTUITION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Under the heading of "Verdicts by Intuition," I perceive you make some rather severe remarks on the proceedings connected with the inquest on the late apothecary of this Infirmary, but I think you must have been misled by the published reports which were by no means accurately given; you state "that he was under vexation or irritation from some alleged want of attention to him by the infirmary sub-officers." Now it was clearly proved at the inquest that he received the greatest kindness and attention from all the servants and officers in the house. His saying to the ward-maid who attended him shortly before his death, "that she would find him dead on her return," was a thing he had said so often before that no one paid any attention to it, and she would never have left him alone if she thought he intended making away with himself. The only grounds for supposing that he had taken a poisonous dose of prussic acid was the finding of an empty bottle of Scheele's prussic acid beside his bed on a chair with the stopper in it. I saw him in his bed in a quarter of an hour after his death, and he had not the slightest smell of it, nor was there any odour of it on a handkerchief which had been laid over his mouth, nor in the room. It then came out that before I saw him he had fallen on the floor at a distance of several yards from his bed, and, in fact, in another room (as his bedroom was partitioned off his sitting-room), he was taken up by some of the patients and carried into his bed. On searching in his room, we got six more bottles of prussic acid, 62 bottles of Hunter's solution of chloral all empty, besides bottles of aconite, digitalis, and several preparations of opium. He was subject to sudden attacks of spasm in different parts of his body. *None* of the three medical men (including myself) gave it as their opinion that he died from prussic acid, but we all agreed that his death was caused by spasm of the heart, as in his enfeebled condition from wretched habits it was very easy to cut the thread of life. The jury was one of the most respectable and intelligent I have ever seen any where, composed entirely of merchants and tradespeople, and some of them showed themselves very painstaking in cross-examining the witnesses. The coroner acted very properly in not ordering a post-mortem, as the jury thought it unnecessary, and so did the medical witnesses. I am one of those that think there should be an inquest in every case of sudden death, but I don't think it follows that in every case there should be a post-mortem.

I remain, dear Sir,
Yours truly,
R. Peyton, M.D.,
Oct. 6, 1876. Surgeon, Roscommon Infirmary.

[Our information was derived from the published newspaper report of the inquest, which was an extended one and apparently accurate in detail. All the sworn evidence as to the words and acts of the deceased previous to death, the finding of the empty prussic acid bottle, and the opinions of Dr. Harrison and Heily, were fully set out, and we had reason to accept it as correct. In any case, it cannot be denied that there was a most grave and reasonable suspicion that death resulted from poison, and that suspicion should have been resolved by a test examination of the viscera, and not by a search for bruises or a guess at the cause of death.—Ed. M. P. & C.]

◆

ILLEGAL PRACTITIONERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In an editorial paragraph in your Journal of this date, I notice the following passage: "Perhaps 'a Society for the Suppression of Illegal Practitioners' would not be amiss." Will you allow me to say that the Medical Defence Association (of which I enclose a copy of the rules and objects) has for one of its principal objects, "To suppress the practice of medicine and surgery by persons not legally qualified," and that the Association has already successfully prosecuted in a number of instances. With regret, it must be added that the medical corporations, instead of assisting the Association, have, in almost every case, thrown obstacles in its way. In one or two instances the fines which were inflicted have been left in the hands of the officers of the Court, the medical corporation declining to interfere in the matter, although the Defence Association could only prosecute in the name of the corporation concerned. This supineness and disregard of the interests of the profession on the part of the governing bodies is much to be regretted, and cripples the action of the Defence Association, throwing the whole expense of the prosecutions upon its members.

I am, Sir, your obedient servant,
Oct. 4, 1876. A Member of the Association.

Obituary.

ROBERT NORTON, M.D., M.R.C.P.

It is with deep regret that we announce the death of Dr. Robert Norton, for many years Chairman of the Court of Examiners of the Apothecaries Society. There are few members of our profession who have been more respected or whose loss will be more deeply lamented by their friends and professional colleagues.

There are many amongst us who have not the ambition, although they have the abilities, to rise to great eminence in their profession: but who amply compensate this indifference to fame by the skill and the integrity with which they fulfil the ordinary duties of a medical practitioner, by the deep and active interest they take in every thing that concerns the interests of the profession or the advancement of medical science, and by the markedly uniform and honourable conduct which characterises their intercourse with their professional brethren.

Such a man was the late Dr. Norton. We had the pleasure of his acquaintance for many years, and we can truly say that no one could long be in his company without recognising the sterling qualities both of heart and head which he possessed.

Not the least remarkable feature in his character was that of his being a thorough gentleman, not one of those men who are entitled to that appellation from the mere accident of birth, education, position, or wealth; but one whose kind consideration and sympathy for the feelings and wants of others, claimed for him the love and esteem of all who knew him.

In early life he was apprenticed to Mr. Wheeler, of St. Bartholomew's Hospital, and was a favoured pupil and house surgeon of Abernethy.

The following interesting episode is a proof of the esteem in which he was held by that eminent surgeon. On paying the fees when appointed to the House Surgeoncy Abernethy enclosed with the receipt the sum which had been handed over, adding a sharp and gratifying remark to the effect that he had well invested the money. Their intimate friendship ceased only with the death of the great surgeon.

Dr. Norton started life in London, where his skill as a practical surgeon would have no doubt soon brought him to the front, for he had scarcely entered into practice when opportunities occurring, he performed most of the capital operations and thus soon gained for himself a very lucrative practice. Ill-health however, brought about by a *post-mortem* wound, obliged him to retire from active employment, and he then travelled as medical attendant with the Earl of Sefton and his family, and afterwards settled for a time in country practice in the town of Uxbridge. He was here enabled without neglecting his duties, to enjoy that recreation to which he had been accustomed from a child, and for some years was well known in the hunting field. Again returning to London in 1840, he became appointed a member of the Court of Examiners of the Society of Apothecaries, and shortly afterwards, in association with Dr. William Jones, established the Samaritan Free Hospital for Women and Children.

He never again occupied himself in extensive practice, but taking the Memberhip of the College of Physicians, he contented himself with a small consulting practice in a western suburb, where he at once gained no small reputation as a practical obstetrician. His name, however, will long be remembered as an active and valued member of the Court of Examiners of the Society of Apothecaries for nearly thirty-five years. Of the manner in which he fulfilled the duties imposed upon him, first as an examiner, and afterwards as the chairman of that Court, can be easily imagined from what we have already said, of the zeal and devotion that he showed on all occasions in which the interests of the profession and the cause of medical education were concerned. What the Society of Apothecaries has done towards the advancement of medical education is well known to all of us, and has been very generally acknowledged. But it must not be forgotten that this good result was in a great measure attained through the exertions of the Court of Examiners and by the Society selecting such men as the gentleman whose death it is now our sad duty to record.

During all the years he was on the Court he was scarcely ever absent from his post, and the great respect and esteem in which he was held by his colleagues will be amongst the most pleasing recollections of his career.

He died on the 20th of September of acute pleurisy, after a few days' illness, in the 75th year of his age.

Vital Statistics.—From the Registrar-General's report we learn that during last week 5538 births and 3033 deaths were registered in London and twenty-two other large towns of the United Kingdom. The mortality from all causes was at the average rate of 20 deaths annually in every 1000 persons living. The annual death-rate was 16 per 1000 in Edinburgh, 24 in Dublin, 20 in Glasgow, and 18 in London. The rates of mortality during the same period in the other large towns were—Bradford 18, Norwich 19, Brighton 20, Wolverhampton 21, Birmingham 19, Sunderland 16, Portsmouth 15, Sheffield 21, Plymouth 18 Nottingham 18, Liverpool 24, Bristol 19, Leicester 23, Oldham 23, Newcastle-upon-Tyne 15, Hull 22, Manchester 25, Salford 29, and Leeds 20. The annual death-rate from the seven principal zymotic diseases averaged 3·1 per 1000 in these towns, and ranged from 0·8 and 1·3 in Newcastle-upon-Tyne and Bristol, to 6·3 and 7·5 in Sheffield and Salford. The 9 fatal cases of scarlet fever in Portsmouth showed a further decline from the numbers in the two preceding weeks, but were equal to annual rate of 4 per 1000, and raised the deaths from this disease since the beginning of the year to 326. Small-pox caused 15 deaths in London, 9 in Manchester and Salford, and 12 in Liverpool.

The Death-rate in Foreign Cities.— The annual rates of mortality, according to the most recent weekly returns to the Registrar-General, were :—Calcutta 25 per 1,000 of the population, Bombay 25, Madras 37, Paris 23, Brussels 22, Amsterdam 18, Rotterdam 26, The Hague 32, Copenhagen, 25, Stockholm 25, Christiania 20, Berlin 32, Breslau 28, Munich 33, Vienna 24, Buda-Pesth 35, Rome 25, Naples 27, Turin 19, Alexandria 53 ; New York 25, Brooklyn 21, Philadelphia 20, and Boston 23. Enteric fever caused 59 deaths in Paris, against numbers declining from 87 to 61 in the six preceding weeks. Cholera caused 71 deaths in Madras and 24 in Bombay.

◆

DINNER TO THE REPRESENTATIVES OF MEDICINE AND SCIENCE BY THE LORD MAYOR OF DUBLIN.

Dr. G. B. Owens, the Lord Mayor of Dublin, entertained the leading members of his profession at a banquet in the Mansion House, on Tuesday the 3rd inst. Amongst those who availed themselves of his Lordship's invitation were—the Presidents and Vice-Presidents of the Royal Colleges of Surgeons and Physicians ; the Registrar-General, Dr. Burke ; the Reverend Professor Galbraith ; Dr. Andrews, President of the British Association ; Mr. Lentaigne ; the Inspector of Irish prisons ; Dr. Macnamara, Representative of the College of Surgeons in the Medical Council ; Dr. Nugent, Inspector of Irish Lunatic Asylums ; Dr. Croker-King, Medical Commissioner of the Local Government Board ; Dr. O'Flaherty, Governor of the Apothecaries Hall ; Mr. Porter, Surgeon to the Queen in Ireland ; Dr. O'Learey, M.P. ; Mr. Scott, *Evening Mail ;* Dr. Jacob, Medical Press and Circular ; Mr. Henry, Wilson ; Dr. Croly ; Dr. McDowel ; and about sixty of the most noted practitioners of Dublin and its vicinity. After dinner, and the usual loyal toasts having been drunk, the Lord Mayor proposed successively the toasts of the Royal College of Surgeons, the College of Surgeons, the University of Dublin, the British Association, and the Press. The entertainment was in all respects worthy of the Lord Mayor's well-known hospitality, and a gratifying demonstration of his regard and respect for the members of his own profession.

◆

GUM-BOILS.

Mr. Bickersteth, in his clinical lecture to the students attending the Liverpool Infirmary (*Students' Journal and Hospital Gazette*, July 15*th*, 1876, page 176), made some interesting remarks upon the subject of "gum-boils." The reporter very truly remarks that, as long as practitioners are at home in the minor operations, the major will take care of themselves, and that, therefore, the more practical the teaching of students the more beneficial its results. Mr. Bickersteth ascribes as the cause of gum-boils the almost invariable existence of decayed teeth. He warned the students that they must frequently take prompt measures to prevent the abscess opening externally, thus disfiguring the appearance of the sufferer's face.

It has been my own lot to see about half-a-dozen cases in which disfiguration had been allowed to take place owing to the want of proper treatment. As soon as feasible, the abscess should be opened internally, into the cavity of the mouth. Mr. Bickersteth warned his hearers that it was not sufficient to make an incision into the abscess, but that a portion of the soft wall of the tumour should be taken away by means of a scalpel and forceps. When all swelling has subsided, the offending teeth should be removed. He pointed out the falsity of the idea, that these abscesses were formed inside the "antrum" in the superior maxilla.

AN EASY METHOD TO REMOVE THE MUCUS ADHERENT TO THE NECK OF THE UTERUS.

Professor Pagot (*Annales de Gynécologie*) recommends the following simple process to effect what is often a very serious difficulty to those who have to deal with diseases of this organ :

Soak a pencil of charpie in the yelk of a new, fresh egg, and mix it well with the mucus for some seconds ; syringe the parts through the speculum with water, continuing to work the charpie about softly. Then allow the water to drain away, dry the neck of the womb, and the parts are found to be perfectly clean.

◆

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Subscribers who have not yet sent in their subscriptions for last year are respectfully reminded of the omission.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

The Right Hon. Edward S. Gordon, Parliamentary Representative in the House of Commons of the Universities of Glasgow and Aberdeen, having been appointed one of the Lords of Appeal under the new Apellate Jurisdiction Act, has issued an address of thanks to the electors on yielding up the trust confided to him, which will be found on reference to our advertising colums.

Mr. Croly.—Proof of your communication will reach you before its appearance in the journal.

Dr. Milner Fothergill will read a paper on "Anhydrotics" at the first meeting of the Harveian Society on Thursday, the 19th inst.

A Bulgarian Atrocity.—Our smart little contemporary *The Students' Journal*, of Saturday last, contains the following poetical effusion of a correspondent which the editor aptly terms an atrocity :—

"Still are the warrior's muscles,
Congealed alas ! his chyle ;
No more in hostile tussels
Will he excite his bile.
Dry is the epidermis,
A vein no longer bleeds ;
And the communis vermis
Upon the warrior feeds.

"Compressed, alas, the thorax,
That throbbed with joy or pain,
Not e'en a dose of borax
Could make it throb again.
Dried up the warrior's throat is,
All shattered too his head ;
Still is the epiglottis :
The warrior is dead."

Dr. A. B.—The subject was noticed in our last ; we cannot revert to it as it is not one of sufficient general interest.

Ant.—Your diligence ought to earn something substantial.

VACANCIES.

Metropolitan Fire Brigade.—Medical Officer for the Central District north of the Thames. Remuneration at the rate of £1 per man per annum in the force of the said district. For full particulars see Advt.

University of Durham.—Lectureship in Materia Medica and Therapeutics. Applications to the Secretary, Newcastle-on-Tyne.

Lancaster Infirmary.—House Surgeon. Salary, £125, with board. Applications, with testimonials, to the President at the Infirmary.

Hospital for Sick Children, Great Ormond Street, London.—Medical Registrar. An Honorarium of fifty guineas is voted at the end of the year. Address the Secretary. (See Advt.)

Leicester Friendly Societies' Medical Association.—Assistant Medical Officer. Address, stating salary required, Mr. Wright, Humberstone Gate, Leicester.

Leeds Public Dispensary.—Assistant Resident Medical Officer. Salary, £80, with board. Applicants must address Mr. McGill, 23 Park Square.

Midland Counties Hospital for Incurables.—Medical Officer for Out-patients. Salary, 50 guineas, with board and residence. Applications to Mr. Winter at the Hospital, Leamington.

◆

APPOINTMENTS.

Cooper, W., M.R.C.S.E., Medical Officer and Public Vaccinator for the Lower Widnes District of the Prescot Union, Lancashire.

Dixon, J. D., M.R.C.S.E., Junior House Surgeon to the Newcastle-upon-Tyne Infirmary.

Eales, H., M.R.C.S.E., Honorary Medical Officer to the Birmingham and Midland Eye Hospital.

Elliott, C., M.D., Acting Physician to the Bristol Hospital for Sick Children and the Out-door Treatment of Women.

Hastings, G., M.D., L.R.C.P.L., Physician to the Westminster General Dispensary.

Jones, W. L., L.R.C.P.Ed., L.F.P.S.G., Medical Officer of Health for Western Sub-district of the Lladilofawr Rural Sanitary District.

Notter, J. L., M.D., L.R.C.S.I., Staff-Surgeon, Assistant-Professor of Military Hygiene at the Army Medical School.

Smith, G. J. M., M.B., C.M., M.R.C.S.E., Medical Officer and Public Vaccinator for No. 4 District of the Cuckfield Union, Sussex.

Army Medical Department.—Surgeon-General H. C. Foss has been appointed principal Medical Officer on the Staff in Ireland, vice Surgeon-General M'Ilhice, retired.

Deputy Surgeon-General J. Sinclair, M.D., has been appointed principal Medical Officer at Bermuda, in relief of Surgeon-General J. M'G. Grant, M.D., ordered to vacate on promotion.

◆

Birth.

Dolan.—On the 5th inst., at 32 North Parade, Halifax, the wife of Surgeon Dolan, of a daughter.

◆

Marriages.

MacDowell—Fishbourne.—On the 4th inst., at Castletown Church, Queen's County, Francis Victor MacDowell, M.D., of Providence Court, Queen's County, to Mary Josephine (May), eldest daughter of Joseph Fishbourne, J.P., Ashfield Hall, Queen's County.

Tuck—Manby.—On the 3rd inst., at the Parish Church, Seaford, Sussex, B. J. Tuck, J.P., M.R.C.S., &c., Mayor of Seaford, to Elizabeth Sarah, daughter of W. E. Manby, of Gable end House, Seaford, and Regent's Park, London.

Williams—Evans.—On the 4th inst., at the Parish Church, Wrexham, Joseph Llewelyn Williams, M.B., of Wrexham, to Margaret Rimmer, eldest daughter of Edward Evans, of Bronwylfa, Ruabon.

Wright—King.—On the 3rd inst., at Prestwich Church, Francis James Wright, M.D., of Northumberland House, Stoke Newington, to Charlotte Dundas, second daughter of the Rev. Richard King, of Prestwich.

◆

Deaths.

Fiske.—On Sept. 24, at Donhead, Wilts, John Fredk. Fiske, M.R.C.S.E., aged 38.

Grant.—On Sept. 28, at Hawick, John Grant, M.D.

Groome.—On Sept. 28, at Ore, Sussex, Leonard Groome, M.R.C.S.E., aged 47.

Macbeth.—On Sept. 27, at Ramsgate, John S. Macbeth, M.A., M.D., late of Brixton Road, London, aged 33.

Taylor.—On Sept. 28, at Heywood, Lancashire, Daniel Taylor, M.R.C.S.E., aged 42.

Tomkinson.—On Sept. 22, at Cheadle, Richard Tomkinson, M.R.C.S.E., aged 64.

Williams.—On Sept. 23, at Carmarthen, John Lewis Williams, M.R.C.S.E., aged 53.

GENERAL NURSING INSTITUTE for TRAINED HOSPITAL NURSES.

5 Henrietta Street, Covent Garden, W.C.

A. EBSWORTH, F.R.C.S., Director.

RESIDENT MEDICAL PUPIL (DUBLIN).—An M.D. Dub. Univ., and F.R.C.S.I., who is intimately acquainted with the method of medical education in Ireland, will receive a young gentleman to reside in his house, for whose education he will, if desired, make all arrangements. Apply by letter to SOCIUS, 23 Ely Place, Dublin.

TO PARENTS, GUARDIANS, and FIRST YEAR'S STUDENTS.

A Gentleman of long experience, Surgeon to a Dublin Hospital, and Teacher and Demonstrator in a large School of Medicine, continues to take Extern Pupils who are commencing the Profession, for the purpose of guiding and superintending their studies from beginning to end, including diplomas. Parents, &c., wishing for such supervision for their sons, which in all cases is found most useful, will get full particulars as to terms, &c., by directing to ALPHA-BETA, Medical Press Office, 23 Ely Place, Dublin.

THE HOSPITAL FOR SICK CHILDREN, 49 GREAT ORMOND STREET, LONDON, W.C.—Notice is hereby given that the office of MEDICAL REGISTRAR having become vacant, Candidates are invited to send in their applications and testimonials on or before Twelve o'clock on Thursday, October 12th. The appointment is made for one year, an honorarium of fifty guineas being voted at the expiration. Candidates must possess some legal qualification, and will be required to attend before the Joint Committees on the day of election. Oct. 12th, at half,past four o'clock precisely.

By order of the Committee,

S. WHITFORD, Secretary.

September 27th, 1876.

SURGICAL SOCIETY of IRELAND.—NOTICE.

The Election of Council of the Surgical Society of Ireland, for Session 1876-77, will take place in the Royal College of Surgeons, on the First Monday in November.

The Ballot will commence at Four o'clock p.m., and terminate at Five.

Members of the Society, being Fellows of the College of Physicians or of the College of Surgeons, are alone eligible, or entitled to vote.

Candidates for the Office of Councillor are required to send their names to the Hon. Secretaries, on or before Monday, the 30th inst.

By Order,

B. WILLS RICHARDSON, F.R.C.S.I., } Hon.
JOLLIFFE TUFNELL, F.R.C.S.I., } Secs.

Royal College of Surgeons in Ireland,
1st October, 1876.

INDIAN MEDICAL SERVICE.

NOTICE IS HEREBY GIVEN that an Examination of Candidates for twenty-seven appointments as SURGEON in Her Majesty's Indian Medical Service will be held in London in February, 1877.

Copies of the Regulations for the Examination, together with information regarding Pay and Retiring Allowances of Indian Medical Officers, may be obtained on application at the Military Department, India Office, London, S.W.

A further notice will be issued when the exact date of examination has been fixed.

T. T. PEARS, Major-General,
Military Secretary.

India Office, 6th October, 1876.

APPOINTMENT OF A MEDICAL OFFICER FOR ONE OF THE DISTRICTS OF THE METROPOLITAN FIRE BRIGADE.—NOTICE IS HEREBY GIVEN that the Metropolitan Board of Works will meet on FRIDAY, the 27th instant, at the Office of the Board in Spring Gardens, Charing Cross, and will at One o'clock proceed to the appointment of a MEDICAL OFFICER for that portion of the Fire Brigade stationed in the Central District of the Metropolis north of the Thames.

The district in question at present extends on the north side to the limits of the Metropolitan area. On the east side it is bounded by a line extending from a point at or near the New River, along the Green Lanes, Mildmay Park, Southgate Road, Bridport Place, New North Road, East Road, City Road, Finsbury Pavement, Moorgate Street, Princes Street, and King William Street; and on the west side it is bounded by a line extending from High Street, Highgate, along Highgate Hill, Highgate Rise, Kentish Town Road, Hampstead Road, Tottenham Court Road, Crown Street, and St. Martin's Lane, to Craven Street, Strand. Any further information required with regard to the boundaries may be obtained on application at the Office of the Board between the hours of 9 a.m. and 4 p.m.

The gentleman to be appointed must be a regularly qualified Surgeon. He will be required to reside within his district, and as a general rule to give his personal attention to all cases brought under his notice, to attend the meetings of the Board or any Committee of the Board whenever required so to do, and to furnish such certificates and returns as may be found necessary. The remuneration of the Medical Officer will be at the rate of 20s. per annum for each man in the force within his district, such payment to cover the cost of medicine, surgical appliances, and services of every kind. The present number of men in the district is about 100, but this number may be increased or diminished at any time.

All applications must be in writing and accompanied by testimonials, and must be delivered at the Office of the Board not later than 4 o'clock on Tuesday, the 24th of October, after which time no application will be received.

Applicants for the appointment must be in attendance at the Office of the Board on Friday, the 27th of October, not later than 1 o'clock.

By Order, J. E. WAKEFIELD,
Clerk of the Board.

Spring Gardens, 7th October, 1876.

THE SUCCESSFUL TREATMENT OF DILATED HEART.

By J. Milner Fothergill, M.D. Edin., M.R.C.P.L.,

Assistant-Physician to the West London Hospital; Assistant-Physician to the City of London Hospital for Diseases of the Chest (Victoria Park).

This title may seem to some readers to be somewhat startling, but the cases which will be given below will demonstrate that it is strictly founded on facts. It is only of recent years that any rational treatment of a dilated condition of the cardiac chambers has been feasible. Doubtless in times past the successful treatment of cardiac dilatation has been achieved, but then it was the result of an accidentally adapted treatment, and not the outcome of a carefully designed therapeutic plan. Now, however, we recognise clearly the means and measures by which such an end may be attained. We now know how far the mere mechanical disturbance of the balance of power betwixt the blood to be driven and the force to drive it, by excessive and sustained exertion making extra demands upon the heart, tends to produce a dilated condition of the cardiac chambers; and not only that, but also that sustained effort will interfere to prevent repair. From this we arrive at the curative influence of comparative rest.

It is only of late years that we have had sufficiently exact views of the action of digitalis and allied remedies, to enable us to pursue steadily and intelligently a plan by which these dilated chambers may be restored to their normal capacity, or, at least, to something approaching it. By the resort to an agent which produces more perfect and complete ventricular contraction, we can in time procure a restoration of the normal condition of the dilated ventricle, such as existed ere the dilatation commenced. In achieving this desirable end, it is necessary to combine the two different factors of rest and remedial agents. A glance at the causal relationships of cardiac dilatation will be useful in directing the thought towards the rational treatment, when from any cause—no matter whether the softening of the muscular fibre by myocarditis accompanying pericarditis, or the exhaustion of the muscle by protracted demands upon it—the walls of the heart fail to contract completely, and to efficiently expel their fluid contents, a small quantity of blood remains in the ventricular chamber. This amount of blood, added to that normally rushing in from the pulmonary vessels, leads to distension of the hollow muscle, and, ere long, a condition of permanent dilatation is produced. This is a very brief statement of the fact, but it is sufficient for the purpose in hand. It gives the clue to the line of repair to be adopted. In many cases dilatation is combined with hypertrophy; the sooner the hypertrophy is inaugurated, the sooner the dilatation is limited; the later it is set up, the greater the dilatation. The establishment of hypertrophy, by which alike the dilating process is arrested, and the power furnished to the ventricle to contract more completely, is dependent upon the reparative powers of the system; in well nourished persons hypertrophy is found under the same circumstances where dilatation is met with in those whose nutrition is imperfect and impaired. This, in chronic Bright's disease, where the blood pressure in the arteries is heightened, in florid complexioned men, we find hypertrophy the rule, and dilatation the exception; while in women who are less perfectly nourished, dilatation is more common than hypertrophy. According to the capacities of the individual, hypertrophy and dilatation will be found blended in every conceivable proportion. This supplies a third factor in the treatment of cardiac dilatation, viz., the absolute necessity for liberal supplies of nutritious food.

We have, then, three different measures which can be profitably combined—rest, appropriate remedies, and improved nutrition. The symptoms of cardiac dilatation are such as might be expected, *à priori*, from the function and anatomical structure of the heart. They are objective and subjective The physical signs are a diffused apex heat broader than the normal, irregular action, with more or less intermittency; palpitation on effort, with a pulse, regular or irregular, according to the action of the heart, but always readily compressible and empty during the cardiac diastole. The subjective symptoms are palpitation on effort—indeed, the whole series of signs and symptoms are aggravated by exertion; breathlessness easily induced; often attacks of dyspnœa, with craving for air, "although air freely enters the lungs" (Haydn), coming on in the night during sleep, as well in the day after exertion. Such, briefly, are the outcomes of cardiac dilatation.

In order to procure relief from these different consequential results of cardiac dilatation, it is necessary to strike at their cause. The following case will illustrate very clearly what must be done:—

W. A., aged fifty-nine, from Stockton-on-Tees, presented himself at the Victoria Park Hospital, on March the 18th, this year. He was a grocer in the above town. For some time he had been in failing health, had felt himself less equal to exertion, even in the light duties of his business, so he came to some friends at Stratford and attended the hospital regularly. He complained, when first seen, of general failing strength, of shortness of breath, of choking sensations, often stopping him when attending to his shop, and compelling him to sit down and keep quiet. His heart's action was irregular, with numerous intermissions, and with a diffused apex heat. He was a tall, well-built man, and his malady in all probability took its origin in excessive taxation of his powers from his industrious habits. He could only sleep propped up in bed. He was told to keep very quiet, to stay long hours in bed, and spend a good portion of his time on the couch when out of bed. His diet was to consist of easily digestible food in moderate quantities at once, and frequently repeated. The medicine prescribed was the ordinary hospital mixture of quinine and iron, an ounce three times every day, with fifteen drops of tincture of digitalis in each dose.

March 26th.—Reported himself already feeling better, symptoms ameliorating.

April 8th.—The intermittency had departed, and only the irregular action of the heart remained. The choking sensations were much better. Medicine to be continued, and a compound colocynth pill at bedtime occasionally, in order to regulate the bowels.

April 18th.—The pulse is now regular in volume and in time is the note of this visit.

He now felt sufficiently well to take a journey down into the county of Durham to look after his business. He stood the journey well, and was not fatigued by it.

May 6th.—Pulse good; going on well. Medicine as before.

May 13th.—Had had an attack of difficulty of breathing in the night from having indulged indiscreetly in a heavy supper, otherwise going on well. Medicine to be continued.

June 3rd.—Feels so well that he asks to be discharged, in order to return to his business at Stockton. His pulse is regular and well sustained, and his heart's action steady, His signs and symptoms are all so much relieved that he could readily pass for insurance. He was a very obedient and intelligent patient, and his rapid improvement was due in part to his carrying out his instructions so well. Further directions were given him as to his future treatment of himself, together with a formula for making a pill, containing a grain of digitalis in powder, with a third of a grain of dried sulphate of iron, one to be taken twice every day after food. He promised to write in a month and say how he is going on. His report is as follows:—

"July 10th. I have steadfastly adhered to the course you presented, and not only feel myself much better, but my doctor and all my friends say I look better."

Sept. 25th.—Still improving. Continuing the pills.

This is a very satisfactory case, and corresponds to one reported at page 68 of my work on "The Heart and its Diseases," where a condition of dilated heart was induced in an elderly woman from protracted over-exertion. After a few weeks of like treatment she recovered perfectly, and six years afterwards was still maintaining herself as a field hand, her health being quite satisfactory. Such cases illustrate what may be achieved under favourable circumstances.

Other cases are less perfectly satisfactory, but still are capable of much improvement.

(To be continued.)

BRIEF NOTES OF A CASE OF IDIOPATHIC GLOSSITIS SUCCESSFULLY TREATED BY FREE INCISIONS—RAPID RECOVERY.

By Richard Croly, L.K.Q.C.P., L.R.C.S.I.,

Medical Officer of Tinahely Dispensary District, County of Wicklow; formerly Resident Physician to the late Lord Stuart de Decies.

Idiopathic inflammation of the tongue, or glossitis, being a rare disease, and of extreme urgency, I feel that I need to offer no apology to the readers of the Medical Press in briefly reporting, for the information of my younger professional brethren, a case which has lately occurred in my practice, and which, I think, may be considered a typical specimen of this remarkable and urgent complaint. My brother, Surgeon Henry Gray Croly, of Dublin, in his "Series of Surgical Reports," has drawn the special attention of surgeons to this important disease. The following is a brief sketch of the case:—

I was hurriedly sent for during the last month to visit Mr. ——, of middle age, residing near Tinahely, whom I found suffering intensely from the following very distressing symptoms, the mere enumeration of which will at once portray the gravity of the case: the tongue was protruded from the mouth, enormously swollen, and very tender to the touch, its edges deeply indented by the teeth, the saliva, mixed with viscid ropy mucus, dribbling from the mouth, inability to swallow, except with considerable pain, speech "thick" and indistinct, distressed breathing, face turgid, countenance very anxious, and expressive of much suffering, pulse full and rapid. Cause of illness not known, but supposed to have originated from exposure to wet and cold. I recognised this remarkable and alarming train of symptoms as characteristic of glossitis or inflammation of the tongue, a disease of not frequent occurrence, and of exact resemblance to the description of cases depicted by my brother, in his paper on the subject. I saw that no time was to be lost, that hesitation or delay might have proved fatal. I at once made a free and long incision on each side of the tongue, from the base towards the apex, midway between the raphe and edges. In doing so I was obliged to pass the scalpel flatways along the surface of the tongue and then turn the sharp edge downwards. Copious bleeding followed, very alarming to the bystanders, but it soon ceased after I permitted it to continue as long as I considered safe. The relief which the sufferer experienced was almost immediate, the engorgement rapidly subsided—so much so that but little further treatment was necessary, and the patient made a rapid recovery, I am persuaded that, as the symptoms were so very urgent, if not thus promptly and boldly treated, the patient in a short time would certainly have been choked.

It is seldom that the surgeon experiences so immediate and gratifying a result of his practice, and therefore, as encouragement to young practitioners, especially in country districts, where they must of necessity entirely rely on their own unaided resources, being often far removed from professional assistance, I think it useful and not intrusive on my brethren to thus record a case so full of interest and instruction as I believe this to be. The young surgeon must bear in mind that in this urgent disease free and sufficiently deep *incisions* (not timid punctures or superficial scarification) will alone afford relief and perhaps save life. My brother, in his paper on the subject, says that "scarifications of timid practitioners are to be deprecated," an aphorism which this case strongly exemplifies.

THE PREVENTION OF SYPHILIS. (a)

By C. R. Drysdale, M.D.,

Senior Physician to the Metropolitan Free Hospital; Physician to the Bolsover Street Hospital, London.

One of the most important points in the hygiene of Cities and States at this moment is the prevention of true syphilis. This disease is extremely prevalent in almost every European city, and we hear it is equally so in the large and flourishing cities of the United States of America. There have been, up to this time, a number of experiments made in the various States of Europe, as to the best means of coping with the great question. It is alleged with much apparent truth by Dr. Crocq and others, that in Belgium there exists a very much smaller amount of syphilis than is found in England; and, in the debate which took place on this subject at the International Medical Congress in Brussels in 1875, I was informed by the late Dr. Vleminckx of Brussels, that there was very little true syphilis indeed in the town of Brussels, owing to the way in which public women were registered and examined. I am not in a position to confirm or deny this statement; but am inclined to believe that there is much truth in it.

However this may be for Brussels, there seems to be no great doubt of the fact, that in Paris the police regulations of prostitutes have only been very partially successful in checking the spread of venereal contagion. In the case of the only very important venereal disease, true syphilis, there is actually more of that disease in Paris at this moment than there was ten years ago; and the same holds good for gonorrhœa, as far as may be judged by studying the records of the Lock Hospitals of Paris, and those of the Hospital St. Louis. Thus, according to Dr. Charles Mauriac (*Rareté actuelle du Chancre Simple*, Paris, 1876), there was seen in the year 1861 at the Hôpital du Midi of Paris, 570 cases of true syphilis; in 1865, 840 cases; in 1869, 1,442 cases; in 1872, 1,265; in 1874, 1,578 cases. This shows, as my friend Dr. Alfred Fournier recently remarked to me, that syphilis increases in Paris, just as civilisation goes on, and this notwithstanding the police laws, which have been most vigorously carried out in Paris during nearly the whole of this century.

At the skin disease hospital of Paris (Hôpital St. Louis) there have been treated for syphilis in the year 1860, 183 persons, male and female; in 1865, 339; in 1869, 754; in 1872, 672; in 1874, 577; so that there also the disease, true syphilis, has been increasing in extent. At the Lourcine Hospital (Female Lock Hospital of Paris for patients not under police supervision) there were equally treated in 1860, 815 syphilitic women; in 1865, 1,002; in 1869, 1,322; in 1874, 1,162. These facts point to the conclusion, that the laws which are modelled on those first framed in France, do not work so well as might at first be supposed. The cause of this failure seems to be, that the French police laws relating to prostitution are so unjust and one-sided, that they miss their aim, by causing so many women to hide themselves in the ranks of clandestine prostitution.

The only effect produced by the Parisian police laws of the Bureau des Mœurs seems to be, that they have checked the spread of what is styled the "soft chancre," an ulcer which is entirely local in character, and which does not at all infect the constitution, which is easily recognised and hence avoided with facility by all such women as practise prostitution, but who are still careful enough of their health to examine those persons with whom they consort. Thus, in 1873, whilst there were treated at the Hôpital du Midi, only 625 cases of soft chancre and virulent buboes; with 1,450 cases of syphilis; among which were 546 cases of hard sore; there were treated at that same hospital in 1863, 572 simple chancres, and 346 hard chancres.

All this points to some other system of hygienic prophylaxis than either the French system or the present English Contagious Diseases Acts being required in countries such as the United States of America, where justice and equal rights are so strenuously claimed by all citizens as their birthright

By the kindness of Dr. Marion Sims, I have recently received a pamphlet on this subject, written by him at the occasion of the meeting of the American Medical Association in the month of June, 1876. He there makes the admirable observation that the plan adopted in France and England is not the one for the United States, which wants no legislation that looks to licensing prostitution as in France, and no such partial legislation as we find in the Contagious Diseases Acts of England. "We would not outrage religious sentiment by adopting a system of fostering vice; nor should we subject the hardy soldier, even for his own good, to invidious restrictions not imposed upon others in the community. Besides, how absurd would the English system work with us, when we have but a nominal army, and that scattered over the frontier, away from the pale of civilisation and its worst vices. Class legislation, in any shape, and for any purpose, is distasteful to the people of any country, and especially of ours." (Legislation and Contagious Diseases, by Marion Sims, M.D. Spottiswoode and Co., London, 1876.)

It appears to me that Dr. Sims is, in this view of the matter quite correct; and that it behoves us to find out a system more suitable to the genius of modern liberal institutions than that which supports a Saint Lazare Prison for prostitutes in Paris, whilst those men who frequent and infect these prostitutes, are allowed with perfect impunity to frequent as many women as they please. According to Dr. Marion Sims, what we want is a system of sanitary inspection and control that will enable us to prevent the importation of syphilis from abroad. There can be no reasons why ships coming from foreign countries should not be required to give a clean health bill as regards syphilis, as well as with reference to small-pox or yellow fever. Dr. Sims proposes that when there is no surgeon on board of a vessel arriving from foreign parts, the quarantine officer of the city where the vessels arrive, should have the right to examine the crew and passengers, for any case of syphilis on board, thus including syphilis among the list of communicable diseases like small-pox, &c.

These powers are not as yet assigned to any English Board that I am acquainted with; but it seems that in New York, the Metropolitan law invests authorities with arbitrary power to meet every emergency when the public health is in peril, whilst it fully protects the public from any abuse of these powers.

If this be the case, I do not see anything against the sanitary authorities in the city of New York endeavouring to find out the existence of any case of true syphilis, and threatening the individual who is contaminated with the disease that, in case he have communication with any other person, whilst suffering from the disease, he shall be liable to prosecution as spreading contagion, and fine with incarceration, until all risk of contagion be proved to be passed.

I would limit the prosecutions entirely to the giving of *true* syphilis; because gonorrhœa, although certainly often enough a grave disease in its consequence to the male sex, is not so much so to the female; and, moreover, that contagion seems to be with the greatest difficulty diagnosed and prevented in the female. Nor would I make the contagion of soft sore punishable; because that disease does not come under the head of constitutional contagions, such as small-pox, scarlet fever &c. I would encourage the prosecution of all individuals who spread true syphilis by those contaminated by them. In London, recently, a member of the medical profession, Dr. Davy, was heavily fined for having spread syphilis to one of his patients in child-bed, by means of his fingers which he unfortunately had contaminated from another patient in the process of delivery.

(a) A Paper read at the International Medical Congress, at Philadelphia. Health Section. 1876.

If such a prosecution were sustainable, it seems to me *à fortiori* it follows that any person, who whilst suffering from true syphilis, puts himself into such intimate contact with another, as he must do in sexual connection ought to be prosecuted if he contaminate that person with such a terrible poison as syphilis.

For my part, then, I maintain that in England, the so-called Contagious Diseases Acts, which were brought into the legislation entirely for the benefit of the military, should be speedily repealed; and similarly that the system of the Bureau des Mœurs at Paris should, as soon as possible, be entirely remodelled. In their place I would have a number of hospitals supported either by voluntary efforts, or failing funds, by government (municipal) aid. All persons with true syphilis demanding admission into such hospitals should be at once received, and treated until all risk of contamination is judged to be over.

Secondly, stringent quarantine laws should be carried out on all persons coming from foreign countries who may be suspected of bringing with them true syphilitic lesions of a contagious nature, and the health authorities of all should endeavour to become cognisant of all cases of true syphilis existing at any moment in their district. All persons attending for advice for true syphilis at public medical institutions should be notified by a printed card that they are liable to immediate prosecution, if they have any intimate connection with any other person whilst suffering from that contagious disease.

In this manner, I feel persuaded that society might do a great deal towards "stamping out" syphilis.

CONTRIBUTIONS TO ORTHOPÆDIC SURGERY.

By Lambert H. Ormsby, F.R.C.S.,

Surgeon to the Meath Hospital, and to the National Orthopædic Hospital of Ireland.

CAUSES AND SURGICAL TREATMENT OF FINGER CONTRACTION.

Permanent contraction of the fingers is a surgical affection that is very frequently met with in persons of all ages, and belonging to all ranks of life. It is met with occasionally as a congenital deformity, but far more frequently it occurs as a non-congenital affection, and at times produces very great inconvenience. Many people thus affected have had to give up their occupation and engage in another, where their fingers and hands would not be so much required. Others have submitted to an operation, and had the contracted finger completely removed, as it was perfectly useless, and very much in the way, by impairing the action and utility of the non-affected fingers.

In many cases where the fingers are contracted, the digit is so flexed that its tip touches, and is closely approximated to the palmar aspect of the hand. All the fingers are liable to this deformity, but the one most frequently affected is the fifth, or little finger, then the ring and middle finger in the order of frequency, the thumb being very rarely affected. For a long time surgeons considered that this permanently flexed condition of the fingers was due to gouty or rheumatic shortening and contraction of the flexor tendons, with paralysis of the extensors. Such may be the case in a limited number of instances, but I believe, with Dupuytren and Goyrand, that the fault does not lie in the tendon, *but is due to the shortening and contraction of the digital slips of the palmar fascia.* Contracted fingers have been dissected after death, and it has been found that when the fibrous aponeurosis sent down along each side of the finger was freely divided, the finger could be completely extended with very little force, and the flexors appeared to offer no resistance whatever. Boyer, who believed in the shortening of the tendon as the correct cause of the deformity, termed the affection, in the language of the ancients, "Crispatura tendinum." When we carefully examine the fingers affected with this contraction, we find the first phalanx slightly movable on the head of the meta-carpal bone, and flexed at an angle closely approaching a right angle. On moving the phalanx to set up motion, we can flex it still more towards the palm, but when we try to extend it so as to obliterate the angle, we find it impossible. Dupuytren mentions that a weight of 150 lbs. will not be sufficient to bring the finger in a straight line with its metacarpal bone. Boyer says, "Our efforts to extend the fingers are resisted to such a degree, that if we continued them they would break before we could force them to yield."

This description only holds good for the first phalanx at the metacarpo-phalangeal joint, the other phalanges being found generally straight, allowing, however, of slight motion. In further support of the belief that it is the contraction of the palmar fascia that produces the deformity, if we trace this fascia we find that it is chiefly derived from the expansion of the tendon of the palmaris longus, and that it consists of two lateral and a central portion; the latter occupies the centre of the palm, is triangular in shape, its apex being at the annular ligament, and is composed of divergent, longitudinal, and transverse fibres, the last becoming fewer and more scattered, till they are lost on the flexor tendons. Some few, however, are continuous with the sheaths of the fingers opposite the heads of the metacarpal bones. The central portion of fascia divides into four bands, which sub-divide each into two tendinous slips; these embrace the heads of the metacarpal bones, and are continued to be attached to the sides of the first phalanges and the inferior transverse metacarpal ligament. At this point of division the transverse fibres are strengthened, and connect these slits into four distinct fibrous arches, through which pass the flexor tendons. Between these arches we find three lesser ones, resulting from the primary division of the fascia; these transmit the digital vessels, nerves, and lumbricales. The palmar fascia is also intimately adherent to the integument by strong fibrous bands, and at its inner margin it gives origin to the palmaris brevis when present. It also sends deep processes backwards to form the inter-osseous aponeurosis. It also helps to strengthen the strong sheaths binding down the flexor tendons along the fingers. The lateral portions of this fascia are much weaker. On the radial side it covers the muscles of the thumb, and is continuous with the dorsal fascia. On the ulnar side it covers the muscles of the little finger.

(*To be continued.*)

◆

Clinical Records.

ST. MARY'S HOSPITAL.

(Under the care of Mr. Norton.)

Injury to Pharynx by a Piece of Bone.—Emphysema.—Death.

A woman, æt. fifty-two, edentulous, was eating a piece of the loin of pork, and owing to the absence of teeth she swallowed the meat without masticating it. When she had nearly finished her dinner, a piece of the meat lodged in her throat. She complained at once of pain, and of some difficulty of breathing, and went to three medical men and chemists for assistance, but as no one attempted to rid her of the obstruction, and as the symptoms did not decrease, she went to St. Mary's Hospital. On her road to the hospital she vomited. Mr. Cundell, the house-surgeon, passed a Ramouneur probang with ease into the stomach, and informed her that whatever might have obstructed the passage was no longer there.

Finding the œsophagus clear, the house-surgeon naturally discharged the patient, believing that all her trouble would gradually disappear. However, about 8 p.m. she was again brought to the hospital, and Mr. Norton, the surgeon of the week, was sent for. She had now extensive emphysema of the face, head, neck, shoulders, and chest; her respirations were forty per minute, short and catching; the pulse scarcely to be felt; the vessels of the neck dilated; the thorax was fully resonant, yet breath sounds scarcely audible. A probang was passed freely into the stomach, and the patient drank a quarter of a pint of milk without difficulty. The laryngoscope was applied, and the pharynx was found to be emphysematous, but the larynx was sound. No injury could be seen by which the air had escaped, though it was evident that some lesion must exist.

The patient died at 4 o'clock in the morning.

At the *post-mortem* examination emphysema was found, as had been detected during life, in the cellular tissue of the head and neck, shoulders, pharynx, and œsophagus. Air also infiltrated the posterior mediastinum, and extended beneath the pleura. At the level of the cricoid cartilage a longitudinal laceration, three-quarters of an inch in length, was to be seen; and corresponding to this, on the posterior part of the pharynx, was a fine longitudinal scratch about a quarter of an inch in length, showing that a foreign body, sharp at both ends, had rested obliquely at the junction of the pharynx and œsophagus, with its lower, and, doubtless, larger extremity fixed on the cricoid cartilage. From the result of the *post-mortem* examination, it was presumed that as the patient was unable to masticate, she had inadvertently swallowed a jagged piece of bone whilst bolting her food; that the bone had become fixed in the pharynx, producing the laceration there found; that coughing and deglutition, or else the vomiting, had soon dislodged the bone after inflicting the injury; that air had at once passed into the cellular tissue beneath the pleura, and produced the dyspnœa of which she continued to complain, notwithstanding that the œsophagus was found by Mr. Cundell to be clear of any obstruction. No bone was found in the stomach after death, nor any foreign body which would have produced the injury, and it had, therefore, been probably lost in the vomit.

◆

STATE BABY-FARMS IN THE "GOOD" OLD TIMES. (a)

SHOULD our readers desire a study of maladministration, incapacity, and corruption in a Government institution,—of inconceivable inhumanity and indescribable villainy perpetrated under the régime of well-intentioned but *nonchalant* citizens—of the miscarriage of benevolent intentions and the failure of a charitable effort, and, lastly—of the state of anarchical confusion to which officials will lapse if unchecked and irresponsible, they can read no more instructive a narrative than the "History of the Dublin Foundling Hospital" just issued by Mr. W. D. Wodsworth, the Assistant Secretary of the Irish Local Government Board, who now holds the honorary office of Inspector of Invalid Foundlings. In discharge of the duty of this latter office, Mr. Wodsworth has inspectioral charge of the few individuals who remain from the Foundling inmates of the Hospital at its disestablishment, and his communications with them have interested him in the rise and fall of the institution.

The building of the Dublin Foundling Hospital, which now exists as the South Dublin Workhouse in James Street, was commenced in 1704, the institution having been incorporated by the Act of the 2nd of Queen Anne, cap. 19. Previous to this time no poor-relief provision whatever existed in Ireland, and the governors of the Foundling Hospital were first invested with the care and regulation of what were then called "vagabonds and beggars." Of their powers and duties in this capacity Mr. Wodsworth gives an amusing account.

In the first place "all men and women begging, and women and children begging, and all other vagabonds were to be taken up and committed to the workhouse."

The accommodation fitted up for their reception consisted of "the vaults and other convenient places" under the hall of the workhouse.

These vaults, or cellars, are specified as having been 240 feet long by 17 wide, with an "airy" sunk at the outside of the building for the purpose of affording light and to carry off the rain water, and they were to have a double row of beds "two tire" to admit of sleeping 100 men and 60 women, and also to be used for their working and day accommodation.

Anyone fond of calculation can form a good idea of what the sanitary aspect of these low pitched, dark, damp, and dreary lodgings must have been.

Any vagabond that thought fit to have the "Fallen Sickness" was to be turned out, and "disabled poor people" were not to be admitted under any pretext whatever.

The law required vagrants and sturdy beggars "to be employed and to work" voluntarily; but there was no work or employment to be had, and then, poor beggars, they were to be flogged, imprisoned, receive "severe usage," and be treated with "proportionate rigour," and finally were to be transported beyond the seas "without trial or traverse."

Until the year 1731, their bodies, when they died, were buried without coffins; but after that time it was ordered that they should have coffins allowed them.

Their diet was perhaps the most merciful thing in their treatment. It consisted of fair quantities of gruel, bread, milk, porridge, and "Burgoo" with some milk, and one pound of meal a day extra to those who could do a hard day's work and earn 8d. This Burgoo (*Burgout*, Fr., *Brose*, Sc.) consisted of some oatmeal stirred up in cold water, seasoned with salt and enlivened with pepper.

The functions of the Board of Governors, which numbered 200 persons, including the lord-lieutenant, lord mayor, lord chancellor, archbishop, sheriffs, members of Parliament, and other influential persons were, as constituted by Queen Anne's statute—

1. To assemble once a month to relieve, regulate, set to work, and inflict "reasonable" punishment on all vagabonds and beggars, and to apprehend them.
2. To detain and keep in their service, until the age of sixteen (this was afterwards reduced to twelve), any poor child or children found, or taken up, "above five years of age," and to apprentice them out afterwards to honest persons "being Protestants."

By subsequent Acts of Parliament, "the age" at which children were to be taken care of was unrestricted, and infants from all parts of Ireland, and even from Wales, came to be admitted into "the Foundling Hospital," which the institution became, exclusively, in the year 1729.

In the year 1729 the Institution ceased to have any relation to the relief of the poor and became a Foundling

---

(a) "A Brief History of the Ancient Foundling Hospital of Dublin from the Year 1702, with some account of similar institutions abroad." Edited by William Dudley Wodsworth, Esq., Assistant Secretary to the Local Government Board, Ireland. Dublin: Alex. Thom, Royal 8vo, pp. 57.

Hospital simply and entirely, and "a cradle, or turning wheel," and a bell, for taking in the infants, were provided at the gate, for use by "day or night."

There is, says the author, no complete enumeration of the foundlings, and other children, who were admitted into the hospital from first to last in one hundred and thirty years during which it was in operation; but from the returns to Parliament it may be computed that, independently of the hundreds of infants who died on the road during transit, and who were exposed on the banks of the adjoining canal, and died there, or drowned, not less than 200,000 infants passed that dread portal, "the cradle at the gate."

It was not until two years after the Foundling Hospital building had been occupied for foundlings exclusively, that specific regulations were framed for its management.

A code was then drawn up providing for prayers, meals, school, taskwork, play, punishment, and Sunday school.

The children's employment consisted of spinning, knitting, net-making, cotton work, lace-making, tailoring, carpentering, wooden toy-making, and gardening, as well as washing and housework.

The boys were to be kept "for the most part on their limbs," the girls' pursuit being of a more sedentary character.

Many of these plans were adopted from time to time according to circumstances, and eventually there was rather an extensive nursery garden, and there were also some manufactures, the buildings having been enlarged to accommodate 1,200 inmates, about double the original number.

The diet for infants was "ponada," or bread and water pap, and some milk; but in 1797, the matron gave evidence to the effect that this food did not suffice to sustain life.

A special dietary for the more grown children was adopted in 1775, by the special advice of, and on a curious report from the College of Physicians, who drew up the form of dietary themselves, and appended thereto elaborate, and indeed very judicious directions as to the preparation, cooking, &c., of the various articles of food.

The infants' clothing appears to have been for a long time "woollen," and it was not for many years after the Hospital was founded that sheets were provided for their beds, and also other articles, especially necessary for their comfort, were ordered.

The "Windsor uniform" (colours, blue, with red collars and cuffs, was adopted in 1762, to distinguish the Foundling Hospital children from the "Charter School" boys.

It was not long until irregularities and abuses of management commenced to show themselves in the Hospital. The governors held their meetings not at the Hospital but at the "Tholsel," and consequently seldom or never saw the Institution which they were appointed to administer, the treasurer, one Pursell, after having been whitewashed on a charge of immoral conduct towards the inmates, ran off with the money of the Hospital.

Disease of a very virulent type is at this time said to have existed throughout the country in the last century.

Thousands of infants came in affected by it, and when the infants appeared on admission to have an eruption out upon them, they were not sent out to nurse at all, but were kept in the Infirmary until they died.

Not many years had elapsed from the time of its opening, when the fact of the existence of such an Institution becoming known throughout the country, children from all parts, north, east, and west, and even from Wales were sent to it, or exposed in order that they might be sent, in the streets of Dublin.

Notwithstanding the numerous deaths which occurred consequent upon hardship and exposure, the governors found themselves embarrassed on several occasions for funds to feed the accumulating numbers.

Donations were sought and obtained. George the 3rd sent £1,000 on one occasion out of His Majesty's private purse; charity sermons were preached, £712 1s. 10½d. being obtained in the city of Dublin in one haul in this way in April, 1760.

From 1744 to 1796 things got steadily worse, and although for nearly twenty years the good Lady Arabella Denny devoted herself untiringly to its management, and kept the Institution in a fair state of purity and efficiency, yet after her retirement the administration of the Hospital was so bad that the building came to be a veritable pandemonium, a perfect charnel house, and the scene of a slaughter of the innocents not paralleled since the day of Herod.

As regards the growth of the Institution from 1702, 260 children were admitted the first year, and the number annually increased especially after the year 1740.

By an average which was taken in 1751 of the three preceding years, it appeared that there had been 700 infants taken in each year, or 2,100 in three years.

In the six years ending 1796, 12,786 infants were admitted, or 6,393 in three years against 2,100 in the former triennial period (1749-51).

The number annually admitted had thus, it will be seen, more than trebled; but these numbers were exceeded subsequently.

In twenty-one years, from 1797 to 1818, we find, by counting the existing registries, that 43,254 infants were deserted, found, and admitted, notwithstanding that during that period a method was adopted, as will be related in its place, to check considerably the influx of children.

It seems that in the early part of the eighteenth century there existed amongst the lower orders of Irish children, and especially amongst the offspring of illegitimacy, a great deal of specific disease. Many of the infants which found their way into the turn-cradle of the Foundling Hospital were so affected, and it, therefore, became the habit of the officials of the institution, in order to save themselves the trouble of daily care of the children, to class them all as tainted, and send them immediately on their admission to the Infirmary, where they were speedily got rid of by the simple expedients of starving and slow poison. As early as 1750, it was discovered that of 1,468 infants admitted in one year 420 died within twelve months, and in 1752 out of 691 admissions 365 deaths occurred within the same period.

But in 1757, says Mr. Wodsworth, "*Great Clamours*" arose as to the mortality amongst the Foundlings.

The officers of the Institution were openly accused of "murder and other atrocious deeds," and one thing which transpired when the usual course of inquiry took place, was, "the indecent and improper manner in use for disposing of the bodies of the children that died." They were chucked, it is said, naked into a hole, eight or ten at a time, and "lime kept roach" was ordered to be used with the dead bodies.

Something was done towards remedying abuses after this inquiry, but not very much.

Any quantity of Resolutions were proposed and passed by the Governors, but they experienced the fate of a good many other resolutions, and though in the letter they remain in the Minute Book, they went elsewhere in the spirit to help to pave a certain place which shall be nameless.

The ugly fact remained that in the ten years ending March, 1760, 3,797 infants out of the 7,781 admitted during the time died in the Foundling Infirmary, 3,932 being sent out to nurse, and 52 being wholly "unaccounted for.'

What became of these fifty-two noboby knew, and it is to be apprehended that nobody cared.

When things were in this condition, Lady Arabella Denny, the daughter of the Earl of Kerry, came to the rescue, and for twenty years devoted herself and her fortune to the reform of the Institution. What snubs, hindrances, and discouragements this noble lady met with in that time at the hands of corrupt officials and jobbing governors may easily be conceived, but she persevered, nevertheless, in her humane task, and to her compassionate exertions may be credited the lives of thousands of doomed infants. In the first ten years of her regime the proportion of children who died in the hospital decreased from over one half (which it had previously been, to less than one fourth), and in that time not less than two thousand lives were preserved by her care.

After the inevitable withdrawal of this noble woman, in consequence of her age and failing health, matters became worse than ever, and the death-rate advanced to a figure which seems almost incredible. *In the year '91, 780 children were admitted, of whom only one survived. In '92, 861, of whom 860 died; in '93, 803 were taken in, of whom not one lived to tell the tale; in '94 903; in '95, 959, and in '96, 910 unfortunate infants entered the Institution, of whom not a soul remained alive.* While in the entire twelve years ending '96, of 25,352 children adopted by the Foundling Hospital (including those at nurse out of doors) more than seventeen thousand died. In '97 the cry of the blood of the hecatonites of infants moved the sluggish comprehension of the authorities, and a committee was appointed by the Irish House of Commons to inquire and report. Their reply contains the following paragraphs:

> Resolved, that it appears to this committee, that of five hundred and forty children received into the Foundling Hospital in the quarter ending the 25th March, 1797, four hundred and fifty-four have died.
>
> Resolved, that it appears to this committee, that from the 25th of March to the 13th of April last (being nineteen days) one hundred and sixteen children were admitted, and that one hundred and twelve have died.
>
> Resolved, that it appears to this committee, that in the six years ending the 24th of June, 1796, there were admitted into the Foundling Hospital twelve thousand seven hundred and eighty-six children, and there died in the infant side of the house in the same period seven thousand eight hundred and seven infants, and in the country one thousand nine hundred and ninety-seven children, and that in that time there appears to have been besides two thousand eight hundred and forty-seven children unaccounted for.
>
> Resolved, that it appears to this committee, that in the same period of six years ending the 24th of June last, five thousand two hundred and sixteen children have been sent into the infant infirmary of that Hospital, and that of these three only were ever brought out alive.
>
> Resolved, that it appears to this committee, that of the diseased infants the greater number are brought from the distant parts of the kingdom, that they are much abused on the road, and are sometimes brought to the Hospital in a condition too shocking to relate.
>
> Resolved, that it appears to this committee, that during the said period no medicine of any kind was ever administered in the nursery to these infants, or in the infant infirmary, except a bottle called the composing bottle, which is administered by the nurses indiscriminately to all alike.

The performance of their duties by the medical staff may be judged by the following other resolutions of the same committee.

> Resolved, that it appears to this committee, that in the said six years, the physician to the Foundling Hospital, Dr. William Harvey, never visited that side where those infant children lay, and that by the bye-laws, the physician is required to visit the Hospital every Monday and Friday, and at all times when sent for.
>
> Resolved, that it appears to this committee, that by the said bye-laws it was the duty of the surgeon to visit the Hospital regularly every day, and that Mr. Philip Woodrooffe, the surgeon, attended or caused attendance to be given at the said Hospital twice a week, and sometimes three times, and not oftener, and that he only prescribed in surgical cases.
>
> Resolved, that it appears to this committee, that the apothecary to the Hospital, Mr. James Shaughnissy, did not visit the infant infirmary so often as once a quarter, sometimes not once a year, although it was his duty to attend every day, and that he has his residence in the Hospital.
>
> Resolved, that it is the opinion of this committee, that the physician, surgeon, and apothecary of this Hospital, ought to be immediately removed.
>
> Resolved, that it is the opinion of this committee, that the Foundling Hospital of the city of Dublin, under its present establishment, ought to be abolished.

A sub-committee was nominated by the general committee to go to the Hospital and "inspect the nurseries and endeavour to discover the cause of the very extraordinary and alarming mortality among the infants."

The report of the sub-committee gives a graphic account of what they saw when they went to inspect, and presents a picture which needs no further painting.

In the Foundlings' Infirmary, they said, a black and gloomy apartment, were eighteen infants, *lying three and four together in filthy cradles, and with covering, in the opinion of your committee, insufficient to preserve vital heat in the bodies of infants at an inclement season, and remote from fire.* This Infirmary exhibits a scene which must excite the most unfeeling to pity—there are only two women to attend this Infirmary. Your committee made some observations on the miserable situation of those infants, and were informed by Mrs. Hunt (the chief matron) by way of accounting for what your committee considered inhuman neglect—"That those children were just laid there to die." Your committee think it particularly incumbent on them to submit to the Board, that in the Foundling Nursery or Infirmary (according to the information they received) *no human efforts are ever made use of to save the lives of children,* except administering to them the common food, bread and milk, or bread and water. When weakly infants are sent into this place of death, whether their weakness arises from premature birth, from diseased parents, or, what is most frequent, from the fatigue of a long journey and want of nourishment, all are indiscriminately treated; bread and milk or bread and water must sustain them, or they perish. No care or exertion to recover them; and though a physician, a surgeon, and apothecary, are attached to the establishment, *no medical advice or assistance are ever administered to the unfortunate innocents.*

Your committee sincerely lament the necessity of stating *facts which carry a complexion of more than savage cruelty,* and which where humanity and national character are so deeply interested, must attract the immediate attention of the Board; remedies for such pernicious evils cannot be too speedily applied.

From the minutes of evidence taken after this report of the sub-committee, it appeared that the children were "stripped" when sent up to the Infirmary (to die), and had the old clothing that they came into the house in, put on them; that they were then laid, five and six huddled and crushed together in the receptacles called "cradles," "swarming with bugs," and they were then covered over with filthy and dirty blankets, which had been "cast" as unfit for use.

Poor little helpless unresisting innocents! Death, and reception into that Place which is declared to be the haven of peace for ever and joy "for such" as these, must have indeed been a merciful release from mundane sorrow and suffering.

The sub-committee, it will be observed, state that no medical advice "*or assistance*" was administered to the children; but this is not quite accurate.

The Hospital nurse deposed, when examined on oath by the committee, that a medicine called significantly, "*The Bottle*," was handed round to them all at intervals indiscriminately.

She did not know what was in it, but supposed it was a "composing draught," for "the children were easy for an hour or two after taking it."

The surgeon, when he did come, always asked if she had given them "The Bottle," but asked no other questions.

Discreet surgeon: he knew well enough what the bottle was made up of, and that the children derived assistance from its contents.

They were being *assisted to die*.

The House of Commons adopted at once the recommendation of the committee to reform the government of the Foundling Hospital, and a Bill was prepared and introduced for the purpose, and the number of the governors was reduced from near 200 to nine, increased afterwards to twelve.

It is almost unnecessary to say that the Governors indignantly disputed, or positively denied, everything that was exhibited and proved against their management beyond a doubt, and it must be admitted that they fought manfully against the desperate odds against them.

They laid the whole blame to one particular source, which they said rendered the preservation of children sent in extremely difficult, and they urged that it was only to *weak and prejudiced minds* that sending the children into the "Charnel House to die" presented anything deserving censure or reproof.

The hardihood of this defence is worthy of all praise. Its coolness cannot be contested, but in accordance with fact was doubtful indeed.

Surgeon Creighton proved subsequently that not one in fourteen children admitted were so affected, and this average was afterwards improved; not more than one in twenty-nine being so affected. "Every kind of eruption" on the skin used to be attributed to this cause and the hapless children were then sent up to the Infirmary to the cradles, the bugs, and the bottle.

The new corporation of governors came into office in 1798, under the new Act of Parliament.

They were in number nine, and the Foundling Hospital was "reformed."

Thirty-three years afterwards it was "abolished."

It took a hundred and thirty years, says Mr. Wodsworth, to convince people of the error of founding such an Institution, and the failure to attain the two ostensible objects proposed, namely saving infant life and making good Protestants, and further to prove to them how mischievous its effects were in a moral point of view.

Foundling hospitals still exist abroad, but their continuance in the British dominions has now ceased universally.

Our space will not permit us to pursue further the history of the Dublin Foundling Hospital. It is sufficient to say that in 1831, in consequence of the enormous cost of the Institution to the country, the difficulty of disposing of the children brought up within its walls and the obvious ill-effect of it upon public morals, it was at length abolished after an existence of 130 years.

The maintenance of deserted children, and some who were not deserted, at the public expense had now been in operation for a century.

The number of children so maintained had gradually risen from 260, and it continued to increase until the year 1820, when there were 8,740 children supported at an expense of £40,000 a-year.

But the existence of the Institution, the folly of which, both as a means of proselytism and of saving life, it had taken a century to develope and disclose, was rapidly drawing to an end.

At length to check the influx of Foundlings

A sum of £5 from the parish, with each child presented, was then required, and this proved effectual. That £5 note settled many a case in the country.

The number of admissions was reduced in one year from 2,000 to less than 500.

A stream of foundling children, which had been flowing with increasing volume for upwards of a hundred years, could not be suddenly dammed up without overflowing its banks or causing some disaster.

There are many persons living who remember that the infants used still to be brought up from the country, without the £5, and in the winter months, notwithstanding the public notices widely published by the governors.

The carriers, or persons bringing up the children, finding no admission, left the infants on the banks of the canal adjacent, and there they perished from cold, starvation, and by drowning.

Fifty-two thousand one hundred and fifty children were admitted during the thirty years ended January, 1826, of whom 14,613 died in the hospital while infants.

Twenty-five thousand eight hundred and fifty-nine were returned as dead while at nurse in the country; 730 died in the infirmary, and 322 more sent into the country for their health.

In all, 41,524 died

The committee of the House of Commons, in 1829, before whom this return and other information was laid, unhesitatingly recommended the closing of the hospital; and it was closed.

Mr. Wodsworth's narrative from which we have drawn these facts is a most interesting brochure, and one which carries its own lesson on every page. Besides that he interests his reader; he has served a good educational purpose in teaching the world how ill-considered are sometimes the most mature plans of statesmen, and how frail may be the means, provided with every care, for carrying those plans into effect. We commend the book to the perusal of the profession.

THE Chair of Physiology in the University of Glasgow has been conferred upon Dr. McKendrick, F.R.S., of the University of Edinburgh.

A MEETING of the executive committee of the Society of Arts in connection with the health and sewage of towns has been summoned for twelve o'clock on Tuesday next, and an invitation has been addressed to the surveyors and medical officers of health of the vestries and district boards of works of the metropolis, asking them to attend, to meet the committee, and confer with them on the house drainage of the metropolis.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 18, 1876.

DIRT: AND THE ARTISANS' DWELLINGS' ACT.

MOST of our readers are probably aware that the Government and several local Corporations have recently done much towards improving the physical and moral condition of the poorer classes by providing them with more roomy and wholesome dwellings than those which many of them live in. In the able and philanthropic speech which he delivered last week at Glasgow, Mr. Cross dwelt upon the good results which he expected would follow from the carrying out of the Artisans' Dwellings' Act. This Act, which is at present a permissive, and not a compulsory one, aims at removing some of the foulest alleys and courts that are to be found in most large towns, and replacing them by decent and well-constructed dwellings. "One of the great difficulties," said Mr. Cross, "that a statesman has to contend with, holding the office which I have the honour to hold, is this, that he sees not only so much wealth all around him, but so much vice, misery, and so much of everything that is degrading in all our great cities, that it is enough almost to make his heart fail when he begins to try to do something towards alleviation. . . . . I will ask any one present in this room if they will go as I have done, with some of those gentlemen now sitting behind me, into the narrow haunts and alleys of this great city and other cities as well; and when you come out of these lanes and alleys put to yourself this one question, and give it an answer: How can we expect self-respect in those who are bound and compelled, as matters stand, to live in the hovels and dens they do?

And we may ask how can we expect our medical officers of health, and our sanitary authorities to perform satisfactorily the duties imposed upon them, and how can they successfully check the outbreak and spread of epidemics, or diminish the mortality arising from other diseases, while the germs of the diseases are being continually fomented by such a state of things as that to which Mr. Cross draws attention? We have no wish to dispel the pleasing illusion that many labour under with respect to the working of this Act, or to question whether its provisions are such as will really reach the lowest stratum of society, as no doubt in time it may "produce a salutary change, not only in the physical, but in the moral health of all the lowest classes of our community."

But there is nothing which appears to us to be strangely overlooked by those statesmen and other gentlemen who have at heart the sanitary improvement of the slums and rookeries of our large cities, namely, the great need, not only impressing upon the minds of the working classes, and particularly their children, the supreme importance of common cleanliness, but of adopting some measures which will compel them to pay more attention than they do to one of the first conditions of both personal and public health. We may turn the dirty poor out of their dirty and over-crowded dwellings, and build for them the most perfect of model lodging-houses. We may do all this, and a great deal more, to very little purpose, if the untidy and filthy habits of all but the most respectable of the working classes are to be totally disregarded, and left to turn the neat and decent tenements provided for them into dens almost as repulsive as those from which they came. The innate laziness, and the innately dirty habits of most of the men and women belonging to the lowest ranks of life, is all but incredible by those who never come into contact with them, and will, we fear, be a very great obstacle in the way of the Artisans' Dwellings' Act being productive of as much good as is expected from it, even if it does, as we much doubt, reach that poor and wretched class of people by which the alleys and courts of London and other large towns are inhabited. Within a short distance of our own residence there is a street of eight and ten-roomed houses, which when they were first built, left little to be desired as regards space, ventilation, or good drainage, and were in most respects well adapted for the dwellings of the poor. Now the majority of those tenements are about as dirty and as dilapidated as can well be imagined. Untidy and neglected front gardens, with their battered door-railings, leading to steps and passages, which, from their squalid appearance, are little better than a continuation of the dirty street. Walls denuded of what was once a clean and decent paper. The very plastering torn off until nothing is left but the naked laths beneath it. Drains choked up, waterclosets filthy, and going to rack and ruin. Dirt here—dirt there—and dirt everywhere—and all this is but a faint and imperfect description of many other places that have become nests of disease, squalor and vice, not so much through any fault of the builder or landlord as through the dirty habits of his tenants. And if we turn from these wretched lodgings to the lodgers themselves, we are not so much astonished at the dirt and corruption which surround them.

Women lounging about with necks that have not been washed since childhood, and with hair that has not had a comb through it for a month. Women returning from, or going to, the neighbouring public-house, the well lit-up bar and gaudy ornamentations of which form a striking contrast to their own miserable homes. Children playing in the gutter making "mud-pies," and outvying their parents in slovenliness and filth.

It must be admitted that the eradication of the dirty habits so prevalent among the poorer classes is a task which our sanitary reformers will find very difficult. As a lay contemporary has well remarked, "it is the personal right of many Englishmen to live like pigs," and to squat in places which are little better than styes, and which "reek with emanations that recall the dead and poison the living." But still it is a task which should be attempted if only to supplement the provisions of the Artisans' Dwellings' Act, and to further the object which the framers of that Act have in view. And with respect to this deplorable feature in the character of our pauper population, we may perhaps say what Dr. Johnson said of some Scotchmen, that much may be done with them if they are only caught young. Whether the School Board and the teachers in our ragged and denominational schools intend to teach their little scholars the value of soap and water and to instil into their young minds the truth of the old maxim, that "cleanliness is next to godliness" we will not pretend to say. But with all reverence for what is holy and good, we shall venture to assert that to compel them to learn a short catechism of personal hygiene in respect of its most simple and elementary rules, would even be to them of more practical benefit than that resulting from the teaching of another catechism with which the memories of too young children are frequently burthened. It may certainly be asked of what use would be the teaching of the elements of hygiene and the importance of thrift, industry, and cleanliness to children to whom the example set them at home would more than gainsay the precept they learnt at school. There is, however, no reason why the education of parents to such habits as are conducive to health and comfort should not go hand in hand with a similar education of their offspring. If the State encourage and even contribute towards the building of more spacious and healthy dwellings than some of the hovels of which we have been speaking, it would certainly be justified in having them periodically inspected, and in seeing that they are kept in as clean and wholesome a condition as circumstances permitted. What a powerful factor "Filth" is in the production and transmission of disease, has been very exhaustively pointed out by Mr. Simon and other sanitarians; but the dirty habits and personal uncleanliness of the poor to which we have more particularly drawn attention, and the need of some such supervisions as we have suggested, have not been so generally noticed. Unless, however, something is done in this direction, we do not see how such a statute as that of the Artisans' Dwellings' Act will do anything more than supply the better class of skilled workmen with more comfortable lodgings than those they at present live in.

◆

THE HANGERS-ON OF SPIRITUALISM.

REMEMBERING that "Dr." Slade is now in the hands of the law, and that his guilt or innocence of imposture is likely to be decided by an unprejudiced tribunal, it would not become us to express an opinion as to whether his phenomena are jugglery or psychic manifestations, but there can be no objection to our calling attention to some of the pretentions and practices which are in alliance with mesmerism, and which, though they do not necessarily affect the truth or falsity of the supposed phenomena, have a direct relation to spiritualism. If any of our readers desires to fathom the abyss of impudence in quackery or of popular credulity, he can apply himself to no more instructive study than a copy of a newspaper called the "Medium and Daybreak," published at 15 Southampton Row, London. Here we find not only the gushing editorial upon Dr. Slade, which is to be expected in such a publication; not only the endless repetition of the observations of the slate "manifestations" by innumerable disciples, not only the old farrago of dark closets, table dancing, pinching, rapping and accordeon playing, but we have the narratives of some experiences by the editor's correspondents which are too funny to be lost to our readers, although they seem to be recorded by people who are unconscious of their preposterous absurdity, and who not only believe in them themselves, but evidently expect to get others to believe them also. For the nonce, we assume the reality of the manifestations in which Dr. Slade deals; it is to the refinements of his idiotic and less prudent disciples that we refer. By way of example, we quote a few paragraphs. A medical gentleman (one Hinds, of 80 The Grove, Hammersmith) reports an interview with a deceased patient :—

> "After listening for a time and watching the uplifting of the different chairs in the apartment, I placed my arms under the table, and then I thrillingly felt the hand of my friend placed in mine. I knew the member by the absence of the first phlange or joint of the thumb, lost many years ago from disease, *and the thumb thus mutilated was pointedly pressed into my palm.* I recollect that when this lady was living I often was accustomed to remark to her that *I should know her spirit-presence by this deficiency,* and her soul remembered this observation whilst impressing my hand. But be it observed that the spirit-touch is very different to the application of that of a living mortal, which would have been known by feeling the touch of the members through the clothes investing my limbs, *but this spirit-hand came in contact* with my flesh, right through the different coverings, as if my skin was naked, and further, it felt soothingly warm, but the heat experienced was very unlike that from the touch of the hand of any living human being I ever came in contact with.

Another correspondent writes thus :—

> After sitting for about two hours, a white form came forth called "Benny," who says he has been about five years in the spirit-land. He was very powerful indeed; touched many, pulled Mr. Fellows, and, to show his power, *struck blows at some sitters. He took a pair of boots from one of the sitters and put them on his own feet and danced in them.* . . . The little spirit "Pocha" came out . . . She was very playful. . . . She took a little boy out of the circle and began to play with him, and he pulled her garments for which "Pocha" *laid the tube right soundly about his shoulders.*

Another disciple produces the following ludicrous narrative :—

> "My mother had scarcely retired when we were all startled by the sudden appearance of the head and face of a male figure with a hat on. . . . He sprang off the platform with a bound on to the floor, and posted himself under the gaslight as an actor would have done on the stage. . . . This last figure was wrapped in

an ample white robe. . . . On enquiring of Daniel (the spirit medium) who this important looking personage was, he replied *Charles* 1st.

By the way it occurs to us to ask, in connection with the elaborate theatrical garb of the ghostly Charles, by what mental process the presence of these costumes in the land of spirits is to be explained. We are asked to believe that the human spirit reappears and communicates its ideas to the world of mortals. Very good. We are obedient and we believe. But then we are asked also to conceive that the breeches, shirt-collars, and drawers of Charles the First have also died with him, and having undergone transubstantiation, are present in human company, in visible, and tangible form. We have often heard of the "ghost of a shirt," but did not anticipate the realisation of our idea. In order to complete the edifice of such folly and gullibility, a capping of blasphemy is appropriate, and we have it in the editorial words as follows:—

> A BOOK WRITTEN AND ILLUSTRATED BY SPIRITS.
>
> If direct writing on a slate be thought incredible, what must be the verdict on the work about to be mentioned, which contains a number of full-page illustrations, *the original drawings being done by spirits, without mortal contact.* This work, "Hafed, Prince of Persia: his Earth-life and Spirit-life"—purports to be the life-story of *one of the Wise Men of the East who did homage to the infant Jesus* as stated in the Gospels. It was dictated by the spirit "Hafed" through the lips of Mr. Duguid, of Glasgow, while he was in the unconscious trance. Mr. Duguid has painted a great number of pictures while in the trance state, and it matters not to him whether he works in darkness or in light. "Hafed" contains various specimens of direct writing in Hebrew, Latin, Greek, &c.

When stuff like this is solemnly perused by the editor, what must we expect from his advertisers, who, as a class are known to be somewhat disposed towards hyperbole. We give a few excerpts upon which we feel ourselves incapable of commenting, language not supplying us with phrases to express ourselves.

> DR. —— ——
>
> MAGNETIC HEALER.
>
> Dr. —— begs to notify that upon receiving a description of the symptoms of any patient, he will return Magnetised Paper, with full instructions. Fee, Five Shillings. Renewal of Paper, Two Shillings and Sixpence a sheet.

To the virtues of the magnetic paper, the editor testifies in a concatenation of superlatives, such as only a spiritualist can put together.

> MISS —— —— ——, *Eradicates* Consumption, Cancer, Insanity, Dipsomania, Nervous and Infantile Diseases. Mesmerism, Healing, Magnetism, &c., taught.
>
> HEALING MEDIUM.—MR. —— —— begs to notify that upon receiving a Description of the Symptoms of any Patient, he will return Magnetised Water, with full instructions.
>
> ASTROLOGY.—PROFESSOR —— may be consulted on the Events of Life. Time of Birth required. Fee, 2s. 6d.

We are not justified in holding Dr. Slade responsible for the imbecility of individual disciples of spiritualism, or for the impudent rascality of traders on the vastness of that imbecility, just as scientific medicine is not responsible for the lies of quacks and the stupidity of their victims, but there can be no doubt that spiritualism is the basis for one of the most incredible systems of imposture which exists.

◆

THE IRISH CONJOINT EXAMINATION SCHEME.

THE Committee appointed to consult on the part of the University of Dublin, the King and Queen's College of Physicians, and the Royal College of Surgeons in Ireland, on the practicability of instituting a Conjoint Examination for Medical and Surgical qualifications, conducted under the direction of the several authorities, met for the first time on Saturday last in the new Museum buildings, Trinity College. The representatives of the several bodies are as follows:—For the University of Dublin, Dr. Hart, S.F.T.C.D., Drs. Stokes and Apjohn, and the Rev. Dr. Haughton. For the King and Queen's College of Physicians, the President, Dr. Gordon, the Vice-President, Dr. Hayden, and Drs. Little and Grimshaw. For the College of Surgeons, the President, Dr. Kidd, the Vice-President, Dr. Robert McDonnell, Mr. Rawdon Macnamara, and Dr. Albert Walsh. Of these representatives there was a very full gathering, the only absentees being Dr. Hart and Dr. Hayden. The proceedings were private, but so far we believe that they were but of a preliminary character, and it is understood on all hands, no matter what be the result of their deliberations, that no action can be taken until their report be submitted to and ratified by the several authorities represented at the Conference. From the foregoing statement it will be observed that two of the Irish Medical Authorities are conspicuous by non-representation at this Conference—the Queen's University and the Apothecaries Company—and so far as we can learn, they were not included in the invitation (emanating from the University of Dublin) to form a Committee to prepare a scheme for a conjoint board for Ireland. How this will eventuate remains to be seen. Under clause 19 of the Medical Act, the sanction of the Medical Council is required for all such conjoint schemes, and if we remember right, at the meeting of the General Medical Council, 1873, a conjoint scheme for Ireland, *which included the Apothecaries Company*, received the sanction of that body. This scheme, however, aborted, and now it is on the cards that at the next meeting of the Council a scheme may be submitted for their sanction in which the Apothecaries Company will not be included. In such a conjuncture what course will the Medical Council adopt? Of a truth, history repeats itself, and once more do we find the Sibylline books cropping up.

◆

Notes on Current Topics.

A Registrable Qualification for Women.

ON Friday week an application from Miss Edith Pechey was presented to the Fellows of the King and Queen's College of Physicians, Ireland, and, after some discussion, it was decided by a large majority that Miss Pechey should be admitted to the Examination for the Licence in Medicine on the usual terms. We understand that a similar application is now under consideration by the

Senate of the Queen's University, and it is reported that it has the support of very influential members, and also of the Government.

An Hospital in a Crater.

THE Board of Physicians of the Neapolitan Hospital for Incurables have determined to build an hospital in the crater of Solatana, lying between Naples and Pozzuoli, in Southern Italy. The vapour that arises from the crater has been found to be charged not only with sulphur but also with arsenic, and it is said that several persons suffering from lung diseases have been restored to health by inhaling this vapour for a few weeks.

Singularly Slow Pulse.

THE *Gazette des Hôpitaux* states that at the Lariboisiere Hospital a patient, a *chiffonnier*, seventy-seven years of age, came in to be treated for hydrocele, in all other respects seeming well and jovial in his manner. It was almost by accident discovered that he had a pulse only of 21. It is regular, the two sounds of the heart and the short interval of silence that separates them occupying scarcely half a second. But the "grand silence" is extraordinarily prolonged, so as to continue nearly two seconds and a half. During this absolutely nothing is heard in the heart—not the slightest souffle. But with the first sound a very distinct souffle is heard, which, continuing during the "petit silence," terminates suddenly with the valvular clap which constitutes the second sound. The heart seems large, its apex beating more externally and lower down than in the normal state. There is some emphysema of the lungs. The pulse was counted carefully four days in succession, and the intervals were found to be perfectly equal, and the same on both sides.

Female Doctors at Zurich.

A CORRESPONDENT of the *Bund.*, of Berne, has lately summed up in successive letters from Zurich the present results of the much-contested "Damenstudium." It is now exactly ten years since the first female student clamoured at the gates, or rather since the medical faculty opened the gates to her; for she had been attacking them by a diligent prosecution of the medical course. She was a young Russian lady. The University of Zurich, on the 14th of December, 1867, conferred upon her the dignity and rights of a doctor of medicine. Doctor or Doctress Erismann has since practised medicine with great success—first alone, and later as the wife and partner of a medical man. Thirteen young ladies have followed her example, all of them standing the test of the severe examination with credit, and some with brilliancy. Each of these ladies has received from the medical faculty of the University the degree of Doctor of Medicine, Surgery, and Midwifery. Six of these graduates were Russians, two were English women (Miss Morgan in 1870 and Miss Atkins in 1872), one was a Scotch woman, one an American, one a Swiss, and the remaining two were Germans. The American, a young lady from Boston, passed with great applause, and her public disputation before receiving her degree on the 22nd of June, 1871, created much admiration. After a short but very promising practice, she lost her life by shipwreck in the Atlantic.

In 1872, when Zurich had braved the worst of the storm of ridicule and anger, the University of Gottingen found courage to stand at her side, and the first female academical student in the Netherlands passed a successful examination in physics and mathematics. The two latest, a Russian from Jaroslaw, and Fraulein Franziska Tiburtius, from the island of Rugen, in the Baltic, have just maintained their theses and been admitted to the dignity and rights of the doctor's degree. The thirteen ladies who have received medical degrees are said to have exhibited an undoubted vocation for the profession. The extraordinary pressure of female students with which Zurich was threatened at the beginning of the movement has now subsided, and is not likely to recur.

A Sanitary Undertaker.

A NEWSPAPER, published a couple of centuries ago, contains the following advertisement:—

"James Maddox, coffin maker, and clerk of St. Olave, Jury, London, at the sign of the Sugar Loaf and Coffin, in the Old Jury, secureth the corps of any dead body from any ill scent or annoyance, without embalming, embowelling, or wrapping in sear cloth, for as long time as shall be required, or for as long time as they shall keep them above ground; and if it be desired, they may have a view of the face for three or six months, which he hath performed, as is well known to several persons of quality and others in and about the City of London. This is he that took up the corps at Painswick, in Gloucestershire, after it had been 13 weeks buried. He hath also an excellent way to take up any corps that hath been some time buried, and preserve the same from any ill scent for the conveying of it to any other place, as hath been eminently performed by him. He also (by God's blessing) hath cured several persons of quality of the gout, and giveth ease within half-an-hour, though the pain be never so violent."

Vegetarianism Scientifically (?) Considered.

IN the last number of *Tinsley's Magazine* we have a popular, and, on the whole, a pretty good, description of the nature and chemical constitution of our various articles of food, but in which the writer has sought to derive from some of the scientific facts at his disposal an argument in favour of a vegetarian diet. After drawing attention to the similarity in the respective composition of caseine, fibrine, and albumen—supplied by the vegetable world—with the same substances derived from animals, the writer remarks: "What a discovery is this! It amounts to saying that science cannot point out any difference between pure and wholesome alimentary vegetable principles and animal ones, simply because there is no difference between them. Thus we see how emphatically we can maintain that a vegetable diet, whether it includes milk, cheese, and eggs or not, can be wholesome, and can supply the body with everything it can possibly require. That is tantamount to saying that health and strength can be as easily kept up upon it as on a purely animal diet or a mixed one."

Now this is just how people talk who are but imperfectly or but partially acquainted with the subject on which they venture to pass an opinion. Doubtless, the fact that the composition of some of the proximate alimentary principles, whether derived from animal or from vegetable sources, are chemically indistinguishable, may, in a theoretical point of view, appear a capital case for the vegetarians; but had the writer been familiar with the physiology of the digestive organs and of nutrition, he would scarcely have ventured to rest his argument upon such a slippery foundation. He would have known that there is more than one factor necessary for maintaining the nutrition and the health and strength of the human body, and that it is not only necessary that there should be a proper amount of nourishment in the food of man, but that it should be supplied in such a form that it can be properly digested and assimilated. If all nutrient constituents of vegetable articles of diet could be extracted before they are used as food, no doubt nearly all the meat which is now consumed might be dispensed with, but until that is the case it is, for the above and other reasons well known to the professional readers, mere nonsense to talk of the health and strength of the body being kept up as well by a purely vegetable as by a mixed diet.

Where the Army Medical Candidates come from.

It is boasted by the Chancellor of the Queen's University—the Duke of Leinster—in his speech at the University commencement last week, that ten of its students won appointments at the competition for the Army and Navy Medical Services. According to this account, nearly one-third of Mr. Gathorne Hardy's thirty-three *protegés* have been supplied to the disaffected ranks of the Army Medical Service by her Majesty's Irish University. The institution ought not to be deprived of the credit of its achievement.

The Cock Lane Ghost Redivivus. Spiritualism at Parsonstown Burial Ground.

A sensation has been caused in Parsonstown, in the King's county, by occurrences which have taken place at the new cemetery near the town. The windows of the house in which the caretaker lived were smashed. The local constabulary were sent out to make inquiry, and in the afternoon, while they were at the very premises in company with their sub-inspector, a series of stones were thrown and the windows again broken. The place is quite open, and all the exertions of the police have been unable to discover where the stones came from. During the day police patrolled the locality, and yet occasionally a shower of stones dropped into the windows till they were riddled. It is now currently reported that some unearthly influence is at work, and numbers visited the scene during the day.

The Queen's University in Ireland.

The Chancellor of the Queen's University, in presenting the degrees to its *alumni* last Friday, stated that in the Faculty of Medicine, 86 candidates have within the year, sought the degree of Doctor in Medicine, and of these, 53 have satisfied the examiners; 47 out of 76 candidates have passed for the degree of Master in Surgery, and 27 out of 55 have been deemed qualified for the separate Diploma which the University grants in Midwifery. 115 candidates presented themselves at the Second University Examination in Medicine, of whom 65 have come up to the standard required by the examiners; while 112 out of 186 candidates have been successful at the first University Examination in this faculty. The senate has passed a special grace to confer the honorary degree of Doctor in medicine upon Fleet-Surgeon Eustace of the Royal Navy, who highly distinguished himself in his care of the troops placed under his charge after the Ashantee war.

Cruelty in Sports.

Our contemporary, *Nature*, has been at some trouble to estimate the cruelty practised in sport, or in other words, by those licensed to kill and mutilate their victims. The calculation is based upon a report by the Inland Revenue Department, presented to both houses of Parliament. It appears from this document, which any one can obtain, that in the year 1873-4 there were 132,036 persons licensed to carry guns, and 65,846 licensed to kill game; and in 1874-5 these numbers increased to 144,278, and 68,079. Now although this large number of people were licensed to kill and did not kill, a vast number of beasts and birds are merely struck and wounded, and then they manage to crawl away, to endure a lingering death of hours or days duration. In this way it is almost incalculable how much pain and misery is inflicted for the gratification of the sportsman and of his friends. Taking the number of shooting days in each year to be 126, and that each holder of a license to kill game goes out on an average of two days a week—a considerable number go out every day throughout the shooting season—this will give an average of forty-two days for shooting for each of the 65,846 holders of licenses in 1873-4, and of 68,979 in 1874-5. Now it is tolerably certain that each sportsman wounds on an average three heads of game per diem; and if we multiply both these by the number of days, 126, we shall find that in the former of these two years there must have been 8,296,196, and in the latter 8,577,954 animals and birds left wounded. Of those who hold gun licenses and mostly use them for the purpose of ruthlessly destroying our song and small birds during the ripening of corn and fruits, a single shot into a flock of sparrows will wound more than it kills, and it does not seem possible to place the average number of birds left wounded at less than 14,000,000 to 15,000,000 adding these totals together of the year 1874-5, we have the enormous total of upwards of 23,500,000 of wounded animals. Here, then, we are in possession of the plain facts of the case, and may judge of how much acute pain and suffering, of an uncertain duration, was inflicted in the year ending March 31, 1874, upon over 22,000,000 of animals and birds; in the following year this amounted to over 23,500,000 in the British Islands. We do not wish, says the editor of *Nature*, "to distress our readers by dwelling on the effects of all this wounding in sport, or call them who shoot by hard names, but we invite our readers to reflect on the proportion which even that number bears to the number of animals which during the same time have been subjected to experiment by the physiologists of this country. The latter have been by many well-meaning persons held up to obloquy as monsters of cruelty. If this has been done justly, what must they think of those who use the gun? The sentimental editor of the *Spectator* will probably look upon this picture as nothing, when compared with the intolerable injustice and hardships involved in the policy of deliberately torturing an innocent *sensitive creature for the chance of relieving a few other sensitive creatures not more innocent.*" To argue that wounding in sport is inhuman and unjustifiable, is to be in the eyes of the *Spectator*, an "exponent of a trades union feeling."

Carelessness in the Sale of Poisons.

A CASE of poisoning by an overdose of chloral hydrate, which was investigated at Carlisle, last week is deserving of scrutiny as an exemplification of the great danger of the slip-slop system under which poisons are hourly sold by druggists. The victim in this instance was a man who had acquired a habit of taking chloral to allay the pain of vesical disease. He purchased an ounce of syrup of chloral (containing eighty grains of the drug) on Saturday night, and the same quantity again on Monday. On Tuesday morning he was dead. The cogent facts are those which throw light on the sale of the drug, and which we here recapitulate. It was sold by an apprentice, 18 years of age, the assistant to the proprietor of the shop being away on his holiday, and the proprietor himself *non est inventus.* This boy swore that the bottle into which he had put the chloral had been brought to him with the following label attached to it—"One-half to be taken at night, and the other half to-morrow night." That he had not put on a fresh label, although sometimes he filled the bottle, and sometimes only half-filled it—that he had sold the same poison to the same man about eight times, asking no questions, and requiring no entry in the poison book, because chloral is not in the official list of poisons—and, lastly, that the victim, when he last sold him a "refresher" of the dose, was so much the worse for drink or something of the sort, that he had to hold the door to steady himself.

Such are the facts. Or course the paternal British law will come to the rescue of the consumer, and some one must be severely punished. We would be glad to know who? Shall it be the poor, distracted, over-worked druggist's drudge—the apprentice-boy of 18, or shall it be the comfortable, well-to-do druggist himself, who calmly leaves his shop, with its magazine of death-dealing drugs, under the charge of the aforesaid drudge, caring nothing upon whom the ignorance or hurry of his apprentice may take effect? Or shall it be the Pharmaceutical Society, which, entrusted with the organisation and management of the English trade in poisons, winks at all sorts of abuses for the benefit of the drug dealers? Or, lastly, shall it be the minister, who to get the shopkeeper's vote, discourages the establishment of any check upon the free trade in poisons?

Hastings Health Report.

THERE have been 268 births registered during this quarter, giving an annual proportion of births to population of 31·52 per 1,000. The average for England and Wales for the half year ending June was 37·7.

The deaths registered during the quarter ending September 30th as having taken place in the borough numbered 113, including 20 visitors, being 22 less than in the corresponding quarter last year, and 18 less than in the same quarter of 1874, an annual average of 13·26 per 1,000. This favourable death-rate is due chiefly to a less number of children having succumbed to diarrhœa, there being only 4 deaths from this disorder in the quarter against 13 in the same period of 1875, and 12 in 1874. But, taking note of the registrar-general's returns, it appears that the past quarter has been peculiarly favourable to the lives of the very young and very old. The weather statistics, not yet received from the different parts of England, will probably show much to account for this happy state of things.

Among the deaths were four from the seven principal zymotic diseases—viz., 3 from diarrhœa and 1 from diphtheria. Constitutional diseases 30, local diseases 41, developmental 24, and of violent deaths 8, 7 of the latter being registered as accidental, and 1 as suicide.

Of the 20 visitors who died, 5 succumbed to consumption, 4 to heart diseases, 2 to accidents, and the rest to local diseases.

Is the German Race Fair or Dark?

IT appears that the Germans have been engaged in the determination of the relative frequency of blue eyes and fair hair as compared with brown eyes and dark hair. On a certain day a census was taken in every school in Prussia, and the numer of children counted under fourteen years of age was 4,127,766. In the result the blue eyes exceeded the brown by two to one, and those having fair hair by three to one. Only one and one-eighth have black tresses, and less than seven in a hundred of Prussian beauties are brunettes. It was an eminently characteristic idea of the German mind to insist upon this census, but we understand that the exact opposite was expected to be the result, and those who promoted the idea are more than annoyed that the Gallic type has made so little progress amongst the German masses.

The Questionable Value of Sutures.

DR. E. H. GREGORY, of St. Louis, has the following inquiry in a paper in the *Transactions* of the Missouri State Medical Society:—

The question suggests itself whether, as a rule, it might not be well *not* to use sutures after amputations, or in similar wounds from other causes. In these cases raw surfaces are extensive, a variety of textures divided, more or less oozing inevitable, and the possibility of exact and homogeneous coaptation scarcely to be entertained. The observation of most surgeons must be, that in a large proportion of instances, on clipping the loops after a day or two, inflammatory products, offensive and poisonous, escape as from imprisonment, and the borders go apart as if relieved from painful tension; meanwhile there is febrile disturbance and local suffering. For our part, we think perfect rest, provision for drainage, and that position which favours relaxation and circulation, would be more in accord with the situation.

DR. HENRY LAWSON, who has for the last thirteen years acted as chief editor of the *Popular Science Review*, announces his intention of resigning that post.

The International Congress of Ophthalmology at New York.

The fifth meeting of the International Congress of Ophthalmologists took place at New York on the 12th, 13th, and 14th of September, and is reported in the *Philadelphia Medical Reporter*. The attendance from abroad was not large. The total number of members registered as in attendance on the present occasion was about ninety.

The Congress was opened at 12 m. on Tuesday, the 12th, by the chairman of the committee of arrangements, Dr. Agnew, who nominated as chairman of this session, Dr. E. Williams, of Cincinnati. He was unanimously elected as a deserving recognition of his early devotion to the science of ophthalmology, at a time when ophthalmologists in America, in the proper sense of the word, could be numbered on the fingers of one hand.

Mr. Brudenel Carter, of London, and Dr. Hanson, of Copenhagen, were then put in nomination as vice-presidents, and duly elected.

Among the papers presented were the following :—

Dr. Noyes, of New York—Plastic Operations on the Lids; the Naso-buccal Flap.

Procedure for Lessening the Pressure of the Lids in Corneal Affections.

An Analysis of Eleven Hundred and Thirty-one Cases of Asthenopia.

On Conical Cornea and its Relief by Operation.

Dr. Knapp—On Orbital Tumours.

Dr. Roosa—On the Relations of Blepharitis Ciliaris to Ametropia.

Dr. Loring—On the Halo around the Macula.

On the Ciliary Muscle.

Dr. Gruening, New York—Tumours of the Optic Nerve.

Dr. Pooley, New York—Hemiopia.

Dr. Agnew, New York—On Asthenopia.

Dr. Jeffries, Boston—On Detachment of Posterior Synechia.

Dr. Dyer, of Pittsburg—On Gymnastic Exercises of the Ciliary Muscle in Asthenopia.

Dr. Heyl, of Philadelphia—On Coloboma of the Lens.

Dr. Nagel, Tübingen—The Metrical System in the Use of Spectacles.

Dr. Alt, New York—Sympathetic Neuro-retinitis.

Dr. Burnett, Tennessee—Trachoma, as Influenced by Race.

Dr. Kipp, New Jersey—Cysticercus under the Conjunctiva.

Dr. Keyser, Philadelphia—Bony Growth in the Site of the Crystalline Lens.

Dr. Thomson, Philadelphia—Astigmatism and Staphyloma Posticum.

A number of instruments were exhibited to the members of the Congress, either at its regular sessions, or during its recesses. Among these were : The metrical ophthalmoscope of Dr. Landolt, of Paris, and the ophthalmoscopes of Loring and Knapp, each with the metrical system, as well as the old inch system, applied in the numbering of the glasses ; Dr. Snellen's phakometer ; Dr. Landolt's artificial eye for the correction of physiological calculation, &c. ; Dr. Keyser's instrument for measuring the distance between the eyes ; the lid forceps and scleral trephine of Dr. Robertson, of Edinburgh, &c.

The place of next meeting, in 1880, was not decided upon, owing to the slim attendance of European members. A committee was, however, appointed, consisting of Mr. Carter, Dr. Hanson, and Dr. Becker, whose duty it shall be, after due consultation, to select a place of meeting, and appoint a committee of arrangements in the city selected.

During the Congress two receptions were given to the members—one by Dr. Agnew, and one by Dr. Knapp, both of which passed off with the utmost pleasantness. The banquet, which came off at Delmonico's, on the evening of the closing day of the Congress, was given by the members of the American Ophthalmological Society to the foreign members.

Among the distinguished personages present, outside the ranks of ophthalmology, was Mr. Walter, the publisher of the London *Times*.

Small-Pox in London.

Dr. Whitmore, the medical officer for Marylebone, last week presented a report to the vestry on the spread of small-pox and its prevention. His opinion is that the outbreaks of this disease in different parts of England and in some of the metropolitan parishes must be taken as warnings that ere long it would assume an epidemic character. Not many cases had occurred in Marylebone, but at any moment he might receive intelligence of some serious outbreak amongst the destitute poor of the parish in some of the crowded districts, and if so he would have to lament that our Sanitary Acts, as at present in force, did not provide adequate means for arresting its progress. The Vaccination Acts had been found to be most beneficial in their results, and sanitary work had been fairly performed ; but the one thing needed to stamp out the malady was still wanting, no power being given to the sanitary or any other authority to enforce the perfect isolation of an infected person, and until this was done they might despair of making small-pox a disease of the past. The managers of the Asylum hospitals instruct their officers "to receive only those cases which are accompanied by a certificate from a duly appointed parish or union medical officer ;" but to get this certificate often implied a delay of some days, and before the parish conveyance arrived to remove a patient the disease had been spread over the house. This serious delay in the removal of infectious diseases had been strongly represented to the Local Government Board ; but up to the present time this rule had not been relaxed. He could not understand why cases where isolation was necessary could not be received into hospital on the certificate of any legally qualified medical practitioner.

The Anniversary Festival of the Guild of St. Luke the Physician is announced for this evening at All Saint's School Rooms, Margaret Street, London, W.

Recent statistics go to prove that the United Kingdom doubles its population in 63 years. France takes 334 years to complete the same process.

A **Chair** of "Mental Alienation" has just been created in the Academie de Medicine of Paris.

Last week Mr. Richard Wadsworth, L.R.C.P., assistant medical officer of Shoreditch Infirmary, was presented by the officers and inmates of that establishment with a gold watch and chain, a silver fish service, and an illuminated testimonial.

A **dinner** of the medical graduates of the Universities of Glasgow and Aberdeen will be held at the Pall Mall Restaurant on Monday, October 23rd, at six o'clock for half-past six p.m., when the chair will be taken by Professor Struthers.

Mrs. Crace Calvert has presented to Owen's College, Manchester, the sum of £700 for the foundation of a scholarship in chemistry, in memory of her late husband, Dr. Crace Calvert, F.R.S. The scholarship will be of the annual value of £25, and will be competed for by members of the evening classes.

Notice has been given that an examination of candidates for twenty-seven appointments as surgeon in her Majesty's Indian Medical Service will be held in London in February, 1877. The notice for the army competition has not yet appeared, but it is rumoured that the War Office will make one more attempt to induce candidates to accept the ten year "turn out" system, and if failure results, will abandon the new Hardy expedient, and revert to the *status quo ante bellum*.

Correspondence.

SPIRITUALISM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—*Apropos* of the remarks in your issue of the 4th inst., on the Slade prosecution, which conclude with the words "we shall at least be able to judge whether spiritualism is a transparent swindle, or something worth looking deeper into;" will you permit me to briefly give my experience in the matter?

Between two and three years ago I assisted, in company with a well-known literary gentleman, whose name I am not at liberty to mention, at a private *séance*, given for our especial benefit, by a celebrated medium (not "Dr." Slade). After waiting a considerable time in a poorly furnished room over a tailor's shop not many miles from Holborn, the medium in question came in, a tall, cadaverous looking young man, with long hair *à l'Américaine*, and a shabby frock-coat closely buttoned. My friend introduced himself and me, and we talked for a few minutes on indifferent matters; the Medium then said, "Excuse me a moment; and while I am away examine the next room where the *séance* is to take place and satisfy yourselves that there are no confederates, and no apparatus of any kind concealed in it."

We examined the room—it was small, without carpet or furniture, except three chairs, a round table, and a deal cabinet such as is used in public *séances*, a very harmless affair, entirely innocent of machinery. The window was boarded up, and the chimney closed: the inner room communicated with the outer by means of folding doors.

Shortly after we had completed our survey the Medium returned, asked if we were satisfied, to which we replied in the affirmative, and then said, "Let us proceed to business; will one of you gentlemen close the folding doors, and put the rug close up to it, so as to exclude all light?"

I did so. We then sat down at the table, my friend holding one of the Medium's hands, I the other (little fingers interlacing), and we had each a foot on one of the feet of the Medium. Thus secured, it was impossible for him, he said, to move either hand or foot without our knowledge. Quite so, and yet after the lapse of a few minutes, during which we spoke about different things, raps were heard, apparently on the surface of the table, in the immediate vicinity of the Medium, and my friend received a smart tap on the side of the head. I was presently favoured with a similar attention, and the sensation was, to say the least, peculiar. I then requested that the spirits would manifest by raps close to me; but this, the Medium said, was unlikely as I was an unbeliever (in spiritualism), and at all events, no such manifestation took place. Every now and then the Medium shuddered and groaned, and on being asked for an explanation, replied that "the approach of the spirits always affected him like an electric shock."

Sometimes, he said, many other manifestations took place, such as ringing of bells, playing of banjoes, flutes, tambourines, &c., but in consequence of our want of faith, mine chiefly, these did not occur in our presence, neither did we witness the spectacle of balls and cones of fire flitting round the room, doubtless for the same reason, my scepticism.

After waiting about three-quarters of an hour, during which I caught a cold, the month was January, and finding the spirits reluctant to manifest, I proposed an adjournment; we broke up our circle, my friend opened the door and we presently took leave of the Medium, who most politely expressed his regret at the reticence exhibited by his spiritual visitants in our presence.

"What do you think of it?" asked my friend, when we had reached the street. "I believe it is all trickery," I replied, "but, at the same time, I have not the least idea how it is done."

On my return home, my wife inquired what I had seen and what I thought about the *séance*. I explained, and expressed my inability to account for the phenomena, while disbelieving, *in toto*, in their production by spiritual agency. "We had hold of his hands and feet," I said, "and never let them go for a moment; there was certainly no apparatus in the room by means of which he could have produced them, nor were there any confederates."

My wife smiled, and gave an explanation at once so simple and so apparent, that I could only wonder that it had not occurred to me before.

We tried the experiment and found it succeed admirably, allowance being made, of course, for our want of skill in performing the necessary manipulations. I immediately wrote to my friend, who was more than half inclined to believe that there might be something in spiritualism after all, and told him of the discovery we had made, and asked him to come with some other friends to test the possibility of reproducing by acknowledged trickery the so-called spiritual manifestations of the Medium. He came, we had a most successful sitting; this was the thin edge of the wedge. Since then I have thoroughly satisfied myself that the so-called "spiritualism" is a most transparent swindle, supported by an increasing number of self-satisfied dupes.

I am, Sir, yours obediently,

W. T. Greene, M.A., M.B.

London, Oct. 10, 1876.

P.S.—I ought to mention that before sitting down at the table the Medium exacted from my friend and self a promise that we should not strike a light, or attempt to seize anything that touched us, and to this compact we adhered, or the imposture might have been discovered at the time.

◆

DR. BLACK ON THE FUNCTIONAL DISEASES OF THE URINARY ORGANS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Circumstances have prevented me from seeing Dr. Black's letter of September 7. I am most truly sorry that it has been so long unanswered.

In reply to his just complaint that I insinuate that he participates in the opinion that spermatorrhœa may lead to phthisis, and clergyman's sore-throat, I merely quoted from page 118 of his work, and neither stated nor implied that they were his opinions. Any reader can clearly see that they are *not*. In reply to complaint the second—viz., that I malign him in saying as follows:—"Finally, fornication is used as a remedy." Lallemand," &c., &c., "all appear to be summoned as authorities in recommending this more than questionable piece of advice." Let me quote (page 176) from the work. "We come now to the delicate and vexed question of sexual congress as a remedy for spermatic incontinence." Is it unfair to translate "sexual congress" "fornication" in relation to a question of this kind? As the remedial measures are now being discussed, am I now unfair in thinking that Dr. Black is discussing "fornication as a remedy?" The remaining question, then, is this, which side of the matter does the author support? Let the book answer (page 176 *et seq.*). "There is nothing easier than to hound down an individual, who, following the guidance of truth and sincerity, is led to form opinions possibly at variance with those of the multitude." "*If morality conflict with physiology*, I apprehend that the fault rests with the former and not with the latter." "That in the treatment of spermatic incontinence sexual congress has been recommended by Lallemand, &c., constitutes a claim to an impartial examination of the subject." "It will be conceded in the first place at least, I maintain and believe, that there is such a thing as sexual appetite or instinct in the properly organised human being, &c." "Am I singular in this belief, as some of the critics of my former work would seem to regard me?" These are not the utterances of one who condemns sexual congress in the treatment of the disease.

Now the work throughout abounds in quotations, and one is apt to assume in reading a book—I assure Dr. Black I did read his work—that the author assimilates the ideas of his authorities.

And herein what I have written may be erroneously received. I did not say that *Dr. Black* uses fornication as a remedy, but I leave your readers to say whether he appears to think that the authorities quoted in favour of "sexual congress" are wrong or right. I should have said that the Greek Church is mentioned in connection with fornication *generally*. "Simple fornication is not regarded as sinful by even the Greek Church, not to speak of customs that obtain elsewhere." These are Dr. Black's own words.

To sum up, I did not say that the Phthisis and Dysphonia opinions were Dr. Black's. And with regard to the second matter, I will leave the quotations in the hands of your readers, and ask them to determine whether the objectionable sentence in my review was a very unfair deduction.

Believe me to be, yours truly,

October 7, 1876. THE REVIEWER.

◆

STUDENT REGISTRATION AND PRELIMINARY EXAMINATION.

THE Registration of Students in the London Schools has just been completed. The circumstance affords us an opportunity of calling attention to the difference of system between England and Ireland in this matter, a comparison which is much to the disadvantage of the latter, and which will deserve the consideration of the Medical Council whenever it suits the medical Rip Van Winkle to return to life. In London a student must commence his medical career by presenting himself for his "prelim," and this ordeal passed, he must then see to his registration, in order that he may get credit for his four years of study, and for every month he delays to inscribe his name on the registration books, he must lose a month at the end of his term of study. By this means the beginning and ending of every student is on record, and the name of each school in the teaching of the profession is known. In Ireland the system is the reverse of all this. The student begins when he pleases, and so long as his name is entered at some school before the 25th of November he is satisfied. He need not pass his preliminary previously, nor indeed until the eve of his examination, if he is lazy enough to defer it, and frequently the surgery, anatomy, Latin and ciphering are compounded into a very unpalatable and incompatible dose to be taken altogether at a gulp, two or three years after his nominal commencement of study. Then, again, he does not look after his own registration, but leaves it to the secretary of his school, who sends in the names to the Registrar of the Branch Medical Council piecemeal or *in globo* whenever he pleases, or not at all, if he does not please. Thus it happens that no one really knows how many students are in the schools, or in what schools they are, or when they really commenced, or whether they have fulfilled the required four years of duty. The only guide to such information in Dublin is the return made by each school in the last week in November of the number of students who are entered for dissection and may probably want subjects. This return is made to the Anatomical Committee—a conclave of gentlemen who are connected with the leading schools, and whose business it is to apportion the supply of subjects according to the demand of each teaching institution. It is whispered, as a not uncommon ruse, that schools pay for subjects for a much larger number of students than they really have on their books, for the double purpose of making a good show of numbers before the committee, and of obtaining an abundant supply of "the raw material" which is often scarce. Moreover, the Anatomical Committee considers it diplomatic to keep secret the numbers of students entered at the schools lest, perhaps, the uninformed public should know too much of the extent of the teaching function in some of them, and accordingly all information such as that which is furnished each year by the English registration system is obstinately refused by the Dublin tribunal.

It will be readily seen in what respects the Irish system fails. It is not of great importance that the public should know the stake of any particular school in the medical teaching of the country, although it seems to us that the concealment of facts and figures tends to place the best schools on a level with the worst, and thus to injure the efficiency of the Irish school as a whole. But it *is* of importance that students should serve their full term of four four years (which they almost never do voluntarily in Ireland), and that it shall be known accurately from what date they have commenced. It is also of importance to know that they have proved their capability to study anatomy and surgery by showing that they have some preliminary knowledge.

Lastly, uniformity of practice in England and Ireland is of much value, and it is very unfortunate that a young man who may become a surgeon in Ireland on three years' certificates must show—in England—another year of study of one sort or another.

◆

MILITIA SURGEONS.

LAST week there was a large and influential meeting of the surgeons of the militia regiments in Ireland, held at the Royal College of Surgeons in Ireland, to consider the terms of the warrant of July 19th, 1876, respecting the future status, duties, pay, and emoluments of militia surgeons. A large number of letters were read from militia surgeons who concurred in the objects of the meeting—to obtain, if possible, compensation for the great losses they had recently sustained. Information having been given that the English militia surgeons proposed appointing a deputation to confer with the Secretary of State for War in reference to the terms of the warrant, it was determined that no step be taken by the Irish militia surgeons with regard to their being placed on the departmental list, until the results of the conference of the English deputation is known. It was also determined that a deputation of three members at least of the Irish militia surgeons should be deputed to accompany the English deputation to wait on the Secretary of State for War.

We earnestly trust that the deputation may be successful in their representation to the War Minister of the great injustice under which they suffer. They have been at one swoop deprived of almost the whole of their emoluments, without a shilling's worth of compensation, excepting the value of a feather in their regimental hat. The loss is no bagatelle. It is a very sweeping and substantial disendowment, which in any other branch of the Queen's service but the army would be at once liberally recognised. We have before us a typical case illustrative of the loss sustained by individuals by this last stroke of impolicy.

Emoluments under the Old System during 83 days Preliminary and Training.

	£	s.	d.
83 Days Pay, at 17s. 6d.	72	12	6
" Mess Allowance, at 4s.	16	12	0
" Lodging, at 1s. 6d.	6	4	6
" Forage, at 2s.	8	6	0
" Rail and Road		13	2
" Travelling		10	0
Attendance on Staff	31	13	2
Recruiting (say)	40	0	0
Total Emoluments	176	11	4

Loss Under the New System.

	£	s.	d.
Preliminary Drill—			
56 Days Pay, at 17s. 6d.	49	0	0
" Mess Allowance	11	4	0
" Lodging	4	4	0
" Horse	5	12	0
" Rail and Road		6	7
" Travelling		5	0
Allowances for Medicine	7	10	0
Recruiting (say)	40	0	0
Total of Loss	118	1	7

Total Emoluments under Old System	176	11	4
Loss by New System	118	1	7
Balance	58	9	9
Add 2s. 6d. a day for 27 days	3	10	0
Total present Emolument	£61	19	9

Against £176 11s. 4d. under the Old System.

This is no exception, but one of average hardship, and we feel confident that no Government can refuse recognition of so heavy a loss when the circumstances are fairly represented.

PLACE AUX DAMES.

The first fruits of Mr. Russell Gurney's Bill of last session, which afforded all licensing bodies the option of admitting women to their degrees, if they see fit, have been already reaped, and we may look upon the Woman Doctors' controversy as finally settled by the recent decision of the College of Physicians of Dublin. The Fellows of that body have deliberately determined to admit Miss Edith Pechey to the examination for the L.K.Q.C.P.I., and have thus thrown open the portals of the profession to all comers, whether they be "persons" of the male or female sex.

However pregnant of results this decision may be, it does not seem to us that any other conclusion was possible, and we expect to see a similar ingress allowed to the ladies by all other bodies. The Queen's University, it is anticipated, will be the next to follow suit, and these fortresses having surrendered at discretion, it is impossible that others can long sustain the siege. The only banner now across the path of the lady-doctors is the difficulty of producing the same hospital, lecture, and dissection certificates as are required from male students, but this they will no doubt readily surmount when the schools understand that their *status* is recognised by the colleges. We congratulate our fair *consœurs* on their success for, though we are ungallant enough to entertain doubts of their ultimate position as practitioners, we deprecate strongly the exercise of any exclusiveness towards them. They are certainly entitled to "a clear stage and no favour" both as students and as doctors, and if they have the energy or talent to shoulder aside male competitors they are entitled to our best wishes.

◆

Medical News.

Vital Statistics.—The state of the public health is at the present time in a most satisfactory condition. The mortality from all causes averaging last week only 19 per 1,000 throughout the United Kingdom. In Edinburgh it was only 13, Dublin 16, London 18, and Glasgow 22 per 1,000. In the other large towns the rates were—Plymouth 13, Nottingham 17, Brighton 18, Bradford 18, Leicester 18, Portsmouth 19, Birmingham 19, Bristol 20, Hull 20, Sunderland 20, Leeds 21, Liverpool 21, Sheffield 21, Wolverhampton 22, Newcastle-upon-Tyne 23, Oldham 24, Manchester 26, Salford 26, and the highest rate 28 in Norwich. The annual death-rate from the seven principal zymotic diseases averaged 3·2 per 1000 in these towns. The 9 fatal cases of scarlet fever in Portsmouth, which had been 20, 13, and 9 in the three preceding weeks, rose again to 14. Small-pox caused 7 more deaths in Manchester and Salford, 9 in Liverpool, and 11 in London.

The Death-rate in Foreign Cities.—The annual rates of mortality, according to the most recent weekly returns to the Registrar-General, were:—Calcutta 27 per 1,000 of the population, Bombay 26, Madras 44, Paris 22, Brussels 20, Amsterdam 19, Rotterdam 19, The Hague 23, Copenhagen, 20, Stockholm 25, Christiania 13, Berlin 28, Hamburg 26, Breslau 29, Munich 30, Vienna 23, Buda-Pesth 32, Rome 25, Naples 25, Alexandria 59; New York 24, Brooklyn 21, Philadelphia 21, and Boston 21. The fatal cases of enteric fever in Paris, which in the seven preceding weeks had declined from 87 to 59, further fell last week to 35. Cholera caused 23 deaths in Bombay, and 47 in Madras.

Faculty of Physicians and Surgeons of Glasgow.—The following office-bearers have been elected for the ensuing year:—President, Dr. Andrew Fergus. Visitor, Dr. J. B. Cowan. Treasurer, Dr. John Coats. Honorary Librarian, Dr. James Finlayson. Vaccinator, Dr. Hugh Thomson. Councillors: The President, *ex officio;* the Treasurer, *ex officio;* Dr. J. G. Fleming, Dr. William Leishman, Dr. Henry Muirhead, Dr. J. D. Maclaren, and Dr. James Morton. Secretary and Librarian, Alexander Duncan, B.A.

Cambridge University.—At a Congregation held on Thursday last, the undermentioned appointments were made:—J. W. Hicks, M.A., of Sidney Sussex, and R. Apjohn, M.A., Gonville and Caius, were appointed examiners for the first, Dr. Humphry and Henry Power, F.R.C.S., for the second, and Dr. Barclay and Dr. Bradbury for the third M.B. Examinations during the ensuing year. Christopher Heath, F.R.C.S., and Timothy Holmes, M.A., F.R.C.S., were appointed examiners for the degree of Master in Surgery during the ensuing year. Dr. Herbert Davies was appointed assessor to the Regius Professor of Physic.

North London Medical Society.—The following officers have been elected for the ensuing year:—President, Thomas Stretch Dowse, M.D.; Vice-President, George Henty, M.D.; Treasurer, Robert Hilliard, M.D.; Secretary, W. H. Kesteven, M.R.C.S.

Central London Throat Hospital.—The following gentlemen have been appointed surgical and clinical assistants to this hospital:—Thomas Godrich, L.R.C.P., M.R.C.S.; H. B. Harrison, M.R.C.S.E.; Douglas W. Hemming, M.R.C.S.; T. J. Hitchins, M.R.C.S.; J. King Kerr, M.D., M.S.; and Samuel Osborn, M.R.C.S.

HYDATID OF THE LIVER.

Dr. Oliver Penfold (*The Australian Medical Journal, March*, 1876, page 80) reports the particulars of a case of this disease, that came under his notice, as an example, of the great recuperative powers possessed by an individual, who for some days lay apparently dying from the exhaustion produced by the discharge from a large cavity in the right hypochondrium, probably as large as a man's head. This discharge gradually drained away, and the patient's health was completely restored. The subject of this notice was a married woman, æt 35, a multipara, who was confined by a midwife in September, 1875, and who had subsequently an attack of pelvic cellulitis. A month after delivery, she complained of abdominal pains, debility, and anorexia. There was a tender spot near the centre of the epigastrium, and an increased percussion—dulness in the right hypochondriac region, a tense, thrilling sensation, being communicated to the percussed finger. There was distinct bulging of the parietes, from the free margin of the right rib-cartilages, and the skin was œdematous in the neighbourhood. Inferiorly, the dulness extended below the umbilicus, and across to the left, for two or three inches; above, it reached to the seventh interspace; behind the dulness was not notably increased. The patient thought the swelling was of at least five years' standing. The medical men consulted by her did not agree as to the nature of the tumour. Dr. Penfold punctured the most prominent portion, near the eighth rib-cartilage, Oct. 17th. 1875, drawing off five ounces only of clear hydatid fluid, She was somewhat relieved, and absorption and cure were hoped for. Soon, however, fever and sweatings supervened, and her strength failed rapidly. Nov. 15th, matters being critical, chloroform was administered, and an opening made by means of a scalpel through the abdominal walls, into the cyst. A small branch of the internal mammary artery was severed during the operation, but the hæmorrhage therefrom was easily arrested by plugging with lint steeped in perchloride of iron. A great quantity of filthy-looking pus escaped; the opening was then plugged with lint steeped in glycerine. The plugging was repeated daily, and cysts and discharge flowed away. Dr. Penfold attempted to wash out the cavity with a solution of permanganate of potass of the strength of one grain to the pint, but desisted after two days trial, owing to the severe pain excited by it.

About December 20th the weather became suddenly very hot, and the patient's strength failed, her general condition being very low. Ice and effervescing malt liquors were ordered. Dr. Penfold's description of the case and its treatment at this stage may best be given in his own words. "Odour in bedroom very foul. All silver instruments were quickly blackened by mere exposure. Introduced a piece of solid india-rubber catheter into cyst, and left about an inch projecting. Four days later, severe pains in the right side and scapular region set in. Her appearance was now very discouraging, her sallow wistful visage, with pinched skin stretched over the prominent cheek bones, giving one the impression of speedily impending dissolution. Opium was continued at night, and hydrochloric acid and cinchona mixture given frequently during the day." A large piece of cyst wall escaped early in January, followed by a great discharge. A pair of dressing forceps, could be passed to their full length into the cyst] without touching the bottom of the cavity at this time. Improvement commenced, the tube being removed for cleaning every few days. "By the 15th of January, 1876, she was able to do without the opiate, and merely took an occasional dose of bicarbonate of potass and infusion of gentian. The menses returned in March for the first time since her confinement. The opening was now about three inches deep, and was narrow. It was dressed with oiled lint till the 27th, when an iron wire below was put in. This was easily made by coiling the wire round a thick probe. After about a fortnight, this was removed, and the skin-wound completely cicatrised, and the patient was in excellent health shortly afterwards."

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Subscribers who have not yet sent in their subscriptions for last year are respectfully reminded of the omission.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be ound very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

THE REPRESENTATION OF GLASGOW AND ABERDEEN UNIVERSITIES.

Lord Advocate Watson has issued his address to the electors, setting forward his claims to represent them in Parliament, vice the Right Hon. E. S. Gordon, whose farewell address appeared in our last. The present aspirant, although differing in political views, entertains the same opinions as his predecessor on matters about which the medical profession is more particularly interested. These are expressed in definite and decisive language, and to subjects relating to the progress of medical and sanitary science he promises his earnest attention. Those of our readers who have votes are referred to his Address and his Committee List in our advertising columns.

Address to Mr. Croly, of Dublin.—The colleagues of Mr. Henry Gray Croly in the private teaching of the Dublin Surgical Class, have recently manifested their appreciation of his talents and industry by the presentation to him of an illuminated address, the text of which appears in our advertising columns of to-day. The address was presented to Mr. Croly last week, having been unavoidably delayed in its execution by the artist. Mr. Croly's separation from his colleagues on his appointment as Surgical Examiner in the Royal College of Surgeons was an occasion which has been fittingly availed of to pay him a compliment, and the recognition of his untiring assiduity when in harness as a private teacher is well deserved.

Dr. Myrtle.—The subject is of some interest, and if the address be short we will endeavour to find space for it in our next.

Dr. T. M. Fleming.—We have instituted inquiries on the subject of your letter.

Mr. T. H. H.—We shall be glad to receive it.

Dr. Abrath, Sunderland.—Letter received.

Mr. G. O. T.—Thanks, but the matter is scarcely suitable for our columns.

Surgeon-Major Maunsell is thanked.

Dr. Williams' paper "On the Growth of the Phthisical" shall appear if possible in our next.

Horse Disease in Egypt.—It is reported from Cairo on the 23rd of September that there reigns there amongst the horses a decimating epidemic, and in a few days hundreds of them have perished On the 18th 200 died in the City of Cairo alone, since when there has been a slight diminution. The principal weight of the epidemic has fallen upon the cavalry, half of whose horses have died. It has been necessary to send away their bodies into the desert in immense waggons, but numbers have also been thrown into the canals and the result has been very serious. It is supposed that this epidemic was brought from Abyssinia by the Egyptian army, but the effect has been very severely felt, inasmuch as cab-horses are scarce, and saddle-horses almost unattainable.

Mr. Hy. Smith.—Enclosures received with thanks. They appear to be of the usual quack type. Will look through them at leisure.

Hospital Saturday Fund.—Notice is given that holders of boxes or cards in connection with this Fund are expected to be present at a public meeting in Exeter Hall, Strand, on Saturday next at 5 p.m., when a statement of this years' collection and expenses will be made.

Student.—The list given by our contemporary was a fair one.

Dr. D.—1. The coroner is bound by law to employ as a medical witness a registered medical man "being at the time in active practice at or near the place" of inquest. He is *not* bound to employ the dispensary medical officer, and often interprets "at or near the place" to mean the locality where a friend resides, be it far or near. The usage is different in different districts. 2. It is not accordant with medical etiquette for an extern doctor to poach inquest fees in his brother's presence, but it is commonly done. The coroner's *protege* usually is a man who has nothing better to do, and to whom the fees are a great object. If our correspondent desires to test the validity of the coroner's proceedings he may do so by appearing by counsel before the fiating judge at next assizes and resisting the payment of the fee on the ground that the law has not been complied with, inasmuch as a distant practitioner has been employed who is not "in actual practice at or near the place."

VACANCIES.

Middlesex Third County Lunatic Asylum.—Medical Superintendent. Salary, £700, with furnished house, &c. Full particulars will be found in our advertising columns. (See Advt.)

East London Hospital for Children.—Assistant Surgeon. Particulars may be obtained of Ashton Warner, Esq., at the Hospital. (See Advt.)

Metropolitan Fire Brigade.—Medical Officer for the Central District north of the Thames. Remuneration at the rate of £1 per man per annum in the force of the said district. For full particulars see Advt.

General Hospital and Dispensary for Sick Children, Pendlebury, Manchester.—Superintendent. Salary, £100, with board and residence. (See Advt.)

Essex and Colchester Hospital.—House Surgeon and Apothecary. Salary, £100, with board and lodging. Further particulars of the Secretary, Colchester.

Tunbridge Union, Kent.—Medical Officer for the first district. Salary, £105, exclusive of fees. Applications to the Clerk of the Board, Tunbridge Wells.

Mitford Parish.—Medical Officer for the Workhouse and Parish. Salary, £110, with fees extra. Applications to the Clerk of the Board, Lowestoft, Suffolk.

Tisbury Union.—Medical Officer for the Donhead District. Salary, £74, with fees extra. Applications to the Clerk, Shaftesbury.

Central London Sick Asylum District.—Assistant Medical Officer and Dispenser. Salary, £110, with partial board. Applications to the Clerk, Cleveland Street Asylum, Fitzroy Square. W.

Kensington Dispensary.—Resident Medical Officer. Salary, £150, with furnished apartments. Particulars of the Hon. Sec., Dispensary House, Kensington, W.

London Female Lock Hospital.—Assistant House Surgeon. Candidates should apply to the Secretary for full particulars.

Sheffield Public Hospital.—Assistant House Surgeon. Salary, £65, with board. Apply to Dr. J. C. Hall, Sheffield.

Worcester General Infirmary.—House Surgeon. Salary, £100, with board. Applications to the Secretary.

◆

APPOINTMENTS.

Bayne, T. L., L.F.P.S.G., Assistant Medical Officer to the Barony Parish Hospital, Glasgow.

Blackader, A. D., M.D., M.R.C.S., Resident Clinical Assistant to the Brompton Consumption Hospital.

Canton, A., L.D.S R.C.S., Dental Surgeon to the National Dental Hospital, Great Portland Street, W.

Casley, R. K., M.B., C.M., House Surgeon to the Royal Surrey County Hospital, Guildford.

Dixon, W., M.B., C.M., Medical Officer for the Woodbury District of the St. Thomas Union, Exeter.

Esler, Robert, M.D., Honorary Medical Officer to the Ulster Hospital for Children, Belfast.

Findlay, G., M.D., C.M., Medical Officer for the Middle District of St. Nicholas Parish, Aberdeen.

Greenish, R. W., M.R.C.S.E., Resident Clinical Assistant to the Hospital for Consumption and Diseases of the Chest, Brompton.

Hick, H., L.R.C.P.Ed., M.R.C.S.E., House Surgeon to the Clayton Hospital and Wakefield General Dispensary.

Joseph, S. W. J., M.R.C.S., L.R.C.P.L., House Physician to the Hospital for Women, Soho Square, London.

Kay, Mr. A., House Surgeon to the Ayr Hospital.

Kenny, Dr. R. D., Medical Officer, &c., for the Oulart Dispensary District of the Enniscorthy Union.

McAfee, W., M.D., C.M., Resident Assistant House Surgeon to the Liverpool Dispensaries.

Morris, J., M.R.C.S.E., Medical Officer for the Northern District of the Brighton and Hove Dispensary.

Nason, J. H., M.D., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, &c., for the Rathcormac Dispensary District of the Fermoy Union, co. Cork.

Smallman, B. F., L.K.Q.C.P.I., L.R.C.S.I., Resident Assistant House Surgeon to the Liverpool Dispensaries.

Army Medical Department.—Deputy Surgeon-General T. C. O'Leary, M.B., has been appointed Sanitary Officer at Aldershot, vice Deputy Surgeon-General W. A. Mackinnon appointed to act as principal Medical Officer at that station.

◆

Marriages.

Hopwood—Matthews.—On the 11th inst., at St. Andrew's Church, Plymouth, Edwin James Hopwood, Surgeon Major, A.M.D., to Sarah Elizabeth (Sela), elder daughter of W. E. Matthews, J.P.

Paterson—Sewell.—On the 11th inst., at St. Andrew's Church, Torquay, William Dalrymple Paterson, L.R.C.P., L.R.C.S.Ed., to Elizabeth Emma Sewell.

Smith—Iredell.—On the 12th inst., at the Parish Church, Reigate, S. Parsons Smith, L.K.Q.C.P., L.R.C.S.I., of Addiscombe, Surrey, to Elizabeth A. Shrubb, youngest daughter of the late Francis Macartney Iredell, Lieut.-Colonel, Bombay Army.

Vores—Preston.—On the 12th inst., at Christchurch, Eaton, Norwich, W. Mallam Vores, B.A., M.B., Cantab., eldest son of W. Vores, M.D., Great Yarmouth, to Harriet Tolver, eldest daughter of the late Edmund Preston, of Guist Lodge, Norfolk.

◆

Deaths.

Bartleet.—On Sept. 29, suddenly, Edwin Bartleet, F.R.C.S., of Chipping Campden, Gloucestershire.

Forde.—On Oct. 11, at Parkstone, Dorset, suddenly, Elizabeth, only daughter of the late Henry Forde, M.D., of Ballybrick, co. Dublin, aged 30.

Hilliard.—On Oct. 2, at Lansdowne Road, Notting Hill, Dr. John Hilliard, late General Medical Inspector, Bengal Army.

Lawson.—On Oct. 6, at Egremont, Cumberland, John Edward Spence Lawson, M.R.C.S.E., aged 44.

Shaw.—On Sept 29, at Handsworth, Birmingham, James Shaw, M.R.C.S.E., aged 36.

Simoens.—On Oct. 6, at Twickenham, Jeronimo Simoens, M.R.C.S.E., aged 85.

INDIAN MEDICAL SERVICE.

NOTICE IS HEREBY GIVEN that an Examination of Candidates for twenty-seven appointments as SURGEON in Her Majesty's Indian Medical Service will be held in London in February, 1877.

Copies of the Regulations for the Examination, together with information regarding Pay and Retiring Allowances of Indian Medical Officers, may be obtained on application at the Military Department, India Office, London, S.W.

A further notice will be issued when the exact date of examination has been fixed.

T. T. PEARS, Major-General,
Military Secretary.

India Office, 6th October, 1876.

GENERAL HOSPITAL and DISPENSARY for SICK CHILDREN, PENDLEBURY, near MANCHESTER.

VACANCY. The Office of Lady Superintendent of the above Institution is vacant. The Hospital contains at present 84, and when complete in June next, will have 163 beds. Ladies who have undergone a thorough course of hospital training, and who can prove by testimonials and certificates, their fitness for the Office, are invited to apply to the Chairman of the Board of Governors, 5 Mount Street, Manchester, on or before October 31st. Salary, £100 per annum, and everything found.

EAST LONDON HOSPITAL FOR CHILDREN,

Ratcliff Cross.—Notice is hereby given that applications are invited from Candidates for the office of ASSISTANT-SURGEON to this Institution. The Hospital contains 35 beds, with an average attendance of 100 out-patients daily.

Attendance is required two afternoons in the week. Further particulars may be obtained from the Secretary, at the Hospital.

Rules 7 and 8, Section viii. of the Rules or Bye-laws, are as follows—

"7. Every Surgeon eligible to this hospital shall be a Fellow or Member of the Royal College of Surgeons of England, or a Fellow or Licentiate of the Royal College of Surgeons of Edinburgh or Ireland, or otherwise legally qualified to practise Surgery in England.

"8. The Physicians and Surgeons in this Hospital shall not practise Pharmacy."

Applications to be sent to the Secretary, at the Hospital, on or before Thursday, the 2nd November proximo.

A Special Court of Governors will be held for the purpose of electing an Assistant-Physician and an Assistant-Surgeon, on Tuesday, the 7th November, 1876, at the Coal Exchange, at 3.30 p.m.

THOMAS CHARRINGTON.
Chairman of the Board of Management.
EDWARD S. NORRIS, Treasurer.
ASHTON WARNER, Secretary.

Hospital, Oct. 10th, 1876.

MIDDLESEX.—THIRD COUNTY LUNATIC ASYLUM, BANSTEAD DOWNS, near SUTTON.

—The Committee appointed to provide this Asylum are prepared to receive applications for the appointment of MEDICAL SUPERINTENDENT. Candidates must be married, not over 45 years of age, and Fellows, Members, or Licentiates of one of the Royal Colleges of England, Scotland, or Ireland, and duly registered in Medicine and Surgery under "the Medical Act, 21st and 22nd Vic., cap. 90." It is essential also that Candidates should have had experience in the treatment of the Insane in Asylums or Public Institutions. The salary will be £[illegible] per annum, with a house supplied with planned furniture only, rates and taxes free, coals, gas, milk, and such vegetables as the garden may produce. The appointment will be held subject to such rules and regulations as the Committee may from time to time determine, and be determinable by either party on one month's notice. Printed forms on which applications must be made, may be obtained on written application to the Clerk to the Committee at the Asylum, and the said form must be returned duly filled up, together with copies of testimonials, on or before WEDNESDAY, the 8th NOVEMBER, and notice will be given thereafter to such selected Candidates as the Committee may desire to see. All canvassing in person is strictly prohibited, and will disqualify Candidates, and no travelling expenses will be allowed. The appointment of the successful Candidate will be on date the 1st day of February, 1877, and he will be expected to commence his duties on that or such subsequent day as the Committee may hereafter appoint.

By order of the Committee.

Dated this 13th day of October, 1876.

ADDRESS.

HENRY GRAY CROLY, ESQ., F.R.C.S.I.,

Surgeon to the City of Dublin Hospital; Member of the Court of Surgical Examiners, Royal College of Surgeons in Ireland, &c., &c.

Dear Mr. Croly,—On the occasion of your retiring from the position of a Demonstrator in the School of Surgery of the Royal College of Surgeons in Ireland to accept the office of an Examiner to which the Council has elected you, we, your colleagues, who have been so long associated with you in the teaching of students in the school you are leaving, cannot allow you to retire from our ranks without telling you most warmly how much we regret the severance of our connection, and how much we lose in the withdrawal of so able and energetic a teacher of surgery.

The high repute you have always borne as a surgeon and the estimation in which your classes have held you are well known and appreciated by us, and we wish, in parting from you not only to assure you of our high sense of your merits, and of the loss of your well-deserved promotion will entail on us, but to offer you our most sincere wishes for your future welfare and advancement.

We are, dear Mr. Croly, your sincere friends,
W. THORNLEY STOKER.
LAMBERT H. ORMSBY.
W. JOSIAH SMYLY.
EDWARD PERLE.
KENDAL FRANKS.

IRISH POOR-LAW INTELLIGENCE.

POLICE ATTENDANCE BY DISPENSARY MEDICAL OFFICERS.

We produce below for the edification of our readers two series of letters which have passed between Dr. Morgan O'Connell, of Kilmallock, and the Chief Secretary's Office at Dublin Castle, which will repay perusal, as an illustration of the mismanagement of the Constabulary Department, which has resulted in the removal of the Inspector-General, Sir J. Stewart Wood, from office.

In the first case, Dr. O'Connell was called upon to testify as to the state of health of a sub-constable, who had been already certified unfit for service, in consequence of suffering from varicose veins. He wrote the following :—

5th April, 1876.

I certify that Sub-Constable William Moutry, Kilmallock Station, still suffers from varicose veins of left leg, the veins are painfully swollen, and render him unfit for marching; they are likely to get worse as the weather becomes warm, and may burst from slight exertion.

Morgan D. O'Connell, M.D.

[copy.]

County of Limerick.

I have carefully examined William Moutry, Sub-Constable, 19437, Kilmallock Station, and have answered to the best of my knowledge and belief the several queries on the other side with respect to his case. He is suffering from varicose veins of left leg and ham, and in consequence thereof I am of opinion, and hereby certify, that he will never be fit for further service in the Royal Irish Constabulary.

Morgan D. O'Connell, M.D.

Dated this 13th May, 1876.

After the lapse of a month, Dr. O'Connell received the following somewhat important communication :—

[copy.]

County of Limerick, Bruff,
3rd June, 1876.

Dear Sir,—I have to inform you that the surgeon of the Force has examined Sub-Constable Wm. Moutry, and has recommended that the Sub-Constable should be sent to his station and resume his duty.

The Inspector-General, R.I. Constabulary directs me to call your attention to the decision of the surgeon of the Force in this case, and to remind you of the recent Government instructions to medical attendants, and to hope you will exercise more care in future examinations before granting certificates such as that granted by you on the 13th May, 1876, to Sub-Constable Moutry.

I have the honour to remain, Sir,
Your obedient servant,
Owen McGuire, S.I.

M. D. O'Connell, Esq., M.D.,
Kilmallock.

To this letter Dr. O'Connell forwarded the following well-deserved replication, which effectually "shut up" the Inspector-General :—

Kilmallock, 10th June, 1876.

Sir,—I am in receipt of your favour 3rd instant as to Sub-Constable Wm. Moutry of this station calling my attention by directions of the Inspector-General, Royal Irish Constabulary, to the decision of the surgeon of the Force in reference to the above-named Sub-Constable's case, and reminding me of the recent Government instructions to medical attendants, &c., &c., and in reply I beg leave to state respectfully for the information of the Inspector-General, Royal Irish Constabulary, that I carefully attended to the recent Government instruction in my certificate of the 13th May, 1870, as to Sub-Constable Moutry, that Dr. Gelston, of Limerick, also concurred in opinion with me that this man was unfit for the service. I myself have had considerable experience in the army, and here at home for the last forty years, thirty-seven of which I am in charge of the constabulary here and during very trying times. Under all the circumstances I consider the communication you were called on to inform me about was to a man of my standing unnecessary, and a slight to the profession which I am bound to take notice of. If the decision was the result of a medical board I should at once have submitted, but I view the decision of the surgeon of the Force in Sub-Constable Moutry's case as *capricious*, *professionally unsound*, and *injurious* to the service. I would reject Moutry to-morrow for service in the common militia of the country, and surely the highly efficient Royal Irish Constabulary should *turn out* men more active and healthy than that corps.

I have the honour to remain, Sir,
Your obedient servant,
Morgan D. O'Connell, M.D.

To Owen McGuire, Esq., S.I.,
Bruff.

It seems to have been decided, in return for this rebuke, to serve out the recalcitrant medical officer, and the opportunity arose shortly afterwards. Having attended a case of injury at the requisition of the head constable, he addressed the following letter to the Castle :—

Kilmallock, 30th August, 1876.

Sir,—I have the honour to inform you, that on the 3rd of August instant, I was called up between two and three o'clock a.m., by Constable Rush, of this station to attend a man named Jeremiah M'Grath, then in Kilmallock Barrack, and who was suffering from a severe wound in his head and a compound fracture of frontal bone. He lost a great deal of blood. I dressed his wounds, put in a suture, and used other fiit appliances. On the following day my further attendance on this patient was discontinued on the part of the Constabulary by Sub-Inspector M'Guire, as he considered M'Grath, being a farmer, was able to pay for professional attendance. I now respectfully apply to you to be so good as to have payment ordered me in this case, and I must observe that, the call having been made at night makes me entitled to a double fee. I have been informed by the Sub-Inspector that similar claims to mine are now made to your department.

I have the honour to remain, Sir,
Your obedient servant,
Morgan D. O'Connell.
Medical Officer, Kilmallock Dispensary District and Union Workhouse.

To the Under Secretary, The Castle, Dublin.

To this communication he received the following reply:—

[reply.]

Dublin Castle, 13th September, 1876.

Sir,—With reference to your letter of the 30th ultimo, I am directed by the Lord-Lieutenant to inform you, that as you were sent for on the night of the 3rd of August by Jeremiah McGrath, the wounded man, you should apply to him for payment of your fee.

I am, Sir,
Your obedient servant,
T. H. Burke.

Morgan D. O'Connell, Esq., M.D., Kilmallock.

Dr. O'Connell does not appear to be the sort of man to leave the question uncontested, even with a Chief Secretary. He, therefore, replied as follows, and received at length, the succeeding answer :—

Kilmallock, 15th September, 1876.

Sir,—With reference to your letter 13th instant, in reply to mine of 30th August, in which it is stated "that as I was sent for on the night of the 3rd of August, by Jeremiah M'Grath, the wounded man, I should apply to him for payment of my fee." I have the honour to state for the information of His Grace the Lord-Lieutenant that I did not state in my application for payment for that visit on the night of the 3rd of August that I was sent for by Jeremiah M'Grath, but that I was requested by Constable Rush of this station to attend a man named Jeremiah M'Grath, lying dangerously wounded at the Barrack, and in making this request for my professional attendance the Constable did not state that M'Grath had sent for me. To confirm the foregoing statement, I have to request your attention to the important fact that the Sub-Inspector Mr. McGuire, notified to me on the following day on the part of the police, that they no longer required my attendance, McGrath being a farmer. This notice it is clear would not have been given if I had not originally been employed by the Constabulary in this case, and not by McGrath. I therefore submit very respectfully that the Constabulary are officially responsible to me for that nights' visit, and that they cannot lawfully or fairly evade that responsibility. Requesting that my application may be reconsidered,

I have the honour to remain, Sir,
Your obedient servant,
Morgan D. O'Connell, M.D.

The Under Secretary, The Castle, Dublin.

Dublin Castle, 30th September, 1876.

Sir,—I am directed by the Lord-Lieutenant to inform you in reference to your letter of the 15th instant, that Mr. Roche, Crown Solicitor, has been instructed to pay you the sum of one guinea for your professional services in a case of assault on 3rd August last.

I am, Sir,
Your obedient servant,
T. H. Burke.

M. D. O'Connell, Esq., MD., Kilmallock.

THE LATE EPIDEMIC OF SMALL-POX IN CONNAUGHT.

In their lately issued report the Local Government Board gave the following history of last year's outbreak of small-pox in Connaught :—

The most serious outbreak of the disease during the twelve months was in the province of Connaught, where 674 persons out of the whole 881 treated by the dispensary officers in Ireland were attacked ; the disease prevailing in the most virulent form in the unions of Claremorris, Loughrea, Swineford, Tobercurry, and Tuam.

The disease had existed in the Swineford and Castlebar Unions more or less in the year 1874, but the first case which was reported in the Tuam Union in the year 1875 was on January the 10th, when the medical officer of the workhouse furnished the particulars of the case of a "traveller" from Mullingar, who stated that—

"On his way towards Athlone he went into a cabin about six miles off, where he remained for two hours, and that there was a child there who had an eruption similar to what he laboured under."

He remained two nights in Dunmore, and from thence came the next report of a case, namely, on the 16th Jan.

The disease soon extended its ravages to Tuam, where 88 persons were attacked.

In the Ballinrobe Union, where there were 22 cases, the infection was reported to have been brought by the family of "an itinerant pedlar and tinker" from the Ballina Union.

In Castlerea Union, where there were 20 cases, it was stated that the disease was brought "by a tramp."

In the Claremorris Union, where there were 103 cases, the disease being more or less prevalent during the whole of the twelve months, the medical officer of the Ballyhaunis Dispensary District stated that he had no doubt that "inoculation" for small-pox had been practised in the district, and that he had no doubt but to that practice the importation of the disease might be entirely attributed there.

The medical officer had taken active steps, so far as he could, to prevent the spread of the disease, having—

"Supplied disinfectants, reported the matter to the guardians, had the houses lime-washed, and the yards cleaned up, and having on all available occasions cautioned the people against frequenting or attending 'wakes' in infected localities, and caused the speedy interment of the bodies of persons who died of the disease."

He also "re-vaccinated over 600 persons with manifest advantage ; those neglecting this precaution being in many instances struck down with the disease in the midst of, and to the exclusion of other members of the same family who had lately undergone the operation."

Dr. Roughan, the inspector in charge of unions in the county of Sligo, in reporting in April, 1875, on the question whether it was advisable that the Sligo Militia should be assembled for training, having regard to the prevalence of small-pox in certain parts of the county during some months previous, stated that—

"Small-pox of a very malignant type still prevailed to a serious extent in Tobercurry Union, and in the neighbouring unions of Swineford, Castlebar, and Claremorris ;" that "much alarm prevailed amongst the intelligent inhabitants ; that the magistrates had postponed holding petty sessions ; and that the public schools were closed."

The alarm and apprehension felt elsewhere when small-pox broke out were exemplified, however, in even a more remarkable degree in the Loughrea Union, where the disease assumed its largest proportions during the two last quarters of the year ending 30th September, 1875.

On the 1st of March, 1875, the medical officer of the Athenry Dispensary District, Dr. Leonard, reported that a very bad case of small-pox had come into the district from Tuam the day before, and that the following was the history of the case :—

"William Burke, aged about twenty-two years, a native of Newcastle, in this dispensary district, took ill on Saturday, the 27th of February, in Tuam, where he was employed as a baker's assistant. He was visited by Dr. Turner on Monday, who ordered his immediate removal to hospital : as also that his bed and blanket should be either disinfected or destroyed ; but instead of complying with the medical officer's instructions, he was conveyed by midday train to Athenry, where he arrived at about twelve o'clock, being exceedingly weak, and suffering from dreadful gastric irritation since he left Tuam. He had to remain in a house in Athenry for some hours, when a car was procured, and the poor sufferer conveyed to his father's residence, a distance of about six miles. I visited him at about nine o'clock p.m., and gave full instructions to his friends."

To the introduction of this case into the Athenry district may be attributed the attack of 171 persons (five of them being private patients), and the death of 49 of this number.

His removal into the Athenry District from Tuam was *primâ facie* a wilful infraction of the 38th section of the Sanitary Act, 1866, which provides for the infliction of a penalty not exceeding £5 on any "person with infectious disorder exposing himself, or on any person in charge of such sufferer causing such exposure ;" and the board at once directed their inspector, Dr. Brodie, to make inquiry as to the parties responsible for the act.

It appeared on inquiry that Mr. P. Corcoran, the baker in Tuam, in whose house he had resided, recommended him to return home, assisted in getting him ready for the journey, took a railway ticket for him, and put him into a railway carriage; and then fearing, as it was stated, detection by the constabulary, immediately left the station and went away.

The particulars having been reported to the Government, the Board were informed that the Attorney-General had advised that Mr. Corcoran should be proceeded against as had been suggested by the Board; and this, after some unavoidable postponement, was done, and Mr. Corcoran was fined £2 10s., or in default sentenced to one month's imprisonment.

William Burke died at his father's house shortly after arriving there; and the next four cases reported in this district were those of the father of William Burke, the Rev. Mr. Walsh, Roman Catholic curate, who had attended his dying bed, a member of the family of Dr. Leonard, and the parish clerk.

The Rev. Mr. Walsh was taken ill in "Kineen's Hotel," Athenry, and died there on the 29th March, the hotel having in the meantime been compulsorily closed in pursuance of the 39th section of the Sanitary Act.

Several fresh cases were then reported, and the Board of Guardians were requested to provide hospital accommodation for the treatment of persons labouring under the disease.

The Board of Guardians, on the 17th April, ordered an iron hospital, capable of accommodating 12 patients, from a firm in London, but very great difficulty was experienced in obtaining a site whereon to place the hospital, partly from the unsuitability of some of the sites proposed, and partly to the determined and violent opposition exhibited by persons in the neighbourhood to the establishment of an hospital at all.

However, eventually a house was rented near Athenry and fitted up and used for the purpose, two skilled nurses having been obtained from the Cork-street Hospital, Dublin, to attend the patients; and an assistant, relieving, and sub-sanitary officer was appointed.

During the excitement and alarm which arose in the neighbourhood of Athenry when the disease broke out, the workhouse van which was being sent to convey a patient to the hospital at the workhouse was attacked by a mob, the horse and driver sent back, and the van itself burned, having been maliciously set on fire.

The town or village of Athenry had been described at the commencement of the outbreak as in a very filthy and discreditable condition, but steps were taken to improve the sewerage and improve the sanitary condition of the place. It had been ascertained that those portions of it that were drained some few years since had escaped the disease, while the streets that were undrained had suffered severely from it.

On the 12th June, Dr. Brodie, local government inspector, reported to the Board that—

"the small-pox was on the decline," and that "it was to be hoped that with close attention to whitewashing, cleansing, and disinfecting the houses, together with the supply of clothes, bed-ticks, and fresh straw given to the patients leaving hospital, through the benevolence of a few charitable ladies who had raised a fund for the purpose, the disease would soon be got under;"

and on the 1st of August Dr. Brodie reported that no one had been attacked in the town during the twenty-two days previous to that date.

◆

SOUTH DUBLIN HOSPITAL.

CORRESPONDENCE.

A LETTER was read from the Local Government Board, stating that the Guardians were bound to pay the fee of £2 ordered by the justices at Tallaght Sessions to Dr. Seward for the examination of a lunatic. The justices had power, under the 14th section of the Lunatic Asylums Act (Ireland) of 1875.

Mr. Byrne explained that his objection was not to the fee, but to its being made on the wrong persons. The lunatic in question belonged to Kilkenny, and had only wandered into the County Dublin for half-an-hour when he was taken up by the police.

ELECTION OF APOTHECARY.

The election of resident apothecary in the room of Dr. Grant, who had retired from failing health, was then proceeded with. The salary is £100 per annum, furnished apartments, attendance, and first-class rations, with liberty to keep two apprentices, who should also receive rations. There were three candidates—Dr. John Moore Nichols, Dr. Thomas Myles, and Dr. John W. Hallahan. Upon the first poll the voting was for Dr. Hallahan, 21; for Dr. Myles, 19; and for Dr. Nichols, 19. On the second poll the voting stood: Dr. Hallahan, 20; Dr. Nichols, 17; and Dr. Myles, 13. Finally, Dr. Nichols was elected by a majority of 22 to 16.

◆

WEXFORD UNION.

The Medicine Contract.—Mr. Stephen Prendergast asked Mr. Peacock what right had he, as a member of the Finance Committee, to pass certain accounts for which he had no vouchers. You (Mr. Peacock) called on me to know what authority I had to pass certain accounts, and I told you how I did so; and now I ask you by what authority you passed accounts without vouchers? Show me your authority. Here is Leslie and Co.'s bill for medicines, and I want to know upon what authority it was passed.

Clerk.—The doctors have not certified that the medicines were supplied. The auditor passed the last accounts for medicines subject to the doctors' certificates, which are to be submitted to him at the next audit.

Mr. Prendergast.—I am very well aware of that, but it has not been done; still a cheque has been passed, and Leslie paid for the medicine. The medical officer of each district must certify that he has received the medicine in order to satisfy you before payment. Why, then, would any man sign a cheque without knowing whether the goods were received or not?

The Clerk said that no bill should be presented without vouchers, and he would take care that it should never occur as long as he was clerk of the union.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING OCT. 7, 1876.

Total registered deaths in Dublin and suburbs * ...	141	
Ten years average of same week	146	
Decrease of mortality below average	5	
Ratio of deaths, suburb of Rathmines ...	4·9	per 1,000
" " " Donnybrook †	9·4	"
" " " Blackrock ...	7·2	"
" " " Kingstown ...	22·5	"
" " Entire Dublin district ...	15·9	"
COMPARATIVE RATIOS—London	17·9	"
" " Glasgow... ...	21·5	"
" " Edinburgh ...	13·3	"

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

The number of deaths from zymotic diseases registered during the week was 22, against an average of 43 for the corresponding week of the preceding ten years. The deaths from these diseases include 8 from fever (1 typhus and 7 typhoid), 3 each from scarlet fever and measles, 2 from whooping-cough, and 5 from diarrhœa.

Nine children died from convulsions.

Eleven deaths were caused by bronchitis, 1 each by pneumonia, asthma, and lung disease unspecified, 5 by heart disease, 3 by paralysis, 1 each by apoplexy and brain disease unspecified, 3 by liver disease, 1 by nephria, and 2 by kidney disease unspecified.

Seven deaths resulted from phthisis, 2 from mesenteric disease, 1 from scrofula, and four from cancer.

Two accidental deaths from fractures (the result, in each case, of "a fall whilst intoxicated"—inquests), 1 death from drowning, and 1 case of homicide were registered.

SUMMARY OF QUARTER ENDING SATURDAY, SEPTEMBER 30, 1876.

Births.—In the Dublin District the number of births registered during the quarter represented an annual ratio of 1 in 28·3 in every 1,000 of the population.

The number in the City was 29·7 in every 1,000, and in the suburbs only 23·5 in every 1,000 of the estimated population.

There was registered in London during the same period 35·1 in every 1,000 of the estimated population, in Glasgow 37·1, and in Edinburgh 33·9 in every 1,000.

Deaths.—The deaths registered in the Dublin district during the quarter amounted to 1,603, affording an annual ratio of 20·4 in every 1,000 of the population.

The number of deaths of inhabitants north of the Liffey was 19·5 in every 1,000, and the south of the river 21·2 in every 1,000. In the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, the number was equal to an annual death-rate of 16·9 in every 1,000.

The deaths registered in Belfast represent an annual ratio of 22 in every 1,000, in Cork 21, in Limerick 22, in Waterford 19, in Galway 20, and in Sligo only 12 in every 1,000. In London 21·7, in Glasgow 21·5, and in Edinburgh 16·8 in every 1,000.

Diseases.—Dublin Registration District.—The deaths from zymotics amounted to 20·9 per cent. of the total deaths, and equal to an annual rate of 4·3 per 1,000.

The deaths from diarrhœa numbered 132, or 8·2 per cent. of the total deaths, and in the corresponding quarter of last year 140.

Fifty-two deaths were ascribed to fever (13 typhus, 30 typhoid, and 9 simple continued fever), 42 to scarlet fever, 20 to whooping-cough, 12 to measles, 11 to croup, 7 to diphtheria, 4 to quinsy, &c.

There were 2 deaths ascribed to small-pox during the quarter—1 that of a girl aged seventeen years, who died in the Meath hospital on the 16th of August; she had but "one indifferent vaccination mark." The other was that of a boy, thirteen years of age, who died in the South Dublin Union Workhouse. The cause of death furnished in the weekly return was "debility after small-pox." It would appear, however, from the Medical Officer's subsequent report that the information as to the cause of death given to the Registrar was erroneous, as the boy's death resulted from morbus coxæ—phthisis; he had been attacked with small-pox four years ago.

Convulsions caused 137, or 8.5 of the total deaths. In the corresponding quarter of last year convulsions caused 155 deaths.

Bronchitis was the cause of 133 deaths, pneumonia of 40, and lung disease unspecified of 19.

Heart disease killed 88 persons, aneurism 14, pericarditis 3, apoplexy 26, paralysis 32, cephalitis 10, epilepsy 8, insanity 3, brain disease unspecified 22, liver disease 21, jaundice 5, peritonitis 11, inflammation of the bowels 8, stomach disease 9, Bright's disease 7, inflammation of the bladder 3, stone 1, suppression of urine 1, and kidney disease unspecified 15,

One hundred and eighty-nine persons fell victims to phthisis, 33 to hydrocephalus, 28 to mesenteric disease, 12 to scrofula, 41 to cancer, 20 to dropsy and 1 to mortification.

Excluding 55 deaths in public institutions, the number of deaths registered during the quarter was 1,548, being equal to an annual mortality of 19·7 per 1,000 of the population, the deaths from the seven principal zymotic diseases representing an annual rate of 3·3 in every 1,000 persons. Of the other nine districts, the only one in which the deaths from the seven zymotics equalled an annual rate of 4 per 1,000 is No. 3, North City (Blackhall Street) District, in which the rate was 4·1 per 1,000.

Three deaths were homicidal, and 2 suicidal.

THE SUCCESSFUL TREATMENT OF DILATED HEART.

By J. Milner Fothergill, M.D. Edin., M.R.C.P.L.,

Assistant-Physician to the West London Hospital; Assistant-Physician to the City of London Hospital for Diseases of the Chest (Victoria Park).

(*Concluded from page* 312.)

W. S., aged fifty-two, a retired soldier, came under my care at the West London Hospital in June, 1875, with a dilated heart, and dropsy in the belly and legs. The pulse was fluttering and irregular, with frequent intermissions. He was placed under digitalis, iron, rest, and as good food as he could procure, and in a week or two he failed to reappear. In September he was back again, presenting the same symptoms. He gave as his reason for absenting himself that he was so much better that he had sought some work as a horsekeeper. Again the symptoms yielded to treatment. In the winter he came again as before with the most cheerful confidence in my capacity to relieve him. I urged him to take the workhouse for the rest of the winter, but he declined. Similar relief furnished by treatment.

On May 14th he again presented himself with swollen legs, pitting under pressure; ascites till his trousers would not meet, great oppression of breathing, a blue congested face, especially the nose, with an irregular, intermittent pulse, and orthopnœa. No albumen in the urine, which is very scanty. He was ordered tinct. digitalis, m. xv.; am. carb., gr. v.; fer. am. cit., gr. v.; inf. quassiæ, ℥j.; ter. in die.

On June 12th his trousers would meet, his legs were fallen; he said he made "plenty of water" under the medicine; he could lie down in bed. His pulse was still slightly irregular, but there was no intermitting. The area of cardiac dulness was much increased, but the impulse of the apex heat though extensive, was feeble. The first sound was thin and clear, but short.

July 17th.—Says he sleeps "beautiful," and that he can run 200 or 300 yards without discomfort. His legs are thin and free from dropsy, or, as he terms it, "as fine as a young lady's. Pulse nearly regular, though he had walked sharply up to the hospital. Says he can do as hard work as ever he did by a little extra beer. Area of percussion dulness becoming more normal. This improvement is very marked, considering the life led. This man had rheumatic fever more than twenty years ago, but he enlisted after it, and served in the Crimea. He was discharged from the army (the Rifle Brigade) for rheumatics, got well, and worked at coal-heaving; again enlisted in the 60th Rifles, served his time, and claimed his discharge in 1868, and has engaged in coal-heaving and other labouring work since. (While his heart was still excited by the walk to the hospital, a presystolic murmur was heard at the right apex, clear and unmistakable, but in a few minutes it was gone.)

Sept. 18th.—Still improving.

Such are cases where there does not co-exist valvular disease. Now a case of cardiac dilatation, with well-marked valvular disease may be recorded. It is perhaps desirable rather to select at first a case of dilatation of the left ventricle with mitral disease (insufficiency), than one where there is aortic disease, to illustrate this complex form of dilatation. Niemeyer has pointed out clearly how we frequently find enlargement of the left ventricle in mitral regurgitation, and Hayden (p. 976) holds similar views. Here the dilatation, with usual consequent hypertrophy, exists, as the result of over-distension of the ventricular chamber by the rush of blood from the gorged pulmonary vessels, driven forward by the hypertrophied right heart, and acted upon by the enlarged and powerful left auricle. The hypertrophy here is to check dilatation obviously, for there is no obstruction to the flow forward of the blood to be overcome; indeed, there are two outlets for the blood now, and not one. The history of such cases is usually as follows:—There has been an attack of rheumatic fever involving the vela of the mitral valve. Along with the endocarditis the muscle of the heart walls has been implicated in myocarditis. The softened muscle has yielded under the distending power of the incoming blood-current, and dilatation is established. Along with this there is enlargement of the mitral ostium, and the vela, contracted and puckered by the inflammatory process, are no longer equal to closing the orifice on the ventricular systole, and regurgitation takes place. It is a matter for question how far mitral regurgitation is anatomically possible as long as the vela of the valve are themselves uninjured. Some English authorities think it possible, while it is opposed by Rokitanski. Wilkinson King, in his well-known researches ("Guy's Hospital Reports," vol. II.) as to the incompetency of the tricuspid valve when the right ventricle is much distended, found that with all the pressure he could exert on the dead left ventricle very rarely did the mitral valve leak. Oppolzer and Kürshner think that valve failure from mere dilatation of the heart, with enlargement of the ostum, is anatomically impossible. But when, together with such dilatation, the valves are injured, and distorted, or shrivelled by a past valvulitis, the regurgitation becomes an undoubted and unquestionable fact. The valves, however, may still be competent to close the ostium when the ventricular chamber has been restored to its normal dimensions. Such cases of restoration have been recorded by my colleague, Dr. Andrew, and the subject of curable mitral regurgitation has been fully discussed by George Balfour in his recent work on the heart, where he upholds Naunyn's views ("Clinical Lectures on Diseases of the Heart," p. 164). A well-marked instance of such restoration is recorded by me in the *Lancet* (May and June, 1875), the subject being a young clerk in the Borough. A brief allusion is there made to the following case, which is at present under my care at the West London Hospital :—

Fred. Quire, aged 13, presented himself on the 15th of October, 1874, with the usual concomitants of mitral insufficiency, an enlarged left ventricle, &c. He had had rheumatic fever in the preceding month of June. The bruit was distinct, and heard well away to the left of the left nipple. He had no dropsy, but was short of breath on exertion, and generally feeble. He was put on the following mixture :—

Fer. pot. tart , gr. v. ;
Tinct. digitalis, m. v. ;
Inf. quassiæ, ʒss. ; ter in die,

which has been continued uninterruptedly till the present date.

On December 28th, 1874, he was very much improved, but the murmur was still audible when examined by my colleague, Dr. Wiltshire, in the presence of the resident medical officers of the hospital. He is an apprentice to an engineering firm, and continued his work steadily and unintermittingly, it being light and not irksome or injurious.

In June, 1875, he was again thoroughly examined by myself and others, and no murmur could be detected. He has frequently been examined since that date, and the heart is apparently perfectly normal ; it is of natural size, there is no bruit, there is no accentuation of the pulmonary second sound, and, though he is very fairly obedient to his instructions, there is no shortness of breath nor palpitation on exertion, and he frequently swims across the Thames without discomfort or inconvenience. He is growing fast, and is a sturdy broad-shouldered fellow.

To all practical intents and purposes this boy is cured, and will remain so until from any cause a dilated condition of the left ventricle and mitral ostium is induced, when the impaired and contracted mitral vela will again readily permit of regurgitation. He was shown to Dr. Wiltshire on Sept. 21st this year. All traces of mitral disease had disappeared.

This case is an excellent illustration of what may be done by suitable treatment in cases of mitral regurgitation, the result of rheumatic fever. For it to be successful in the highest degree it should be commenced early, pursued intelligently and persistently, and without fear of that mischievous idea, "the cumulative action of digitalis," which has done so much to retard the therapeutics of heart disease.

A still more striking case has yet to be related. It is that of the cure—temporary at least—of a dilated condition of the left ventricle, consequent upon aortic valvulitis, with double murmur, in a girl of twenty.

M. C., æt. 20, presented herself to me, at the West London Hospital, on April 10th, 1876, with distinct double aortic disease, great enlargement of her ventricular chambers, and with dropsy in her legs, shortness of breath, and orthopnœa, rare concomitants of aortic disease in its early stages. She was an unusually handsome, well-made, indeed, strapping girl, looking the picture of health to a casual observer. She had had no rheumatic fever, nor other ostensible cause of valvulitis. I had her father and mother attend with her, and carefully examined them ; but failed to find any thing in her family history, or in the condition of her parents, to warrant the conclusion of there being any congenital tendency to such disease. She herself had been in service for some years; had then returned to her parents, and been engaged in laundry work.

I put her upon—

Am. carb. gr. v. ;
Fer. am. cit., gr. v. ;
Tinct. digital mx. ;
Inf. quass. ℥j. ter in die.

And ordered her to keep in bed the greater portion of the twenty-four hours, and to be very quiet the rest of the day. No improvement followed, probably because in her anxiety to be useful, she did not fully carry out the orders as to quiet. Thinking the case an instructive one, I got my friend, Dr. Broadbent, to admit her into St. Mary's Hospital ; and from this point the remarks are his. I may say that at Christmas last she was very ill and almost persistently unconscious for a week, during which time she possibly had an attack of acute aortic valvulitis, as she was said to have had inflammation of the heart.

June 7.—On admission to St. Mary's Hospital she was found to be as follows :—Pulse rather small, sudden, and empty betwixt the beats. Temp. 99·6°. Urine sp. g. 10·15. No albuminuria. Impulse extensive and powerful ; apex beat in 7th. interspace, an inch behind the anterior line of the axilla. A loud, but rather short first sound ; no second sound. There was excessive dilatation, with little hypertrophy of the left ventricle. The dilatation was greatly in excess, from the short first sound and the small pulse. (If the case progresses favourably there will be hypertrophy of the left-ventricle, and the apex beat will be more to the right.) Port wine, 4 oz. Medium diet.

Tinct. fer. mur., ♏ xv. ;
Inf. digitalis, ʒij. ;
Sp. bœth nit., ♏ xx. ;
Mag. sulph., ʒss. ;
Aqua ℥j., ter in die.

June 13th.—The patient is much improved. Has had a good deal of palpitation in the morning. The apex beat is now almost in its normal position.

June 24th.—Had a distressing fit of palpitation, and the same on the 23rd ; it seems to be worse after taking the medicine. A belladonna plaster ordered. To leave off the mixture and maintain the recumbent posture.

28th.—Feels much better ; has had very little palpitation.

July 5th.—When seen by me in the hospital, she was looking very nicely. There was no swelling of her feet. Her heart sounds were much louder ; both the first sound and the systolic portion of the bruit indicating the recovery of tone in the left ventricle. Area of heart impulse much lessened. The left ventricle is much improved, the dilatation diminishing, and the hypertrophy increasing—the normal method of restoration after dilatation.

In the progress of this case two things are distinctly indicated. First, the futility of treatment and the stationary position of the case until complete rest was maintained. Second, the powerful effects of digitalis in reducing the dilatation and the palpitation, showing the influence exercised upon the cardiac ganglia, as it were the effect was just too pronounced. The progress of the case shows that except when the muscular walls are very much impaired and yielding, digitalis does not suit aortic cases. While the girl persisted in moving about, and repair was impossible, the digitalis was tolerated. When improvement was once inaugurated, the digitalis had to be withdrawn.

July 26th.—The heart is apparently now no longer a dilated but rather an hypertrophied heart. It is nearly an inch longer than the norm, and broad in proportion. The impulse is strong and the pulse regular. Very little palpitation experienced of late. The general condition is much improved.

Sept. 25th.—Condition persisting. Passed through last catamenia very comfortably. Tinct. of digitalis, in five minim doses three times daily in a steel mixture, is agreeing with her, and keeping the muscular walls from again dilating.

Such are a number of the more satisfactory cases met with in practice. It would be easy to supplement the number, but that is unnecessary. They sufficiently illustrate what may be done by well applied treatment. The permanent effect of digitalis in reducing a dilated heart is well shown in the aortic case, as also the stimulation of the cardiac ganglia evidenced by the attacks of palpitation, when the drug was pushed freely.

When, however, dilatation of the heart is found along with failing hypertrophy, a condition now commonly described in text-books (Hayden, p. 559), then the treatment of it is unsatisfactory, and necessarily but palliative. In such cases the hypertrophy has been accompanied by a gradually advancing atheroma of the arteries, especially of the coronary vessels, and this leads to an imperfect supply of arterial blood, the consequence of which is that the structure of the heart becomes deteriorated, and fatty degeneration is established. As soon as the hypertrophy is so undermined the dilating process recommences, and the walls gradually yield. In these cases we find the blended condition of hypertrophy and dilatation; but we must bear in mind that here the conditions are widely different as regards prognosis and treatment from those found where the condition has always been blended; and, though there is dilatation, the structure of the heart is sound. In these latter cases there is a fair prospect of treatment being successful: in the dilatation of failing hypertrophy, with degenerate muscular fibre, all that can be done is but to try to retard the downward progress. In treating blended hypertrophy and dilatation it is of the greatest importance to make an accurate diagnosis, else undeserved discredit may await the treatment. It does not, however, necessarily follow that no relief can be afforded, even in failing hypertrophy, as the following case will demonstrate:—

J. L., aged forty-five, a wheelwright, presented himself at Victoria Park on May 2nd. The notes of him then are: "First sound thin; second sound accentuated; failing hypertrophy; lithiasis; nocturnal dyspnœa." He was put upon potash, digitalis, and buchu, and in a fortnight steel drops were added, after food. After this he wrote me that he was at the Convalescent Home at Dover, feeling much benefitted. On July 8th he was feeling much better; the attacks of nocturnal dyspnœa had ceased; he felt more equal to exertion, and the first sound was of much better quality, showing increased vigour in the muscular fibres remaining sound and undegenerate.

The different cases given in this paper illustrate the different forms of cardiac dilatation, and their amenability to treatment, and especially treatment carefully adapted to the particular wants of each individual case. Good general information on the subject dealt with is sufficient for the coarse adjustment of the treatment, *i.e.*, the general line of therapeutic attack; but a certain amount of personal enthusiasm seems indicated in order to arrive at a satisfactory fine adjustment of the therapeutic measures for the relief of the individual, and the adaptation of these measures to the exigencies of the case before one. Enough has been said above to vindicate the title of this paper, and to demonstrate that a dilated heart is not necessarily beyond the reach of the therapeutic art.

◆

VOICE TRAINING AS A BRANCH OF SURGICAL SCIENCE.

By Charles Lunn.

It is with no small pleasure that I see my efforts to induce the members of the medical profession to take up voice training bearing rapid fruit. And the reason why they should do so is twofold. Firstly, the musical profession, as we now have it, is not sufficiently qualified, even if it be qualified at all, by scientific knowledge to carry out this obvious duty to mankind. Secondly, many of the principles of true training so apparently conflict with all that musicians are justly taught to admire, that the very training of these specialists of necessity forces them into the repudiation of what is true, and into the invention of what is false: besides, it is time for thoughtful men to reflect what can be done to improve the technique of the pulpit, the stage, or the platform, and not leave these three great human appeals to the mercy of those who, rightly or wrongly, undertake the entire culture of our public singers. To take the most simple point of difference; musicians train by "ear," forgetting or ignoring that the ear is the judge, not the guide; the approver of what is, not the director of what is not; the "break" or drag, not the motor power—not the steam which works the engine. The ear, then, is *not* the guide, but the check; the mind is the only guide. Supposing in a spoken word a consonant be feeble or absent, we do not enquire into the beautifulness (the music) of its sound, nor do we enquire into the ugliness of it, but we proceed to cause an excessive nerve force to rule certain muscles calculated by their right use to produce the desired effect. This is purely a force of volition directed on to a known locality.

Now this is just what takes place in voice. If it be desired to give a vowel (a, e, i, o, or u) loud and without an aspirate—a very difficult matter to some—then the will is directed on to a direct nerve action, ruling the rightly-adjusted parts for such sound, and this will-force affects the intrinsic nature of the parts appealed to, whether the result be musical or not; the first principle ofcontrolled words—whether uttered to the utterer's music, or to the music of another man not signifying—consists in a restitution of a disturbed law acting between the brain and the vocal organ, and secondarily, the organic relationship between laryngeal resistance and thoracic pressure. That a first attempt, producing what musicians would condemn as "ugly," may finally flourish and bloom into the uttermost radiance of beauty in sound, is shown by the just tentative and unopposed efforts of our solo violinists, and this also may ultimately be proved to be true respecting the training of the voice. But in order to this, known laws in Natural Physics must be put before fancy, known Psychical laws must be put before personal preference, and Physiology must be allowed to claim authoritative sway. Such can only be when those who know Actual Physics, who know Psychology, who know Physiology, take the matter in their hands, and insist on ruling where they have hitherto obeyed.

If a meeting were held to discuss this matter, and an attempt thereby made by men of known repute to define and approve an apparently correct method of voice culture, much will thereby be gained.

Pathological Anatomy of the Brain—

LOCALISATION IN CEREBRAL DISEASE. (*a*)

By Prof. Charcot.

Chapter IX.

Gentlemen,—We must examine these two systems in each of the great vascular territories. In entering upon this study we shall notice common points and differential points. First, we will take up the Sylvian artery, the most important and most complicated of the cerebral arteries. The account of the other two will afterwards appear easy and simple.

1. The Sylvian or middle cerebral artery passes into the fissure of Sylvius, of which we must separate the margins in order to lay the vessel open to view. But it has already given off from its upper surface, in a region called "the anterior perforated space" (formed by the white matter) a series of branches which enter separate holes, all the arteries running parallel to each other. These are the *arteries of the grey central ganglia*, or more exactly of the *corpus striatum.* We will leave on one side for the present the system of the grey nuclei, to be engaged only with the cortical grey matter. At the bottom of the fissure of Sylvius the *island* of Reil appears, at the level of which the artery divides into four branches, each of which deserves a special name. These branches follow the sulci which separate the convolutions of the island, and to these convolutions vessels are given off. These bend back afterwards from within outwards, to ascend to the surface of the hemisphere, where they are distributed to a certain number of fundamental convolutions, there mapping out secondary vascular territories which correspond with each of these convolutions.

We will not at present tarry over this description, but will go on to examine more minutely the method according to which the cortical arteries ramify in the substance of the pia mater before passing into the brain substance.

At the outset I must call your attention to the fact that the branches of the middle cerebral subdivide into branches of the third order, two or three from each secondary branch. These tertiary branches form a sort of vascular framework, on which is constructed a complete system of *arborisations.* This is a peculiar and quite original system of little vessels, which start not only from the ends of the branches, but from the trunks themselves. In opposition to most authors, M. Duret asserts that the *arborisations do not anastomose among themselves*, while the branches sometimes communicate with those of neighbouring territories.

The ramifications and arborisations are situated in the plane of the pia mater. On the inner surface of that membrane they give rise to the *nutrient vessels* of the brain matter, dipping vertically into it. All these nutrient vessels are already capillary (according to Robin's nomenclature). This characteristic distinguishes them from the vessels of the central ganglia, which, by the anterior perforated space, penetrate the white substance of the base of the brain, the latter having still the size and structure of arteries.

The time has now arrived for examining more closely, by means of sections for the microscope, the details relating to these *nutrient arteries.*

In a vertical section of the whole thickness one can distinguish, near the periphery, the grey substance in the form of a festoon, and of a thickness of from 2 to 3 millimetres, then within this the medullary substance consistency of radiating fibres and of commissural fibres, which connect each convolution with its neighbour. How, then, do the arteries appear in such sections? There are distinctly two sorts of arteries, as has been known for a long time, and especially noticed by Todd and Bowman; some of these arteries are long, others short.

1st. The *long* or *medullary* arteries arise from the *ramifications*, or rather are the ends of the *arborisations.* We see twelve or fifteen on a section of a convolution, three or four on the free surface, the others distributed on the two slopes, or in the sulcus. The arteries of the ridge are vertical, those of the sides are oblique, those in the bottom of the sulcus are again vertical. The arteries penetrate into the oval centre to the depth of three or four centimetres. They advance without any anastamosis except that of fine capillaries, and therefore constitute systems independent of each other. Finally, let us remark that their extremities approach the terminals of the central arterial system, *but there is no communication between the two systems.* The result of this arrangement is that on the confines of these regions there is a kind of neutral territory, where nutrition is carried on rather feebly. This neutral region is especially the seat of certain lacunar softenings, occurring in the aged.

2nd. The *short* or *cortical nutrient* arteries have the

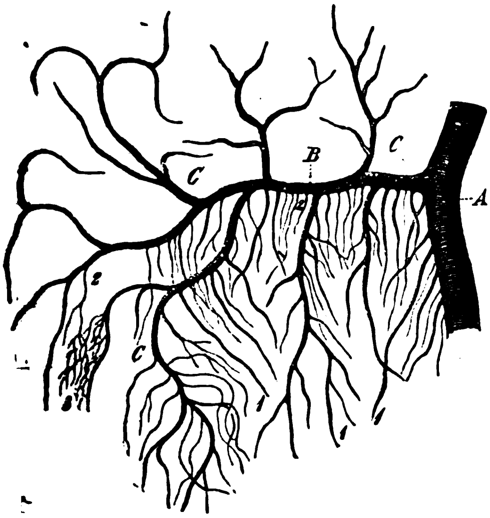
(*a*) Translated from *Le Progrès Medical.*

same origin as the long ones, but they are more slender, shorter, and, so to speak, "they stop on their way." Some go as far as the margin of the grey matter in the direction of the medullary matter, others do not reach so far, and end in the substance of the grey matter. The short arteries give rise to capillaries, which, with those coming from the longer vessels, form a complete network.

In the convolutions the network possesses the following characters: 1. The first layer is half a millimetre in thickness. 2. The second layer corresponds with the two zones of nerve cells, and the network here is very close—the polygonal meshes being very fine. 3. On the border of the last layer the network becomes coarser. 4. Lastly, in the medullary substance the meshes are still larger, and are lengthened vertically.

Fig, 9.



A. Principal artery. B. Primary branch.
CC. Secondary branches.
1.1.1. Medullary arteries.
2.2. Cortical arteries.
3. Twigs of the cortical arteries in the cerebral pulp.

From the preceding information it arises that, regarded in an arterial light, the grey cortical matter and the subjacent white matter are in close relationship, since the vessels each receive are alike derived from arteries running in the pia mater. Are these vessels obliterated at any point? The grey matter and white matter would suffer simultaneously at the corresponding region, and would undergo that kind of mortification that is called "cerebral softening from ischæmia." The relation of these various parts enables us to give a systematic account of superficial softening.

Remember the general distribution of the nutrient vessels. They pass towards the central parts parallel to one another like so many rays. The white and grey regions of the cortex can be divided into a certain number f *wedges*, of which the bases are towards the surface, and he truncated summits are towards the central part. And hat is just the form which most of the "superficial ramollissements" take.

This at once brings back to the memory the appearnce of infarctions of the spleen and of the kidney. If he softening is old, that is to say, if it already dates ack some weeks, the grey matter appears depressed by reason of the destruction of its elements, and of the concomitant wasting of the subjacent white substance.

The superficial part of the faulty spot forms that which is called the *yellow layer.* This yellow colour belongs exclusively to the grey matter, the white matter when oftened being only whitish or sometimes slightly tinted ith yellow.

A. We have, in this case, supposed ourselves to be ncerned with the obliteration of a branch of the second r third order. The obliteration of the trunk of the sylvian artery itself might have the effect of bringing about the death of all the grey layer, and of the subjacent white matter.

The central parts would be quite safe if the obstruction were situate above the origin of the arteries of the corpus striatum.

B. You must not think, gentlemen, that *all* obliterations of this kind will of necessity always produce such disastrous results. There are some cases, truly rare, where such an obliteration affects the trunk or a branch of the middle cerebral artery. (I take this one for the sake of example, but the anterior or posterior would be just the same), where such an obliteration, I say, may in some cases produce only passing results, or none at all.

This being the case, gentlemen, shows that the three great vascular territories forming the cortex of the brain, and their smaller departments, are not independent, strictly speaking. They may, and really do, communicate, as a general rule. Are such communications easy, frequent, or, on the other hand, are they accidental, indirect? Here is a problem, on the solution of which our authors are not agreed.

Heubner asserts that the said communications are not uncommon, that they are formed by vessels not less than a millimetre in diameter. He founds the assertion on the results of injections in which he has found that the colouring matter injected into any one of the "departments," either by the principal arterial trunk or one of its its branches, penetrates quickly into the other departments.

He appeals also to pathological instances indicating that the obliteration of one of the vessels of the cortical system or of its branches, is not revealed during life by any evident symptoms, and in which death having occurred, the cerebral substance has not (at the autopsy) showed any trace of softening at the point corresponding to the obliteration. In the first place, as to the pathological facts to which Heubner refers, we must remember that they unquestionably exist. Still, if I may judge from the very numerous observations I alone have been able to collect, such cases are very rare.

And again, it is certain in the domain of normal anatomy, things are far from being always as Heubner has seen them. Duret's observations on this point have been very numerous, and almost always confirmatory.

Briefly, then, we learn from Duret as follows: a ligature is placed on each of the three arteries of the brain, on each side, just above their origin from the circle of Willis, then a fluid is injected into the middle cerebral. This fills first the territory supplied by that artery, and in most instances passes beyond its limits. The injected matter invades the neighbouring regions entering them little by little, the invasion passing from the periphery of the vascular territory invaded towards the centre. It is effected by the agency of small vessels belonging to the system of ramifications, being therefore only 1-4th or 1-5th of a millimetre in diameter, contrary to the opinion of Heubner, who believes that such intercourse takes place through vessels a millimetre in diameter. The number of anastomoses between the territories is very variable. There are cases in which one can inject one of the three grand territories by itself, the anastomoses not being sufficient to allow the injection to pass into the neighbouring regions. The communication existing in the peripheric zone of a vascular territory explains why the obliteration of a principal trunk often results in isolated softening of the *central* parts of the territory, the peripheric parts remaining unhurt. Such are Duret's conclusions. They are, in my opinion, more conformable to pathological facts than those of Heubner. I must add that M. Cohnheim, who had undertaken a certain number of partial injections of cerebral arteries, arrived at the same conclusions as Duret. If the arteries of the brain, says Cohnheim, are not absolutely *final* or *terminal* (we shall see presently what Cohnheim means by these words) they approach nearly to their type. Under this name *final* or *terminal* arteries [Endarterien] Cohnheim ingeniously designates the arteries or arterioles, which in their whole course from origin to capillaries, neither furnish nor receive any anastomotic branch. An example of terminal arteries, convenient for study, is furnished by the tongue of the frog, which is transparent, and in which it is easy to trace by the help of the microscope the effects of an obliteration.

You can easily imagine the fatal consequences of obliteration of a terminal artery. If we consider, on the contrary, an anastomosing artery, the course of the blood is generally re-established with ease by anastomoses. These can be obliterated in their turn, and it follows that an artery, which in normal conditions is *not* a terminal artery, may become so by accident.

The circulation of the brain furnishes many instances of terminal arteries. Thus, without including the ramifications existing in the pia mater, we may instance the nutrient arteries. We shall see that the system of arteries of the central ganglia is constructed entirely and strictly on this model. The same type is found in all the other circulatory systems where pathologically or experimentally occurs a lesion by vascular obliteration customarily called *infarctus*. Such are the spleen, the kidney, the lung, and the retina. All the viscera (M. Cohnheim remarks) where infarctus does not, as a rule, occur, have not this arterial distribution.

◆

ON THE GROWTH OF THE PHTHISICAL.

By Edward Williams, M.D.,

Consulting-Physician to the Essex and Colchester Hospital.

> "The growth, and often the rapid growth of the consumptive in all the stages of the disease, is a phenomenon that must have arrested the attention of those medical men who think concerning what they see."—Beddoes on "Pulmonary Consumption."

In perusing the essay from which the above is an extract, I became interested to ascertain the cause of so paradoxical a condition in which the muscles, tissues, and fat are being rapidly absorbed, while the bones are elongating and attaining their normal development.

In a paper published by me in the Medical Press and Circular, October, 1875, I endeavoured to show that emaciation in consumption arises from the prevention of chyle passing freely into the venous system, from obstruction at the mouth of the thoracic duct, thereby depriving the circulation of sufficient chylous supply, and the system in general of nutrition.

Admitting the existence of such obstruction, how is the fact to be explained, that while nutrition is withheld from parts that should receive the soluble materials of proteine as albumen and fibrin, yet that the gelatinous tissues should continue to be fully developed.

We are informed by that accomplished writer, Dr. Prout, that gelatine, though existing most abundantly in various animal structures, yet that it is never found in the blood or in any product of glandular secretion. (*a*)

Since the above observation, *Mulder*, by careful and exact analysis, discovered proteine, and ascertained this important result, that the chief constituents of the blood, albumen, fibrine, and caseine, contain the same organic elements, and hence arguing that proteine must be considered as the commencement and starting-point of all other animal tissues that are *produced from blood.*

It is further shown that the composition of the blood consists solely of albumen, fibrine, and caseine, with the colouring matter, which have this character in common, that they yield no gelatine.

Liebig, the greatest chemist of the age, while treating the subject of the origin of gelatine, finds great difficulty in connecting gelatine with proteine; in fact, he fails in the attempt, observing that the tissues yielding gelatine, on being acted on by caustic alkalies, shows that they contain no gelatine, and closing his remarks by the statement that no fact is as yet opposed to the law deduced from observation, that nature has exclusively destined compounds of proteine for the *production of blood.* (*a*)

But gelatine contains no proteine, that is to say, it is not a blood producer, and appears not in the blood vessels as a constituent of the liquor sanguinis. Yet the tissues mainly supported by gelatine—such as the organic tissues of the bones, of tendons, ligaments, and cellular tissue, with the skin and the serous membranes—are so considerable, and requiring so large an amount of gelatine, that with carnivorous animals they are instinctively impelled to seek a supply from the bones which they devour for the gelatine contained in them, since proteine or its compounds, albumen and fibrine, does not form it.

From the aforementioned premises, it is evident that gelatine passes not into the thoracic duct, therefore in obstruction of that duct the circulation of gelatine is not interfered with, and those tissues formed therefrom increase in growth, whereas the organs receiving from the thoracic duct have this supply abridged or curtailed, causing the emaciation with consumptives, and a gradual absorption of those tissues which are furnished with nutriment from the general circulation.

This corroborates the result of the previous inquiry into the cause of the emaciation in consumption, and fully justifies the conclusion there deduced, and further explains the circumstance referred to by Dr. Beddoes, of the apparent and rapid growth of those labouring under phthisis.

ON ALCOHOL, CHLORAL, AND DEPLETION.

An Address to the LEEDS AND WEST RIDING MEDICO-CHIRURGICAL SOCIETY

At the Opening of the Session 1876-77.

By Dr. Myrtle, President.

After thanking them for the high honour of electing him as President of the Society, and asking for their assistance to enable him to carry out the many duties which devolved upon him, Dr. Myrtle said—

Gentlemen,—We, in our corporate capacity, have every reason to feel satisfied with our position and progress, whether we look to our numbers, the names on our roll, or to the state of our finance. Hitherto, the Leeds and West Riding Medico-Chirurgical Society has been a decided success, but success in the past, I beg you to remember, is no guarantee for success in the future, and with your permission I shall briefly touch on one or two points that strike me as worthy of notice at this our first meeting of the present session. In order to be successful and increasingly so, the most important thing to accomplish is to make our meetings more and more attractive, and in order to do so I would urge on all members regular attendance at each meeting; nothing acts so like a wet blanket on a meeting of any society as a thin attendance. Then we must have more workers and a little more variety in the work. Every member ought to make it an imperative duty and bring before us any new medical or surgical fact which he has observed, no matter how trifling it may appear to him, it may gather strength by exposure and grow into a tree yielding much fruit. During the last four years how many members have not only allowed valuable clinical facts to pass without laying them before us, but without taking note of them at all, and even now they may have vanished from their memories never to return. Let me therefore impress upon you the desirability, the absolute necessity of recording interesting and exceptional cases for your own as well as the public good, by all means be brief and to the point, but let us have the facts, if they are not new to all they will be to some, and need not take up much of our time either in relation or discussion ; of this we may be assured within ourselves we have abundance of men and material to make each of our meetings more and more attractive, more and more useful to ourselves, and consequently more and more auxiliary to the prevention, cure, or alleviation of disease.

To the younger members, and especially those connected with public institutions, I would suggest the propriety of their bringing before us any new methods of treatment both as regards surgical appliances and therapeutic agents ; besides, they might occasionally favour us with practical demonstrations by means of the syphmograph, laryngoscope, and ophthalmoscope ; as a rule, middle-aged practitioners have neither time nor opportunity to indulge in such investigations, and would feel deeply indebted to any one who would take the trouble to bring them forward. This ought to be done at the termination of the ordinary business, especially on those nights when there is a paucity of papers.

Hitherto we have almost entirely confined ourselves to the records of clinical cases. I have long felt that whilst this is by far the most useful work we could engage in, we would be all the better for an occasional change of diet, and I was glad to hear Mr. Wheelhouse at our last meeting suggest that we should occasionally have a subject brought before us which would lead to a debate, such as the London Clinical enjoyed over pyæmia. Now two difficulties stare us at the threshold—the first is what subject or subjects shall we select ; the second, who is to throw down the gauntlet. Once the glove is on the floor, I know there will be plenty of fellows ready to break a lance with the challenger. I would mention three subjects which might worthily engage our attention—the first is alcohol ; a cry, I think a fashionable cry, has gone forth against the principles and practice so recently taught and carried out by the late Dr. Todd. Alcohol is pronounced by many here in England and on the Continent to be useless as a food, injurious as a medicine, and some go so far as to trace every form of disease to the evil influence which the consumption of alcoholics entails on our moral and physical conditions not only as regards the individual more immediately concerned, but as regards the health and development, mental and bodily, of his progeny. Our hospitals, mad-houses, prisons, and workhouses are said to be filled by the victims of intemperance, murders and suicides are laid to its door ; in short, were it not for intoxicating drinks this earth might be a paradise, and disease, death, and doctors seldom heard of or seen. It occurred to me that among the members of this Society many must have had abundant opportunities of observing the effect of alcohol, first of all upon themselves, second, upon their friends, and third, upon their patients ; and it further dawned upon me that we might elucidate much valuable information by taking up the subject of stimulants and soberly discussing their merits as a food or inhibitory agent as regards the waste of tissue when taken moderately in a state of health, as a pathogenic agent when taken immoderately, and a therapeutic one when administered medically. The second subject has a close affinity to the first—it is chloral and the bromides, and the effects produced by long continued and increasing doses taken for the purposes of allaying recurrent pain, inducing sleep, or the prevention of epilepsy. I have been recently very much astonished to find so many patients, especially among the better class of females, given to the irregular use of some nerve sedative. The saying, "I could never get on without my bromide or chloral hydrate," is of daily occurrence, and the amount consumed is proportionately large ; for myself, I have observed one or two facts which are traceable to chloral drinking—reduction of the pulse and temperature, and absortion of the fatty tissue ; in several instances I have found a gradual disposition to the diminution of the red corpuscles, but beyond these and bromic acne I have seen no evil result from their uninterrupted and free exhibition. I would suggest that their use in *delirium tremens,* insanity, and neurotic affections generally might afford us another interesting topic for an evening's debate ; but the subject I have most at heart, and the one which I consider requires to be thoroughly opened up, is depletion. General and local—have we been right or wrong in repudiating this almost universal remedy in the treatment especially of all cases of active inflammation or passive congestion—was the constant practice of our fathers at variance, not with their empirical knowledge, but with our own, plus the light which recent scientific discoveries have thrown on pathological changes ? Since blood-letting has been cast aside as a useless and filthy garment, are the diseases for which it was once the sole, the sovereign remedy, more easily, more speedily cured by the present modes of dealing with them —are the complications and sequelæ of such diseases as pneumonia, pleurisy, peritonitis, apoplexy, and nephritis less grave, less frequent now than they were five-and-thirty years ago ? These are questions which might engage our very best thoughts ; the older I get the more convinced am I that in abandoning the lancet and the leech, as we have done, we have acted unreasonably ; the more I think of the practice of my early days, the more inclined am I to return to it once more ; in those days we not only bled, but we starved our patients and physicked them, calomel and antimony were literally dealt out—in the bleeding I believe we were right, in the rest wrong—and yet the results were highly satisfactory. I think we had fewer cases of collections of fluid in the chest—fewer cases of such severe paralytic affections, and more rapid recoveries than we have now. Some of you may say that was because we had more deaths ; that I do not admit. At the same time I can bring forward no proof in support of my view, because I have no authentic records to adduce. Your public hospitals might furnish these, and here again one would require to make a liberal allowance for the comparatively imperfect means of diagnosis in the time I speak of, when compared to the more accurate knowledge of the present day. Still, my general impression is, that the sooner we resume, under proper limits, the abstraction of blood in the treatment of cases where we have blood stasis to any considerable extent, no matter in what organ or from what cause, the better ; and I find that this view is much more generally entertained by practitioners like myself, who witnessed the effects of it in their early days, than any one would believe, seeing that entertaining the conviction, we still hesitate to put it into practice. For my own part, were I the subject of any form of disease for which I bled when I received my licence to practice, I should strongly insist upon being treated by means of general or local depletion in preference to any other.

Clinical Records.

ST. MARY'S HOSPITAL.

(Under the care of Mr. SPENCER SMITH.)

Ventral Hernia, with Symptoms of Strangulation.—Treatment by Ice, &c.—Recovery.

(Reported by Mr. GILES, House-Surgeon.)

M. W., a healthy-looking woman, was admitted to the hospital on October 2nd with the following history : About ten years ago she suffered from a femoral hernia, for which she was fitted with a truss. About five months ago the swelling "shifted," as she expressed it, upwards to the right side of the umbilicus, and she was attacked with symptoms of obstruction, which disappeared without active treatment. Three days ago similar symptoms set in ; constipation of the bowels, and severe vomiting.

On admission, a hard, nodulated, rough, inclastic tumour, about the size of a fist, which gave no sense of fluctuation or impulse, could be felt, with its anterior portion projecting apparently through some slit in the abdominal muscles, and lying immediately beneath the skin a little below, and about two and a-half inches to the right of the umbilicus. The tumour and the abdominal wall in its neighbourhood were very tender, pulse quick and full, temperature 101°. An ice-bag was applied over the tumour, but it occasioned so much pain that it had to be removed in a few hours, large hot poultices being substituted.

Oct. 3.—Patient about the same; had not vomited since her admission, but had had no action of the bowels. On examining the tumour it could no longer be felt immediately beneath the skin, but appeared to have slipped into the abdomen, where it could still be distinctly made out. An opening could be felt in the abdominal muscles at the site where the subcutaneous mass was felt the day before. The pain and tenderness continued as before.

Oct. 4.—On this day a consultation was held as to the case, and the opinion being that the tumour consisted of the caput cæcum coli, displaced, and filled with impacted fæces, she was ordered pil. colocynth co., gr. x., to be given at 12 p.m., and to be followed by ol. ricin, ℥j., on the following morning.

Oct. 5.—Bowels had been freely opened. The tumour was much less tender, but did not appear to be notably diminished in size.

Oct. 6.—Castor oil acted very freely. Abdomen much less tender. The tumour had almost entirely disappeared this morning. The motions contained a quantity of hard fæces.

After the above date the patient became rapidly better, and having been fitted with a belt and elastic pad, left the hospital on the 20th October, cured.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

Friday, October 13th, 1876.

Thomas Bryant, F.R.S., Vice-President, in the Chair.

INTESTINAL OCCLUSION DEPENDENT UPON TUBERCULAR DISEASE OF THE INTESTINES.

Dr. **Wolston** read notes of this case, which had also been seen by Dr. Sutton and Mr. Maunder. The patient was a young lady, twenty-five years of age, and somewhat mentally deficient, though quite capable of expressing all her sensations and wants. Up to the time of her illness, she had been considered by her friends to be in robust health. In the afternoon of the 20th February, having appeared perfectly well in the morning, she complained of headache, and in the evening sickness with colicky pains in the bowels came on. For the next few days she was better, and then the sickness and colicky pains, with constipation, returned, and continued, with slight intermission, till Friday, March 3rd, when she was first seen by Dr. Wolston. The patient looked as if there were nothing much amiss. The face was apathetic, but with no expression of distress or anxiety. There had been no pain or sickness that day. The tongue was white at the back, but clean at the tips and edges. There was slight febrile excitement. Pulse 80; temperature 99·5; urine thick and high-coloured. The most marked symptom was extreme tympaniti but there was no tumour to be detected anywhere, and there was no pain or tenderness on pressure. The catamenia were two months over due. The history of the case, with the constipation and extreme tympanites, led at once to the suspicion of intestinal obstruction. With that view, purgatives being contraindicated, the bowels were directed to be well fomented with hot water, and copious water enemata to be administered whilst nothing was to be taken by the mouth but a little milk and water to allay thirst.—March 4th. The patient had passed a restless night, with a good deal of pain, coming on in paroxysms, but no sickness. There was no pain or tenderness on pressure, but the tympanites had increased. Urine had passed freely. The enemata had caused no action from the bowels. The tongue was more coated. Pulse 80; temperature 90 deg. An enema, containing castor-oil and turpentine, was directed to be administered. This freely opened the bowels, but was followed by extreme pain and sickness, with no relief of the tympanites.—March 5th. There had been much pain and sickness during the night, nothing being retained on the stomach. Another enema was administered, which had the effect of quite emptying the bowel below the constriction, though it caused no relief to the tympanites.—March 6th. She was much worse; there was more pain and sickness; the vomited matters were stercoraceous; the abdominal distension was extreme; pulse 100; temperature 99·5 deg. Several attempts were made to overcome the obstruction by means of the forcible injection of tepid water, but the only result was increase of pain and sickness. She was ordered nutritive enemata of eggs, milk, and beef-tea thickened with arrowroot, with a dessertspoonful of brandy and fifteen drops of opium, to be administered every three hours, and ice dipped in brandy to be given freely by the mouth; the bowel to be washed out once in twenty-four hours with tepid water and turpentine.—March 7th. She had passed an easier night, with fewer paroxysms of pain, and had had several hours' sleep. There had been some vomiting and hiccough. The tympanites was extreme, but there was no pain or tenderness on pressure; pulse 100, full and firm. The tongue was cleaner; the urine free and normal. In the afternoon, the patient was seen by Dr. Sutton, who confirmed the diagnosis of intestinal occlusion, probably from a band over which the intestine had twisted, but without strangulating it completely. No change was made in the treatment.—March 8th. The patient had passed a good night, without pain or sickness, and had slept a good deal. There was some hiccough. Flatus had passed freely, and the abdominal distension was less; occlusion plainly not complete. Pulse 82; tongue clean; temperature 99 deg. During the next few days there was slight improvement; but on March 11th, the paroxysms of pain and vomiting returned; the tympanites again became extreme, and was but slightly relieved by puncture of the bowels with a small trocar. In the afternoon of this day, the patient was seen by Mr. Maunder, who confirmed the diagnosis as to the probable cause of the occlusion, but deprecated any surgical interference in her present state. He put her under chloroform, and, by manipulation of the bowels and inverting the body, tried to free the supposed entanglement of the intestine. Some flatus passed, but no other result ensued.—March 12th. There had been some pain and sickness during the night; in other respects there was no change; pulse 82. From March 13th to March 28th, the condition of the patient varied very little. The pulse remained about 80, and temperature at about 99 deg.: the tongue kept clean and moist, sickness was pretty constant, but the pain was comparatively slight, and easily relieved by hot fomentation and rubbing. A good deal of flatus was passed at times, but never any feculent matter. The urine was free and normal. The nutritive enemata were all well retained, and, save that wasting became manifest, the patient retained the appearance of health. March 28th. Sickness and pain existed; the pulse was 90; tongue clean. On this and the three succeeding days the electro-magnetic current was several times applied, and the peristaltic action of the bowels was thoroughly aroused, but with no effect, except the passage of flatus. Peristalsis was absent, unless when aroused by the electric currents.—April 1st. She was in about the same state; her tongue was clean, and pulse 80. During the next few days the watery extract of aloes, podophyllin, calomel, and croton oil were given, but only with the effect of increasing pain and sickness.—April 10th. Much pain and sickness were present; flatus freely passed, and the bowels were softer. She was weak and low. The wasting was very apparent; pulse 100, and feeble; temperature 99·6. From this date the patient steadily sank, and died somewhat suddenly on the 21st of April. The *post-mortem* examination took place the next day, and the chief features were as follows: On opening the abdomen, the intestines, moderately distended with flatus, presented the appearance as if they had been scattered thickly over with boiled sago, and on closer examination this was found to be a tubercular deposit, which extended throughout the entire length. Many of the deposits were as large as beans, looking like yellowish-white nodules on the surface of the gut, but being deposited really in the substance of the peritoneal covering. They were most extensively distributed in the neighbourhood of the cæcum. The intestines were extensively adherent to the peritoneum in many places, especially to the sides of the pelvis. They were also much glued together and puckered by adhesions, so that it was with much difficulty they could be removed and properly examined. Complete occlusion of the bowels was nowhere found, but they were tightly constricted in many places, so that their contents were contained in a succession of pouches. The internal lining of the intestines was healthy throughout. There were no signs of recent inflammatory action, or appearance of recently thrown out lymph, all the adhesions being old and firm.

Mr. **Maunder** was obliged to look upon this case as another instance where science and art of surgery must fail. The cavity of the abdomen always presented difficulties in the diagnosis of disease. The patient, however, was not sufficiently ill to guarantee any surgical operation. He thought that the partially imbecile condition of the patient tended to conceal those permanent symptoms by which any diagnosis might be made.

Dr. **Hilton Fagge** considered the case one of peculiar interest. He had carefully searched numerous records, but never yet found the report of a case in which tubercular peritonitis produced obstruction of the bowels. He did not, however, think the case so difficult of diagnosis, though he felt some diffidence in saying so, after the precise condition had been made known by a *post-mortem* examination. He would not say that the existence of tubercle in the peritoneum ought to have been recognised, but certainly the symptoms were not those of a local obstruction, but rather of some general disease. One great point leading to this conclusion was the very gradual way in which the constipation increased, a certain proof that there was no obstruction by a band, or other sudden local change. With regard to the character of peristaltic action, he considered that where the obstruction was due to a band, the vermicular action was less than when there was general disease of the small intestine. The general symptoms would lead to the view that there was some condition by which the intestines were held together, such as would result from a chronic form of peritonitis.

Dr. **Southey** agreed with Dr. Fagge that the diagnosis of the case did not present to him the difficulties suggested by Dr. Wolston, but with regard to the character of the peristaltic action in a case of a local obstruction compared with one of general obstruction, his experience went to prove precisely the opposite view to that expressed by Dr. Fagge.

Mr. **Brown** would be glad if some of the able men present would decide as to the point at issue between Dr. Fagge and Dr. Southey. He thought that, physiologically, binding down of the intestine would entirely prevent peristaltic action, from being recognised externally, whereas with the presence of a band peristaltic action was certainly excessive.

Dr. **Southey** repeated that there was most peristaltic movement in cases of cancer of large intestine, then in cases where bands existed, and least of all in cases of chronic peritonitis.

Dr. **Wolston**, in reply, said he was prepared to hear different views expressed as to the diagnosis, but owing to the absence of tenderness, the idea of turbercular peritonitis had not suggested itself to him. He might add that there was in this case no peristaltic action visible except under the influence of galvanism or excitement by the hand. He had punctured with the aspirator, but it had given such little relief that he had not persevered. He had employed the battery, one pole being applied to the mouth, and the other to the anus, and by this means he had certainly overcome constipation to an extent.

SEQUEL TO A CASE OF GASTRO-ENTEROTOMY—ARTIFICIAL ANUS IN THE SMALL INTESTINES.

Mr. **Maunder** read the account of the above case, from the time when the patient had been submitted to operation in November, 1875. The case was fully reported in the *British Medical Journal* for April 1st, 1876, p. 413, and appears in the new volume of *Transactions* of the Clinical Society. The patient's general health improved, and he was able to enjoy a good two hour's walk daily. The hard lumps, which Mr. Gordon Brown had detected in the abdomen, steadily increased in size; the appetite gradually fell off, and solid food became distasteful. Hiccough ensued, and week by week he became more feeble. The artificial anus, which Mr. Maunder had made in the right iliac region in the small intestine, continued healthy and adequate. To avoid inconvenience arising from the irregular action of the bowels through the artificial anus, Mr. Gordon Brown advised his patient to use an enema of half a pint of water daily. By this means he was able to clear his bowels before leaving his room in the morning, and had no further trouble. He wore a sponge-tent, which acted as a plug, and, at the same time, kept the orifice open. His death appeared to result from exhaustion, consequent on inability to take sufficient nourishment, and was most peaceful, seven months subsequent to the operation. Mr. Maunder thought he was entitled to say that the operation was eminently successful, inasmuch as it prolonged for seven months a life that threatened to become extinct in forty-eight hours. The patient was sixty-eight years of age, gouty, and with a feeble circulation. Much to the annoyance of Mr. Brown and Mr. Maunder, a *post-mortem* examination was obstinately refused. Mr. Maunder said that the operation had now been performed by Mr. McCarthy, Mr. Wagstaffe, and himself, once by each of the three. In answer to Mr. Bryant, he said that no motion or flatus had ever passed *per anum* after the operation.

Dr. **Greenfield** had made experiments in the dead house to ascertain what part of the bowel would come into view by making the incision according to Trousseau, at a little below the centre of a line drawn from the umbilicus to the right anterior superior spine of the ilium; in one case it was the cæcum, in another the sigmoid flexure of the colon, and in a third the ilium, eight feet above the cœcum.

Mr. **Maunder** replied that his colleague, Mr. McCarthy, had examined about seventy bodies with the same object in view, and in a very large majority of cases the lower part of the ilium had been seized and opened, so that the bowel was invariably opened above the seat of obstruction, and yet at a point sufficiently low for the purposes of digestion to be carried on.

Mr. **Wagstaffe** remarked that the person on whom he had operated was still alive, and that he passed fæcal matter both by the wound and by the rectum.

TRAUMATIC STRICTURE OF THE URETHRA AND NUMEROUS PENILE FISTULÆ CURED BY INTERNAL URETHROTOMY.

Mr. **Teevan** related particulars of this case. The patient was a sailor, who had injured his scrotum and penis by a fall twenty-one years previously. Numerous abscesses formed, and sixteen fistulæ resulted, through which all the urine passed. In the course of a few years, the fistulæ in the scrotum (eleven in number) closed, but those in the penile urethra remained open. For a period of more than three months Mr. Teevan tried three separate plans of treatment, with but partial success. 1. Retaining a catheter in the bladder; 2. The patient drawing off all his urine through a catheter for two months; 3. The application of heated wires and probes tipped with nitrate of silver. On January 6th, Mr. Teevan performed Dr. Otis's operation, and nine days afterwards all the fistulæ were closed, and remained so permanently. The points of interest in the case were—1. The stricture being a traumatic one of the worst description; 2. The fistulæ being in the penile urethra, where they were always most difficult to cure; 3. The fistulæ having been open for the long period of twenty-one years; 4. The failure of three different methods of treatment; 5. The permanent closing of the fistulæ nine days after the stricture of portion of the canal had been enlarged by Dr. Otis's urethrotome to its natural calibre, which was ·31; 6. Subsequent to the operation, no catheter was left in the bladder, nor was the urine drawn off.

Mr. **Heath** said the case was an ordinary one. If a stricture is dilated, the fistulæ heal, and if in the case referred to, the stricture had been cut or split, they would have healed without any of the varied treatments employed by Mr. Teevan. He thought that caustic probes had long been set aside, and at the present time it was the general custom of every hospital not to retain the catheter in the bladder after operation.

Mr. **Maunder** said the treatment was not novel, unless indeed Otis's operation could be considered novel. He never kept a catheter in, unless he had a fear of hæmorrhage, and after splitting a stricture, he should never retain the catheter.

Mr. **Teevan** affirmed the case was a rare one; that few people had met with sixteen fistulæ in any case, and these fistulæ did not heal, notwithstanding the stricture had been dilated sufficiently to admit No. 9 catheter. He affirmed that Mr. Heath could not show a single English book in which it was advised not to retain the catheter. He should like to know how Mr. Heath would have treated the case?

Mr. **Heath** said that instead of occupying unnecessary time he would have at once introduced a Holt's dilator and split to the full size. He had not referred to any English books, but he knew what was the treatment invariably practised.

HYDATID IN THE ORBIT.

Mr. **Higgens** furnished a report of this case. The patient, a girl, æt. 14, who had always been delicate, came to Guy's Hospital, having for a month had pain in the right eyeball, which had then begun to protrude. It was pushed downwards and forwards, but the lids could be easily closed. Movement of the eyeball upwards was impossible, but other movements were perfect. There was diplopia when vision was directed upwards; the eye read Snellen x. The optic disc was red, greatly swollen, and bulging into the vitreous; the retinal veins were large and tortuous, and their visible number were greatly increased. The arteries were of about the normal calibre. There was no pulsation in or about the orbit, and no *bruit* could be detected; but there was some fulness deep in the orbit beneath its roof. It was thought there was a growth situated between the globe and the superior rectus muscle, passing backwards and involving the optic nerve. Twelve days after being first seen, the eye became inflamed and painful; there was swelling of the upper lid, œdema of the conjunctiva, and increased impairment of mobility of the globe. There were no rigors and no constitutional disturbance. An abscess of the orbit being suspected, an incision was made through the conjunctiva beneath the upper lid, and a director passed backwards came against a firm substance at the back of the orbit, which was incised and blood only escaped. A fortnight subsequently the protrusion was increasing. An incision was then made through the soft parts in a line parallel with the upper border of the orbit. The lachrymal gland was found pushed forward and was removed. Behind it was a firm growth, which was torn away with the fingers and the handle of the scalpel. The growth collapsed, and was then found to extend to the apex of the orbit and to be closely connected with the optic nerve, whence it was scraped away. It was an extremely thick walled cyst, composed of inflammatory tissue, inside which was a thin pellucid cyst, which separated easily, and which the microscope demonstrated to be made up of a delicate membrane, presenting an appearance of serrated fibres. The contents of the cyst had escaped; no hooklets nor daughter cysts were found. The whole tumour was nearly as large as the eyeball, but its central cavity was very small. After the operation, the wound was stitched up and the edges of the lids were pared and united so as to prevent subsequent damage to the eyeball from exposure. Some suppuration occurred at the site of the wound; but the patient made a good recovery. A month after the operation, the eye was found to deviate downwards; there was no mobility upwards; the lid could be raised to a very limited extent. The patient read Snellen 2½ easily; she had double vision when attempting to look upwards. There was a plentiful secretion of moisture, notwithstanding the absence of the lachrymal gland. The swelling of the optic disc had quite subsided, but there was some haziness of its inner border. The retinal vessels were quite normal.

Queen's University in Ireland..—The following degrees were conferred on the 13th inst. :—*Doctor in Medicine:* First Honour Class: William M'Geagh, John Jagoe Whelby. Second Honour Class: Jeremiah Mullane, Arthur A. Woods. Upper Pass Division: Robert George Camac, George Louis Latour. Unclassed: Alfred Allen, Thomas Archer, Samuel Bateman, Thomas Beattie, Charles H. Bennett, David Bradley, Robert A. Brannigan, James F. Brodie, Richard J. Burke, William Coates, Fredk. H. Collins, Michael Collins, Jephson J. Connell, Patrick J. Dempsey, Arthur Derham, Dunbar Dickson. John S. Dillon, Justin F. Donovan, Michael Dundon, Robert Eccles, F. Meagher Geoghegan, Charles Good, Thomas Greer, Henry Hunter, John B. Isaac, James M. Kennedy, Gilbert Kirker, George Laffan, Wm. M'Afee, Michael J. M'Carthy, Mark A. M'Donnell, Robert M'Ivor, R. D. M'Master, Robert B. M'Vittie, James Magill, Edward G. Marks, Henry Melony, John Mulrenan, Francis H. Murphy, Channing Neill. Maurice J. O'Sullivan, James Pedlow, Thomas F. Riordan, Charles D. Tanner, John E. Wales, Archibald Wallace, William Williamson. *Honorary Degree Doctor in Medicine;* Richard Eustace, R.N. *Master in Surgery:* Alfred Allen, Thomas Archer, Samuel Bateman, Robert Beattie, C. H. Bennett, Robert A. Brannigan, James F. Brodie, Richard J. Burke, Robert S. Camac, William Coates, Fredk. H. Collins, Michael Collins, Jephson J. Connell, Patrick J. Dempsey, J. Dunbar Dickson, John T. Dillon, Justin F. Donovan, Michael Dundon, Robert Eccles, Turner J. Fisher, Samuel Fergus, F. Meagher Geoghegan, Charles Good, Thomas Greer, Thomas Kyle, George Laffan, George L. Latour, William M'Afee, Michael J. M'Carthy, Mark A. M'Donnell, William M'Geagh, Robert M'Ivor, Edward Marks, Francis H. Murphy, Henry Molony, Jeremian Mullane, Channing Neill, James Pedlow, David Robertson, Thomas F. Riordan, James Rose, Maurice J. Sullivan, Charles D. Tanner, John Wales, John Jagoe Whelpy, William Williamson, Arthur A. Woods.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 25, 1876.

SIR WILLIAM GULL AND DR. GEORGE JOHNSON.

OUR readers will doubtless remember that as far back as July we drew attention to some extraordinary statements made by Sir Wm. Gull in the evidence he gave in the Bravo case. We said that that physician was apparently about to establish a new precedent for the conduct of consultees. We further remarked that the precedent is one which will not meet with the sanction of the profession generally, and will not be conducive to the public interest if followed by other consulting physicians. Since that time the conduct of Sir Wm. Gull has been the subject of very general comment, so much so that we may safely say that the judgment and the verdict which have been recently passed upon his evidence both by the medical press and the Fellows of the College of Physicians, have been already discounted by the opinion of the profession.

However, as our readers are aware, the whole matter, including the conflict of evidence and differences between Sir William and Dr. Johnson, was referred to the College of Physicians, and the conclusions arrived at by the Censors of the College have been recently communicated to the parties concerned. The Censors are of opinion that the perusal of Sir Wm. Gull's evidence was calculated to prejudice in the opinion of the public the position of Dr. Johnson and the other medical attendants of Mr. Bravo, and that, although he may have had no intention to disparage the character of his professional colleagues, certain portions of his evidence were "very objectionable." They even remark that Sir Wm. Gull's infringement of at least the spirit of the bye-law of the College which relates to the conduct of Fellows in consultation was "disastrous," and that the consequences arising from such infringement show how necessary it is that physicians in consultation should strictly observe that bye-law. On the other hand, they think that Dr. Johnson's evidence indicated considerable warmth, and might naturally give offence to Sir Wm. Gull, although they think that Dr. Johnson was led to give his second evidence from a sense of public duty, and in self-defence to correct that part of Sir Wm. Gull's statement which tended to throw discredit upon Dr. Johnson and his medical colleagues. With most of the conclusions which the Censors have arrived at, the profession will heartily agree, but it must be admitted that they have not fully considered the matter in all its bearings, and that they have endeavoured to put the best construction they could upon the conduct of Sir Wm. Gull.

It has been urged that, although this physician's statement in evidence was certainly open to the censure of the College, his actual conduct at the consultation gave no offence at the time, and that it was on the former and not on the latter grounds that his behaviour was impugned by Dr. Johnson. It has also been stated that the "little bit of glorification" which he showed in his statement to the jury, although it gave just ground for complaint, was founded upon a defective memory. The treacherousness of Sir Wm. Gull's memory was certainly very remarkable, especially in a man who had risen to great eminence in his profession, but we do not see how such a plea can be advanced in extenuation of the objectionable character and inaccuracy of certain portions of his evidence, and which evidence appears to us even far more open to censure than the course which he pursued during the consultation itself.

The Censors of the College of Physicians very naturally opened their remarks by expressing their regret that a public contest should have occurred between two senior and distinguished Fellows of the College, and that when it did occur means were not taken to settle the differences by mutual conference without reference to the censors. It was, however, only right that a subject of so much consequence to the character of the gentlemen concerned should receive some official notice, and that the general verdict which the profession had come to on the merits of the question should either be wholly endorsed, or qualified, by the verdict of that College which is supposed to watch over the interests and conduct of its Fellows, and to resent any breach of professional etiquette of which they may be guilty. In our opinion it is more to be regretted that any reflections whatever should have to be cast upon the conduct of a physician whose eminence in his profession should have been the best guarantee of the most irreproachable behaviour in his intercourse with his professional brethren, and whose strict integrity and courtesy of manner should entitle him to as much respect and consideration as his great talents and high position have won for him.

◆

CONDITION OF LUNACY IN ENGLAND AND WALES.

The state of lunacy in this country is a topic which cannot fail to interest all classes of the community. The statesman, the physician, the sanitarian, and the general public must all feel some interest in the treatment of, and in the provision that is made for, one of the most dreadful diseases in existence, and one by which not any of us can say we shall never be afflicted. It may therefore be worth while to glance at the 13th Annual Report of the Commissioners in Lunacy which has just appeared, and, although it is deficient in some of that particular kind of information we expected to derive from it, to cull a few of the more important facts in connection with the subject.

It appears that on January 1st, 1876, there were 64,916 registered lunatics on the official books of the Commissioners, showing an increase of 1,123 over that of the year preceding. Of this number 7,509 were private patients and 57,407 paupers. The average annual increase of lunacy during the last ten years has been 1,726, but the total increase of the past year over the one preceding has been less than in any other year of the series commencing in 1859. The increase during the year of private patients, is 119 as against 98 of last year, and an increase of 1,004 paupers, as compared with 1,668 of the same year. There has been an increase of 1,606 paupers in county and borough asylums, and a decrease of 352 of this class is in licensed houses, but this is owing to the opening of the second Kent Asylum at Chartham, and of additional wards at the New Lancashire Asylum at Whittingham, as well as by the extended accommodation now provided at the Surrey Asylums, both at Brookwood and Wandsworth. But with regard to the prevalence of insanity at the present day, it would appear from the tables contained in the Report, that lunacy is decidedly on the increase, as the proportion of lunatics is 26·76 per 10,000 of the present population, as compared with 22·26 per 10,000 of the population of 1866.

There are 15,509 lunatics confined in workhouses, being an increase of 133 over the number last year; and this number includes 4,204 patients resident in the Metropolitan District Asylums at Leavesden, Caterham, Hampstead, and Clapton. At the commencement of the year there were 2,796 lunatics confined in registered hospitals; and 399 patients confined under certificate in unlicensed houses, of which 193 were chancery patients.

On the whole, the Commissioners report favourably with regard to the general condition of the various lunatic houses and asylums, as well as to the treatment and personal welfare of their inmates. Some places, however, continue to be "dangerously overcrowded," and we regret to say that the representations of the Commissioners on this point are too frequently and persistently ignored by the local authorities. A favourable report is also given of the lunatic wards in workhouses and with respect to the accommodation and diet supplied to the inmates; but they animadvert in the strongest terms on the practice of sending to these workhouses patients suffering from all varieties of insanity without subsequently taking steps to promote their removal to an asylum, and the result of which is that many lunatics are deprived of the benefit of medical treatment until they either die or their case becomes chronic. And here again the representations of the Commission seem to have been without effect, for they say: "We have constantly drawn attention to this subject, both in our annual report and in other ways. . . . and in any future legislation we think that more stringent provisions should be made to prevent delay in sending patients to asylums, and also to restrict, as a general rule, the admission of cases into the workhouse, unless they have passed through the asylum and are certified by the medical superintendent as being harmless and chronic, and suitable for removal."

In justification of the above remarks, the report contains many instances of the evils attached to the indiscriminate reception and detention of insane persons in workhouses. Thus, two male patients destroyed themselves at the Marland Workhouse, Rochdale. One of these cases was sent to the workhouse by the relieving officer with the usual order "of unsound mind," and at the back of this order was written by the master "attempted suicide; brother cut his throat; cousin hanged himself." Yet, in this case *no* notice was given by the relieving officer to a justice, pursuant to the 67th section of the Lunacy Act.

Considering the large number of asylums scattered over the country, the very large number of lunatics under control, and the fact that the great majority of them must necessarily be left to the care of nurses and keepers, we must not be surprised to find in this report several instances in which the designs and actions of lunatics have escaped the vigilance of their attendants, and even taken away their own lives or the lives of others. Consequently, we find that one case of suicide took place at the Cheshire Asylum, another at Durham, a third at the Littlemore Asylum, Oxfordshire. A patient at the North Riding Asylum, Yorkshire, destroyed himself through the carelessness of an attendant; while an attempt at suicide which took place at the Bristol Asylum, was very skilfully frustrated by the physician who had charge of the case. The facts connected with the last-mentioned case were remarkable, and will be found recorded in our "Current Topics." Other cases of murder or suicide are recorded; but the most deplorable of all because they are preventible, are those which have taken place in our workhouses; and two or three cases are given to illustrate the mischief done by placing lunatics suffering from acute mania in workhouses, instead of at once removing them to an asylum. These, as well as all the other cases to which we have referred, will be found fully detailed in the report, and are well worthy of the consideration of those who are specially interested in the management or improvement of our public and private asylums.

We may remark in conclusion that this Blue-book contains also a good deal of other interesting information to which, for want of space, we have not been able to notice; and in the appendix will be found full descriptions and reports of each of our various hospitals and county asylums. Nevertheless, it would add very much to the value of these reports if they could go into other matters than the statistical details above quoted on the general condition and management of the asylums themselves. It would be highly instructive to have more particulars respecting the proportion of recoveries and the mortality among our lunatic population, and to know more about the habits, family history, and physical health of the patients, the causes of their disorder, the prevalence of various complications such as general paralysis, epilepsy, &c., the results of different kinds of treatment moral and physical, the means of exercise, occupation, or amusement adopted, and several other subjects generally omitted or but cursorily noticed in these reports.

THE PHARMACO-MEDICAL INVASION.

The English counter-prescribers seem to have been at last brought to bay, and a combat *a l'outrance* between them and the Medical Defence Association is about to commence. It does not need that we should inform our readers that throughout England the medical and surgical wants of certain classes of the community have been openly and constantly catered for by druggists or druggist's boys, of whom it cannot be pretended that they knew, or could know, even a smattering of medicine or surgery. Indeed, to do them justice, they were not usually guilty of any such misrepresentation, for they prescribed without seeing the patient, and did not at all excite themselves about the possibility that they were doctoring the wrong disease or giving the wrong medicine. This method of treating the sick existed everywhere, and in some districts was almost the only system which did exist, and as the druggist, who never saw the patient, and was completely innocent of medical knowledge or skill, had supplanted the doctor, who was supposed to be specially educated in such subjects, deaths, both by neglect and poisoning, were every day occurrences, and it became necessary to put some check upon the illegal practice of physic by drug-vendors. The Medical Defence Association took the matter in hand, and having achieved a sweeping and authoritative judgment in their favour from Baron Bramwell, have, without difficulty, brought many counter-prescribers to the block. It was not to be expcted that the chemists and druggists would yield a long enjoyed privilege without a determined fight. Experience shows that their combativeness is not in the least influenced by any consideration whether the practice for which they contend is legal, just, expedient, or honest, or the contrary, and they have already manifested their determination not "to let their bone go with the dog," even when the bone is plainly the dog's property purloined by themselves, and kept for their own gnawing, in spite of every appeal to their ideas of fairness. We recollect how bitterly they have battled for the licence to defraud the public by adulterations, and how they were rewarded for their courage by Mr. Sclater-Booth with a permit to do so within limits, and with such encouragement it is not likely that they will tamely surrender the right to earn a living by pretending to medical education and competency, which they do not themselves suppose that they possess. In the manner of other great powers, they are negotiating amongst themselves at the present movement for material support against their enemy the doctor, and the Council of the English Pharmaceutical Society has been challenged to come forward and be the champion of the counter-prescribers, and to pay away the Society's public funds for the protection of this illegal and criminal practice. We observe, with some surprise, that they have returned rather a cold reply to those who have begged for their aid, and are evidently troubled with that inconvenient appanage for a chemist's and druggist's council—a conscience, the possession of which has brought down upon them the wholesale abuse of the *Chemist and Druggist*, the exponent of the counter-prescribers. Whether the Pharmaceutical Society decides to enter the field or to stand neutral does not much matter in the long run, for we are confident that the event of the contest is already decided, and the counter-prescribers must be content to run the peril of breaking the law if they mean to continue their trade in doctoring. Neither the public nor Parliament will sustain them in so gross a misuse of their trade, for no thinking person, except those who earn an income by thinking all on one side, will say that it is expedient that persons who pretend to no medical skill shall be allowed to treat persons whom they never see, and to administer death-bearing drugs with little care and no knowledge. The Legislature is sufficiently liberal on this point, for it allows any amateur to advise any fool who will ask or take his advice, but it does not allow such a person to receive fees for such service, or put himself forward as educated and skilled. This the prescribing druggist does, for no one can doubt that the money paid to him is as much a return for his advice as a price for his medicine, and it is notorious that such persons cultivate a medical reputation, and do their best to represent themselves as being, if not legally qualified, at least as competent and experienced as those who are.

◆

COUNTER-PRESCRIBING.

The pressure of other matters has prevented us noticing the long and able address which Professor Redwood recently delivered at the Pharmaceutical Conference held at Glasgow. In that address Professor Redwood drew the attention of the Conference to the practice of counter-prescribing, and to the relations existing between the pharmacists and the medical profession. He spoke on this vexed question with so much moderation and good sense, that we are not surprised that some of our contemporaries have felt bound to endorse most of the remarks he made on the occasion above referred to. Our views on this subject was laid before our readers many months ago when commenting on the case of the *Apothecaries' Company* v. *Nottingham;* but some of the observations of the President of the Pharmaceutical Conference are so just and so in accordance with what we have already offered, that we may be excused for drawing attention to them. It was forcibly urged by Professor Redwood that of the 14,000 chemists in Great Britain, the greater part have little to do with the dispensing of physicians' prescriptions, but are principally engaged in supplying medicines to be used by the public on unprofessional responsibility, and that it would be unreasonable whilst heads of families and others were considered justified in treating their slighter ailments according to knowledge empirically obtained, that men who through being continually engaged in the preparation and sale of medicines might be supposed to have a knowledge of their properties, should be debarred from imparting that knowledge when appealed to. Besides, the public, rightly or wrongly, place confidence in the power of the chemist to advise "not only with regard to the properties and doses of medicines, but also in the treatment of diseases, with regard to which he possesses no real qualification. In this direction from simple questions and trivial cases he may be led on step by step, unless he has strength of mind and firmness enough to resist the temptation which a desire to satisfy customers, to retain and not to discredit or weaken the favourable opinion previously formed of his knowledge, with other considerations natural to a man of business, into a habit of prescribing for which no sound justification can be advanced." At the same time Professor Redwood would not have any one thus appealed to travel beyond the bounds required for the safety and convenience of the public, and he admits there should be some control exercised over the assumption of a duty which so obviously affects the interests of the public as does that of the treatment of disease.

It is, moreover, as we remarked on a previous occasion, only fair to consider, when talking of the chemist usurping the office of medical adviser, how many there are in our profession who trespass upon the province of the chemist and druggist. One of our medical contemporaries thinks there is far more work to be done by pharmacists whenever they will give their undivided energy and attention to the duty of preparing remedies for public use on the prescription of medical men. But to this very considerate remark the *Pharmaceutical Journal* justly retorts that "an important factor is at present much wanting—the prescriptions." The fact is, that the medical men who prescribe form but a very small portion of the profession, and we are sorry to say that a great number not only make up their own medicines, but sell drugs and other things indiscriminately, and carry on a trade little different from that of an ordinary chemist. Besides, the prescriptions are most wanting just in those neighbourhoods where the practice of counter-prescribing is most rife. It is not the fashionable chemist who does much prescribing business, but the chemist in the back street. The former is well supplied with prescriptions, and sells to the surrounding gentry a large amount of aërated waters, scents, and other fancy articles. The latter makes up nice cough mixtures for Mrs. Brown's only child, or liniments for her husband's sprained ankle. It stands to reason if every member of the profession was to write prescriptions, chemists could have little or no further motive for prescribing themselves, inasmuch as they would know that they must eventually make up the prescriptions of their customers. Until this is the case we cannot expect that counter-prescribing, much as it is to be deprecated, will be entirely given up, and until this is the case we are not justified in throwing all the blame upon the chemists. But the abolition of counter-prescribing would be productive of much good. As we said months ago, "if every member of the profession tried to confine his practice to prescribing, and every chemist to dispensing only, there is reason to believe that the good intentions of the chemist will have to yield to a strong pressure from without." This difficulty could only be got over by the general public being better educated than they are at present with respect to the respective claims of the pharmaceutical and the medical profession upon their confidence in the hour of illness.

◆

Notes on Current Topics.

The Coming Pharmacopœia.

We understand that a meeting of the Pharmacopœia Committee of the Medical Council was held on the 20th of October, as we announced in our last issue that it would be. The views which are urged upon the committee as to the amendment of the Pharmacopœia in many material respects, and the incorporation of the "additions" in its text, have not, we regret to say, found favour with the committee, for they have decided that "as the new publication is to be a reprint, and not a new edition, the committee cannot concur in any alteration of the text, except so far as regards the correction of errors." The tender of Eyre and Spottiswoode for the printing of 5,000 copies was therefore accepted, and Professor Redwood was retained as its editor. We fear that the majority of the committee who arrived at this decision have lost sight of the fact that they are about to print a work not for their own benefit or profit, but as a standard of perfection, officially binding upon pharmaceutists and prescribers. In such a work imperfections of any sort are quite unjustifiable, and haste in publication is a very insufficient excuse for the presence of even a single error. We believe that in this matter the views of Mr. Macnamara and Dr. Aquila Smith—the only special authorities upon materia medica which the committee contains—have been disregarded, and that the work is likely to be hurried through in a form which will probably need amendment at a heavy cost before long. We hear that the old edition is all but sold out, but it does not seem to us that this is a reason for the issue of a discreditable book, and as the committee will meet again on the 27th, we trust that wiser counsels may prevail.

The Famine in the Army Medical Department.

It is not a pleasant consideration that at the moment when war threatens to break out, and the British army may stand in need of all its valour and efficiency, the surgical care of the soldiers is unprovided for, and if the war be inevitable, we must enter upon it with an entirely insufficient and badly organized medical corps. It may be assumed that we accurately describe the state of affairs and are justified in what we say, inasmuch as the army medical service is not now able even to provide for the permanent medical offices of the state. The Royal Hospital of Kilmainham—the Chelsea Hospital of Ireland—is now under the care of a civil practitioner, there being no army surgeon to be had to replace the usual surgeon, who is absent. To make matters worse, typhoid fever has shown itself in the institution.

The Medical Defence Association and the Prosecution of Illegal Practitioners of Medicine.

The necessity for the existence of this useful association arises from the unaccountable difficulty of moving the medical corporations to prosecute offenders against their charters or against the Medical Act. Were it not for the energetic action of the Defence Association, quacks, prescribing chemists, herbalists, and bonesetters, and unqualified practitioners of every description, could drive a roaring trade, as many of them are still doing for a time, without let or hindrance. This spectacle is no doubt a disgrace to our civilisation, but the inaction and supineness of the medical profession as a body is, in great measure, responsible for it. The profession is armed with the means of protecting itself and the general public against illegal practitioners, but has hitherto declined to move in the matter. The public, ignorant of the means of discriminating between the legal and the illegal practitioners, are therefore unable to protect themselves.

The time has come for a cessation of this period of inaction, and the Medical Defence Association, already successful in recovering fines, varying from £5 to £20, from about a dozen prescribing chemists and quacks of the stamp of the notorious "Dr." Kahn, is now preparing for action on a still more extensive scale. It is the duty of every legally qualified practitioner to second the efforts of this association, either by voluntary contributions to its funds or by enrolling themselves in the list of members. By the rules of the association "every registered medical practitioner" is "eligible for election as a member," and "every candidate for election must be proposed and seconded by two members of the association, and elected by a majority of the council," the subscription is 10s. 6d. annually.

The names of intending members and contributions to the funds will be received by the Treasurer, Mr. W. Spencer Watson, at 7 Henrietta Street, Cavendish Square, or by Mr. George Brown, of 12 Colebrooke Row, Islington.

Extraordinary Case of Swallowing Foreign Substances.

In the last annual report of the Commissioners in Lunacy will be found the particulars of a remarkable case, of which the following is a slight abridgment:—A female patient, E. W., æt. 43, was admitted for the third time to the Bristol Asylum on June 15, 1875. On the occasion of her first residence there, in 1863, she swallowed (with a suicidal intention) the entire contents of a domino box, fifty-four dominoes in all, fifty of which were recovered by vomiting alone, with fragments of stone, weighing fourteen ounces, while four dominoes and some stones passed through the intestines. In May of 1871, she was re-admitted to the above asylum, still with suicidal tendencies, and after two actual attempts, she was again removed to Wells, and discharged thence recovered in 1873. Finally, as already mentioned, she returned to the Bristol Asylum in 1875, that is, twelve years after the swallowing of the dominoes. The certificate again gave a history of renewed suicidal attempts.

On the 31st July, 1875, she got possession of fifteen shutter screws, and in the course of three-quarters of an hour she swallowed thirteen of them. The screws were new ones; and thirteen of the same pattern weighed twenty-four and a-half ounces avoirdupois weight. To prevent injury to the coat of the stomach, Dr. Thompson administered a mess of tapioca pudding and gruel, of which she took a large quantity. The screws consisted of a body two and a-half inches long, half an inch thick, with a square head, and with a raised collar nearly three-quarters of an inch in diameter; consequently, an attempt to recover them by the œsophagus was out of the question, while their passage through the pyloric valve was very doubtful. On the 10th September, however, the patient passed some of the screws by the bowels, and the rest were passed at various intervals up to the 4th of

February, when the last was passed in the same manner. During these months the patient suffered much pain of a spasmodic nature. The treatment chiefly consisted in attention to the diet, subcutaneous injections of morphia, night and morning, then ounce-doses of olive oil, and subsequently large doses of castor oil. It appears, also, that on the 3rd of August E. W. passed a large piece of a chamber utensil by the bowel, which was followed by severe hæmorrhage. This woman, Dr. Thompson remarks, "is a melancholiac of the most abject type, and with a touch of moral obliquity. Perhaps she did not wish to commit suicide, but rather to draw attention to herself, and to cause trouble."

There have been many cases recorded in which the most extraordinary substances have been taken into the stomach, and the one to which we are now drawing attention is not the least remarkable of them. But, as the Commissioner observes, the facts connected with this case are also interesting from a purely medical point of view, affording a remarkable instance of the recurrence, after a lapse of years, of a morbid propensity once developed in the mind of a patient of the melancholic type, with a suicidal tendency; and also as showing how much may be done by skill and care to remedy an injury which at first might seem likely to prove fatal.

Sanitary Eucalyptus Oil Soap.

The *Eucalyptus globulus,* a tree so common in Australian vegetation, has recently created considerable interest in this country on account of its supposed disinfecting properties. From the tree are obtained a tannate gum resin, a volatile acid, and a volatile oil. The aroma of the volatile acid may be detected in the air in the vicinity of the tree, and it is considered to give to the atmosphere an invigorating and healthy tone. The active principle of the *Eucalyptus* has recently been utilised by Messrs. Whitaker and Grossmith in conjunction with a soap. The soap has a pleasant aromatic odour derived from the volatile acid, and is refreshing and soft to the skin, and may be considered an addition to the toilet.

Ovariotomy in Dublin.

Ovariotomy has been performed twice in Dublin during the last week—on Thursday at the Coombe Hospital, by Dr. Kidd, and on Saturday at the Rotunda Hospital, by Dr. Aubin. Dr. Kidd's case was complicated by the presence of extensive adhesions, which were broken down with much difficulty. Dr. Aubin's case also presented very unfavourable symptoms. The patient was greatly emaciated, and there was much ascetic fluid in the abdomen. Notwithstanding these unfavourable features, at the date of the last report both patients were progressing satisfactorily.

Thames Mud Butter.

The statement that much of the Dutch butter in the London market is the offspring of Thames mud, which has been always looked upon as a myth, is again revived, and a description is now given of the process by which it is presumed to be made, the nature of which we give *quantum valeat.* It is said that multitudes of little balls are made up of cork, with hair matted on the outside. These are sprinkled in suitable places upon the Thames mud, and in process of time they catch all the greasy globules which the tide carries past them, and which accumulates in a shape resembling dirty tallow, and causes them to grow in size, when they are at length gathered by persons paid for the purpose. This narrative does not sound probable, but it is given in the papers in authoritative form.

Woman Doctors.

As we last week predicted, the Senate of the Queen's University in Ireland have agreed to admit female candidates for their M.D., at and after the next University Session.

The London Student Class.

The following is the number of new entries at the various London and provincial medical schools:—St. Bartholomew's, 131; Guy's, 95; University College, 79; St. Thomas's, 43; The London, 35; King's College, 28; Middlesex, 38; St. George's, 33; Charing Cross, 31; St. Mary's, 28; Westminster, 9; Owen College, 42; Leeds, 32; Liverpool, 22; Sheffield, 16; and Bristol, 17. The new entries at St. Bartholomew's this year is, we believe, the largest number ever entered in one year at any London Hospital. At Charing Cross, in addition to thirty-one full entries, there are nine entries for special courses; and at Guy's there are four entries for special courses. There are also several special entries at some of the other hospitals.

Hospital Saturday Fund.

A public meeting of the promoters of the Hospital Saturday Fund was held in Exeter Hall on Saturday evening last. The result of the collection was made known by the Chairman of the Committee, Mr. Mercier, who stated that the Fund up to the present time amounted to £5,450, a trifle less than that of last year. The first year's collection was £6,400, while the expenses were very large. The second year resulted in a collection of £5,473, with an expense of £470 less than the first. The second year's collection was made on the 31st of July, when eighty-two ladies took charge of as many collecting tables, and £490 was collected by their instrumentality. This year 160 ladies interested themselves in the movement, and a much larger sum was collected, and the actual cost of collecting had been very small, leaving a good sum to be divided among the hospitals and dispensaries. A resolution, expressive of approval of the Hospital Saturday Fund was moved and carried, and the Secretary announced that a cheque from the Stratford Committee had just been received amounting to £225. A vote of thanks to the Chairman brought the proceedings to a conclusion.

The Small-pox Epidemic.

Under the authority of the managers of the Metropolitan Asylums District, Sir William Henry Wyatt, Chairman of the Leavesden Asylum Committee, have already drafted large numbers of imbeciles from the Hampstead Asylum to those institutions, and early in the ensuing week the latter will be fully prepared for the reception of small-pox patients, should the epidemic continue to progress.

An Obstinate Mute.

The *Portsmouth Times* reports a strange case which has occurred on board the training ship *Impregnable*, at Portsmouth. Shortly after his entry a boy was discovered thieving, and was in consequence birched. He immediately ceased to speak, and was sent to the hospital, where he was treated for dumbness, and where he remained for four months. Whilst there, according to the report of the medical officer in charge, he behaved very badly, and the hospital authorities stated that they could keep him no longer. It was also alleged that he had spoken to at least half a dozen of his fellow-patients; and when he got on board the *Impregnable* he was found to be in possession of a letter that he had written to his friends, stating that he had not spoken for a certain length of time, and that he expected to be discharged from the service shortly. The authorities were communicated with, and pending their decision the lad was placed behind a screen with a sentry in charge of him, but he tore down the screen, assaulted the sentry, and otherwise misconducted himself, and for this and his misbehaviour at the hospital he has been again flogged.

Intemperance in Dublin.

The Recorder of the City of Dublin, Mr. Falkiner, has signalised his first licensing sessions, and achieved for himself great public popularity by a vigorous, courageous, and independent onslaught on the whiskey-drinking mania, which had grown to the dimensions of a perfect pestilence under the free-and-easy rule of the late Recorder. Of late years public-house licenses and transfers had been dealt out with so liberal a hand, and the trade in whiskey had become so lucrative that almost a tenth of the houses in every leading street were occupied by "shebeens" and gin-palaces, whose blandishments seduced to intemperance even the steady, industrious working man. The Recorder opened his assize with an eloquent phillipic against the system, and declared his intention not to countenance it, and he carried his beneficent views into effect by refusing almost every application for a new license which came before him. How far the public house speculators had presumed upon the good nature of his predecessor may be judged from the facts that great sums of money—in one instance as much as £8,000—had been spent in anticipation of a grant which was nevertheless refused. The whole respectable population of Dublin is under a debt of gratitude to Recorder Falkiner, who, if he has the courage to persist in his good work, will have fought almost as grand a crusade as his noble fellow-countryman, Father Mathew.

Desault.

Last Sunday week was fixed for a grand *fête* of the town of Loire, in the Haute Saone Department of France, to celebrate the inauguration of the bust of the great surgeon Desault. The bust is said to be a work of the highest artistic merit, and it has been presented to the town by the sculptor. The eulogium of Desault was spoken after his death in 1795 by the immortal Bictat. "The creator of the first school of clinical surgery was he," said Bichat, "who created surgical anatomy. The inventor of the apparatus for the treatment of fractures by permanent extension, a skilful operator, and a great teacher, a physician of genius, Desault, who was but the son of a poor peasant, raised himself by the pure force of his talent and his industry, to the highest scientific position. From the age of twenty-two he attracted crowds to his lectures and occupied successively every position of honour which was open to any surgeon of his epoch. In 1795, while engaged in the case of the unhappy Dauphin, the son of Louis XVI., then a prisoner in the Temple, he died suddenly at the early age of fifty-one of what some called a low fever, but what others described as poison. It is sufficient to say that he was the master and mentor of Bichet, Dupuytren, Larrcy, and Chopart, and that he was to all intents the initiator and founder of the first surgical school of the nineteenth century.

The Modern Treatment of Lunatics.

On Thursday last the foundation stone of a large asylum for imbecile pauper children, under the management of the Metropolitan Asylums Board, was laid at Dareuth, in Kent, by Dr. Brewer, chairman of the board. The cost of the building is estimated at £75,000, and the accommodation, 500 children. Time was when lunatics were treated rather as criminals than as guiltless beings whose sufferings might be alleviated by proper treatment. At the present time things are very different. Modern medical science does not consider keeping lunatics out of harm's way its sole duty, but our professors of physiology have for years devoted themselves to the amelioration of the condition of those of their fellew-creatures who are deficient in brain power. For adult imbeciles there is perhaps little to be done, but with children of weak intellect the case is not hopeless. Practical experience has long since shown that a great majority of imbecile children might, by proper and judicious training, be made of use to themselves and others. Medical science, remarks *The Observer*, has discovered that the passion for imitation which exists in all living creatures might be employed either for good or for bad. Under the old system of indiscriminate confinement this love of imitation acted badly in the case of idiots, but men of science came to the conclusion that children possessed of faculties for imitating bad habits might by proper associations be brought to learn good ones by the same means. For some time the Metropolitan Asylums Board has been endeavouring to develop this idea, and the result of several years' experience shows that a large percentage of the pauper imbeciles of London are actually capable of learning to work, and doing something towards earning their own living. At the new asylum the classification system is to be carried out, children being educated together in various sections, according to their capabilities, every care being taken to avoid baneful influences of any kind. Every thinking person will join in the heartiest wishes for the success of the movement, which is fraught with such vital consequences to the community at large.

As a sad sequel to the ravages of war in the East, Dr. Zieman has just returned from a tour in the Czernagorska mountains. He reports a fearful state of disease, and gives as his opinion that if the war continues much longer the whole country will be entirely depopulated.

"A Daniel come to Justice."

Three prosecutions for the milk of sulphur fraud were heard in the Belfast Police Court on the 5th instant, and miscarried, in consequence of the stupidity of the stipendiary magistrate, Mr. Orme. We need not apologise for using so uncourteous an expression towards a representative of the law's dignity, because Mr. Orme candidly confessed that his brains were incapable of enclosing the arguments pro. and con., and after halting between many opinions, and having almost decided to impose a heavy fine, he escaped the dilemma by giving up the enigma, and dismissing the cases, without prejudice, because, as he avowed, he could not understand it.

If the authorities at Belfast mean to carry their prosecutions further, we advise them to bring the delinquents before some judge whose comprehension is capable of taking in the subjects brought before him for decision. Such a confession of mental muddle as that of the Belfast stipendiary is a novelty of magisterial candour, but it is to be regretted that the complainants should be sent away unsatisfied, because the head of Rhadamanthus is not roomy enough for their complaints.

Dr. Richard Henry Pope has been placed on the Commission of the Peace for the county of Donegal.

The Royal College of Surgeons of Edinburgh has re-appointed Dr. Andrew Wood its representative on the General Medical Council for a period of three years.

The Committee of the Hospital for Diseases of the Throat, Golden Square, London, have just received a donation of £250 from the Rev. Henry H. Hughes, of Layham, Suffolk.

The Goldsmith's Company have voted a sum of £1,000 to the Chemical Society to aid in the formation of a fund to which £1,000 has already been promised for the promotion of original research in the science of chemistry.

The promoters of the Hospital Saturday Fund in London must be greatly disappointed at the result of their labours. This year it was confidently predicted that the collections would double those of last, whereas they have not quite reached the amount of 1875, and are less than the 1874 collection by £1,000.

A very successful *conversazione* was held in the College of the London Hospital on Friday evening, which was set on foot by the London Hospital Medical Society. Upwards of 400 visitors, representing sections of the various medical and scientific associations of London, accepted the invitation, and a most enjoyable evening was the result.

The *Students' Journal* states that a large part of the school buildings of St. Bartholomew's will be entirely rebuilt on an extensive scale next summer. It is not unlikely, too, that certain measures may be taken to utilise still further, for the practical instruction of the more advanced students, the vast multitude of cases annually under treatment at this hospital.

Stimulants for Workhouse Patients.

The "Todd" line of treatment of disease by stimulants has become of late years a hobby, so over-ridden that it has at last been made unpopular and ridiculous in the eyes of the public. The abuse of stimulants in workhouses has brought about an *emeute* amongst boards of guardians, in deference to which doctors are reducing the amount of their whiskey and porter prescriptions, and we hope that the movement will gain and keep its strength until the medical use of alcohol is brought within proper extent. We would naturally be the last to suggest that any limit should be placed to the necessary use of alcohol in disease, nor do we think that any money consideration should be allowed in the least to hamper the discretion of workhouse physicians. But it is evident that some control is necessary, because the appetite for liquor on the part of workhouse inmates is voracious, and there is a great inducement to medical officers to purchase popularity amongst them at the expense of the ratepayers by ordering a daily dram or two, on the theory that they are infirm or sick. The consumption of drink in some workhouses is so outrageous as to be altogether indefensible, and incapable of explanation, upon medical grounds, and the guardians have our sympathy in doing their duty as controllers of waste so long as they allow fair independence of judgment and discretion to the medical officer. The waste of money is the smallest of the evils caused by the over-stimulation of paupers, and we give no countenance to the idea that whiskey or beer is at all necessary to able-bodied workhouse inmates for the maintenance of their health. We see no better way of approaching the question than the appointment of a committee in each workhouse to see and examine the persons to whom grants of stimulants are made, and to form a judgment as to whether they are ill enough for the doctor's ministrations. If they are, the doctor must be the judge of their medical wants, and must do what he conceives necessary to their health.

Correspondence.

THE FIRST CONVICTION UNDER THE VIVISECTION ACT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In your issue of the 7th inst. you express your approval of the conviction recorded against me for an alleged offence under the Vivisection Act at Sunderland. In that spirit of fairness which I have found generally animates journalists in this country, you will doubtless afford me an opportunity to place my view of the case before your readers. My position is this, I did not break the law, therefore I deserved not punishment. First let me state the legal objections to the conviction. Section 6 of the Act says: "Any exhibition to the general public, whether admitted on payment of money or gratuity, of experiments on living animals calculated to give pain, shall be illegal;" and a subsection runs—"And any person publishing any notice of any such intended exhibition by advertisement or a placard, newspaper or otherwise, shall be liable to a penalty not exceeding one pound." I was summoned under the sub-section. The announcement in the placard to which so much objection has been taken was as follows: "Interesting experiments will be made, showing the effects of poisons upon animals." Concisely stated, the technical objections to my conviction are these:—1. The alleged offence was not the complete offence intended by the Act to be punished, the experiments not having been made. 2. The words in the placard did not come within the meaning of the Act, inasmuch as (*a*) I did not state in the placard that I intended to experiment on vertebrate animals, therefore it ought to be assumed that I meant invertebrate animals, experiments on which are permitted by the Act; (*b*) I did not say I intended to experiment on living animals; and (*c*) I did not say I would cause pain to living animals. But what were the real circumstances of the case? I may premise that I am a German, therefore can scarcely be expected to know the provisions of every new law passed at Westminster. While, as I now learn, the Vivisection Act, then a bill, was before Parliament, I had given instructions for the printing of the placard, and within three days of the passing of the Act the placard was issued. Up to that time I had not been aware that there was anything in the laws of England which could prevent me making the experiments I proposed, but on the existence of the Vivisection Act being brought to my knowledge a few days afterwards, I at once abandoned the idea of illustrating my lecture in the way I had intended, and no experiments were made during my address. I was, however, fined by the Sunderland magistrates for publishing my intention—my abandoned intention. "If," as the *Standard* observes, "the clause which is taken as rendering the mere announcement of an intention a misdemeanour must be considered on such a subject unreasonable," what must we feel when we find a person convicted under it who has voluntarily abandoned the intention on learning that it is illegal for him to make the experiments? "Ah," but say my prosecutors, or as many of the inhabitants of Sunderland who know the circumstances maintain, persecutors, "you spoke disrespectfully of the Act." I certainly did condemn the Act, as it interferes with my professional studies; but surely it is not a criminal offence, an offence to be urged against one in a court of law, that the defendant spoke disparagingly of an Act of Parliament. At any rate, I can find no clause in the Vivisection Act under which a person can be punished for speaking disrespectfully of it. Nor is there, so far as I can see, any clause providing punishment for a person who has merely said that if the Act had not come into operation he had intended to experiment on animals. Then it is urged against me that I declined to express regret for having broken the law. Had I published anything which I believed to have been a breach of the law, no one would have been readier to apologise. But as I believe I did nothing of the kind, and had nothing to regret. Yet although my able legal agent, Mr. Hines, forcibly stated these arguments, the Sunderland justices convicted me, though in the smallest penalty. I attribute their decision to the way in which the prosecution was conducted, which led the magistrates to make the error they did. If, as a talented local justice, Mr. Ritson, who presided at my lecture, recently observed, the magistrates occasionally may be too lenient, may it not happen that in some cases they are too harsh, and even convict where they should not. If others murder justice, I will not. I will doubtless some day be in a position to relate the secret history of this case, how certain medical men living in my own locality, inspired by professional jealousy, stirred up in a few well-intentioned gentlemen in London who had assisted to induce Parliament to pass the new measure for the prevention of cruelty to animals, the desire to pursue me as they would pursue a hare—a desire which ought to be very foreign to their natures, but a desire fed by an anxiety which made them (at most regardless as to whether the opportunity was a good one or not) eager to show the world what a wonderful instrument for the suppression of cruelties they had badgered the Legislature into giving them. I may say here that I am a subscriber to the local branch of the Society for the Prevention of Cruelty to Animals, which, I may add, declined to prosecute me. A word as to the alleged unprofessional character of my conduct in giving the lecture on "The Balham Mystery," in which I maintained that Mr. Bravo was poisoned with tartar emetic and laurel water. Being a legally qualified medical practitioner, I hold that if I see medical evidence degrading to the medical profession, I have just as much right to criticise it as the editor of any medical journal. The word doctor, as you are aware, means teacher. I am a teacher who likes to instruct all who seek instruction, not secretly, but openly, so far as decency will permit. I trust I shall always fulfil the first motto given me by my earliest schoolmaster, "Do thy duty in thy calling."

I beg to subscribe myself, yours truly,

Gustav Adolph Abrath, M.D.

Cumberland, October, 1876.

◆

EMPHYSEMA CAUSED BY DYSTOCHIA IN A PRIMIPAROUS PATIENT, AND FOLLOWED BY ACUTE MANIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Some time ago I was called to visit Mrs. ——, in labour with her first child. On examination I found the os rigid and œdematous, and about the size of a crown-piece. The pains had commenced the evening before, and the liquor amnii had escaped.

The labour progressed slowly, but the rigidity and constriction of the os yielded after the administration of an enema and sedative draught, and the following morning, about 1.30 o'clock a.m., the child was born with cord twisted round neck, body, legs, and foot.

Towards termination of labour the pains became very strong, and the patient made violent expiratory efforts. Placenta was easily removed. I now noticed for the first time a swollen condition of left eye, cheek, neck, and chest on same side, without discolouration, and having an emphysematous crackle on pressure, owing to the pressure of air in the subcutaneous areolar tissue. In forty-eight hours afterwards this rare complication in primiparous labour had almost disappeared without the necessity of having recourse to puncturing or bandaging.

After the lapse of some days this woman was attacked with acute mania, and finally succumbed to the latter disease.

As regards the causation of *Emphysema*, whether in primiparous labour, whooping-cough, hysteria, or foreign bodies in bronchi, I believe Dr. Mapother rightly ascribes it to the air being pumped into the posterior mediastinum during forced inspiration and retarded expiration. The air cells near the root of the lungs not being firmly enveloped in pleura, as we find the lung elsewhere, burst when over-distended. Moreover, the conical terminations of the bronchial tubes tend to confine the air, and the cells at the root give way. not being so well supported as those along the side.

Yours, &c.,

Charles Garland, L.K.Q.C.P., L.R.C.S.I.,
Medical Officer Donoughmore Dispensary.
Carrickmacross Union.

ASCARIS LUMBRICOIDES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I was consulted on the 29th ult. for a boy, six years of age, who his mother said had been suffering from worms for some months previously. I accordingly prescribed two powders of santonine, four grains in each, one to be taken in castor oil each night in succession. On the following morning after taking the first powder, the boy passed four large round worms (ascaris lumbricoides), measuring from ten to thirteen inches in length. After the second powder he passed five more of the same worms, varying in length from seven to ten inches. Further administration of the santonine has not exterminated any more of those "unwelcome tenants," so I conclude from this and the rapid improvement in the patient (who before treatment was quite emaciated), that he is now quite free from helminthiasis.

Yours, &c.,

Morgan D. O'Connell, Jun.

Kilmallock, Co. Limerick.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted Licentiates of the College on Monday, October 16 :—

Collins, Floyd, Ware.
Downes, Edmund, St. Mary's Hospital, W.
Dunbar, James John Macwhirter, 77 Ladbroke Grove, W
Fry, John Blount, Swindon.
Greenish, Robert, 20 New Street, N.W.
Khory, Rustomjee Naserwanjee, 49 Elsham Road, W.
Merriman, John William Conyers, 45 Kensington Sq., W
Page, William Henry, 27 Flaxman Road, S.E.

Street, Alfred Wm. Frederick, Royal Free Hosp., W.C.
Thompson, Arthur Hirst, Gomersal, Leeds.
Tomlinson, Edward Denham, Preston.
Traill, Mark Windeyer, University Hospital, W.C.
Woollett, Charles Jerome, Monmouth.

The following candidates, having passed in Medicine and Midwifery, will receive the College Licence on obtaining a Qualification in Surgery recognised by this College :—

Byam, Samuel Henry, 14 Milner Street, S.W.
Goulder, Frank Samuel, 16 Holford Square, W.C.
Sugden, D'Arcy, St. Bartholomew's Hospital, E.C.

King and Queen's College of Physicians of Ireland.—At the annual stated meeting of the College, held on St. Luke's Dan, 1876, the following officers were elected for the ensuing year :—President—Samuel Gordon, M.B., Dublin ; censors—Thomas Hayden (Vice-President), Wesley B. Jennings, B.A., Dublin, Thomas W. Grimshaw, M.D., Dublin, John Wm. Moore, M.D., Dublin ; Registrar—J. Magee Finny, M.D., Dublin ; Treasurer—Aquilla Smith, M.D., Dublin ; Examiners in Midwifery—Edward B. Sinclair, M.D., Dublin, and Fleetwood Churchill, junr.; Professor of Medical Jurisprudence—Robert Travers, M.D., Dublin ; Representative on the General Medical Council—A. Smith, M.D.; Agent to Trust Estates—Charles Townsend ; Law Agent—Charles Woodward. The following licentiates of the College were on the same occasion elected to the Fellowship :—Walter Bernard, M.R.C.S. Eng., 1852 ; James Cuming, M.D., Queen's Univ., Irel., 1855 ; Christopher John Nixon, L.R.C.S.I., 1868 ; John Mallet Purser, M.D., Dublin, 1874 ; Richard Newman Townsend, L.K. and Q.C.P.I., 1865, B.A., Oxon.

Royal College of Surgeons, Edinburgh.—At the annual meeting of this Collega, held on she 18th inst., the following office-bearers were elected for the ensuing year :—President, Dr. Henry Duncan Littlejohn. Presidents of Council, Dr. Andrew Wood, Mr. William Walker, Professor J. Lister, Dr. P. Heron Watson, Dr. John Smith, and Dr, J. D. Gillespie, Examiners, Dr. Archibald Inglis, Dr. Peter David Handyside, Cr. James, Dr. Gillespie, Dr. Henry D. Littlejohn, Dr. P. H. Watson, Dr. David Wilson, Dr. John Smith, Dr. Argyll Robertson, M. Joseph Bell, Mr. Thomas Annandale, Dr. John Duncan, Dr. Robert J. Blair Cunydghame. Secretary and Treasurer, Mr. Joseph Bell.

The Death-rate in Foreign Cities. — The annual rates of mortality, according to the most recent weekly returns per 1,000 of the various populations were :—In Calcutta 23, Bomday 27, Madras 39, Paris 23, Brussels, 24, Amsterdam 21, Rotterdam 19, The Hague 20, Copenhagen, 18, Stockholm 27, Christiania 17, Berlin 25, Hamburg 25, Breslau 25, Munich 31, Vienna 25, Buda-Pesth 30, Rome 21, Naples 24, Turin 16, Brooklyn 22, Philadelphia 20, Boston 25.

Vital Statistics.—According to the Registrar-General's most recent returns the health of the country continues remarkably good, and the mortality exceptionally low. During last week 5,675 deaths and 2,945 births were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,730. The mortality from all causes was at the average rate of 19 deaths annually in every 1,000 persons living. The annual death-rate was 18 per 1,000 in Edinburgh, 18 in Glasgow, 19 in London, and 19 in Dublin. In the other large towns the rates of mortality were —Birmingham 14, Bradford 15, Newcastle-upon-Tyne 17, Hull 17, Sunderland 17, Brighton 18, Bristol 18, Wolverhampton 18, Sheffield 19, Plymouth 20, Liverpool 21, Leeds 21, Portsmouth 21, Leicester 22, Norwich 23, Manchester 23, Nottingham 23, Oldham 24, and Salford 29. The annual death-rate from the seven principal zymotic diseases averaged 2·9 per 1,000 in these towns, and ranged from 1·6 and 1·7 in Brighton and Sheffield, to 7·5 and 8·3 in Portsmouth and Salford. Thirteen deaths were referred to scarlet fever in Portsmouth. Small-pox caused 8 more deaths in Salford, 7 in Liverpool, and 16 in London.

◆

THE URINE OF THE FŒTUS.

Dr. Englisch, in the *Wiener Medical Zeitung* (*Medical and Surgical Reporter*, May 27th, 1876), gives some interesting information upon this subject. He is convinced, from a series of preparations exhibiting defective conditions of the fœtal uro-genital system, that a fœtu may attain the age of seven or eight months without ever producing a drop of urine. The kidneys may be wanting, or rudimentary, the ureters obliterated, the bladder undeveloped, &c., and yet the fœtus may attain the above age. He believes that diseases of the kidney are of much greater frequency in children than is generally believed. It is a matter of no small importance whether the ureter pursues a longer course than usual within the walls of the bladder, as it is on the side in which this occurs that hydronephrosis results. In the numerous examinations of the immature fœtus made by Dr. Englisch, he found that at this period the walls of the uretus are in the closest contact, so that, even by the aid of a microscope, no interval could be detected. At a later period a slit is observed, which becomes first elliptical, and then rounded in form. Stenosis, or partial adhesion of the walls of the ureter, has also been observed. Obstructions to the outflow of the urine are of such frequent occurrence that it is not surprising that the presence of albumen should often be detected.

◆

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

SUBSCRIBERS who have not yet sent in their subscriptions for last year are respectfully reminded of the omission.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

A. B. C.—By 30th Section of the Pharmacy (Ireland) Act, 38 and 39 Vic., cap. 57, passed 11th August, 1875, it is provided "that it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons within the meaning of the Sale of Poisons Act (1870), or medical prescriptions, unless such person be registered as a pharmaceutical chemist or a chemist and druggist under this Act. . . and any person acting in contravention of this enactment . . . shall for every such offence be liable to pay a penalty of £5, provided always, that nothing in this section contained shall affect any licentiate of Apothecaries' Hall, or any legally qualified medical practitioner. Nothing in this Act contained shall interfere with the making or dealing in patent medicines, or with the business of wholesale dealers in supplying poisons in the ordinary course of wholesale dealing, or of chemists or druggists who are practising as such in Ireland upon their own account at the time of the passing of this Act." There is no registered chemist and druggist in Ireland, but any person who was selling poisons or drugs before 1875 may continue to do so, but may not compound prescriptions. It is not decided whether the phrase "retailing, dispensing, or compounding poisons within the meaning of the Sale of Poisons (Ireland) Act, 1870," includes the making up of sheep-washes and such like preparations, and at present such a sale by unqualified persons is tolerated. The Pharmaceutical Council is, however, now considering the advisability of creating a druggist's licence to remove the ambiguity.—ED. M, P. & C.

ALNWICK INFIRMARY.—At the annual meeting Mr. W. Hindmarsh, solicitor, read the report, in which it was stated that the finances were in a most satisfactory position. The committee expressed great satisfaction at the manner in which Dr. McNamara had discharged his duties as house-surgeon, and the other honorary medical men attached to the establishment. The number of patients admitted had been 720, of whom 703 were out-door patients, and 17 in.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Please to inform me in your valuable journal if there is an American University of Philadelphia.

A SUBSCRIBER.

[The University of Pennsylvania is in Philadelphia, and is a genuine chartered institution. The University of Philadelphia was a swindle and lived by the sale of bogus diplomas. Its charter was cancelled by Government, and its doors are, we believe, closed.—ED. M. P. & C.]

Hewitt.—On Oct. 9th, at North Walsham, William Hewitt, L.S.A.L., aged 70.

Maul.—On Oct. 21st, at Southampton, without previous illness, Edward Harman Maul, M.D., aged 63.

Orr.—On Oct. 7th, at Portsmouth Road, Surbiton, William Orr, Surgeon, aged 41.

Pilkington.—On Oct. 9th, at Accrington, William Binns Pilkington, L.R.C.P.L., aged 25.

Wade.—On Oct. 11th, at Wath-upon-Dearne, Johnathan Gawtress Wade, M.R.C.S.E., aged 65.

Wright.—On Oct. 13th, at Edinburgh, Thomas Strethill Wright, M.D.

GENERAL NURSING INSTITUTE for TRAINED HOSPITAL NURSES.
5 Henrietta Street, Covent Garden, W.C.
A. EBSWORTH, F.R.C.S., Director.

GENERAL HOSPITAL and DISPENSARY for SICK CHILDREN, PENDLEBURY, near MANCHESTER.
VACANCY. The Office of Lady Superintendent of the above Institution is vacant. The Hospital contains at present 84, and when complete in June next, will have 168 beds. Ladies who have undergone a thorough course of hospital training, and who can prove by testimonials and certificates, their fitness for the Office, are invited to apply to the Chairman of the Board of Governors, 5 Mount Street, Manchester, on or before October 31st. Salary, £ 00 per annum, and everything found.

EAST LONDON HOSPITAL FOR CHILDREN, Ratcliff Cross.—Notice is hereby given that applications are invited from Candidates for the office of ASSISTANT-SURGEON to this Institution. The Hospital contains 35 beds, with an average attendance of 100 out-patients daily.

Attendance is required two afternoons in the week. Further particulars may be obtained from the Secretary, at the Hospital.

Rules 7 and 8, Section viii. of the Rules or Bye-laws, are as follows—

"7. Every Surgeon eligible to this hospital shall be a Fellow or Member of the Royal College of Surgeons of England, or a Fellow or Licentiate of the Royal College of Surgeons of Edinburgh or Ireland, or otherwise legally qualified to practise Surgery in England.

"8. The Physicians and Surgeons in this Hospital shall not practise Pharmacy."

Applications to be sent to the Secretary, at the Hospital, on or before Thursday, the 2nd November proximo.

A Special Court of Governors will be held for the purpose of electing an Assistant-Physician and an Assistant-Surgeon, on Tuesday, the 7th November, 1876, at the Coal Exchange, at 3.30 p.m.

THOMAS CHARRINGTON,
Chairman of the Board of Management.
EDWARD S. NORRIS, Treasurer.
ASHTON WARNER, Secretary.
Hospital, Oct. 10th, 1876.

MIDDLESEX.—THIRD COUNTY LUNATIC ASYLUM, BANSTEAD DOWNS, near SUTTON.—The Committee appointed to provide this Asylum are prepared to receive applications for the appointment of MEDICAL SUPERINTENDENT. Candidates must be married, not over 45 years of age, and Fellows, Members, or Licentiates of one of the Royal Colleges of England, Scotland, or Ireland, and duly registered in Medicine and Surgery under "the Medical Act, 21st and 22nd Vic., cap. 90." It is essential also that Candidates should have had experience in the treatment of the Insane in Asylums or Public Institutions. The salary will be £700 per annum, with a house supplied with planned furniture only, rates and taxes free, coals, gas, milk, and such vegetables as the garden may produce. The appointment will be held subject to such rules and regulations as the Committee may from time to time determine, and be determinable by either party on one month's notice. Printed forms, on which applications must be made, may be obtained on written application to the Clerk to the Committee at the Asylum, and the said form must be returned duly filled up, together with copies of testimonials, on or before WEDNESDAY, the 8th NOVEMBER, and notice will be given thereafter to such selected Candidates as the Committee may desire to see. All canvassing in person is strictly prohibited, and will disqualify Candidates, and no travelling expenses will be allowed. The appointment of the successful Candidate will be on date the 1st day of February, 1877, and he will be expected to commence his duties on that or such subsequent day as the Committee may hereafter appoint.

By order of the Committee.
Dated this 13th day of October, 1876.

LINCOLN LUNATIC HOSPITAL.
(OPENED IN 1819.)
THE RIGHT HONOURABLE THE LORD MONSON, President.
THERE are a few VACANCIES for PATIENTS of both sexes in this INSTITUTION.—This Hospital was the first in England to adopt the most beneficent system of non-restraint, and that system is still carried out in the greatest perfection. The Hospital stands in its own well arranged grounds of over 8 acres, and occupies a most healthy and delightful site, the views from the grounds and building being of a most extensive character. The Hospital has an experienced Resident Medical Superintendent, and is visited by four Honorary Physicians and Surgeons. The business of the Institution is conducted by a Board of Governors which meets weekly, and regulates the terms upon which patients are admitted.
By Order, RICHARD HALL, Secretary.
Board Room, Lunatic Hospital, 1876.

ONE MILLION STERLING
Has been paid as
COMPENSATION FOR DEATH AND INJURIES
Caused by
ACCIDENTS OF ALL KINDS,
By the

Pathological Anatomy of the Brain—
LOCALISATION IN CEREBRAL DISEASE. (a)

By Prof. Charcot.

Chapter X.

Gentlemen,—I close a digression which I think will not have been inopportune, and I return to the individuality of the vascular territories of the brain. That feature does not exclusively belong to the great territories; it is also found in the secondary departments into which the primary divide, and which correspond to the arterial ramifications of the second or third order. Between these regions of the second order, as also between the great territories, the communications are practicable, but oftener very difficult. It results from this disposition that the obliteration of one of the secondary branches may have—and often will have—the effect of causing mortification in a very limited region of the cortex. Here is a capital point for study of cerebral localisations. It might happen that the lesion, thus limited, may correspond exactly with one of the convolutions or a group of convolutions, endowed with special properties and represented during life by special phenomena.

That exact localisation of lesions of the cortex, produced by the obliteration of arterial branches of the second or third order, will be specially interesting to study for the middle cerebral region, as you can easily suppose. It is, indeed, in that great region that experimentation tends to put the important motor centres, and it is there also that clinical medicine (with the aid of pathological anatomy) has located the faculty of articulate language.

It is, consequently, important to be well acquainted with all of the chief arteries arising from the middle cerebral, and to closely examine their mode of distribution in the fundamental convolutions of the region. The sylvian artery divides, or at least gives origin, to four chief branches. The distribution of these has been carefully studied by Duret and Heubner.

The first Duret calls *external inferior frontal.* It is, strictly speaking, the artery of the third frontal convolution (Broca's). Many times have I myself seen obstruction of this trunk alone cause softening limited to the territory of this convolution alone, and even confined to its posterior part. Let me state a fact in confirmation. It concerns a woman, named F———, in the Salpêtrière under my care. She had been seized with aphasia. There was no trace of paralysis, of motion, or sensation. The aphasia was, in this case, the *only* symptom, and atrophy of the third convolution was revealed by the autopsy, the sole lesion to account for the disease. Here, gentlemen, you have a fine and indisputable example of cerebral localisation!

The second branch is called by Duret the anterior parietal. I would rather name it the *artery of the ascending frontal convolution.*

The third branch (the posterior parietal—Duret) is named by us *the artery* of the *ascending parietal convolution.*

The fourth branch goes to the curved convolution, and to *the first sphenoidal convolution.*

The two convolutions to which the second and third branches of the middle cerebral run, would be, according to Ferrier's experiments on the monkey, the seat of the motor centres of the members. You perceive that as a result of their arterial supply, these two convolutions could be injured by themselves. I do not know whether the complete destruction of these two central convolutions has ever taken place, but the ascending parietal convolution has been wholly destroyed, being according to Ferrier, in the monkey, the centre of movement for the upper limb, and partly for the lower. In this case the convolution in question was replaced by a depressed yellow plate. The ascending frontal was in great measure unhurt, but clearly atrophied. While the thalamus opticus and corpus striatum were quite uninjured (that fact is distinctly stated), there yet was a complete and permanent hemiplegia of the upper and lower

---

limbs of the other side. Here we have a result, gentlemen, which contrasts strikingly with the observations in two other cases of extensive injuries of other parts of the grey matter of the brain. Thus, in a case of injury limited to the square lobe (yellow patch) there was no sign of a corresponding paralysis. In another case, we have to do with a yellow patch involving a large extent of the inferior surface of the sphenoidal lobe, which, as you are aware, is supplied by the posterior cerebral, and during life there had not existed the slightest trace of hemiplegia in this case. These examples will suffice, I think, to convince you that it will be possible some day, perhaps not far in the future, to judge exactly and from indisputable evidences, the localisation of the least affection of the superficial parts of the brain.

After the particulars into which I have entered on the subject of the middle cerebral artery, I believe it my duty to be concise in speaking of the other vascular territories.

II. The anterior cerebral is much less frequently the seat of great changes than the middle cerebral. This peculiarity is doubtless partly due to its relation to the internal carotid.

The anterior cerebral furnishes three chief branches:—The first supplies the two inferior frontal convolutions; the second, of greater importance, is distributed to the convolution of the corpus callosum to the corpus callosum to the first frontal convolution (internal and external surface), to the paracentral lobule, and on the convex surface of the frontal lobe, to the first and second frontal convolution—finally, to the upper end of the ascending frontal convolution; the third branch of this artery is destined for the square lobe, and may suffer injury confined to it self, of which I have before furnished an example.

III. *The posterior cerebral* is the seat of alterations by embolisms and by thrombosis, less frequently than the middle cerebral, but much more commonly than the anterior cerebral. Also ischœmic softenings from the posterior lobes is much more frequent than those of the anterior lobes. The territory of this artery is divided into secondary departments corresponding to the three arteries of the second order.

The *first* of these goes to the convolution of the "hook;" the *second* to the inferior part of the sphenoidal lobe, comprising the inferior sphenoidal convolution and the fusiform lobule; the *third* goes to the lingual lobule, to the angular lobule, and to the occipital lobule.

◆

THE ADULTERATION OF FOOD, AND BRITISH LEGISLATION RELATIVE THERETO.

By Dr. C. R. Alder Wright,

Lecturer on Chemistry at St. Mary's Hospital.

The term "adulteration" may be broadly regarded as signifying the substitution for a more or less considerable proportion of the article sold as genuine, of other substances intended either to increase the total weight of material, or to give to the mixture the appearance, and to cause it to simulate the properties of a better quality of goods than that actually sold; in either case the purchaser is defrauded, inasmuch as he pays for an inferior article the price due for a superior class of goods. The same result is manifestly arrived at, if any important constituent be wholly or in part abstracted or omitted from the substance sold, the purchaser being kept in ignorance of the circumstance, and being led to believe that the article supplied is of a quality superior to its actual nature. Thus, the addition to milk of ordinary water, or the subtraction from it of cream, constitutes an adulteration; the admixture of cheap fatty matters with cow's butter, or the addition of roasted acorns or chicory to coffee, of sand to sugar, of starch to mustard, of sulphuric acid to vinegar &c.,; are adulterations when the alteration or admixture is not specially required by, or not duly notified to, the purchaser of such altered articles. In short, adulteration means the selling of an inferior or debased substance under the name of a superior or genuine article.

So far from being a device of modern invention, the adulteration of food is a practice that has flourished for many centuries, more especially in the case of wines, malt liquors, and bread; and on account of the injury to health likely to be caused in many instances by the addition of deleterious ingredients to the food-stuffs thus manipulated, such practices have for centuries been rendered illegal by special enactments, and penalties have been inflicted on those perpetrators, who have been caught *flagrante delicto.* Thus, Entick states ("History and Survey of London and Westminster." London, W. Ward and Charles Tilley, 1766) that in the reign of Henry III. punishments were inflicted for various offences connected with the sale of food, *e.g.*, short-weights, deficient measures, admixtures &c.; whilst in the reign of Edward I. the imperial and municipal laws against adulteration were extended in their operation, and were more generally enforced; in A.D. 1274 he states that "engrossing, forestalling, and all sorts of frauds and impositions in the sale of provisions, has now got to such a height as to oblige the Legislature to provide new laws against such practices, especially against bakers for short weight and bad materials in bread, and against millers for bad measure. Therefore, his Majesty commanded the Mayor of London and the sheriffs to enforce those laws and also to regulate the price of provisions, especially of poultry and fish, by which laws the baker for the first offence was to forfeit his bread; for his second offence to suffer imprisonment; and to be pilloried for the third. The miller was to be carried in a tumbril or dustcart through certain streets, exposed to the derision of the people; accordingly, an ordinance was published by the Mayor and other magistrates in this form." Twenty-one years after (1295), "the King sent a precipe to the Mayor and Sheriffs of London, to punish corporally all bakers, brewers, and millers convicted of bad practices, and also to oblige millers to return the flower by weight according to the weight of the grain sent to be ground"; and, in 1311, Edward II. issued a special writ enacting, amongst other restrictions on wine dealers that "every wine to be set at its value without mixture," whilst about this time various prosecutions of bakers appear on record for selling bread made of objectionable materials, "so that persons by eating that bread would be poisoned or choked." One, Alan de Lyndeseye, was twice convicted of selling bread "made of false, putrid, and rotten materials, through which persons who bought such bread were deceived and might be killed," and for these offences he was pilloried on each occasion. In 1364, vendors of bad and adulterated wines were compelled to drink some of their own mixtures, and were thoroughly drenched with the remainder which was poured over them; at the same time their trade privileges were lost. In the middle of the fourteenth century several of the guilds of tradesmen dealing in articles of food, agreed amongst themselves to draw up codes of regulations for their respective trades, amongst which regulations prohibitions of short weight, and of adulteration generally, bore an important part; for example, the association of spicers and pepperers issued such an ordinance in 1361, whilst, in 1370, the vintners guild agreed "that four men of the trade should be chosen and sworn to search into such defaults, and to oversee that the ordinances are well and justly kept and observed from year to year; and that no wines shall be exposed in taverns for sale before that the four persons aforesaid shall have seen that they are good and fit for sale." (Riley's "Memorials of London.")

It thus appears that Acts for the repression of adulteration of food are of considerable antiquity, and also that something very much resembling the modern organisation of inspectors and analysts was in vogue centuries ago, the chief difference being that the antique systems only attempted to deal with one or two kinds of provisions at a time, and that chemical science, being then practically not in existence, was not called into requisition as a means of proving the existence of adulteration in the substance condemned.

During the last century various enactments have been made at different times with a view to the repression of adulteration of various kinds of food, and some of these are so worded as almost exactly to correspond with certain clauses in the most recent laws relating to the subject; thus, in 1777, an Act was passed whereby a fine of five pounds was inflicted on any one who should "mix, colour, or stain tea," and these very phrases also occur in the most recent Act on this subject (Sale of Food and Drugs Bill 1875); in the reign of George IV. it was enacted that any person using either alum "or any preparation or mixture in which alum should be an ingredient" for the manufacture of bread, should be liable to a fine not exceeding £20, or to imprisonment for from three to twelve months in default. By the same Act, power was also given to inspectors to enter the premises of any baker, in order to search for, and if found, to seize adulterated bread or the materials used in its manufacture; if such substances were found on the premises of any baker, he was liable to the above-mentioned penalties, whilst punishments were also provided for the obstructing or hindering these officers in the execution of their duty. Another Act relative to adulteration was passed in the reign of William IV. (6 & 7 Giugl. IV. c. 37).

Notwithstanding, however, the praiseworthy desire on the part of the legislature and the more respectable portion of the food trades to put down the practice of adulteration, this evil has always existed to a greater or less extent. Of late years the rapid strides made by science have given great facilities for the employment of certain special malpractices of the kind, flavouring matters of numerous kinds being obtainable by various chemical processes; these are often extensively used along with cheap materials as a basis to manufacture spurious viands of peculiar or agreeable flavour or taste, wines, liqueurs, and malt liquors being the chief substances thus fraudulently manipulated and adulterated; the modern diffusion of knowledge and the extension of science have thus acted both injuriously and beneficially on the purity of the food supply of the population. On the one hand, it has enabled many to judge for themselves by simple tests whether the substances sold are really what they are represented to be; and the mere knowledge that most deleterious ingredients can now be readily detected by chemical analysis serves as an effectual deterrent from their use in numerous cases, and thus greatly tends to improve the quality of the food supply. On the other hand, it has rendered people aware of the nature of many adulterations who would a few decades ago have remained in ignorance of the possibility of making large sums of money by such malpractices, such knowledge being then confined to a comparatively small number of people, or not existing at all. In this respect the progress of education reminds one forcibly of the old story of the ostler who on being asked by his father confessor whether he had ever greased the teeth of the traveller's horses to prevent their eating their allowance of oats, replied, "No"; but on being asked the same question again some weeks later answered, "Faix, since your riverence was so good as to tell me the thrick, I've been timpted to thry it, and be the powers a beautiful plan it is altogether!"

In 1842, the laboratory at Somerset House was established by the Board of Inland Revenue for the purpose of detecting and suppressing the adulteration of tobacco and snuff, at that time carried on to a large extent; the immediate result of this step was that as soon as sufficient experience had been gained to enable the staff to detect the nature of the fraudulently admixed substances, the obnoxious practices rapidly diminished in frequency. Such bodies as peatmoss, starch, malt-combings, ground wood, fustic, chicory leaves and roots, coltsfoot, rhubarb, dock, and other leaves of different kinds were thus prevented to a great extent from taking the place of genuine tobacco. The success of this experiment led to the placing of the examination of many edible products liable to duty in the hands of the department, *e.g.*, pepper, tea, coffee, lime-juice, &c., &c.; and as regards these additional substances, the results have been satisfactory with reference to the quality of imported produce. Manifestly, however, the examination of a cargo by the Somerset House testers and its being found free from injurious admixtures is but little guarantee that the foods retailed up and down the country are unobjectionable; whilst many articles of food, not being subject to duty, are never examined at all by the Government analysts.

The evils arising from the sale of adulterated foods by retailers became so great about the middle of this century that when the well-known *Lancet* Commission examined the subject carefully, the number of samples found to be adulterated frequently outnumbered the pure substances met with in the retail trade. Then Dr. Hassall's results were that pure bread and unadulterated milk were almost impossible to procure, alum being almost invariably present in the former, whilst the latter was watered to an astounding extent, frequently exceeding 50 per cent.; of 49 samples of bread consecutively examined not one was pure. Tea was almost equally bad, turmeric, "lie tea," starch, Russian blue, China clay, and more especially exhausted leaves being almost always present. More than 80 per cent. of the specimens of coffee examined were adulterated with mangel-wurzel, beans, chicory, acorns, and various other substances; even the chicory used to adulterate the coffee was frequently itself adulterated in turn with powdered roasted carrots, &c. Cocoa was very frequently admixed with large quantities of flour or starch, and in order to hide the addition was then coloured with metallic or earthy substances, ochre, &c. Pepper was mixed with linseed, rice, wheat, mustard, &c. Pickles invariably contained copper, and spices were frequently increased in bulk by the admixture of flour, arrowroot, starch, sago, &c. Notwithstanding that out of many hundred substances examined many were of a nature where adulteration was unprofitable or very difficult, it was found that about 65 per cent., or nearly two-thirds, of the total quantity of samples examined were adulterated, and it appeared that the goods supplied to the poorer classes of customers were almost invariably impure, and frequently to a large extent.

Mr. Wanklyn only found six pure samples of milk out of 56 specimens of the material supplied to the London workhouses, whilst out of hundreds of samples from other parts of the country, more than half were found to be adulterated; although the names and addresses of all the delinquents were published, yet not one action for libel was brought (although one at least was threatened).

(To be continued.)

◆

ON THE IDENTITY OF SO-CALLED SIMPLE CONTINUED FEVER, AND TYPHOID FEVER.

By Thomas P. Tuckey, M.B.,

Medical Officer of the Ballyholey Dispensary of the Fermoy Union.

Simple continued fever has long been considered as a distinct disease, different from true inoculated fever on the one hand, and enteric fever on the other. It is my object in this paper to endeavour to prove its identity with typhoid fever. Although young as a physician, it has been my good or bad fortune to be witness of a very extensive epidemic of fever, hence I have some experience, and have watched most carefully the primitive type. I have seen during the last three years over 300 cases of fever, and can come to no other conclusion but that simple continued fever *so-called* and typhoid fever are one and the same disease.

My friend, Dr. Russell, of Fermoy, a gentleman who has wide experience of fever, stated to me that for [illegible] years he had had only one case of true typhus, and that all his other cases were of a typhoid or enteric character. On expressing to him my surprise that various [illegible] had called the fever of the past twenty years by very different names, gastric, bilious, simple continued, &c., he said that as far as he could see, the organ the most frequently attacked had been seized upon to name the prevailing epidemic. In other words, the genus was the same, but the species different. In some epidemics gastric symptoms prevailed, in others derangement of the liver and bowels, in others, again, though often of long duration, there were no complications. As the union medical officer pertinently expressed himself to me, there were no complications, only the fever *went on.*

It is for such fevers as the last that I claim an identity with typhoid, and it is worth our while to see what writers on the subject of fever have said on the subject. Let us turn to Copland, whom all acknowledge to be most worthy of attention. Amongst other forms of fever he enumerates :

"Common continued fever," nervous fever, and typho-enteric fever; to my mind but one and the same disease. Thus, of simple continued fever he states that it continues "usually for several days, its duration varying from two, three, or four days, to as many weeks ; and, again, "the digestive mucus surface is often severely and prominently deranged ; when the stomach is affected there are *retchings and vomiting early in the disease, pain, and tenderness in the epigastrium and constipated bowels ;* whilst the tongue is red *at its sides and point, and loaded with a dirty yellowish fur."* Again, "when gastric or gastro-enteric affection comes on—*looseness or diarrhœa is the most frequent symptom. The stools are from three or four to eight in the twenty-four hours, and are at first feculent, fœtid, dark, and thin. They subsequently become in unfavourable cases watery and of an ochery hue."*

Of nervous fever, he states that there is sometimes pain at the epigastrium, nausea and vomiting, an irregular or relaxed state of the bowels, or offensive evacuations, "the urine is pale, partial sweats, the pulse becomes small, weak, and very quick ; hearing dull, the tongue becomes brown or black, incrusted, and fissured. He then enumerates some of the fatal symptoms, such as clammy sweats, diarrhœa, involuntary evacuation, tympanitic abdomen. He also calls attention to sore throat, "so severe and early as to resemble cynacose maligna," paralysis. And, again, "the affection of the mind continues for some days, or even weeks, after the bodily functions are restored. Instances may even occur of permanent insanity, being the consequence." "*Relapses are not infrequent after the mild forms* of fever." This fever, especially its gastric and enteric states, may pass into a low or typhoid form of dysentery." Dr. Copland's definition of typho-enteric fever is much the same as other authors. Let us, for comparison sake, put the symptoms of the three fevers in a tabular form. I have myself heard the three names given to fevers by gentlemen of long standing in their profession. I think we shall see that the difference is one in degree and not in kind.

A glance at the following Table, in which I have inserted Dr. Copland's own words, I think is enough to convince anyone that he is treating of the same disease in which the symptoms are alike, but in one fever the symptom which is most prominent is subordinate in the others. The only discrepancies are in the temperature, which Dr. Copland has not paid very great attention to, as in only one of the fevers does he even mention the number of degrees, and in the mode of termination ; and even in this the difference is not so great as it appears, as in writing about the mode of recovery in nervous fever, he enumerates a number of symptoms, which are necessarily gradual in their action, and nowhere does he say that the fever goes off as it used in spotted typhus, *i.e.,* by true crisis. I am particularly anxious to be explicit on Dr. Copland's views, as I am sure they are those of a large number of professional gentlemen *still practising,* who hold that the fevers enumerated by Dr. Copland exist as individualities, and are not different types of the same disease.

Let us now turn to those modern writers : Dr. Aitken makes no mention of simple continued fevers, and only admits "febricula" to be distinct from typhus and typhoid (of course excluding relapsing fever), which no one disputes to be a distinct disease. Sir Thomas Watson admits only typhus and typhoid, having first confessed that he once believed in their identity.

	SIMPLE CONTINUED.	NERVOUS.	TYPHO-ENTERIC.
Pulse.	100-120, small, weak, irregular; intermittent when a dangerous attack.	Soft, feeble, and quick ; about eleventh day very quick and unequal.	90-120 in later stages, soft, compressible, feeble, small, irregular, or intermittent.
Temperature.	Heat of surface generally rises over 100°.	Heat of skin natural or diminished.	Skin warm and dry in evening and night, cooler in the morning.
Tongue.	White, foul, loaded or furred; again red at its sides, and point loaded with dirty yellow fur.	Loaded or covered with a dirty mucus, afterwards brown or black, incrusted, or fissured.	Tongue furred, with red edges ; afterwards dry and brown, or red and glazed, and marked by fissures.
Gastric Symptoms.	Tenderness at epigastrium ; looseness or diarrhœa of an ochery hue ; vomiting early.	Fœtor o the breath and of the discharges, an irregular relaxed state of the bowels, pain at the epigastrium, nausea and vomiting.	Stools colour of yellow ochre, offensive. The abdomen is distended, occasionally bilious vomiting, abdominal pains, breath very offensive, flatulence, and diarrhœa.
[illegible]	Pain in head, throbbing of arteries, brilliant expression of eyes, marked acuteness of senses, watchfulness and restlessness, moaning and incoherent muttering, dilated pupils, and coma.	Countenance pallid or transiently flushed, head heavy, continual restlessness, want of sleep, tremor, hearing dull, coma, unconscious evacuations, low delirium, early stupor, and delirium.	Headache, wakefulness or disturbed sleep, slight delirium about twelve days, pink flush on cheeks, tremor of limbs, subsultus carphology, somnolence, coma.
Lung Symptoms.	A common and early complication, either to bronchial surface or congestion of substance.	The bronchial surface is the part chiefly affected ; substance of lungs sometimes complicated.	Bronchitis, pneumonia, &c., may severally occur in a varying proportion.
Affection of Throat.	Sore-throat or inflammation of fauces sometimes accompany.	Sore-throat, occasionally so severe as to resemble an attack of aganose maligna.	Laryngitis and pharyngitis may occur.
Crisis.	By subsidence of the prominent morbid actions indicative of a gradual decline.	Often announced by a true crisis.	Return to health gradual.

Murchison, one of the greatest living authorities on fever, admits that there is such a disease as simple fever, but I think that no one can mistake his description, or take it for that of a case of typhoid fever of such a type as to come under the nomenclature of simple continued fever so-called.

No physician of long experience whom I have spoken to on the subject has even disputed the existence of a fever, "non-specific, characterised by its frequent full and often firm pulse, white tongue, thirst, constipation, high-coloured urine, hot and dry skin, absence of eruption, severe headache, and by its subsidence in from eight to ten days with copious perspiration."

Such a fever is very different from the kind commonly called "simple continued fever," and Murchison asserts in one place that a patient may "make a good recovery and then this illness is spoken of as simple continued fever." He points out that medical men often call enteric fever *without abdominal lesions* simple continued fever, and calls attention to the fact of such cases being registered as cases of typhoid, and also makes this remarkable statement, "that most of the febrile attacks known in England as simple continued fever, or febricula, are abortive attacks of enteric fever." I do not know the opinions held by the majority of the profession in England, but I am sure that many of my Irish brethren believe in a fever distinct from febricula on the one hand, and typhoid on the other, and called by them simple continued fever. The characters of such fevers are: a temperature of 101° to 102°; a pulse for the first few days pretty full, and from 90 to 100 in its beat, becoming by degrees weaker and quicker; partial sweatings, breaking out at intervals; the urine high-coloured and scanty, but in some cases almost normal in quantity and appearance; the tongue white with red edges, sometimes, in bad cases, becoming dry, black, and fissured, with sordes about the teeth; the bowels sometimes too free, at other times requiring opening medicine; delirium about the tenth day, sometimes severe, having a tendency in fatal cases to pass into torpor and coma; slight bronchitis almost universal, and sometimes running on into pneumonia—a very fatal combination. The fever continues from fourteen to twenty-one days, and cannot be said to terminate by any decided crisis. It may run on, however, for eight and ten weeks without any decided complication, the temperature and slight delirium being the most prominent features. Recovery ultimately takes place, the patient being reduced however, to a very living skeleton. The fever is infectious when a family are crowded together in a small cabin, rarely failing to attack successively every member of the family unless the infected are sent into hospital at first. The attack may be so slight as not to cause any suspicion beyond that the person is suffering from general malaise, and the infected one may even walk about during the whole period of the attack, or go to bed for as short a time as a couple of days. Such is the fever whose identity with typhoid I shall endeavour to prove.

I have rarely failed in adults on careful search to find a few rose-coloured spots, different in no way from those seen on the bodies of patients acknowledged to have typhoid fever. I consider the temperature to be the most reliable diagnostic, as the rose spots are not always present, according to Murchison, Barthez, Rilliet, and others, and have been seen in other diseases besides typhoid fever, according to the last-mentioned physicians and Sir Wm. Jenner, I think they are not so reliable for diagnosis as the temperature, which, as far as I have had opportunity of judging, always shows the characteristic rise in the evening and fall in the morning, the "temperatures each morning and evening being each day about a degree (Fahr.) higher than those of the day preceding," but there being always a temporary arrest or remission of about 2° in the morning.

It would take up too much space to give in detail a record of the symptoms of the cases in proof, I will content myself with giving a general history of the cases.

Catherine Sheehan, æt. 15, was seized with a rigor, having been for some days previously complaining of general malaise; she vomited and had bleeding from the nose. When I saw her the next day she complained of headache, pains in the limbs, pain under the left breast, and also in the belly; her pulse was 94. Her pulse during the disease varied greatly, being generally, however, higher in the evening and lower in the morning; her tongue was at first whitish with prominent red papillæ, and red edges, afterwards it became dry and brown, and her lips covered with sordes; her urine was little changed, her bowels moved four times in the twenty-four hour, at first very liquid and yellow, afterwards more of the colour of burnt amber. She had pretty severe delirium and partial sweats. She had no tympanitis, no spots, her face was flushed, she had cough and bronchial râles. The worst feature of her case was a sore throat, which was very severe. Her whole mouth and fauces became red and swollen, she had great difficulty of swallowing, and ultimately the whole of the mucous membrane became detached, and she actually *spat up the lining of her mouth and throat into a basin.* She became gradually better, but there was no sign of a crisis. The girl was for a long time afterwards in a bad state of health.

I put this case because it may be taken as the type of the general run of cases I have seen, several of which I sent into hospital, and which were pronounced by various medical men to be simple continued fever. The sore throat, however, though seen several times, was not frequent; it occurred, however, in this case, and, therefore, I think it necessary to mention it.

The next case I will give is that of John Reeffe, æt. 12. I did not see this boy until the tenth day. As far as I could gather of the disease when I saw him he was lying in bed with seemingly not much the matter with him; he had eaten some toast with apparent relish some time previously; his tongue was quite clean, his face clear. His mother sent for me because she said he was "one day up and another day down." His pulse was quick, 110, his bowels constipated, he complained of slight headache, he had no pain in the belly, and pressure in the iliac region caused no uneasiness. He had no cough or pain in his chest, his urine was clear as when in health. During his whole illness his tongue remained clean, his urine clear, his bowels natural. Towards the end indeed, he had some slight delirium, but nothing alarming. Several successive crops of rose-coloured spots appeared on his abdomen. He ultimately recovered, the amelioration of his disease being ushered in by a sort of crisis by sweating, a symptom which he had not had during his illness. He has worn to a complete skeleton, but quickly got strong and well. I give this case because the boy communicated the disease to several of his brothers and sisters, as also to his mother. They were pronounced by a no mean judge of fever to be suffering from simple continued fever.

The next case, though one of aborted typhoid, is interesting, as being that of a girl who took the fever from her sister who had a fever, of long duration which was stated by an experienced practitioner to be simple continued fever.

Two hours previously to my seeing Bridget Swiney, æt. 20, she was seized with shivering, and vomited several times. When I saw her she was bleeding profusely from the nose, her face was flushed, her pulse was over eighty, and temperature 99, her tongue was somewhat furred. I ordered an emetic of

Tinc. sulph, grs. xxx.;
Emet. tart., grs. ss. ft. pulv. emet.

Her sister had just recovered from fever, and looked dreadfully pale and worn.

With the exception of the epistaxis there is nothing beyond the temperature worthy of note. I may state that I saw her sister once during her illness, and detected five or six rose spots on her abdomen. Her sister, as far as I could trace, caught the prevailing fever from patients of mine—her cousins—who had undoubted typhoid fever with the tache Roseés and diarrhœa, of which one died. I detected no rose spots on Swiney's skin, but I think, on comparison with Wunderlich's table given by Murchison, there is no doubt that this was a case of typhoid. It is interesting to note that an emetic was given within two hours of the initial rigor. It is asserted that emetics have the power when given very early of cutting short a fever. Was the abortion of this attack to be attributed to the exhibition of an emetic.

On comparison of the Tables given above with that furnished by Murchison, I think the identity of simple continued fever with low typhoid cannot well be disputed. Murchison states that there is always a temporary remission of about 2° in the morning. Doubtless this is often the case, but I have myself found the remission to be much more irregular in some cases. The temperature of the case of Bridget Swiney agrees very closely with that of Murchison's Table. As this was pronounced to be simple continued fever it is all the more valuable. It had the commencement which is usually seen in cases of simple continued fever so called. I have seen several other cases of fever, which agreed in their symptoms with those mentioned by Copland, terminate as suddenly, or nearly so, as this, and have noticed that it was generally cases which set in with great violence which terminated thus.

I think it is worth while calling the attention of the profession to the fact of the identity of the several fevers which are supposed to exist independent in their identity from typhoid fever. It is astonishing what a number of professional men still refuse to recognise typhoid unless they see it complicated with diarrhœa and other abdominal symptoms. They will call one case typhoid because the patient has liquid stools and another simple continued fever because, though the symptoms may be much the same, there is an absence of diarrhœa or even constipation. This causes great confusion, and besides is injurious in practice. It throws men off their guard, and draws away their attention from the dangers for which they must be always on the watch. Perforation of the intestines and collapse may occur without any diarrhœa; hence, practitioners may lull themselves into the fancied security that everything is going right, when in reality everything is wrong. We all have read of the man who walked into hospital some three miles and died in three or four hours after (Murchison). I myself saw a case somewhat similar, and suppose that many practitioners have seen the same. Such cases are often put down as failure of the vital powers; I am persuaded that often the real cause is perforation of the intestines. Another grave cause why medical men should recognise the identity of the two fevers, if there be sufficient cause, is the fact that simple fever is generally supposed to be noncontagious while no one can dispute that typhoid fever is. Among the poor, my experience has been that as sure as one case appears in a cabin, so surely will others arise, whether from contagion or the inhabitants being all exposed to the same atmospheric influence I do not pretend to say, but still think it a strong point in the argument for contagion that a family will be for years free from fever, though they have always the cesspool before their doors, and that when one of the family who is in service comes home ill with a disease which turns out to be fever the rest take it almost immediately. I hope I have not been tedious. I shall be satisfied if I have removed from the minds of at least some that simple fever is different from typhoid, and I am sure shall have done some good if I have helped to simplify the fever which is often such a scourge, and thereby opened a way for a more solid line of treatment.

Dr. Frankland reports, as the result of his analysis of the waters supplied to the metropolis during September, that the Southwark and Lambeth companies delivered water which, through inefficient filtration, was slightly turbid, and contained moving organisms. With these exceptions, the river waters furnished by the London companies were clear and transparent, and contained, as in August, a remarkably small proportion of organic impurity.

Clinical Records.

ST. MARY'S HOSPITAL.

Under the care of Dr. Cheadle.

Reported by Mr. J. Coumbe, House Surgeon.

Acute Yellow Atrophy of Liver—Jaundice—Low Temperature—Delirium—Sickness—Coma—Rise of Temperature to 101·4, *and Death.*

B. A., a gentleman's servant, a well-nourished, strongly-built man, aged 20. About the 14th of August he felt indisposed, and became jaundiced. He had syphilis eighteen months ago, and has lived freely of late. On the 18th he was admitted. He was very yellow, complaned of pain and tenderness over the hepatic region, liver dulness extends an inch below costal cartilages, bowels confined, stools pale, urine sp. gr. 1028, full of bile, no albumen, temperature 97, pulse 60, tongue furred, appetite bad, not thirsty. He vomited an amber-coloured fluid on the 15th. Was ordered

℞ Potass. bicarb., ʒss;
Tr. hyrs. cy., ℈ij;
Aqua, ℥j., T. D. S.;
Calomel, gr. iij. statim.;

His bowels acted twice, stools pale.

23rd.—No improvement.

℞ Rep. pulv.; Pulv. jalap co. ℈ij.;

28th.—He seemed dull and stupid. Powder repeated. Was ordered, dilute nitrohydrochloric acid compress over liver. During the night he was sick, and complained of much pain.

29th.—Was ordered

℞ Res. Pyodoph., gr. ½;
Ext. Tarax., gr. viij.,

which acted well; stools light; he improved slightly; less pain; liver still enlarged.

30th.—Very dull and stupid.

31st.—Insisted on getting out of bed, saying he was "all right." During the night he was sick, brought up some blood and coffee ground matter. He was decidedly much worse.

Sept. 1.—Hot bath; temperature 97.

℞. Calomel grs. v., and grs. iij.;
4 tis horis, 3 doses.

Wrapped in blankets, his surface became warmer, skin moister, pulse quicker and better tone, urine sp. gr. 1028, full of bile, no tyroseine or seveine found.

2nd.—Hepatic dulness diminished, extending from 6th to 8th rib in nipple line. Pulse 60, temperature 96·4, comatose, tongue bitten, pupils contracted, stertorous breathing, sphincters relaxed, bladder empty.

3rd.—Morning. Pupils dilated, respiration 20, stertorous, limbs flaccid. Afternoon. Temperature 99, pulse 100, full and soft. Evening. His temperature gradually rose to 101·4, respiration 60, pulse 120. Died 12.40 a.m.

Post-mortem twenty-six hours after death. Liver small (about the size of an infant's), shape normal, weight 32 ounces, tough and hard, colour of burnt ochre; gall bladder and ducts empty, no obstruction in gall bladder or ducts. On microscopical examination very few liver cells could be seen; the tissue consisted of fibrous tissue, the liver cells being replaced by small oil globules. The fibrous tissues were more distinctly seen towards the centre, where in some instances nothing else was visible, the oil globules appearing in great numbers towards the periphery of the lobules. The lungs, kidney and spleen were congested, otherwise healthy.

A CASE OF ACUTE ANTERIOR MYELITIS (ATROPHIC SPINAL PARALYSIS, INFANTILE PARALYSIS) IN THE ADULT.

(Translated from the *Progrès Médicale* by the late Francis M. Luther, M.D., Cappoquin.)

It has long been believed that atrophic paralysis was a malady peculiar to childhood, hence the name of *infantile paralysis* adopted as its designation by the greater number of authors. The facts which show that this variety of acute myelitis may be met with in the adult are not numerous; thirteen or fourteen observations, some of which even would hardly bear critical analysis, are all the cases of atrophic spinal paralysis in the adult that we can count up to the present date. Duchenne (of Boulogne), who was the first to declare that the paralysis called infantile might be met with in the adult, only reports in the last edition of his "Treatise on Local Electrisation" three observations in support of his statement (Observations lxix., lxx., lxxi.). In two even of those cases the patients had not been submitted to Duchenne's inspection until long after the invasion of the malady; it is to be remarked too, that one of them was only ten years old when the first symptoms appeared, which it is true were reproduced at the age of twenty-one years.

Other cases of acute anterior myelitis in the adult have been published since: these observations are due to Messrs. Charcot (three cases in men of 15, 19, and 35 years—one case in a woman of 60 years, who died at 67), Bernhardt (three cases in men of 20, 22, and 35 years), Cuming (one case in a man of 40 years), and Kussmaul (three cases in a man of 28 and women of 18 and 33 years). Messrs. Bourneville and Temturier have published (in 1874) in the *Progrès Médicale* an excellent critical review of all the medical works relating to spinal paralysis in the adult. I think it useless to give a *résumé* of an article so recently published, I therefore refer the reader to it, and pass at once to the narration of the new case that has fallen under my observation.

Case.—Philippe Gosnet, æt. 23, trumpeter in the 74th Regiment of the Line; is a well-built intelligent lad; he answers with much precision the questions put to him.

The patient had small-pox at three months old; he is greatly pitted; in 1874 he entered the Vincennes Hospital for a mild typhoid fever, and went home on furlough during a three months' convalescence. The patient's mother died at 59; she was paralysed in her right side for four years before her death; his father lives in the enjoyment of good health, as also a brother and sister; before entering the army Gosnet was a field labourer.

The symptoms that brought Gosnet to hospital supervened very rapidly in the month of September, 1875, during the autumn manœuvres; Gosnet was then with his regiment in the department of Eure. On the evening of the 12th September he went to rest quite well, having dined with a good appetite and strolled about the camp; for several days there had been heavy rain, and Gosnet went to sleep on the damp earthen floor of his tent; the next morning the patient awoke with his right arm paralysed; he felt neither general malaise, headache, nor pain; he thought he had fallen asleep in an awkward position, and that his arm was simply numbed, such also was the opinion of the physician who saw him.

Gosnet continued to perform his duty; he held his bugle with his left hand, and all the day followed the officer who commanded the school of musketry; the numbness of the right arm, far from disappearing rapidly increased; on the 13th, the paralysis of the right upper limb was nearly complete; the patient could only move his fingers, and he was incapable of giving a good grip.

Three days after those first symptoms the patient, on getting up, felt that his left leg could with difficulty support him, that it bent under him; his comrades raised him into an upright position, and Gosnet was then able to walk to the ambulance, whence he was directed to the hospital at Bernay.

The paralysis of the left leg went on increasing; at the end of three days it had attained its maximum; the patient could no longer lean on it; it was impossible for him to walk; nevertheless, in bed he could still execute some movements: flexion and extension of the toes, flexion of the leg on the thigh, the heel dragging along the bed.

During twelve days the paralysis of the right arm and left leg continued stationary, the general state was very satisfactory, the appetite continued good, there was, by the patient's account, no sign of fever (the temperature was not taken at the hospital of Bernay), but pains supervened soon after his entering the hospital. These consisted of darting pains in the paralysed extremities, mainly in the leg, then in pains in the loins; his sufferings were more severe by night than by day. At no time did the patient experience formication in the extremities, nor pains round the body; the sensibility of the paralysed parts has never been diminished, neither has any difficulty been noticed in urinating or defecation.

Prescriptions and Treatment.—Sulphur baths, friction of the affected limbs with camphorated spirits of wine, tincture of nux vomica internally; three blisters were applied successively to the right arm. At the end of twelve days the paralysis of the lower limb lessened; at the same time the darts of pain disappeared. Soon the patient could hold himself up and walk, but the left leg was still very weak, and the right arm remained paralysed. About a mouth after the patient's entrance into hospital the patient noticed a wasting of the paralysed extremities, more particularly of the arm. On the 23rd November, 1875, the patient was relegated to Val de Grâce, and placed under Professor L. Colin, who prescribed the employment of electricity and cold douches. At the end of the month of December I took charge of Ward No. 30, where the patient lay, and found his state to be as follows (20th December, 1875):—

All the muscles of the shoulder, and of the right arm and some of the muscles of the right fore-arm are paralysed and in progress of atrophy. The patient can neither raise his right arm nor bend the fore-arm on the arm, nor extend the three last fingers of the right hand; he is obliged to make use of the left hand in order to move his right arm; the hand being placed in pronation, the patient cannot supinate it (paralysis of the supinator longus and brevis) neither can he hold the hand in forcible extension on the forearm (paralysis of the radii muscles); the movements of pronation, of flexion of the wrist and of the fingers, those of extension of the thumb and of the index are preserved as well as the movements of abduction of the fingers and apposition of the thumb, this latter being, however, limited. Gosnet asserts he can extend the fore-arm on the arm, but on seeing him do it one is satisfied that he contrives to execute this movement by allowing the fore-arm to obey the force of gravity.

The atrophy of the muscles of the shoulder and arm is evident; it affects in particular the pectorals, the deltoid, the biceps, and the triceps brachialis; when the patient is upright or sitting the head of the humerus, no longer sustained by the deltoid and supra-spinatus, itself also atrophied, hangs loose from the glenoid cavity. In the fore-arm the atrophy is less marked; it appears to affect mainly:—

1st. The extensor communis digitorum (in consequence of the paralysis of the muscle the three last fingers of the right hand are in a state of permanent demi-flexion, the patient can't straighten them, while extension of the thumb and of the index is easily affected by the aid of the extensor proprius.

2ndly. The supinator longus and brevis.

3rdly. The radials, particularly the second which is the direct extensor of the wrist (Duchenne).

In the hand the muscular prominences of the thenar and hypothenar eminences persist, the inter-osseal spaces are not depressed as in progressive muscular atrophy. The comparative measurement of the healthy and of the affected sides are as follows:—

Left arm (in the middle) 24 centimetres in circumference.
Right arm 21 ditto.
Left fore-arm (upper third) 23 ditto.
Right fore-arm (upper third) 22 ditto.

Electric exploration of the muscles shows as follows: the pectorals, the sub and supra-spinatus, the biceps, the brachialis anticus, the triceps, the coraco-brachialis do not contract under the influence of the strongest current (Moren's Battery), so likewise with the greater part of the deltoid; a small fasciculus of the anterior edge of this muscle contracts slightly, but without sufficient force to impress motion upon the arm; it is only seen to stiffen under the skin at the moment of the passage of the current. In the fore-arm the extensor communis digitorum, the supinator longus and brevis, and the muscles of the radius are insensible to electricity; the other muscles of the fore-arm and those of the hand appear to us to enjoy their normal contractility.

A little fragment of the posterior part of the deltoid removed by Duchenne's *emporte-pièce*, and submitted to microscopic examination, presents the following characters:—The transverse normal striation is absent from almost all the fibres; one can only discern longitudinal striæ and the sarcolemma containing a finely granular matter without any large fat corpuscles. The nuclei, which are coloured with picro-carmine, are not altered. Two or three fibres only in the whole preparation still show the transverse striæ and an appearance resembling the normal. A minute arteriole removed with the fragment of muscle is unaltered.

The sensibility is intact—as perfect in the right arm as in the healthy limb.

The disturbance of mobility is happily much less serious in the left lower limb than in the right upper limb; the patient walks without limping, but he still complains of weakness in the limb, and as soon as he tries to run the limb bends under him and the limping reappears. In bed all the movements of the foot, of the leg, and of the thigh are executed with regularity; all the muscles contract under the influence of electricity. The thigh and the left leg present traces of atrophy, as simple inspection and mensuration prove:—

Right-thigh	(middle)	... 36 centimetres.
Left thigh	(*idem*)	... 35 „
Right leg	(upper third)	... 30c. 5
Left leg	(upper third)	... 28c. 5

The sensibility is intact in the left lower limb.

There is no difficulty in urinating or in defecating; no disturbance of nutrition, except the atrophy of the muscles. All these functions are performed with regularity; the patient eats three meals a day. Examination of the internal organs—lungs, heart, &c.—gives only negative results.

The diagnosis arrived at is *acute anterior myelitis, with consecutive atrophic paralysis*. Treatment:—Local electrisation, cold douches.

The *Medical Times* prints the following as a copy of a label taken off a bottle of medicine supplied by a firm of druggists of Cork:—"*Caution*.—To all medicines for outward application this label is attached to the bottles, in order to distinguish it from others for internal use, but persons unable to read should not be allowed to administer medicines, and never give or take a dose without first perusing the label.—Signed, ———."

The health of the country continues in a most satisfactory state; the marvellously low rate of mortality having been returned last week by the Registrar-General, of 12 per 1000 in Edinburgh, 16 in Dublin, 18 in London, and 21 in Glasgow. These figures are lower than we ever remember to have seen them in Edinburgh, Dublin, and Glasgow, speaking volumes for the preventive medicine of the day.

The polling for election of a member of Parliament to represent Glasgow and Aberdeen Universities takes place on Monday next and four following days. The candidates are Dr. Anderson Kirkwood, proposed by Dr. Mitchell, and seconded by Professor Robertson, and the Lord Advocate Watson, proposed by Mr. King, and seconded by Professor Ogston.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 1, 1876.

FOOD IN ITS RELATIONS TO HEALTH.

Apropos of an article which recently appeared in this journal "On What to Eat and Drink," we find from the last number of the *Boston Medical and Surgical Journal* that Professor Austin Flint has been reading a paper on the same subject before the American Public Health Association. In that article we summed up our view of this question by saying, that it is best not to be over careful as to what we should eat or drink, but to partake of all things in moderation, while at the same time we should eschew whatever our natural instincts or aversions prompt us to avoid, and whatever experience has shown to be prejudicial.

In the paper to which we refer, we are glad to see that the able professor at Bellevue Hospital has been guided by the same principles as those upon which our own remarks were based, while some of his observations on this important subject are so practical and original, that we shall not hesitate to draw particular attention to them. In allusion to the old saying, that we do not live to eat, but eat to live, he observes "that we are not to eat merely to live. Alimentation has ends beyond simple existence. We must eat to secure the complete development and growth of all parts of the organism. Eating is indispensable for attaining to and for maintaining the capabilities of body and mind." After remarking, as we have recently contended, that normal instincts having obvious reference to the needs and welfare of the organism, are entitled to precedence over human judgment, he remarks that, as respects the quantity of food needed, popular notions by no means correspond to the requirements of health. Physiology, experience, and common sense, are alike opposed to the idea that we should always rise from the table with an appetite, that food should never be taken except at fixed times, no matter how great may be the desire of it, and that a full diet tends to impair the faculties of the mind, and to debase the best sentiments of our nature.

"The conditions of perfect health," says Professor Flint, "are *first*, a sufficient appetite, *second*, the gratification of normal appetite before the food reaches the abnormal degree expressed by hunger; *third*, the satisfaction of appetite by an adequate quantity of food. With regard to the question whether the appetite is infallible as a guide in dietetics, Dr. Flint says that it is so under normal circumstances, and that it is at all events more reliable than rules based on theoretical ideas, popular notions, or on purely physiological data. "Moreover, it was evidently not intended that the quantity of food should be accurately adjusted to the needs of the economy. To do this is impossible, and therefore it is necessary to elect between the risk of taking either more, or less food than enough. Which is to be preferred? Undoubtedly it is better to incur the risk of taking too much than too little. Nature provides for a redundancy, but there is no provision against a persistent deficiency, *ex nihilo nihil fit*." This last observation is, to say the least, very original, and whatever may be its merits as respects the practical adoption of the principle which it inculcates, it is certainly worthy of consideration, and places the subject on quite a different standpoint to that from which it is usually regarded. Equally happy are his remarks when he combats the popular notion that the functional ability of the digestive organs is maintained in proportion as they have little work to do. "Physiology and experience teach otherwise. It is a law of the living organism that deficiency of functional exercise impairs function, and that prolonged suspension of function leads to organic changes which destroy functional capacity." There is not only much truth in this remark, but it would have much weight in the consideration of certain points in the physiology of appetite which Professor Flint has not touched upon. As he says, appetite is, as a rule, a reliable guide in dietetics, but it is so only in a positive and not in a negative point of view. Its presence is generally a sign that the system requires food, but its absence is by no means a sign that nourishment is not required. And one of the reasons why this fact should in practice receive particular attention, is the law just mentioned—namely, that deficiency of functional exercise impairs function, and that as regards the stomach, a persistent deficiency in food-supply renders that organ less and less able to digest and dispose of a proper quantity of food when it is obtained. And this law, moreover, shows the fallacy of pushing too far the principle upon which both Dr. Flint and we ourselves have put so much stress, viz., the value of our normal instincts in regulating the quality and quantity of our food, for reliable as most of those instincts are under ordinary circumstances, the possession or not of a healthy appetite is certainly one of the most unreliable signs on which we could depend. Were we all to abstain from eating until we felt a keen appetite for our food, such, for example, as is often felt by the huntsman after a good ride across country, most assuredly many of us would die of starvation.

On the other hand, we must admit that the principle laid down by Professor Flint, that a full diet is better than a spare one, and that "it is vastly better to incur the risk of taking too much than too little," is a principle which should not be generally acted upon, except under great reservation. That it is impossible to accurately adjust the quantity of food to the requirements of the system, and that nature provides for a redundancy, but not for a deficiency of food, are facts which are too often overlooked both in the maintenance of health and in the treatment of disease. But great as are the resources of nature, we must be careful not to draw upon them too much, or irrespectively of the peculiar circumstances of the case. A persistent course of full living may be all very well, and any redundancy thereof will be amply provided for by Nature, if only the demand for food is really great, if all the animal and organic functions of the body are fully active, and if, moreover, the functions of all those eliminating organs by which Nature has provided against a redundancy of food are in a healthy and active state. But directly these organs get a little out of gear, or have more work imposed upon them than they can bear, then the prejudicial effects of full living will be only too apparent. If, therefore, a man is subjected to much physical or much mental exercise, or to both, and if at the same time the excretory function of the skin, kidneys, and bowels are duly attended to, then a full diet may not only be indulged in with impunity, but be absolutely necessary. Where, on the other hand, these conditions do not exist, we should certainly consider ourselves safer under a restricted or even a spare system of dietary.

Then much will depend upon idiosyncrasy and peculiarities of constitution. It is astonishing how some people will lead an active life both of body and mind, and keep in perfect health, upon a supply of food upon which others would almost starve. Whether this is owing to a difference in the assimilative functions of different individuals, or to some more recondite peculiarities in the relations subsisting between tissue waste and tissue renovation, we cannot say, but the fact remains incontrovertible and pregnant with useful suggestions. Professor Flint is disposed to ridicule this notion. He says that "an exaggeration of individual idiosyncrasies is a common error," and that "the idea of innate peculiarities of the physical constitution is a not uncommon form of egotism." We think, however, the profession will join with us in asserting, not only that this idiosyncrasy is one of the least disputed facts in physiology, and one of common observation, but that it is more frequently exemplified in respect of the stomach and digestive organs than of any other part of the system.

A great deal more might be said on this interesting topic, had we not already trespassed too much upon the space allotted to us, and perhaps upon the patience of our readers. But, as Professor Flint truly remarks, this subject is a large one—it touches the sources of public health—and that it touches the question of either the progress of our people in mental and bodily vigour, or, on the other hand, degeneracy of both mind and body.

◆

THE ANNUAL REPORT OF THE REGISTRAR-GENERAL.

It is not our intention to give the reader a long analysis of the 37th Annual Report of the Registrar-General, but many of the facts it contains are so interesting, instructive, and even suggestive, that we should not be doing our duty as medical journalists did we not take some notice of them. And perhaps there is no part of the report more interesting than that which shows the influence of sanitary improvement upon the health and mortality of the population. In the first place our readers must have remarked, in perusing our former analyses of these returns that certain high rates of mortality continually prevail in particular districts of England. Thus while the mortality of England in the year 1874 was 22·3 per 1000, the death-rates in Lancashire, Durham (county), Northumberland, and the West Riding of Yorkshire, have always been remarkably high, averaging even last year as much as 25 to 27 per 1000. The reporter in commenting upon this fact, remarks that if the sanitary laws had been administered in these counties, as well as they have been in London, no less than 26·400 lives would have been saved during the year. So that it is owing to the high rates continually prevailing in three or four counties that the death-rate of the entire country is never below 20 per 1000.

The Registrar-General has often in his Quarterly Returns drawn attention to the fact that the large towns have, in virtue of their importance, been the first to benefit by the administration of the sanitary laws, and that consequently it is by improvement in the sanitary condition of our smaller urban or rural districts that we must in a great measure look for an abatement in the general death-rate of the country. But that this great sanitary work is not only being ably carried out, under the directions of the medical staff of the Local Government Board, but has already been attended with great success, will be apparent by noticing the remarkable diminutions in the mortality of certain districts previously noted for their disgraceful insalubrity and bad sanitary conditions. The Report draws our attention to the great change that has taken place in the healthiness and mortality of Whittlesey, Wisbech, Orsett (Essex), Salisbury, Wolverhampton, Coventry, Macclesfield, Kingston-upon-Hull, Newport, Merthyr-Tydfil, and several other places, but the scope of this article will only allow us to enter into details as respects one or two of the above-mentioned places. Thus in North Witchford, in Cambridgeshire, the average annual mortality fell from 27 per 1000 in 1841-50, to 21 in 1851-60, and to 20 in 1861-70; while the results were still more remarkable in the four years 1871-4, the mortality of the district being reduced to 17 per 1000. Again, Merthyr-Tydfil, the great centre of the iron industry in South Wales, had the high mortality of 28 persons in 1841-50, and the still higher of 28 in the next decade, the result of deficient drainage, the absence of any system of scavenging, and a scanty and impure water supply. In fact, according to the very careful investigations of Mr. Dyke, it appears that the death-rate of that district in the 11 years, 1845-55, before any sanitary improvements were begun was as much as 33 per 1000, whereas after the works of paving, nuisance removal, main drainage works had been completed, and after the introduction of the improved water-supply, the mortality declined to 26 per 1000, followed by a further decline of 25 per 1000 in the seven years 1866-72.

One of the most interesting and gratifying statements in these voluminous Reports is in reference to the remarkable and exceptionally healthy state of two districts in England, their average annual mortality for the years 1840-71 being as low as 15 per 1000. These very salubrious regions are Glendale and Rothbury. And no more striking proof of the salubrity and good sanitary conditions of these places could be found than in that afforded by the small mortality among the children. In the Rothbury district the village of Harbottle has 120 inhabitants, and Dr. Frank Richardson states that among them are 37 children under 14 years of age. During the last twenty years "no child has died." An instance is given of a farmer and his three shepherds the latter having occupied their present situations nearly thirty years. There are 47 children in these households, and not a single death has yet occurred in the four families. The district of Rothbury contains several very large ancient parishes. That of Alwinton, on the southern slopes of the Cheviots, extends over 46,681 acres, and comprises 16 townships. The population of this parish decreased from 1,325 in 1861, to 1,205 in 1871, when 39 births and only 9 deaths were registered. Accordingly, the birth-rate of the parish in 1871 was 32·4 per 1000 of the population, whereas the death-rate was but 7·5 per 1000. Among these nine deaths was one of a person 92 years of age. In the year 1874 only 6 deaths were registered, and, assuming the population to have been stationary since 1871, the mortality was only 5 per 1000. These facts are indeed extraordinary, and withal very encouraging. As the Registrar-General remarks they are well worthy of study, and we regret that we are not furnished with more information as to the meteorological, geological, and sanitary conditions of these villages, and the habits and occupations of their inhabitants. It is very pitiable to turn from what the mortality among infants and children might be to what it really is in most parts, and especially the manufacturing districts of England. We shall not, however, say much about this subject, as we have already drawn attention to it on previous occasions. In the present Report there is a table which shows the mortality of children, under one year of age, from different causes in six large towns, in the two years 1873-4. The specified causes of death were teething, diarrhœa, convulsions, lung diseases, tubercular disease, atrophy, suffocation, premature births, and the usual infantile diseases, measles, scarlet fever, and whooping cough. The mortality from these diseases is very great. Thus out of 152 deaths per 1000 births in Portsmouth, as many as 136 were due to those causes. In Liverpool the deaths from suffocation were unusually numerous, and this fact is mentioned, as calling for special inquiry. They were as many as 8·2 as compared with 3·9 of the London rate. In the factory towns of Oldham, Salford, and Leicester, the death-rate from convulsions was remarkably high, being considerably in excess of that of London. These results are of course chiefly due to maternal neglect. The mortality from premature births was also particularly high in the factory towns. With regard to the general mortality we may summarily remark that the death-rate of children under five years of age was high in 1871; that the prevalence of scarlet fever and measles materially increased the death-rate of that year; that diarrhœa is not more fatal than it was twenty years ago, and that the death-rate from "alcoholism" rose considerably in 1874. It is also remarkable that the mortality from diphtheria was greater in the healthy districts of England than in Liverpool, the proportion being 1,029 in the healthy districts to 442 in Liverpool, out of 100,000 born. Fatal diseases of the nervous system also show some increase; while, on the other hand, the report on diseases of a tubercular nature, and on diseases of the digestive organs is more favourable.

◆

Notes on Current Topics.

Removal of House Refuse.

At the Social Science Congress held at Brighton in October, 1875, Mrs. M. A. Baines contributed a short paper (which she has recently published) on the urgent need of some compulsory sanitary enactments. It is well known that vestries in metropolitan districts have extensive powers on sanitary matters, but those powers are rather remedial than preventive, and are, moreover, very imperfectly exercised. Among other matters affecting the health of households and towns the removal of house refuse is certainly one which requires to be dealt with in a more summary and compulsory manner than that which now obtains.

"The difficulty," says Mrs. Baines, "of settling the question as to the proper disposal of house refuse is a disgrace to a civilised country—it is not simply a domestic question, which at first sight it might appear to be; but the ignorance, and neglect with which it is treated, render it in its effects a public scandal and nuisance; nothing can be more simple than the solution of the difficulty, and that subject was fully explained during the sittings of this Association at Brighton last year; in almost every borough there are bye-laws, which, if carried out, would effectually do away with that terrible nuisance, the dust-heap, but the rules are never enforced; the few exceptional householders, who act for themselves in the matter, are obliged to take upon their own shoulders the trouble and odium of making a stir in such an unpleasant and unpopular cause; but the indifferent householders and their servants are allowed to create a pestilential nuisance around them."

In these remarks we entirely concur, and there can be no doubt that the plan already pursued on the Continent, and even at some English towns, of carting away the house refuse every morning, instead of allowing it to collect and remain for weeks, would be a great sanitary improvement, both as respects the householder himself and the whole district in which he lives.

Chinese Credulity.

A letter from the Shanghai correspondent of *The Times*, recently published, says that an anti-Christian book, called the "Ki-King-lu," has been published in the province of Szechuen, in which it is stated that the skill and intelligence of foreigners have been obtained by robbing the Chinese. One method of doing this, it is there represented, has been the making of an extract from the eyes of Chinese who have become Christians, and touching the eyes of foreigners with it, by which they have been enabled to understand astronomy and perceive the mineral wealth of the earth. Another valuable medicine for the promotion of intelligence has had for one of its ingredients the brains of a Chinese girl who has embraced christianity. Other medicines have been mixed with the brains and the compound made up into pills, which received their final touch in the shape of certain incantations instead of a sugar coating. The *bona fides* of the author is attested by his statement that he has himself lived three years in England, during which time he had three princesses given him to wife by the Queen, and that he was only permitted to return to China upon giving a promise not to expose the improprieties he had witnessed in this country.

Plant Anæsthesia.

The *Scientific American* states that the curious discovery has recently been made that anæsthesia may take place not only in animals but in plants, and, in brief, in all forms of life. It has been demonstrated that etherisation acts finally on all the tissues of animals and on the central nervous system. Hence, if plants have tissues, the anæsthetic should equally act on them. This substantially appears to be the case; and every vital act, whether occurring in animal or vegetable, may be anæsthetised. In plants, M. Claude Bernard, to whom is due the credit of the discovery, has found that germination ceases under the influence of ether. He introduced water cresses, which germinate from day to day, into two precisely similar tubes. In one tube he placed a little ether. The plant therein on the following day was found not to have germinated, as the other had; but after being removed from the anæsthetic, the first went on and germinated in a natural manner. The plant had literally been put to sleep.

Supposed Poisoning by Infants' Cordial.

On the 16th ult., the Leeds coroner held an inquest respecting the death of a child, five weeks old. The child's mother stated that it had been suffering from diarrhœa, and she sent a neighbour for some "Meconio," or infants' cordial, which she had been in the habit of giving to her other children. She was supplied with what she supposed to be "Meconio," in a spoon, and gave the child a few drops of it. The child slept for several hours afterwards, but awoke screaming and in convulsions. A surgeon saw the child in the evening, and prescribed castor oil and milk, but it died about seven o'clock the following morning. He made a *post-mortem* examination of the body, and found the venous circulation of the brain much loaded. Although he detected no trace of poison in the stomach, yet he was of opinion that death was the result of vegetable poisoning. He knew that "Meconio" was very frequently administered to children in that neighbourhood. He had not analysed the liquid, part of which had been given to the child. Mrs. Wade stated that a friend having written for a bottle of "Meconio," she got one. That bottle was wrapped up as it had come from the chemist's, when Mrs. Pinder sent for some "Meconio." Her husband tore off as much of the wrapper as enabled him to take out the cork, and poured out a teaspoonful of the liquid. He could not have seen what was on the bottle. The jury returned a verdict that the child was accidentally poisoned, and recommended that the bottle supposed to contain "Meconio" should be looked after, and its contents analysed.

Report on the Discipline and Management of Military Prisons, 1875.

COLONEL DU CANE'S Annual Report is, as usual, full of interesting matter. No force of improvement with hard labour, he tells us, has been as yet devised, which can during a short period produce the deterrent effect punishment is intended to, without, in a greater or less degree, lowering the bodily condition, and to avoid going beyond the exact limit to which this could be properly carried, cannot be effected without a great amount of attention and even of individual study of soldier prisoners, which is a source of continual anxiety to those on whom this duty is thrown.

The average strength of the army at home was 92,802; the sentences of court-martial, 9,018; percentages of punishment, 9·7; of minor punishment by commanding officers, 176·8. On the 31st December 1,892 soldiers were undergoing punishment, or 1 in 49. Desertion was the chief crime for which imprisonment was awarded.

Return of Sickness.

Prisons.	Cork.	Dublin.	Limerick.
Aggregate number in prison	429	406	354
Aggregate number of cases of sickness	194	41	47
Percentage	28·9	10	14
Average daily number of prisoners	96·71	90·96	77·78
Average daily sick	3·74	2·79	2·76
Percentage	3·8	3	3·5

The governor of the Cork prison reports—"The class of men who have been admitted during the year have been generally of the most wretched sort physically, or of the worst sort morally," while from the remarks of the medical officer in charge of the Military Prison, Dublin, it seems that of 361 soldiers admitted,

141 were of good physique.
146 were of fair physique.
66 were of indifferent physique.
8 were of bad physique.

A remarkable illustration is given of the length a soldier will go to in order to obtain his discharge. The tattooing of a crown upon enlistment is recommended as the remedy against desertion for the purpose of re-entering the army. In many instances sickness only partially exempted the prisoner from punishment.

The New University College, Bristol.

THE new Bristol University College, incorporated in December last, was opened, without formal ceremony, on September 10th. During the erection of suitable buildings, for which a site has been obtained, the educational work will be carried on in the temporary premises. Of £40,000, the capital required, two-thirds have been subscribed. All the classes, except those of medicine, are open to women.

Militia Surgeons.

SIR,—In consequence of the the terms of the New Medical Warrant for Militia Surgeons, the following questions were put to the War Office, and answers were received as follows.

Yours faithfully,
FREDK. GOODCHILD,
Hon. Sec. Militia Surgeons' Society.

Warwick, Sept. 25th, 1876.

"War Office, Sept. 21st, 1876.

"1.—*Question.* Whether, in accepting the terms of the New Warrant, the surgeon relinquishes his present Commission, and will be considered as entering into an entirely new engagement.

"*Answer.* In the event of the surgeon electing to be placed on the Departmental List, he will not relinquish his present commission; but, in common with other Militia Medical Officers accepting the terms of the recent Royal Warrant, he would, when embodied or out for training, be under the orders of the Director-General Army Medical Department.

"2.—*Question.* Whether, by so accepting, he will relinquish all claim to compensation for the loss of nearly the whole of his professional income, which will result, should the terms of the New Warrant be fully carried out.

"*Answer.* His election to be placed on the Departmental List will be without prejudice to any claim he may consider he has to compensation for loss of emoluments."

Public Mortuaries for the Metropolis.

A VERY well arranged mortuary and examination room has just been completed for the parish of St. James's, Westminster. In order that its services to the public may be widely known and appreciated, where in consequence of poverty or other cause, the health and comfort of the living may be imperilled by the non-removal of the dead, Dr. Edmunds, the Medical Officer of Health, has addressed a letter to the keepers of hotels, clubs, lodging-houses, &c., in the district reminding them of their duty in respect thereto. Copies of the notice have also been posted in various convenient positions.

Prosecution of Quack Doctors.

THE Manchester stipendary had before him twelve persons, who were each summoned on three charges—first, of wilfully and falsely pretending to be a physician, doctor of medicine, or general practitioner; second, with falsely using a name implying that he was recognised by law as physician, surgeon, or practitioner in medicine; and third, to show cause why a quantity of objectionable books and pamphlets, found upon his premises, should not be destroyed. Detective Caminade went to one of the defendants, who styled himself as Dr. Lewis, M.D., who also carried on business in Liverpool and Leeds, paid him 10s. 6d., consulted him about his health, and subsequently he paid him another 10s. Witness was told he was suffering from extreme nervousness, and the defendant said he would put him right in three weeks for forty guineas. This defendant was fined £20 on the charge of falsely pretending to be a physician or doctor of medicine; and another charge against him in reference to the objectionable literature was adjourned. Another defendant named Whitechurch was fined £5; and in other cases fines of £10 and £15 were inflicted. Some of the cases were adjourned for a week. A raid was made upon their premises, and some tons weight of pamphlets were seized.

The Magnet in Surgery.

The use of the magnet for the diagnosis and removal of particles of iron impacted in the eye and elsewhere was again discussed at the last meeting of the Royal Medical and Chirurgical Society, the question being opened by a paper from the pen of Sir Benjamin Brodie, who had found the magnet useful as a means of diagnosis, but altogether useless as a tractor, although he had used a powerful electro-magnet for the purpose. The hoary myths about the removal of steel chips from the eye was once again repeated by the president, and was apparently classed by the assembled surgeons as a feasible method of procedure.

The magnet undoubtedly has its use as an indicator of the existence and the locality of an iron body not—in the case of eye injuries at least—its successful use is an entire fiction. Every ophthalmologist of experience knows that spiculæ of iron impacted in the cornea are so tightly grasped by the anterior lamina as to require digging out with the spud, and, if located within the eye-ball—we imagine that the process of groping for them with a magnet would incur risk of injury to the internal structures which the chance of successful removal would not repay. Bearing in mind the minute size of the body, and that a magnet should be placed almost in contact with it to receive any influence from it, we entertain the greatest doubt that, even as a diagnostic, it will ever be employed in eye injuries.

St. Mary Abbotts, Kensington.

The annual report of the health and sanitary condition of this parish, which has just been issued by Dr. T. Orme Dudfield, is of a very satisfactory nature. This parish has a population of 143,500—a population which for some years past has been rapidly increasing. The number of houses newly brought into voting last year was 777, and this represents an increase in the population of about 5,500 souls. The gross death-rate for the year 1875 was 19·4 per 1,000 persons, but after certain necessary deductions the death-rate is lowered to 18·1 per 1,000. Taking, however, the former calculation, it will appear that the state of the public health in Kensington admits of a favourable comparison with the metropolis as a whole, while it is much less than that of the several great districts into which the metropolis is divided by the Registrar-General. The death-rate in Kensington, though slightly lower last year than in 1874, was still in excess of 1873. The decennial average death-rate in Kensington is 19·4.

Dr. Dudfield draws particular attention to the great mortality that arose from the epidemic of measles. "It would be well," he justly remarks, "if steps were taken to impress on parents the importance of not making light of measles and whooping-cough, as there can be no doubt that many of the fatal complications are the immediate result of want of care, and of premature or avoidable exposure, at a time when the pulmonary organs are peculiarly susceptible to inflammatory action. These observations are well borne out by the prevailing epidemic of measles, which in the first six months destroyed 193 children." With regard to the gastric diseases the report is more satisfactory. Not one fatal case of small-pox was registered during the year. Nor was there a death from this cause in 1874, the last death having occurred in January, 1873. In the first half of the current year (1876) two deaths have occurred, the first of which, after an interval of three years, occurred at Notting Hill Square, the deceased being a male aged 40, and unvaccinated. Scarlet fever was not prevalent beyond the average, the deaths having been 83 against an uncorrected average in ten years of 73. Diphtheria, scarlet fever, and measles were prevalent diseases for a short time at the end of the year in Brompton, but they did not lay any serios hold on the district. The deaths from "fever"—typhus, enteric, and simple continued fever—were only 29, the corrected decennial average being 60. From diarrhœa the deaths (107) were 29 below the actual average of the last ten years; while, on the other hand, the deaths from whooping-cough (107) exceeded the average by 41.

The "Globe" on Habitual Drunkards.

Although we have already pointed out some of the difficulties in the way of legislating for the compulsory restraint of habitual drunkards, we have taken an early opportunity of giving our support to the general principles which underlie this movement. The *Globe*, in commenting upon a letter of Dr. Carpenter, remarks :—

> "With most of the propositions advanced by Dr. Alfred Carpenter we heartily agree. From the first we have aided by all the means in our power the movement for dealing with dipsomaniacs by legislative restrictions. Nor have we changed our opinion that the subject ought to be dealt with by Parliament at the first possible opportunity. It reflects disgrace on English institutions that an evil of such magnitude, which is directly sapping the healthy tone of society, should have been so long allowed to remain unchecked. So far, we are quite at one with Dr. Carpenter and the other philanthropists who have taken up the good cause. What we fear is lest their zeal should outrun discretion by attempting too large a work at first starting. It would be found very difficult to carry a sweeping measure of reform such as that sketched out in Dr. Carpenter's letter. Parliament might possibly consent to restrict the liberty of offenders against the laws who were proved to have given way to habitual drinking. There is, however, a large class of dipsomaniacs not included in that category. People in good positions who are afflicted by the disease rarely come under magisterial notice, and even when they do there is no evidence forthcoming of their being dipsomaniacs. We believe that as a beginning it will be most expedient to make such legislation as permissive as possible by forbidding the confinement of a sufferer without his own consent. When that was once obtained, he would forfeit the power of revoking it for a certain period previously specified. We would also suggest the expediency of confining legislation to "dipsomaniacs" properly so called. By this term we understand people who have temporarily lost their will-power—a loss by no means invariable in the case of habitual drunkards."

Dr. Carpenter's letter and the above editorial remarks strikingly illustrate an observation we have made on a former occasion as to the discrepancy of opinion which exists in regard to the class of the habitual drunkards to be dealt with in the first instance, ; for while the *Globe* would confine legislation to "dipsomaniacs," properly so called, and most cases of which are to be found among the middle and higher ranks of life, Dr. Carpenter would have the habitual drunkard among the lower classes attended to first, for he says :—

"We do not propose to deal at once with all existing dipsomaniacs, but we ask that magistrates who have habitual drunkards brought before them may have power to commit them to a reformatory for a term of one year instead of sending them, as at present, to a common jail for fourteen or twenty-one days a hundred times."

Poisoning by Bromide of Cadmium.

POISONING by the salts of cadmium is so extremely rare, if it has ever occurred at all, that in the latest edition of Taylor "On Poisons," no mention is made of the poisonous properties of this metal. In the last number, however, of the *Boston Medical and Surgical Journal* a case is recorded in which this salt was taken in mistake for the bromide of ammonium, which it closely resembles in general appearance. The symptoms were a pungent taste and sensation in the mouth and throat, prolonged vomiting and purging, with great pain and a burning sensation in the œsophagus and stomach. The vomiting and purging lasted five hours, and during a part of that time the pulse was imperceptible in both the ladies who had taken the salt. After this period the symptoms ameliorated, and they both fell asleep. For several days they were both confined to their beds, and were obliged to be very careful as to what they took into their stomachs. The exact quantity of the salt taken is not known, but the dose of bromide of ammonium ordered by the medical attendant, Dr. George A. Wheeler had been eight grains, but they may have taken half that amount or twice as much. The nature of the poison was recognised by the following tests:—

(1) Dissolved in water and treated with sulphuretted hydrogen gas, a yellow precipitote is formed, which is insoluble in ammoniac sulphydrate.

(2) Mixed with cyanide of potassium and heated in a closed glass tubethe cadmiumwas reducedto the metallic state.

(3) Mixed with dipotassic sulphate and binoxide of manganese in a closed glass tube the blood-red vapour of bromine is given off.

All the soluble salts of cadmium are corrosive poisons, but as the bromide is never used in medicine, and little in the arts, except by photographers, it is doubtful, remarks Dr. Wheeler, whether it has ever been taken before.

A People without Consumption.

UNDER this heading Dr. E. M. Wright, of Hamilton County, U.S., has published a small pamphlet, in which he gives an interesting account of a people, four thousand in number, who live on Walden's Ridge, a district of the Cumberland Table-land. No well authenticated death from consumption has ever occurred among the natives of this region. The ridge is from 2,000 to 2,500 feet high. The mercury has never been known to be above 95 deg. F. or below 10 deg. F. The people, who are chiefly farmers, live mostly in log-houses, which admit plenty of fresh air, burn wood, wear no flannels, and live on corn bread, bacon, and coffee. The Cumberland Table-land is an extensive district, and comprises territory enough to form a good-sized state.

The advantage to consumptives of living in elevated regions has, as the reader is probably aware of, attracted a good deal of attention within the last few years, and we have noted the publication of this pamphlet as being an interesting addition to the literature of the subject.

The State Lunatic Asylum in New York.

FROM the "Report of the State Lunatic Asylum at Utica, N.Y.," it appears that 37 per cent. of the number admitted since its establishment thirty-three years ago, have recovered, 15 per cent. have been much improved, and about 12 per cent. have died. The average number under under treatment last year was 595. The superintendent, Dr. Gray, reports among the admissions of the thirty-three years 173 as "not insane," comprising dipsomaniacs, opium-eaters, hysterical cases, and cases of temporary delirium. The facilities for occupation and amusement at Utica appear to be unexceptionable. The farm, shops, kitchen, laundry, and sewing-room afford useful occupation to the patients, while riding, walking, reading, lectures, and games, contribute to their amusement. This establishment is also provided with a good theatre, with an amateur company of officers and patients. It seems, however, that the absolute disuse of mechanical restraint is not adopted, as the general doctrine in America is that this form of restraint is occasionally necessary, and that its use should be left to the discretion of the superintendent.

Artisans' Dwellings Act.

A MEETING of the Commissioners of Sewers was recently held at the Guildhall, when the Finance and Improvement Committee submitted for approval and signature an improvement scheme in reference to Blewett's Buildings block, Golden Lane, Petticoat Square, Stoney Lane, and Meeting House Yard blocks. The cost of it would be about £280,000. The buildings on the respective sites should provide for at least 2,113 persons. Mr. Scott moved the approval of the scheme, and Mr. J. C. Davis thought the report should be printed. The motion was agreed to.

The Suppression of the Trade in Venereal.

THE state of Plymouth and its neighbourhood before and since the adoption of the Contagious Diseases Act is compared by Mr. Lowndes, of Liverpool, in a pamphlet which he has just published. Speaking of the effect of this legislation upon the morality of the town, he says, 'that its usefulness is by no means alone in the direction of protection against the spread of venereal disease, for it has effected a most remarkable change in the moral character of the district. It has reduced the number of prostitutes from 1,770 to about 400, and of brothels from 366 to 98, and the orderly character of the street population is visibly increased." This is a remarkable result, considering that the paid agents of the Anti-Contagious Act fanatics exercise every influence to defeat the law, to encourage the prostitutes, and to impede the inspectors.

DR. DOMVILLE, C.B., Inspector General of Hospitals and Fleets, of the Royal Naval Hospital at Plymouth, has been granted three months' leave of absence to enable him to proceed to Malta to attend her Royal and Imperial Highness the Duchess of Edinburgh at her approaching *accouchement*.

Surgical Society of Ireland.

The election of Council of the Surgical Society of Ireland, for the Session 1876-7, will take place in the Royal College of Surgeons on the first Monday in November. Members of the society, being fellows of the College of Physicians or of the College of Surgeons, are alone eligible, or entitled to vote.

Methylated Spirit in Tinctures.

In reference to the subject of the recent memorial of the English Pharmaceutical Society, the Board of Inland Revenue has issued a general order, stating that "in addition to soap and compound camphor liniments as the only medicines in the composition of which methylated spirit was allowed by General Order of 24th July last, the Board now also consents to the use of such spirit in aconite and belladonna liniments."

Statistics of Tobacco Smoking.

The following table gives for each country named its consumption of tobacco per annum per 100 inhabitants:—Belgium, 250 kilogrammes; Holland, 200; Germany, 250; Austria, 124·5; Norway, 102·5; Denmark, 100; Hungary, 94; Russia, 83·3; France, 81; England, 62; Italy, 57; Spain, 49; Sweden, 34.

The Health and Sewage of Towns.

A conference on the health and sewage of towns was recently held in the Lecture Hall of the Society of Arts, under the presidency of Lord Alfred Churchill. Amongst others present were Sir H. Cole, and numerous surveyors and medical officers connected with the metropolitan parishes. Several gentlemen having expressed their views on the subject, the following resolutions were agreed to:—1. That the protection of public health from typhoid and other diseases demands that an amending Act of Parliament be passed as soon as possible to secure that all house drains connected with public sewers in the metropolis, and towns having an urban authority, should be placed under the inspection and control of local sanitary authorities, who shall be bound to see to the effective construction and due maintenance of all such house drains, pipes, and connections. 2. That plans of such drains and connections be deposited in the charge of the respective local authorities, who shall be bound to exhibit them and supply copies of them to the public on payment of a moderate fee. 3. That the owners of houses be compelled by law to send to the respective local authorities within a specified time after the passing of the Act plans of all house drains on an appointed scale.

We need scarcely remark that this is a move in the right direction, and it is to be hoped not only that the public and the profession will do all they can to further the passing of such an Act, but that when it is passed householders will assist the local authorities in practically carrying out its provisions; for however careful the inspection and control of the local sanitary authorities and their inspectors may be, and however perfect the construction of house drains, pipes, and connections may be, the due maintenance of these drains, and the keeping them in proper working order, will, in a great measure, depend upon the attention and cleanliness of the householder himself. Nevertheless, if periodical inspection be properly carried out, any temporary obstruction of the drains through accident, or the carelessness of the servants or other residents of a house, would soon be rectified.

Typhoid Fever at Lincoln.

We learn from the *Lincolnshire Chronicle* that a severe epidemic of typhoid fever has occurred at Lincoln, which reflects strongly upon the conduct of the local authorities of that town. The conditions of drainage and water supply appear to have been very deplorable. There were cesspools which, according to one correspondent, were not emptied, because they were supposed to periodically empty themselves, and the contents of which found their way into wells by which drinking water was supplied. So culpable indeed have been the authorities at Lincoln that they actually allowed a drinking fountain to be supplied by some one of these contaminated wells. In the newspaper above mentioned there is a long letter from a medical man, who signs himself "Analyst," but instead of impressing upon his readers the necessity of the Town Council doing all in their powar to improve the sanitary condition of their town, the whole of his letter is taken up with a disquisition on the specific origin of typhoid fever, and with the object of showing that the mere sewage contamination of water or air will not give rise to typhoid fever, unless the specific germs of that fever are also present. This was scarcely judicious, inasmuch as whether typhoid fever may arise spontaneously or not, his observations were, as one of our contemporaries justly remarks, only calculated to throw the public off their guard, and to give the idea that not so much harm arises from sewage contamination of air or water as is generally believed.

Small-pox in the Metropolis.

We are sorry to see that the epidemic of small-pox which is now prevailing shows no signs of abatement. The fatal cases of this disease, that had been respectively 15, 11, and 16 in the three previous weeks, further rose to 22 in the week ending the 21st October, a higher number than in any previous week since July, 1872. Of this number 5 occurred in the Metropolitan District Small-Pox Hospital at Homerton, 9 in that at Stockwell, 1 in the hospital at Highgate, and 7 in private dwellings. Of these 22 fatal cases 5 originated in Islington, 2 in each of the districts of Hackney, Camberwell, Lambeth, and Brixton, and 1 in each of the districts of St. Giles's, Finsbury, Whitechapel, Clapton, City Road, Walworth, Battersea, Stockwell, and Clapham. If we take these 22 fatal cases together with the 16 of the previous week, we find that of these 38 cases 18 were certified as unvaccinated, 10 as vaccinated, whilst in the 10 other cases it is to be regretted that the medical certificates of the cause of death did not furnish any information relative to vaccination. It appears also that many of the fatal cases have occurred among the working classes, living under circumstances which render isolation practically impossible. The two Metropolitan Asylums District Small-pox hospitals at Homerton and Stockwell contained 180 patients last Saturday week, against numbers increasing steadily from 72 to 175 in the six preceding weeks.

It is gratifying to find that measures have been taken to stem the epidemic as much as possible, as well as to secure correct returns of all the deaths arising from the disease. The Hampstead Small-pox Hospital will soon be made available for the reception of small-pox patients, as arrangements have been made for the removal of the imbeciles from Hampstead to the Leavesden and Caterham Asylums, and as regards the returns, it is satisfactory to report that of the thirty-nine vestries or district boards in London thirty-five have taken care to have their respective health officers supplied weekly with the registered particulars of all the deaths recorded in their several districts.

THE Arctic Expedition has just returned. What discoveries have resulted it is, of course, premature to conjecture. The crew has suffered considerably from scurvy, from which four deaths resulted.

THE War Office has lowered the standard for the infantry in respect to weight, chest measurement, and age, with a view of increasing the influx of recruits. The measure has caused some surprise.

THE next evening meeting of the Pharmaceutical Society of Great Britain will be held to-night, at eight o'clock. The following paper will be read :—"Suggestions for an Improved Method of making Mistura Guaiaci and similar Mixtures," by Mr. Greenish.

AT the last meeting of the Council of the King and Queen's College of Physicians of Ireland, Dr. Aquilla Smith, who has so well represented the interests of his College for many years past, was re-elected member of the General Medical Council.

THE Medical Society of the College of Physicians in Ireland will hold its first meeting this evening at half-past eight p.m. The President, Dr. Gordon, will open the session, and the following communications are set down for reading: Dr. W. G. Smith, "On some New Tests for Bile-Pigment;" Dr. MacSwiney, "Syphilitic Phthisis."

THE prosecution of the spiritualists closed on Saturday. The charge of "conspiracy to defraud" having fallen through, Slade was arrainged under a clause of the Vagrancy Act. How he will fare under this can at present be only conjecture, the magistrate having reserved his decision until to-day. Another so-called medium, Dr Monck, was arrested at Huddersfield on Friday last, and charged before the magistrate under the Vagrancy Act. A raid was made on the prisoner's apartments, in which a large number of conjuring articles were found, the "Dr." having in the meantime escaped by the bedroom window.

TYPHOID having broken out amongst the West African Squadron inquiries were at once set on foot as to its origin and extent. According to the latest counts, the fatal cases have been confined to the *Active*, Commodore Sir William Hewett. There is reason to believe that the outbreak is not caused by the unhealthiness of the ship itself, but that the fever was contracted up the Niger. Those first affected had been engaged in the expedition up that river and had been employed on board a steamer engaged in the oil trade. It is probable that the disease was contracted on board that vessel, owing possibly to foul bilges and a want of ventilation.

Correspondence.

THE PHYSICIAN'S OR SURGEON'S HOLIDAY: HOW TO PASS IT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am led to believe that many of my professional brethren who now spend their summer vacations in the old way at some German watering-place, would gladly cross the Atlantic and visit the United States of America, and the Dominion of Canada, did they but know how pleasantly, how easily, and how very reasonably the voyage and journey can be made.

I propose, therefore, with your permission, giving to your readers a *résumé* of the excursion which I myself took during the past summer, the money that it cost me, and how I fared by the way. I should premise by saying that on the day that I set sail from Ireland I did not know a single soul in America, but that upon the afternoon on which I departed from New York I *felt* that I was leaving many true friends behind me, and the kindness and hospitality which was extended to myself will, I am sure, be equally experienced by every one who makes himself known as being a professional brother.

To commence, then—I left Dublin on Sunday morning, the 20th of August, having secured my passage in the Cunard Royal Mail Steamer *Bothnia* some short time before. Quitting the Kingsbridge Station at 9 o'clock by special train, we were at Queenstown at half-past one, on board the *Bothnia* at half-past two, and well upon our way to America by three. Of the voyage I shall only say that it was most enjoyable, Capt. McMicken and his officers doing all in their power to make everybody happy and comfortable. We had 294 passengers in the saloon, and each seemed determined to be pleasant and agreeable, amongst this number being the Scottish Rifle Team under their captain, Colonel MacDonald. Fun and amusement prevailed from morning to night. During the forenoon rehearsals for the evening entertainments occupied the time of some; whist, chess, and backgammon did the same for the more sober-minded individuals; ship-billiards and shuffles amused the younger portion; whilst innocent flirtation and spoonying prevailed amongst the full grown. At nightfall there were concerts and *tableaux vivants*, waxworks (conducted by Mrs. Jarley), recitations and story-telling; whilst national airs and popular songs were sung until the hour had arrived for the "lights to be out." If melody was ever wanting harmony, at least prevailed.

As to eating and drinking, it went on all day long. Of the voyage out I shall not further observe than to say that, upon the morning of the 30th of August (when we landed at New York), there was not a passenger who did not wish God speed to the *Bothnia*, its captain, officers, and crew, from the bottom of his heart; and as to the leave-taking between the passengers themselves they were, in one or two instances, not a *leetle* affecting. Till then I had not the slightest conception of the rapidly secreting power of the lachrymal glands in the human subject. It was explained to me, however, by a distinguished physiologist, who said that it arose from the peculiar stimulus of saying the words "good-bye," when uttered under certain conditions of the female heart. Fearing that the disorder might be contagious, I proceeded to look after my luggage, and guided by a kind American fellow-voyager and brother member of our profession, soon found myself comfortably located in the Fifth Avenue Hotel. For three days this same excellent fellow escorted me through New York to every hospital and kindred institution, to every place, indeed, that I wished to see, so that I passed a most enjoyable time. From New York I proceeded to Philadelphia, and stayed four days in that city, dividing my time between the Medical Congress and Exhibition. From Philadelphia I proceeded to Washington, passing one day there, and from Washington returned to New York. Here I remained for a day, and then started by steamer, going up the Hudson River to Albany, and passing through some of the most lovely scenery in the world. From Albany I went by rail to Niagara Falls, and put in a day there, seeing everything in and around the place. From Niagara I went across to Toronto, and thence down the St. Lawrence to Montreal, passing the thousand islands and through the rapids of that river. At Montreal I stayed two days, and then went by steamer to Quebec, where I remained one day, leaving by railway for Boston. At Boston I stopped two days, and then left by rail for Newport, Rhode Island, whence I embarked upon the fall river steamer, and next morning awoke in New York. Here I spent a day and a half, and on Wednesday, the 20th of September, at 3 p.m., set sail in the Cunard Mail Steamer *Russia* for home. This steamer's charges being higher than that of any other of the Cunard line, the number of passengers was considerably less, only fifty, but *the agreeability of the few* compensate for the absence of the many, and under the watchful eye of Capt. Cook we came safely to Queenstown, forging ahead through the heavy gale that met us in the Channel, and which caused the sad loss of life off Bray. Upon Sunday, the 1st of October, I landed at Queenstown, and soon after was deposited by the Southern and Western Railway in Dublin.

To recount all that I saw during this trip would fill a book. Every town and place had institutions so large or scenery so grand that my description might be regarded as exaggeration. I leave it therefore for each one (who wishes to ascertain the truth) to go and judge for himself. I have refrained from giving the names of any of those from whom I received such kindness, because they might not like to be specifically pointed out, and also because I feel assured that, even if they themselves had not been there, others would in every town have done, as they did. There is no "bunkum" amongst the American or Canadian doctors. No sham invitations are given by them (at least such is my experience), and they will, one and all, put themselves out of their way to show you that which you express a wish to see, and they can show you what is really worth seeing. For the expenditure incurred I subjoin the annexed detail:

The charges for wine at the American hotels are simply exorbitant, and the wine, in my opinion is not worth the money; therefore, I was very moderate in this respect; but on board ship I had my glass of sherry at luncheon; a pint of good champagne—Moet's, Ruinart's, or Perrier's and Jouet's—each day at dinner, and half-a-pint of claret after, the charges for the same being £3 18s. on the voyage out, and £3 10s. on the voyage home.

To my professional brethren I would say this: "Instead of muddling away your holiday with Brown, Jones, and Robinson up the Rhine, &c., leave London or Dublin upon the 20th of August (or as near that date as the sailing of the ship will permit), embark at Liverpool or Queenstown, as may suite your convenience (the charge for the passage being the same), and with one hundred pounds in your pocket, go out and *do* yankee land; and I will engage that you will come back wiser if not better men."

I am, dear Mr. Editor,

Yours truly,

JOLLIFFE TUFNELL.

NOTE.—I say the 20th of August for this reason, sir, that prior to the 1st of September (the time by which New York will in all probability be reached) the weather is too hot to be comfortable. Washing is very dear. I would advise, therefore, the taking out of plenty of collars and pocket-handkerchiefs; and cigars also, as they are both bad and dear in America.

Expenditure incurred in a trip from Dublin to the United States of America and Dominion of Canada, August, 1876, *the charges made in dollars being here represented by English money.*

TYPHOID CHARACTERISTICS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In an outbreak of typhoid fever this autumn, I noticed the following facts, some of which may be interesting to your readers:—

1. That in women after parturition, a vesicular eruption appeared over the breasts, each vesicle being about the size of a pin's head, and full of a fluid-like milk.

2. That in adults of full habits the fever has been followed by a scarlet rash, which looked like scarlatina, but quite rough to the finger. This rash fell off in small scales.

3. That the infantile remittent fever, or typhoid fever of children is more likely to be followed by tubercular deposit (be it in the head, abdomen, or chest) than is typhoid fever of adults.

I have, moreover, noticed that those adults in whom tubercle followed the fever were not visited by an eruption, and that very few of the children had any eruption at all. Thus there appears to be a connexion between the non-appearance of the eruption, and the subsequent appearance of tubercle.

Sulphurous acid seemed to act like a charm in those cases in which it was administered; and so much did I like the results obtained by its use that I have always employed it lately. Looking over the ages of forty-six patients, I find that one was thirteen years of age, five were over twenty-five years of age, and the rest were under twenty-five years.

The insertion of the above in the columns of your interesting Journal will oblige.

Yours, &c.,

Charles Wood, M.B. Univ. Dub.,
Assistant House-Surgeon Liverpool Dispensaries.

Oct. 26, 1876.

CORONERS' COURTS.

The contest between the coroners and the police has become a public scandal, and the scenes which are every week recorded in the public papers in connection with the discharge of the coroner's duties are such as to make necessary the intervention of Parliament to decide which tribunal shall in future be charged with such investigation, or, at least, to apportion to each its own special part of the inquiry. A case has been recently reported in which the body of a man was found in a river. It was thrown on shore and the police took charge, but they refused to hand it over to the jurisdiction of the coroner or to produce it where it could be conveniently viewed by his jury, and—inasmuch as a view was absolutely necessary to the holding of an inquest—the learned judge of the inquest court and his dozen of arbitrators were obliged to march through the mud and view the corpse on the river slob.

A correspondent in the north of Ireland calls our attention to another case, in which the coroner actually sat to investigate the cause of death after the inculpated person had been tried before the Assize Judge—convicted, and actually remitted to his punishment for manslaughter. This is certainly a *reductio ad absurdum*, and we cannot desire to see the coroner's tribunal perpetuated unless a radical change in its duties and system be made. We have already pointed out that in some districts of Ireland, and especially in Dublin, the medical evidence most pertinent to the inquiry is systematically suppressed, and testimony is substituted which is of little or no value; and that consequently verdicts the most ludicrous and mischievous are the constant outcome of the so-called investigation. We must not be understood for a moment as suggesting that the police court is preferable to the inquest court as an arena for enquiry into causes of death, for we fully recognise the fact that the question of criminality of an individual would be—as far as is possible—kept separate from the question of the cause of death, and it is obvious that the latter enquiry necessitates a form of investigation which would be foreign to the purposes or the capabilities of the police court. There is, in fact, a distinct and most necessary *rôle* for the coroner's court to fulfil, and its abolition would to a great extent leave that *rôle* unoccupied, and instead of simplifying the search after causes of suspicious deaths, would tend to confuse the two separate lines of enquiry. While, however, we maintain the necessity for a properly organised and strictly defined coroner's investigation, we deprecate the existing system in the most forcible terms. From its inception the system is thoroughly bad. The mode of election of the judge is ridiculously inappropriate—the circumstances which set him in motion are indefinite—the mode of procedure is slip-slop—the jurors are as a class entirely unsuitable, and the verdicts are, as a consequence, worthless. Hence they carry no confidence with them, and it is felt that a fuller and more reliable enquiry is necessary, and the case passes into the hands of the police. We need not pursue the subject further at present than to quote the words of the *Pall Mall Gazette*, spoken in an article last week:—

The "coroner and his jury" are the latest additions to the number of these doomed institutions. After having laughed with good-natured indolence at "crowners' quest law" for nearly three hundred years, we are at last seriously reminded that if the grave-digger's jests have a less complete application in these days, we owe no thanks to anything but accident. The coroner, as Mr. Herschell said, "is appointed, his court is constituted, and proceedings before him are conducted almost exactly in the same fashion as they were in the days of Queen Elizabeth." Nor can the coroner plead that he and his system are harmless anachronisms. They are, on the contrary, in too many instances mischievous anachronisms, and those who should take the trouble to search the records of coroners' inquests for a good many years back would find numerous proofs of the manner in which they have either obstructed, endangered, or absolutely defeated the ends of justice.

The defects of the whole system are, in truth, so flagrant that the wonder is less that there should be frequent failures of justice than that they should ever be avoided. The mode of procedure affords no security against frivolous inquests on the one hand, or the hushing up of necessary inquiries on the other; and, lastly, there is no sort of *rapport* established between the coroner's inquiry and the rest of our machinery for investigating cases of suspected crime, and consequently no means of preventing an inquest from becoming an interference with, instead of an assistance to, the ordinary criminal procedure of the country. Having provided for the proper conduct of the coroner's inquest, Mr. Herschell next proceeds to suggest an improved machinery for setting the functions of the coroner in operation. He would attach a medical officer to each coroner's court in county or borough, whose duty it should be to report to the coroner the circumstances of every death which in his judgment suggested the necessity of an inquest. Mr. Herschell would abolish the coroner's jury altogether. This change he justifies in a convincing manner by pointing out what occurs under the present system. A coroner's jury at present discharges a double function; it not only inquires into the cause of death, but in many instances initiates criminal proceedings; and in respect of this latter function its labours are either superfluous, or actually mischievous.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted Members of the College on Thursday, October 26:—

Ewart, Joseph, M.D. St. Andrews, Bewcastle.
Ross, James, M.D. and C.M. Aberdeen, Manchester.
Carter, Alfred Henry, M.D. London, Birmingham.
Collie, Alexander, M.D. Aberdeen, Homerton, E.
Semon, Felix, M.D. Berlin, 6 Chandos Street, W.
Watney, Herbert, 1 Wilton Crescent, S.W.
Cory, Rbt., M.B. Camb., 14 Palace Rd., Lambeth, S.E.

Vital Statistics.—According to the Registrar-General's returns during last week 5,957 births and 2,947 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,730. The mortality from all causes was at the average rate of 19 deaths annually in every 1,000 persons living. The annual death-rate was 12 per 1,000 in Edinburgh, 21 in Glasgow, 18 in London, and 16 in Dublin. In the other large towns the rates of mortality were —Birmingham 20, Bradford 17, Newcastle-upon-Tyne 12, Hull 16, Sunderland 19, Brighton 15, Bristol 19, Wolverhampton 15, Sheffield 22, Plymouth 18, Liverpool 20, Leeds 28, Portsmouth 22, Leicester 30, Norwich 21, Manchester 22, Nottingham 17, Oldham 30, and Salford 26. The annual death-rate from the seven principal zymotic diseases averaged 3·0 per 1,000 in these towns, and ranged from 1·5 in Plymouth, Newcastle-upon-Tyne, and Hull, to 7·5 and 8·8 in Portsmouth and Salford.

◆

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Dr. Jno. Lowe will find that the leader last week, "Sir Wm. Gull and Dr. Johnson," embodies all the points in his letter, the publication of which is therefore unnecessary.

Omnias Sanitas.—Your argument is both legally and morally absurd. The conviction under the Public Health Act is both commendable and just, and we are surprised that any one in his right senses should have questioned the decision, still more so that he should have gone to the trouble and expense of printing post-cards to show his stupidity. We do not for a moment contend that you should not hold what opinion you please however ridiculous it may appear to others, but you have no right to spread that opinion broadcast in order to set others at defiance with a wise enactment.

Epidemiological Society.—The first meeting of the session will be held on Wednesday evening next at 8.30, when the President, Dr. J. Netten Radcliffe, will deliver an address on the "Present Position of Epidemiological Science."

A Militia Surgeon.—Proof of your letter not returned at time of going to press.

Dr. Handsel Griffiths will receive proofs of his communication in the course of the week.

Type-writer.—With the progress of time everything appears possible to mechanical genius. What with shaving, hair-cutting, and brushing-machines, sewing-machines, and type-composing machines, one might almost have imagined that the acme of progress in this direction had been reached. Not so, however, as an American firm has just introduced an invention which is to write all ones' letters as fast as thoughts fly from the brain. This machine is called a type-writer, is in the form of a sewing-machine, and is set in motion on a keyboard similar to a piano. The inventors claim for it that writing can be done with it as rapidly as the most skilful musician could run his fingers over the piano. The only machine now wanted is a "Brain-machine," which, if invented and properly protected, *should be* in great request.

The London Hospital Medical Society.—We are asked to state, in explanation of the short notice of the *conversazione* at the London Hospital in our last, that the ordinary meetings of the Society are now thrown open not only to members of the staff and College but also to neighbouring medical men and members of similar societies elsewhere. It is expected that thus greater unity of action will be obtained, and a stronger *esprit de corps* developed.

Communications, Enclosures, &c., have been received from—Dr. Buzzard, London. Dr. Myrtle, Harrogate. Dr. Hy. Hardy, London. Dr. E. Williams, Colchester. Dr. Milner Fothergill, London. Mr. J. E. Hansen, Manchester. Dr. Alford, Hampstead. Dr. Ashenden, Hastings. Dr. Abrath, Sunderland. Dr. Greene, Old Kent Road. Mr. Nelson, Felling, Newcastle. Dr. Whitmore, London. Dr. Bucknill, London. Dr. Croly, Tinahely. Dr. Drysdale, London. Dr. Ormsby, Dublin. Dr. Semple, London. Dr. S. Lewis, Liverpool. Dr. Major, Wakefield. Mr. Warner, London. Mrs. Baines, London. Dr. Dudfield, Kensington. Dr. Collenette, Guernsey. Dr. Handsel Griffiths, Dublin. Miss Jex Blake, London. Dr. Sewall, Boston, America. Mr. Fleming, Chatham. Mr. McClean, Tunbridge Wells. Mr. Charles Lunn, Edgbaston. Dr. Smith, Detroit. Dr. Langley, London. Mr. Hitchins, Brailes, Shipston-on-Stour. Mr. Iredell, Reigate. Dr. Trimble, Castlebellingham. Dr. Darby, Monastereven. Dr. M'Munn, Ballymote. Dr. Browne, Frankford. Dr. McEvoy, Nobber. Dr. Deely, Kilconnell. Dr. Waters, Carbery. Dr. Langstaff, Athlone. Dr. Garland, Carrickmacross. Dr. Lynam, Strokestown. Dr. John Dill, Manchester. Dr. Cornelius, Mountrath. Dr. Robinson, Clogher. Dr. O'Connell, Kilmallock. Dr. Edgeworth, Longford. Dr. Goediske, Romford. Dr. Donaldson, Crossmaglen. Dr. Haiton, Kells. Dr. Conolly, Killinchy. Dr. Simpson, Manchester. Dr. White, Castletown-Conyers. Dr. Crawford, Tanderagee. Dr. Ferrier, London. Dr. Greene, Baltinglass. Dr. Faussett, Clontarf. Dr. Hanan, Tallow. Dr. Crean, Ballyhaunis. Dr. Cronin, Cushendall. Dr. Clarke, Downpatrick. Dr. Reid, Kingstown. Dr. Davy, Kimmage. The Registrar of the Royal College of Physician. Prof. Gairdner, Edinburgh. Dr Pantaleoni, Rome. Mr. Francis Vacher, London. Mr. Shelley, London Mr. Mears, London Hospital. Dr. Billings, New York. Dr. Drewry London. Dr. Edmunds, London. Dr. Bartley, Weston-super-Mare. Mr. J. M. Dodd, Bayswater. Hering.—On Oct. 11, at Reigate, Wm. Hering, M.D., aged 72.

Loughead.—On Oct. 20, at Colinton, near Edinburgh, Joseph Fletcher Loughead, Surgeon-Major, late 21st N.B. Fusiliers, son of the late Joseph Loughead, M.D., of Ballymote, co. Sligo, Ireland. Brother officers and friends will please accept this (the only) intimation.

IRISH POOR-LAW INTELLIGENCE.

CORRESPONDENCE.

COMPULSORY SUPERANNUATION.

TO THE EDITOR.

SIR,—In some of your late numbers of the MEDICAL PRESS AND CIRCULAR I have read with much interest letters on the subject of compulsory superannuation for Poor-law medical officers, also your remarks on them "that it would be next to impossible to pass an Act of Parliament making it compulsory on Boards of Guardians to give such." I agree with you in this, but in my opinion there is no concession that could be made to us that would be more welcome or would give as much satisfaction. Now, granting that there is a possibility of receiving it from the poor-rates, still, I think, if there was a strong effort made, Government might be induced to pay from the Consolidated Fund as a retiring allowance after say twenty years' service, what is now paid—namely, half our salaries. It would not take a very large sum to do this—somewhere about £8,000 a year,—and I think we have a considerable claim on our country, and that it would not be too much to expect this. The sum I have mentioned would give £100 a year to eighty retired medical officers, not much more than is now given to retired head constables of the constabulary; and surely this could not be considered too much for members of an educated profession.

I remain, &c.,
DISPENSARY DOCTOR.

[Our correspondent's suggestion seems reasonable and feasible, and we hope will receive attention. If an effort were made to obtain Parliamentary sanction to the payment of half superannuation from the Consolidated Fund, the proposal would, we believe, receive the hearty support of the guardians throughout Ireland, and would thus be received with favour by the Government. The proposal has justice on its side, and its principle has been already fully recognised by the authorities, and it would therefore not seem difficult of achievement.]

MONAGHAN QUARTER SESSIONS.

W. N. BARRON, Esq., Chairman.

W. WOODS, ESQ., M.D., *v.* W. CRUMLEY.

THIS was an action brought by Dr. Woods, medical officer of the Monaghan Dispensary, against William Crumley, an ex-Poor-lawguardian, and formerly a member of the Monaghan Dispensary Committee, in which the plaintiff charged the defendant with having fraudulently issued a red ticket directing the plaintiff to attend at the house of a national schoolmaster named M'Geough, and administer advice, medicine, and attendance to his wife gratis, the said defendant not being a "poor person" within the meaning of the poor-relief Acts."

It will be recollected that a decree was granted by the chairman of quarter sessions against the grantor of the red ticket. The defendant appealed from the decree to the going judge of assize, who reversed the decree to enable the plaintiff to bring it into court in the proper form. The evidence was a recapitulation of the evidence given at the assizes, except that Bernard M'Geough, on cross-examination, said his income at the time he received the ticket was £30, his wife's was £20, and their combined results fees as national teachers amounted to £10. Besides these sums he had received £3 from the pupils; but notwithstanding that net profit, he was at a loss.

At the close of the evidence Mr. M'Loughlin addressed the court at great length, in the course of which he confined himself mainly to citing authorities as to what constituted fraud, and denied that this was a fraud within the meaning of the definitions given by lawyers. He also said it was without precedent, and said the attorney for the plaintiff should have given some precedent, or adduced reasons for bringing it into court.

Mr. Givan briefly replied, and the Chairman said he was against Mr. M'Loughlin on the main points of his argument, but he would give judgment on Friday morning. The Chairman gave judgment at four o'clock on Friday, and dismissed the case, on one of the points raised by Mr. M'Loughlin. that the action was not brought within three months or due notice given. He gave £1 of expenses. The plaintiff appealed.

TUAM DISPENSARY DISTRICT.

ELECTION OF MEDICAL OFFICER.

WITH reference to the late election of Dr. M'Donnell as medical officer of the Tuam Dispensary, a letter has been forwarded by the Local Government Board in reply to the bill of exceptions taken by the Rev. D. Corbett, chairman of the managing committee, to the effect that the election was regularly conducted, and the *ex officio* guardians present at the election were entitled to vote, although the list of *ex officio* guardians for the current year had not been laid before the board. The four *ex officio* guardians who recorded their votes for Dr. M'Donnell are duly qualified, and it is not necessary they should be annually elected.

BALLINA DISPENSARY.

CHARGE OF NEGLECT.

H. ARMSTRONG, Local Government Board Inspector, attended to inquire into the charge preferred by Thomas Mullen against Dr. Scott, medical officer of the Ballina District Dispensary, for alleged neglect of his wife.

Thomas Mullen examined—I got a red ticket on 4th June from Mr. John Beatty to attend my wife. I met Dr. Scott a quarter of a mile from my house, end he came at once. He did not delay long; he did not come a second time; on Tuesday morning the 6th I called in Dr. Nolan; he attended on the following morning.

To Mr. Thompson—I heard it reported that my wife did not die for three weeks after the doctor saw her; I heard it from different people, but cannot name any one person; it was read to me from the paper.

Bridget Coleman, an Irish witness, sworn. Am a midwife; I was in attendance on Mullen's wife when she was delivered; I was present when Dr. Scott called; when he came in he took off his top coat and bared his arm, but I saw him do nothing with the woman except to take a drop of blood from her; he threw the drop of blood on the floor, and said she would be well in a few days, that what was wrong with her would come off then.

Winny Coleman sworn—I was in Mullen's house when Dr. Scott called; he came to the bedside to the woman, and turned up his cuff; he did not bring the "after-birth" with him; he then said she would be all right in a few days' time; that the after birth would come away with the discharge; he ordered her a glass of wine; the woman herself cried out "could he do anything more for her," he said he could not; that she would be all right in a few days' time; I was present when Dr. Nolan came; he said if he had been there he would have relieved the woman, that he would have brought the after-birth with him.

Mr. Thompson—How long was Dr. Scott in the house? About a quarter of an hour.

Mullen asked that Dr. Nolan be examined.

Dr. Nolan—I can give you no information; the woman was dying when I saw her.

Inspector—You will be sworn, doctor.

Dr. Nolan sworn—On a Tuesday—I don't recollect the day of the month—Mullen came for me; I could not go then; he told me his wife was confined on Sunday, and that the after-birth had not come away since; I gave him a draught to relieve her; he came back the following day and said the women would not give the draught, the patient being too weak; I went out on that day and saw Mrs. Mullen; she was suffering from puerperal fever, of which she died in a few days after; I only saw her once, as I could be of no service to her, she was dying; I prescribed for her up to the time she died; I got £1 from Mullen.

Inspector—Do you think she was neglected in the first instance? I could not say that.

Mr. Egan—the great cause of complaint is the non-removal of the after-birth; can you say was that removed? The woman was so weak and tender I could not ascertain whether the placenta was there or not when I saw her.

Mr. Dillon—Could you not tell from appearance whether it was or not removed? I could not, she was so far advanced in fever.

Dr. Scott was then sworn—I met Thomas Mullen near his own house on the road; he handed me a red ticket; I immediately proceeded to his house; found Mrs. Mullen after being confined some time before of a living child; I was informed that the funis, or navel string, was not to be had; upon examination I found the woman had been improperly treated, and that some person pulled away part of the after-birth and the navel string; I introduced my hand and took the remaining portion of the after-birth with some clots of blood, and threw it on the ground; I then washed my hands, and asked her if there was any stimulants in the house; I was told there were none; I waited a short time to see if there would be any hæmorrhage, but there was none, and the woman seemed to me to be doing well, and I considered she would be well in a few days; Dr. Mahon and my brother were sitting in my waggonette outside while I was within; I did not think it necessary to call in Dr. Mahon; I did not visit the case again, as I became aware that a private practitioner was in attendance, nor was I called a second time, or had any communication with Mullen till some time after his wife died; he met me in Ballina, and I felt annoyed, as he blamed me for his wife's death.

Mullen—All I have to say is that Dr. Scott did not come the second or third day.

Dr. Scott—Did I not go at once when you asked me?

Mullen—You did indeed.

Dr. Scott—I would have gone if I thought it necessary or you had sent for me.

Mr. Dillon—Finding the woman, as you say, improperly treated, did you not consider it your duty to call the next day? No, as I left the woman going on well.

The midwife here advanced up the room towards the Inspector, speaking very loudly in excellent English.

The Inspector said he would not hear another word from her, and that she might consider herself very safe if not brought up before Mr. Mitchell on a charge of perjury.

Mr. Dillon to Dr. Scott—Who told you a private practitioner had been called in? Dr. Nolan told me on the following Tuesday, I think, and before her death.

Dr. Nolan was re-called at the instance of Mr. Dillon, and said that after Mrs. Mullen's death he met Dr. Scott, and told him he had been called in to see a patient of his, and that her friends were blaming him very much for his treatment of her.

Inspector—Had you any communication with Dr. Scott previous to the woman's death? None; I had with Dr. Thompson and Mr. McNulty.

Mr. Dillon—Have you ever stated to any person that the non-removal of the after-birth was the cause of Mrs. Mullen's death? I cannot recollect.

Dr. Thomas Mahon sworn—I was with Dr. Scott when he got this ticket; I went with him to the house, but remained outside till he came out; he was inside for nearly half an hour; when he came out he told me of the operation he had performed; he said it was a nice operation; I asked him what it was, and he explained to me that he had removed a retained after-birth; I heard him give the people instructions about the wine.

Mr. Thompson, honorary secretary of the Dispensary Committee, was examined by request of Dr. Scott, and deposed to the efficient and satisfactory manner in which Dr. Scott had discharged the duties of the office since his appointment twelve months ago, and to the very high terms in which the dispensary patients spoke of him.

The inquiry ended here.

◆

WATERFORD BOARD OF GUARDIANS.

The following extract from minutes of proceedings of the Waterford Board of Guardians on 8th September, 1876, is published by the Local Government Board in its last report:—

Read letter from solicitors, forwarding case submitted to counsel on behalf of Sir R. J. Paul, Bart., as Chairman of the Waterford Union, in reference to the powers of the Local Government Board to fix the salaries of the sanitary officers at a higher figure than that agreed upon by the Board of Guardians.

1. Counsel stated in reply to inquiriss,—"That in his opinion the effect of the Public Health Act, 1874, established by the decision of the Queen's Bench upon an earlier statute (Reg. *v.* Guardians of Bantry Union), is to empower the Local Government Board to compel the payment of the salaries approved by the Board. The sealed order will not authorise the treasurer to make the payment, but if the guardians should refuse to sanction the salary directed by the Board, a mandamus can be obtained by application to the Queen's Bench enforcing the payment of the salary fixed by the order notwithstanding the opposition of the guardians.

2. The medical officers cannot, in counsel's opinion, sue by action for their salaries, but they, as interested parties, can apply for the writ of mandamus to enforce payment of the sum which has been approved by the Local Government Board.

3. The Chairman is only one member of the Board of Guardians. He cannot be enforced in any way to obey the

orders of the Local Government Board, in signing checks or otherwise, contrary to the vote of the majority of the guardians, but the whole body of guardians can be compelled by mandamus to pay the approved salary.

4. The same difference of opinion arose in many poor-law unions. I believe that the opinion I have given above has been given by other counsel, and acted on by the guardians elsewhere. Inquiry might well be made as to this, because if it has been determined in any other union to contest the matter, the Waterford Guardians might be unwilling to yield until a general decison has been obtained, but I cannot advise litigation, and I would recommend the guardians to pass a resolotion under protest, to the sealed order, and directing the payment of the approved salaries. Gerald FitzGibbon.

The following proceedings occurred thereon :—

Read letter of the Local Government Board to the guardians, 17th September, 1875, for return of salaries of officers under "The Public Health Act, 1874," to be signed by the presiding chairman and executive sanitary officer.

The executive sanitary officer prepared the return as directed, and submitted it for the presiding chairman's signature ; but, on a division, the board decided by 11 to 6 votes to postpone the consideration of this return, as also the counsel's opinion upon the subject of the payment of the sanitary salaries fixed by sealed order of the Local Government Board for a fortnight.

Extract from Minutes of Proceedings of the Board of Guardians on 27th October, 1875.

The board having proceeded to the consideration of counsel's opinion upon the subject of the payment of the sanitary salaries fixed by the Local Government Board, &c., &c., it was moved and seconded " that this Board of Guardians adheres to its former resolution to pay the salaries of the sanitary officers as fixed by themselves.

The presiding chairman accordingly declined to sign the return prepared by the executive sanitary officer of the sanitary officers' salaries, the amount stated therein as the salaries of the rural sanitary officers being in accordance with the sealed orders of the Local Government Board.

Letter from the Local Government Board to the Board of Guardians.

Local Government Board, Dublin.

Sir,—The Local Government Board for Ireland have had before them the minutes of proceedings of the Board of Guardians of the Waterford Union on the 27th ult., when the opinion of counsel upon the subject of the payment of the salaries fixed by order of the Local Government Board was under consideration, and the following resolution was adopted :—

"That this Board of Guardians adheres to its former resolution to pay the salaries of the sanitary officers as fixed by themselves."

In reference thereto I am directed to state that the Local Government Board desire to learn whether, in face of the opinion given to them by the learned and eminent counsel whom they have consulted, the guardians of the Waterford Union are prepared to oppose a deliberate resistance to the law.

A specific statement of their intention to do so, on the other hand, to pay the sanitary officers what they are legally entitled to receive must be promptly given, if the guardians have any desire to avoid legal proceedings.

By order of the Board,
B. Banks, Secretary.

Extract from Minutes of Proceedings of the Board of Guardians on 1st December, 1875.

Moved and seconded, and resolved :—

That the order of the Local Government Board be carried on as regards the salaries of our sanitary officers to avoid the threatened legal proceedings, at the same time this Board protesting against the arbitrary and coercive policy of the Local Government Board.

GALWAY UNION.

THE MEDICINES.

A conversation took place in reference to a complaint made by Dr. Colohan of the quality of the medicine.

Mr. Kelly said it appeared strange to him that Dr. Colohan did not complain all the year. He would suggest that Dr. Colohan be sent for.

Dr. Colohan, who was sent for, said in reply to the Chairman that he frequently complained during the year of the medicines, and frequently sent them back. He complained to the apothecary ; as long as he considered it his duty to report against the medicine he would do so, irrespective of what any one thought.

Sir Valentine Blake suggested that the better way for Dr. Colohan would be to report to the Board in future.

Dr. Colohan said he would do so. It would be ridiculous to be cramming people's stomachs with medicine in order to get a desired effect.

The Chairman said that would not be very pleasant.

Dr. Colohan—Any member of the Board, from Sir Valentine down, might take two or three boxes of the pills without deriving the slightest advantage from them (laughter).

Mr. Kirwan said they would have the medicine analysed.

Dr. Colohan said that only milk and food could be analysed, but that medicine was one of those things that could not satisfactorily be analysed. It could only be tested by result—the benefit derived from its use in a number of cases.

CONTRACTS.

The Apothecaries' Hall was declared contractors for the supply of medicine.

◆

EXCERPTS FROM THE SANITARY OFFICERS' REPORTS FOR HALF-YEAR ENDING JUNE, 1876.

No. II.—North-Western Division.

Belleek.—The deaths in this quarter were much above the average, and have exceeded the births, which has never occurred heretofore. The sanitary arrangements are satisfactory.

Donegal.—The sanitary state of Donegal is in a great way improved of late.

Gweedore.—Scarlatina, which made its appearance in this district in the first month of the present year, still continues, and has for the past month assumed a very malignant form ; although not called to a great number of cases, I have reason to know that it has been very prevalent, scarcely a part of the district escaping ; unfortunately, the measures I recommended to the Sanitary authorities at the outset of the epidemic could not be carried out.

Moville.—Thirteen deaths were caused by scarlatina, which has increased the death-rate. Sanitary state of the district much improved.

Ederney.—Scarlatina has been very prevalent during the quarter. I am of opinion that the pernicious habit of concealing such cases has had the effect of spreading the disease to a very much greater extent than would have happened had due precaution been taken to prevent contagion. Whooping-cough is still very general over the district.

Irvinestown, No. 1, W.—Whooping-cough and scarlatina very prevalent in the district. I find the greatest difficulty in inducing the poor to avail themselves of the benefits to be derived from hospital treatment. Their neglecting to disinfect their dwellings, and the old custom of holding wakes when a death occurs, tends greatly to spread the disease.

Eglinton.—Scarlatina has been prevalent. The sanitary state of different parts of the district is anything but satisfactory. There is a studied determination to evade the provision of the law, not only by the cottier class but by the owners, from whom might be expected more enlightened action.

No. III.—Eastern Division.

Kingscourt.—The sanitary state of the district is very good, and the people carry out whatever improvements they are directed to do.

Carlingford.—The sanitary state of the district is now, after much trouble, improving.

Kells.—There is not a single case of infectious disease at present in the district. A grave sanitary defect, caused by an open main sewer, which I reported as far back as 1870, has been at last removed by the Town Commissioners, who have caused it to be lined and covered. As it ran the whole length of Back Street, behind the houses, and skirted the grounds attached to the extensive schools of the Christian Brothers, its open surface in dry weather reeking with foul odours, its removal marks an important step in the sanitary improvement of the town.

Rathmore.—I have to state that the complaint which I made six months ago of the want of water still remains unattended to; I have repeatedly reported the matter to the Sanitary authority.

Castletown.—Scarlatina of a malignant type made its appearance on three occasions during the last quarter. Out of a family of 5 attacked, 3 died. Good water scarce in this locality. Sanitary Act working well.

Shillelagh; *Coolkenna and Hacketstown.*—The district during the quarter has been very free from any epidemic. The sanitary arrangements of the district improving. My recommendations are in most cases complied with, without the necessity of many "reports" to Sanitary authority. No prosecution for neglect or disregard of notices.

No. IV.—North Midland Division.

Roscommon. –This nuisance has been repeatedly brought under the notice of the Sanitary committee, verbally and by official report, yet no steps were taken to remedy the evil. The sewerage of the whole town requires remodelling, and our water supply is totally insufficient, many of the inhabitants having to send carts a mile into the country for it.

No. V.—South Midland Division.

Carlow.—In some parts of the district much good has been effected by sanitation. The new Act, when passed, is sure to simplify the working of the sanitary organisation.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING OCT. 21, 1876.

Total registered deaths in Dublin and suburbs * ...	99	
Ten years average of same week	147	
Decrease of mortality below average	48	
Ratio of deaths, suburb of Rathmines ...	21·9	per 1,000
" " " Donnybrook †	18·7	"
" " " Blackrock ...	28·9	"
" " " Kingstown ...	16·8	"
" " Entire Dublin district ...	16·4	"
Comparative Ratios—London	18·3	"
" " Glasgow... ...	21·3	"
" " Edinburgh ...	11·6	"

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

There were only 13 deaths from zymotic diseases registered during the week; the average number in the corresponding week of the previous ten years was 47·8. Of the deaths from these deaths last week 4 were from fever (1 typhus, 2 typhoid or enteric, and 1 simple continued fever), 4 from diarrhœa, 3 from scarlet fever, and 1 each from measles and diphtheria.

Twelve children died from convulsions.

Bronchitis caused 6 deaths, pneumonia 3, lung disease unspecified 1, stomach disease 3, liver disease 1, obstruction of the bowels 1, diabetes 1, kidney disease unspecified 1, heart disease 3, paralysis 3, apoplexy 2, inflammation of the brain 1, and brain disease unspecified 8.

Thirteen deaths resulted from phthisis, 3 from hydrocephalus, 1 from scrofula, and 2 from cancer.

Two accidental deaths were registered, viz., 1 from fractures and 1 from drowning.

Pathological Anatomy of the Brain—
LOCALISATION IN CEREBRAL DISEASE. (a)

By PROF. CHARCOT.

CHAPTER XI.

GENTLEMEN,—I have in the last lesson furnished the anatomico-medical description of the cortical system of the cerebral arteries. To-day, I propose to call your attention to the arterial circulation of the *grey cortical ganglia.* You know that under this name are included the thalami optici, the corpora striata, and what we may call their annexes. Here, gentlemen, is a study well worthy of your careful attention; for the phenomena which occur in these nuclei, in consequence of vascular lesions, are by no means of less importance than those which happen in the surface of the brain in consequence of alterations in the cortical arteries. We shall find in the central regions of the brain which will occupy us now, ischemic changes such as we have descibed in the cortex of the brain; but, we shall also encounter lesions on a grand scale, such as rarely occur at the periphery. I speak of common intracephalic hæmorrhage, one of the most common anatomical causes of apoplexy. There is, in this respect an interesting contrast between the centre and periphery of the brain. In the latter, intercephalic hæmorrhage is comparatively rare, while it is common in the former. This fact is shown distinctly by the ancient statistics of Andral and Durand-Fardel, and by modern statistics as well. In 119 cases collected by Andral and Durand-Fardel, the thalamus opticus and the corpus striatum were in 102 cases the starting points of hæmorrhage, while 17 cases only arose in the centres or peripheries of the anterior and posterior lobes. On the other hand, ischemic softening of the brain predominates (as Durand-Fardel judiciously remarks), in the superficial parts. The facts which I have collected at the Salpétrière confirm these results in all points.

We shall presently have to indicate certain conditions which will explain this remarkable contrast; for the present it is sufficient to fix your ideas on this point, in order that you may know that supposing the studies concerning the cortical arterial system to have been a necessary introduction to the chapter treating of ischemic softening of the brain, then the "developments" into which we are about to enter are the necessary introduction to the not less interesting study of intra-cerebral hæmorrhage.

1. You have not forgotten, gentlemen, in what manner the arterioles constituting the *central system* take origin from the three great central arteries, close to their origin from the circle of Willis. The arteries forming this system are generally vessels of a certain importance as to size. The arterioles of the corpus striatum have a diameter of half to one and a-half millimetres, according to M. Duret.

Their mode of origin recalls that of the young suckers which one sees in woods shooting up at the base of the trees. This comparison, which is due to Heubner, besides being picturesque is also exact, but it must not be pushed too far; for the arteries of the central system, from their starting point, run perpendicularly to the axis of the principal trunk.

This perpendicular direction reminds us of what we have seen in the nutrient arteries of the brain cortex. It is always as well to recollect that there is a difference between the nutrient arteries of the cortex and those of the gray central nuclei—the former being actually capillaries (according to Robin's definition), the latter, on the other hand, being vessels of some size.

Another characteristic of the arteries of the central nuclei is that, according to the meaning of the word given by Cohnheim, they are, *par excellence*, "terminal" arteries. Though it might be possible, as we have seen, to raise a discussion concerning the autonomy of the vascular territories of the cortex, it is not so with regard to the central arteries, they are entirely independent of one another, that is a point on which our observers are quite agreed.

(a) Translated from *Le Progrés Medical.*

So, says Heubner, one may, with the aid of a Pravaz syringe, whose trocar point is blunt, inject one by one all the little arteries running to different parts of the corpus striatum or thalamus opticus. In spite of all possible precautions, it has never been possible to inject the whole of the corpus or the thalamus. You will only inject small departments of either of these bodies; if the injection is pushed too far ruptures are caused, but the vascular territories do not extend beyond the indicated limits.

The multiplied experiments of Duret have the same result. It is right to add that under no circumstances is it possible to cause injected matter to pass by the central arteries into the domain of the cortical arteries. And I will remind you that the reverse is equally true—viz., that no injection in any artery whatever of the cortical system will enter the central arteries.

It may, perhaps, be interesting to review the analogies existing in the mode of origin of the nutrient arteries of the basilar parts of the brain, the pons varolii and the medulla.

In the pons the resemblance is striking, the median arteries springing at a right angle from the basilar artery (a large trunk) and penetrating as far as the posterior parts, parallel to one another, without anastomosing, thus they seem to belong to the "terminal arteries."

In the medulla the same arrangement obtains, but is in some sort weakened by a special modification. The median arteries of the medulla do not spring directly from the great trunks of the vertebral artery, they arise from the spinal vessels.

It is already possible, if I am not mistaken, to find in this mode of origin and distribution of the arteries of the pons, and central ganglia a reason of a mechanical sort, which will help to explain the predominance of arterial ruptures in these parts.

Remember that on the surface of the brain where, as I have told you, hæmorrhages are comparatively rare, arteries do not penetrate the brain substance until they have run a long course in the pia mater, and are transformed into very small vessels, strictly speaking, capillaries. I say, remember these peculiarities, and you will the more easily understand the differences which I have called your attention to in the central arteries.

1. The distance from the heart to the great ganglia at the base of the brain is very short. The arteries going to these ganglia come directly from the arteries of the circles of Willis, and are of the third order, reckoning from the heart. This circumstance is clearly favourable to arterial rupture. It is, in truth, compensated in a certain proportion by the mode of origin of the vessels, taking place at a right angle, and by the great difference in size as well.

2. As compared with the cortical arteries, the central arteries are voluminous; I allude especially to the arteries of the corpus striatum, since they are half to one and a-half millimetres in diameter.

3. I will add that the absence of anastomoses is a further danger, for in case of exaggerated pressure in a vessel, any relief is impossible by reason of the absence of a collateral circulation.

The three great arteries of the brain, as I said in commencing, all take part in the vascular supply of the central regions, but the part is very unequal.

The anterior cerebral only sends a few vessels to the upper part of the corpus striatum, and these branches do not invariably exist. The posterior cerebral has a much more extensive and more important domain. It furnishes branches to a large extent of the thalami optici to the upper third of the cerebral peduncles, and to the corpora quadrigemina.

The middle cerebrals give all the branches which pass to the tailed nucleus with the exception of variable branches from the anterior cerebral, and to different parts of the lenticular nucleus.

We will therefore take the branches of the middle cerebral as the type of our description. It will be easy for us afterwards to complete the account of the nutrient cerebral system, by some words relating to branches of the anterior or posterior cerebral artery.

◆

THE ADULTERATION OF FOOD, AND BRITISH LEGISLATION RELATIVE THERETO.

By Dr. C. R. Alder Wright,

Lecturer on Chemistry at St. Mary's Hospital.

(Continued from page 354.)

For comparison with these numbers, the following table may be given deduced from returns furnished by the great majority of public analysts in Great Britain, appointed under the "Adulteration of Food, Drink, and Drugs' Act 1872," (*Chemical News*, XXXI, 148):—

Place.	Time that the Act has been in Operation.	Total number of Samples analysed.	Number found to be Adulterated.	Number of Convictions.	The Adulterated Samples included—					
					Milk.	Tea.	Mustard.	Butter.	Bread.	Coffee

Total number of samples analysed ... 15,480
Ditto found to be adulterated ... 3,963
or 26 per cent.
Total number of convictions 1,542
or 10 per cent.

Mr. G. Wigner gives the following statistics derived from the returns of sixty districts showing, during an average period of sixteen months, (*Chemical News*, XXXI, 115):—

Total number of samples analysed	...	14,383
Ditto found to be adulterated	...	3,774

or 26 per cent.

Of these 3,774 adulterated samples, 1,066, or about 37 per cent. were samples of milk.

In three of the largest metropolitan districts during eighteen months upwards of 700 samples of various kinds were examined, of which 84, or less than 12 per cent., were found to be adulterated; of these, however, a much smaller percentage of adulteration was found in the latter part of the period than in the former, when the percentage was correspondingly higher; thus, whereas, at first every sample of bread was more or less adulterated with alum, at the end of the period no trace was to be found in any sample; whilst of sixteen consecutive samples of milk taken in 1873, fourteen were either skimmed or watered, out of thirteen taken at the end of the period in the same districts, only two were adulterated.

The deterrent effect of the appointment of analysts and of those rigorously carrying out the object of their existence is thus rendered very evident.

As the result of the outcry which the disclosure of the *Lancet* commission naturally caused, the Act of 1860 was passed, whereby power was given to various authorities in the country generally to appoint analysts in these several districts for the purpose of systematically examining articles of food and drink, and drugs, and certifying to their purity or otherwise. Thanks, however, to underhand trade influences, the appointment of these officers was made *optional* and not compulsory, and as a natural result very few were actually appointed, and of these most found that the duties of their position were but little onerous, little or no work of any kind being submitted to them; one, however, the analyst for Dublin succeeded in actually carrying the Act into practice having made since 1862 something like 2,600 official analyses of articles of food, drink, and drugs, out of which number about 1,500 (58 per cent.) were found to be adulterated, whilst 342 convictions (13 per cent.) were obtained for the following. (Paper by W. L. Scott, on "Food Adulteration and the Legislative Enactments Relating Thereto." *Journal Soc. Arts*, XXIII, 427.) Adulterated samples of milk, 286; coffee, 28; tea, 2; bread, 2; butter, 2; mustard, 6; essence of coffee, 1; champagne, 1; brandy, 1; gin, 1; confectionary, 12; total convictions, 342.

These figures show a state of things in Dublin between 1862 and 1872 almost as bad as that found previously in Great Britain; and it hence seems extremely probable that little actual good resulted from the 1860 Act, what little was effected being due rather to its passive deterrent effect than to any special means of prevention brought into action through its provisions; indeed, it does not seem that more than some three hundred cases were examined under the Act in England between its becoming law and the passing of the "Adulteration of Food, Drink, and Drugs Act, 1872"; at any rate, notwithstanding the Act, adulteration was most widely practised during this period, whilst, as above shown, the more effective provisions of the 1872 Act have considerably decreased the frequency of the practice, although unfortunately the first steps only in the matter of repression are accomplished as yet.

The wording of the clauses of the 1872 Act relative to the punishments to be inflicted on sellers of adulterated food, drink, or drugs was as follows:—"The Pharmacy Act of 1868, and the "Act to regulate the sale of poisons in Ireland." being incorporated in this Act in its application to England and Ireland respectively, the practice of adulterating articles of food and drink and drugs for sale, in fraud of Her Majesty's subjects, and to the great hurt of their health and danger to their lives, requires to be repressed by more effectual laws than those which are now in force for that purpose.

"Be it therefore enacted by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

"1. Every person who shall wilfully admix, and every person who shall order any other person or persons to admix, with any article of food or drink, any injurious or poisonous ingredient or material to adulterate the same for sale, and every person who shall wilfully admix, and every person who shall order any other person or persons to admix, any ingredient or material with any drug to adulterate the same for sale, shall for the first offence forfeit and pay a penalty not exceeding fifty pounds, together with the costs attending such conviction, and for the second offence shall be guilty of a misdemeanour, and be imprisoned for a period not exceeding six calendar months, with hard labour.

"2. Every person who shall sell any article of food or drink with which to the knowledge of such person any ingredient or material injurious to the health of persons eating or drinking such article has been mixed, and every person who shall sell as unadulterated any article of food or drink, or any drug which is adulterated, shall for every such offence, on a summary conviction of the same before two justices of the peace at petty sessions in England, or before two justices of the peace in the justices of the peace court, or before the sheriff substitute of the county, or before any magistrate acting under any general or local Police Act in Scotland, or before justices at petty sessions or a divisional justice in Ireland, forfeit and pay a penalty not exceeding twenty pounds, together with such costs attending such conviction as to the said justices, sheriff substitute, magistrate, or divisional justice shall seem reasonable; and if any person so convicted shall afterwards commit the like offence, such justices, sheriff substitute, magistrate, or divisional justice shall cause such offender's name, place of abode, and offence to be published, at the expense of such offender, in such newspaper or in such other manner as to the said justices shall seem desirable.

"3. Any person who shall sell any article of food or drink or any drug, knowing the same to have been mixed with any other substance with intent fraudulently to increase its weight or bulk, and who shall not declare such admixture to any purchaser thereof before delivering the same and no other, shall be deemed to have sold an adulterated article of food, drink, or drug, as the case may be, under this Act."

It is here specially noticeable that the preamble of the Act makes *fraud* on the purchaser a chief reason for the repression of adulteration, and as it is expressly recited in the second clause that "every person who shall sell as unadulterated any article of food or drink, or any drug which is adulterated, shall for every such offence" be liable to certain penalties, it is evident that the plea which has been often raised that the seller sold the goods in the condition in which he bought them is of no avail; it is the seller's business to see that the goods supplied to him by the wholesale merchant are unadulterated, and if he is too busy or too indifferent to see to this he must bear the consequences. That an enactment of this kind would raise up a vehement opposition to it is self-evident, and the experience of the last two or three years has clearly shown, not only that the provision was extremely necessary from a common-sense view, but that it was felt by the food trades to be a great bar to their lucrative malpractices whence the great outcry raised about the "hardships" inflicted on retail tradesmen by the enactment, and the attempt made by every possible device, not always of the most worthy nature, to enlist popular sympathy on the side of the knavish or culpably careless smaller dealers.

A defect in this Act is the not defining what is meant to be an adulteration, wherefore the decisions of the courts have been somewhat uncertain on this point, and some

b

admixtures having been allowed to escape without punishment, on the ground that they were not adulterations within the meaning of the Act. Thus many have argued that the imparting of a "face" or "colour" to tea by mineral and other substances, or the addition of starch to cocoa or mustard, is not an adulteration; whilst, on the other hand, the strict wording of the Act hardly allows of the abstraction of cream from milk being viewed as an adulteration within the meaning of the Act, although there can be no doubt from a common-sense point of view that the practice is just as reprehensible as watering the milk; accordingly, whilst some magistrates have refused to convict for these offences, others have inflicted penalties in precisely similar cases.

As regards the recital in the third clause, that "any person who shall sell any article of food or drink, or any drug, knowing the same to have been mixed with any other substances with intent fraudulently to increase its weight or bulk, and who *shall not declare* such admixture to the purchaser thereof," "shall be deemed to have sold an adulterated article;" it has been almost unanimously decided that what is meant by this is that a *verbal* declaration shall be made to the purchaser; and fines have been inflicted for selling mixtures even when *labelled* as such (though not verbally stated to be mixtures).

The clauses relative to the appointment of the analysts under this Act and their duties recite that certain authorities may, and when required by a Local Government Board, a Secretary of State, a Lord-Lieutenant, &c., "shall for their respective city districts, counties, and boroughs, appoint and remove one or more persons possessing competent medical, chemical, and microscopical knowledge as analysts of all articles of food, drink, and drugs purchased within the said city, metropolitan districts, counties, or boroughs, and shall pay to such analysts such salary or allowances as they may think fit; but such appointments and removals shall at all times be subject in England to the approval of the Local Government Board, in Scotland of one of her Majesty's Principal Secretaries of State, and in Ireland of the Lord-Lieutenant or other chief governor or governors.

"The inspector of nuisances or the inspector of weights and measures, or the inspector of markets, one or all of them, as the local authority appointing them shall think fit to determine, in every district, county, city, or borough, shall procure and submit samples of articles of food or drink and drugs suspected to be adulterated to be analysed by the analysts appointed under this Act, and shall, upon receiving a certificate stating that the articles of food or drink or drugs are adulterated, cause a complaint of an offence against this Act by the party selling or adulterating such articles of food or drink or drugs to be made before a justice of the peace.

"The analysts appointed under this Act shall report quarterly to the local authorities appointing them the number of articles of food, drink or drugs analysed by them under this Act during the foregoing quarter, and shall specify the nature and kind of adulterations detected in such articles of food, drink, and drugs, and all such reports shall be read at the meetings of the local authorities appointing such analysts.

"Any purchaser of any article of food or drink or drugs in any district, county, city or borough, where there is any analyst appointed under this Act, shall be entitled, on payment to the inspector or inspectors appointed under this Act of a sum not less than two shillings and sixpence, nor more than ten shillings and sixpence, which shall be accounted for to the local authority appointing such inspector or inspectors, to have any such article analysed by any analyst who may be appointed for such district county, city, or borough, and to receive from such analyst a certificate of the result of his analysis, specifying whether in his opinion such article is adulterated, and also whether, if it be an article of food or drink, it is so adulterated as to be injurious to the health of persons eating or drinking the same, and such certificate, duly signed by such analyst, shall, in the absence of any evidence before the court to the contrary, be evidence of the matters therein certified, and the sum so directed to be paid for such certificate shall be deemed part of the costs.

"All articles of food, drink, or drugs to be analysed by the analysts appointed under this Act shall be received by the inspectors appointed by the local authorities, and from all such articles of food, drink, or drugs samples shall be taken and sealed in the presence of the analysts by the inspectors, to be retained by them and produced in case the justices, sheriff substitute, magistrate, or divisional justice shall order other analyses to be made."

Some points in these clauses call for a considerable amount of criticism. In the first place, the authorities are only compelled to appoint an analyst when required to do so by a Local Government Board (England), a Secretary of State (Scotland), or the Lord-Lieutenant, or other chief governor (Ireland): the result of this has been that in many districts the appointment of analysts was delayed for a long time, whilst in many places no analyst at all has as yet been appointed! (*a*) Next, the authorities named to make the appointments are the Commissioners of Sewers of the City of London and the liberties thereof, and the vestries and district boards in the rest of the metropolis, the Court of Quarter Sessions in every county, and the Town Council of every borough having a separate Court of Quarter Sessions, or separate police establishment, in England; the Grand Jury of every county, county of a city or county of a town, and the Town Council of every borough, in Ireland, and the Commissioners or Boards of Police, or failing the latter, the Town Council for boroughs in Scotland. Now experience has shown that in many cases these authorities are accessible to trade influences exerted directly or indirectly, and as the result, analysts have been appointed whose special knowledge and skill in the work required of them was almost absolutely *nil*, the object of this being purposely to stultify the Act, and to defeat its provisions, even whilst nominally complying with them. The same result has been attained in other places by the simple device of neglecting to forward samples for analysis to the analyst when appointed; thus in Oxford, High Wycombe, Cambridge, Cornwall, and Derby no samples whatever had been submitted for examination up to April, 1875 (W. L. Scott, *Journal Soc. Arts*, xxiii., 434). Again, even in places where this underhand work was not in vogue, it has frequently happened that the authorities named to make the appointment have been about as unfit to judge of the qualifications of a candidate, and to decide between several as to which was the best, as could well be imagined. The result of this has been that in several instances inferior (though not necessarily incompetent) candidates have been selected, and superior ones neglected, either because the former were personally known to some of the appointing authorities, or because they were not as careful of their dignity as their more high-minded co-applicants, and did not feel it beneath them to canvass for votes, and solicit the support of the appointers previous to the selection being made. The following description of the mode of interrogation sometimes practised towards candidates by the appointing authorities is very far from being a caricature, most, if not all of the questions mentioned having been actually put to candidates of the class described, whilst the style of the whole interview described is in no way exaggerated. A vacancy occurring in the analystship of a large district, the same is duly advertised, candidates being requested to send in their applications, *accompanied by testimonials*, before a certain date. Accordingly, something like a couple of dozen applications are received, many of which are from more or less unsuccessful medical practitioners, whose knowledge of chemistry and of analytical work (presumably never great) has not been increased by years of desuetude; some are from fairly trained but inexperienced students, in some school or college of science; others are from well-known chemists, who have acted as referees in disputed cases under the Act; or from public

---

(*a*) This paper was written before the passage of the 1875 Act (Sale of Food and Drugs Bill, 1875.)

analysts practising in neighbouring districts. On some fine day all candidates who choose are "interviewed" by the appointing authorities; those who do not care to subject themselves to this not very dignified ordeal, or who may be otherwise engaged, being probably struck off the list at once. It is scarcely necessary to say that the Board, or whatever it may be that interviews the candidates, is mostly composed of gentlemen or tradesmen, or both, wholly innocent of any knowledge of chemical science generally, and especially of any practical knowledge of the special work and qualifications required :—

Enter Professor A B C, *a pure chemist, well known for various elaborate investigations.*

Chairman.—You are professor of chemistry in such-and-such a college?

A B C.—Yes.

Chairman.—You are a graduate of such and such a university, and possess such and such qualifications and diplomas?

A B C.—That is so.

Chairman.—You have made chemical investigations your special study, and are familiar with the kind of work required by the Act?

A B C.—I am, having had such and such special experience.

Chairman. — Oh, yes; we understand you are a chemist, (*a*) and know all about drugs, but have you any *medical* knowledge?

A B C.—Medical knowledge is not of the slightest use in the chemical examination of food, &c., for adulterations; it is, however, one of my special occupations to instruct embryo medical men in subjects which are most intimately connected with the working of the Act.

Chairman.—That means you can only test chemically, not medically?

A B C.—There are no processes which can be called medical tests apart from chemical ones, saving perhaps, physiological experiments on animals, &c., with poisons and such like; and before these can be applied in cases under the Act the poisons must be extracted by purely chemical means.

A Member of the Board.—I can't understand you; do you know anything about (refers to pocket-book) qua—quat—no—qualitative analysis? I understand that is an important subject?

A B C.—I have already said I am a *teacher* of this subject; qualitative and quantitative analysis are the essentials in my particular vocation.

First Member.—Well, I can't make that out. According to you there are several sorts of analysis. What is the difference; is'nt analysis, analysis?

A B C attempts, with limited success, to expound the matter, but is cut short by another querist, presumably a lawyer.

Second Member.—In your experience in cases under this Act, did you usually succeed in getting your clients off? We always consider that that is more creditable to a man than merely obtaining convictions.

A B C.—People do not usually refer samples that they know to be adulterated to adepts or consulting chemists; it is only when a man thinks that a mistake has been made by the analyst, and that no real adulteration is present, that he wishes for another opinion to upset the analyst's certificate. Consequently, in most of the reference cases in which I have been consulted, the result of my examination has been favourable to the appellant.

Second Member.—Ah, yes; but you are not a medical man?

A B C.—No, but I have the honour of teaching medical men that are to be.

The Chairman.—You don't seem to care much for the appointment; you have not even taken the trouble to print your testimonials, and send them to each member of the appointing Board.

A B C.—The Board did not state in their advertisement that that was necessary. I think it most undignified to canvass *in any way*, or to solicit votes in such matters; and I may further say that if first-class men of reputation are wanted for such appointments, it is not a likely way to induce them to come forward to put them on a par with beginners, and make them produce testimonials, especially when their own testimonials to competent men are accepted by other authorities.

Chairman.—Yes, that is all very fine, but let me tell you that unless you ask people for votes they will give them to some one else more suited to the appointment.

A B C.—Having been given to understand that the Board asked for the best man they could get, I am glad to know what are their views as to excellence in such matters.

Chairman.—I think we need not detain you any longer.

End result. A B C is "nowhere" in the selection, and X Y Z is appointed, he having taken the precaution to solicit as many votes as he possibly could previously, and having met with some such experience as the following, while so doing :—

X Y Z calls on a leather dresser in the afternoon; finds him with a long clay pipe and a pot of ale, engaged in discoursing over matters in general with two or three grooms and coachmen. "Mr. So-and-so, I believe?" "The same; who do you want?" "I have called about the appointment advertised in this district." "Who are you, and wot do you know about it?" "I am so and so, and have such and such knowledge." "Set down, young man, and have a glass of ale; these gentlemen here (the groom, &c.) will be very pleased to make your acquaintance." Groom: "Looks *tovards* you; vish you success. This gentleman 'ere (the leather dresser) his a great friend of mine, and hall friends of 'is hare velcome." Leather Dresser: "Look 'ere, young man, we don't want no hinterference in our parish matters; if I votes for you (hic), you must just attend to your own business, and do your work quietly, do you see." X Y Z being desirous of obtaining a vote, and not being very particular, having made up his mind to swallow anything whilst canvassing, sits and smokes a pipe, drinks beer with his host and his guests, assents to all they have to say, receives their advice on all points connected with his profession, and, finally, after having cordially shaken hands with all, departs with the comforting reflection that his host thinks him a "very haffable chap," and has promised that if he does'nt meet with any "more properer" candidate, he will be 'appy to vote for X Y Z, but he "halways votes for the best man as can be got." (*a*)

What wonder, knowing that even the best candidates often stand little chance unless they choose to run the risk of meeting with such adventures as the above, that the names of the leaders in the chemical world are for the most part "conspicuous by their absence" from the list of public analysts?

(*To be continued.*)

The Servian Government have bestowed the decoration of Jakowo on Mr. Hume, an active and energetic young English surgeon, and on Mr. Kenett, who has done good service in organising the transport of wounded between the front and the English hospital at Belgrade.

(*a*) The popular notion of a "chemist," even among many educated persons, is a man in a clean white apron, mixing pills, or dispensing prescriptions; the idea that there is something in connection with chemistry which may enable a highly educated man to exercise his knowledge in as purely a professional way as a lawyer or clergyman, is one which has never entered the crania of most people; whilst the notion that there is a higher rank still, that of the experimental philosopher, bearing to the others somewhat the same relation as Rafaelle to a talented art designer, or to a house decorator, is one quite beyond the popular conception. It is unfortunate that in England the same word has, in practice, to do duty for both "chimiste" and "pharmacien."

(*a*) This is given to us as a faithful report of what actually occurred to a canvasser for a metropolitan vacancy (as medical officer of health, however, not as analyst).

ON ALCOHOL. (a)

By F. J. Boxwell Quinlan, M.B., M.D. Univ. Dub., L.R.C.S.; L.K.Q.C.P., &c.,
Physician to St. Vincent's Hospital, Professor of Materia Medica in the Catholic University.

Gentlemen,—On the present occasion I wish to make a few observations upon the alcohol question—a subject of the most profound physiological and moral interest—which has latterly occupied a foremost place in public attention, and the settlement of which cannot be far distant. Into the political and social aspect of this great question I do not purpose to enter, but simply to explain to you the exact physiological position of alcohol as a medicine for the treatment of certain forms of illness, as an article of dietetic use for the invalid, and lastly, as an agent of ordinary consumption among the healthy. Alcohol is composed of carbon, hydrogen, and oxygen, chemically united, and occupies an intermediate position between the hydrocarbons or fats, and the carbo-hydrates or starches and sugars. Both of these great classes of alimentary substances are powerful and undoubted sources of nutrition, and producers of heat and of motion. What is the exact position and value of alcohol, which, chemically speaking, occupies an intermediate position between them? The only satisfactory answer to this question will be a brief examination of the physiological action of alcohol on the animal economy. I may here mention that under the term alcohol I include beer, ale, and porter, which are made by the fermentation of corn or starches; wine, which is produced by the fermentation of the juice of the grape, and the various kinds of spirit which are obtained by distilling fermented products, and thus extracting from them the alcohol which they contain. Many years ago the distinguished Liebig put forth the doctrine that all foods were divisible into nitrogenous or flesh-forming, of which meat and vegetable albumen are the types, and carbonaceous, consisting of fat, starch, and sugar. He maintained that nitrogenous food was the source of all muscular power; that every muscular act consumed nitrogen; that the excretion of nitrogen from the body was in proportion to muscular work, and that the amount of work done could be determined by measuring the nitrogen excreted. As a corollary of this it was held that carbonaceous food simply maintained vital heat by its combustion in the system. This system, so plausible, and with so much to recommend it, reigned supreme up to a very short time ago, when it was suddenly and completely overthrown by the experiments of Fick and Wislicenus, of Zurich. Their observations have been repeated upon Weston, the celebrated American pedestrian, in his 100-mile walks, and on other occasions. The matter is now settled beyond all doubt by a series of careful and accurate experiments upon man and animals, performed in various countries and by observers of reliability and eminence. It is now proved that carbonaceous food supplies motive power as well as bodily heat; that the muscles are the agents, and not the sources, of motive power; that the excretion of nitrogen is in proportion to the amount taken into the system, and not to the work done; and lastly, that nitrogen not only builds up muscular tissue, but actually contributes to vital heat. This doctrine is one of the two keys of the alcohol question. The other is the determination of what becomes of alcohol when introduced into the system and of the method and form in which it or its component elements are eliminated from the body. This question, after much controversy, has been nearly settled. Enough is settled, however, to guide us completely. Liebeg asserted that although a small quantity of the alcohol introduced into the system was excreted as alcohol by the breath and other ways, still that the great majority of the alcohol so taken in was destroyed in the system by oxidation; and that alcohol was a source of bodily heat only second to fat. As far as very moderate quantities of alcohol are concerned, this distinguished chemist has turned out quite right. In the French school, on the contrary, a very different view was maintained by Lallemand, Perrin, and Duroy, that any amount of alcohol great or small, taken into the system was excreted from the body as alcohol and wholly unchanged. Consequently they maintained that alcohol could not be a source of either heat or power—that it, in fact, acted as a spur acts upon a horse, eliciting the power of the animal but of itself supplying no force. This view has also been upset by a series of carefully performed experiments, and it is now conclusively shown that, although a small quantity of the alcohol taken into the body is eliminated, unchanged by the lungs or otherwise, still that the predominating quantity continues circulating in the blood, is consumed in the system, and does not appear as alcohol in any of the channels of egress from the body. This consumption, which must take place by chemical action, which is another word for heat or its correlative force, would at once establish alcohol as a source of heat and force were it not for this very important reservation —the fact that a small quantity of alcohol stimulates the nervous system and the bodily functions, but a larger proportion of it depresses them and materially checks and interferes with the vital processes by which heat, energy, and life are maintained. The capability of individuals for bearing the effects of alcohol varies very much. Some persons, and it is their misfortune, can bear a great deal; others very little. By a series of experiments upon animals, Dr. B. W. Richardson has ascertained that thirty grains of pure alcohol (about a dessertspoonful of proof spirit) to each pound of the animal's weight produces intoxication; and that double that quantity endangers life. I may here observe that proof spirit consists of forty-nine parts of pure alcohol and fifty-one of water. The nearness to equality of these proportions arises from the fact that in ancient times, before the hydrometer first was invented, spirit was tested by placing a small quantity of gunpowedr on a plate and soaking it with the spirit to be proved. If the spirit lighted on the application of the flame, and after a brief interval exploded, the gunpowder leaving the plate dry, the spirit was said to be up to proof. And it is to this rough and now almost forgotten process that our standard point is due. There is no doubt that the introduction into the system of a small quantity of alcohol—for example, of a glass of sherry or half that quantity of spirit diluted with water—stimulates the nervous sytem, quickens and strengthens the action of the heart, and slightly elevates the temperature of the body. After a certain interval these effects cease, and reaction sets in. By repeating the dose, the same results are again obtained, and the process can be kept up for a time, but not indefinitely. It is on this principle that the physician proceeds. He has a patient before him suffering from some acute disease, accompanied by such a prostration of vital power as threatens that the patient will die before the physician has sufficient, or in fact any time to combat the acute attack. By small and often-repeated and carefully-watched doses of alcohol he supports the flickering lamp of life for twenty-four or thirty-six hours, and thus gains time for the action of his remedies. When large quantities of alcohol are at once introduced into the body the effect is uniform and instructive. The co-ordinative power of the muscles is interfered with, beginning with those of the lower lips and those used in the production of speech, then proceeding to those of the legs, and lastly of the rest of the body. The vital processes are now interfered with, and a great and sudden fall in the bodily temperature, often as much as two or three degrees, ensues. Consciousness is next suspended, and, except feeble action of the heart and lungs, no function is proceeding, and the fall of temperature is as much as four degrees. If the sufferer be exposed to cold and without warm clothing, the heart and lungs cease to act and death ensues. More usually the alcohol is slowly destroyed and eliminated, and the sufferer awakens weak, with prostrated nerves, dried up secretions, and, above all, an overpowering sense of chilliness, for the bodily temperature, although falling quickly, recovers slowly, and too often the alcohol is again resorted to to relieve the prostration and chilliness. The above observations will, I think, place the physiological action of alcohol in a very clear point of view. The views I have expressed have been well set forth by M. Desguin at the recent conference at Brussels. He laid well-merited stress on the fact that the action of alcohol may be divided into two stages—the stimulative, when it enhances the bodily functions and raises the temperature of the body; and the depressive, where it does the contrary—and points out that the efforts of the physician should always be directed to keep his patient (where he employs alcohol at all) in the stimulative stage, and never to allow him to even enter the stage of depression or loss of temperature. The above facts throw a strong light upon the folly of using large quantities of alcohol on the part of persons exposed to cold and hardships. They could not use a worse thing, and this fact is well known to all Arctic voyagers. The employment of alcohol as a medicine in cases of acute disease, attended by prostration of vital power is a very simple problem indeed. Carefully and prudently administered, alcohol has an almost magical effect in such cases; and there is no agent capable of replacing it. If denied it, such cases usually end fatally; and a hard and fast line of treating all diseases without alcohol is, in my opinion, opposed alike to physiology and to good sense. The prescribing of alcohol as a dietetic remedy of habitual use to persons in delicate health or in conditions of chronic debility, is one of the most difficult, perilous, and responsible duties which the physician has to discharge. There is no doubt that, in very many elderly persons, and in those recovering from acute illness, the action of the heart is weak, and the nervous system is prostrated; and that in such cases moderate quantities of wine, porter, or ale are found beneficial. In many forms of weak digestion a small quantity of spirit and water, taken with a meal, promotes the secretion of gastric juice, and thus helps digestion. I may here remark that raw spirit, by coagulating the pepsine of the gastric juice, has the very opposite effect. In all these cases alcohol must be dietetically prescribed; but the physician should use this two-edged sword with the utmost caution and reserve. He must remember that if it has done much good it has also done much harm, and that thousands have thus acquired a taste which has been their ruin, and which they otherwise might never have acquired at all. I think, however, that the matter is one which is best left to the judgment of the profession, who are quite aware of the dangers and responsibilities in question. The use of alcohol as an article of habitual or occasional use among the healthy is our greatest social problem, and one which time does not permit me to discuss. I will merely express my conviction that alcohol, like tobacco, cannot under any circumstances be regarded as a necessary of life to the healthy. Both one and the other of these potent and widely used substances are to the healthy simple luxuries, and as such have by most Governments and countries been selected as a means of raising revenue—a course much more consonant with reason and humanity than the taxation of salt or other articles of indispensable necessity. There is no doubt, however, that the moderate and rational use of alcohol or of tobacco, with many persons with whom they agree, greatly conduces to the enjoyment of life, and is occasionally beneficial. With some persons either or both of these agents entirely disagree; and with all, if used beyond the strictest bounds of temperance, they lead to great evils. Total abstinence in a healthy man can never be wrong, and is always laudable; to a man who is not quite sure of his self-control it is indispensable. But I cannot see that a total abstainer is entitled to wrap himself up in his own virtue and to look down upon the man who can use without abusing the gifts of Providence, and who, with unlimited quantities of alcohol always at his command uses but never exceeds. Time does not permit me to enter upon the consideration of the long train of diseases consequent upon the abuse of alcohol. I will merely say that it induces a dilatation of all the minute blood vessels of the body—a condition which is seen upon the Bardolphian nose of the habitual indulger, but which extends throughout the internal organs which we cannot see, and induces its train of maladies. Likewise a thickening of the dialysing membranes of the body, which entails its accompaniment of liver and kidney affections, and generally the ultimate loss of life. I hope this brief explanation of the position of alcohol will be found useful to all engaged in watching the effects and treatment of disease.

A COURSE OF PAPERS ON THERAPEUTICS; INCLUDING THE PHYSIOLOGICAL ACTION OF MEDICINES.

By W. Handsel Griffiths, Ph.D., L.R.C.P.E.,
Corresponding Member of the Therapeutical Society of Paris.

ACIDUM NITRICUM.

The caustic action of nitric acid is less rapid and intense than that of sulphuric acid. The former acid imparts to the skin a yellow stain due to the production of picric or xantho-proteic acid. The stain resembles in appearance that which iodine causes, but unlike the latter it is not removable by caustic potash. Nitric acid gives to mucous membranes a brownish stain, owing, perhaps, to the action of the alkali in the saline and other secretions. As a caustic nitric acid is applied to the bites of rabid animals, &c., and to remove warts, excrescences, and condylomata. It has been extensively used, and particularly by Houston, in the treatment of hæmorrhoids, for which it proves an efficacious but painful remedy. Care should be taken to limit the action of the acid to the affected part. Rivallie's "solidified nitric acid," formed by making a paste with lint and the concentrated acid, is not so painful in its operation as the liquid acid, and it does not spread beyond the part to which it is applied.

Nitric acid is well calculated to promote a healthy action in indolent ulcers, and to prevent the spreading of sloughing sores. Sir Astley Cooper recommended as an application to ill-conditioned sores a lotion consisting of 50 or 60 drops of the strong acid in a pint or two of water. Chapman states that in those peculiar scrofulous sores which approach the nature of cancer nitric acid has proved more efficacious than any other remedy; it should be given internally as well as locally applied in such cases. Welbank especially eulogised the application of nitric acid in sloughing phagedena. The acid under consideration is preferable to all others in checking excessive secretions from unhealthy sores. Applied over indolent periostoses, so as to cause slight inflammation of the skin, it sometimes causes these to disappear.

Diluted nitric acid is sometimes used as a wash in torticaria, and has been recommended as a lotion for chilblains. As a gargle or wash it is applicable for syphilitic sores of the throat and to arrest mercurial salivation.

Nitric acid has been used to blister the skin rapidly, but this is an objectionable proceeding as the acid sometimes leaves an intractable ulcer; ammonia is equally efficacious and gives less pain.

When nitric acid is given internally, the teeth should be protected from contact with it, as it exercises a very destructive action on the enamel. It is a good plan to wash the teeth with some alkaline solution after taking it, or it may be sucked through a quill. Rayer has cured obstinate cases of impetigo by the administration internally of this acid; he gives it in doses of half a drachm in the course of the day. It should be given in some bland fluid, and its use should be persevered in for some weeks.

In the treatment of syphilitic cutaneous eruptions nitric acid has been highly praised by Alyon. By Beddoes and Scott it is regarded as a specific in venereal complaints. Scott assumes that its action resembles mercury, and his recommendation of its administration in syphilis is endorsed by many practitioners. Hutchinson states that he has found it useless in primary syphilis. The cases in which it acts most beneficially are in chronic syphilitic ulcers of gums, general feebleness of function from a scrofulous taint, and morbid sensibility to the action of mercury.

In small doses nitric acid acts first as a tonic, increasing the appetite; it generally causes a whitish coating of the tongue and a sensation of dryness of the throat. It acts as a stimulant to the glandular system of the alimentary canal, and owing to its astringent action on the mucous membrane of the bowel it exercises a beneficial effect in serous diarrhœa. The following was Dr. Hope's formula:

℞ Acid. nitrosum, ʒj.;
Mist. camph., ℥viij.;
Misce et adde tinct. opii, gtt., xl.

S. "A fourth part to be taken every three or four hours."

In chronic diarrhœa of children, characterised by sour smelling, pale pasty motions, nitric acid in small doses is a valuable remedy, and in the straining diarrhœa of children with green curded mucous evacuations it has been employed with benefit; other remedies, however, are preferable in such cases. Graves advised the administration of nitric acid in habitual constipation, accrediting it with aperient as well as tonic properties. It seems to the writer, however, that its value as a remedy in constipation is altogether attributable to the tonicity which it imparts to the intestine. What has been said of the action of hydrochloric acid on the secretion of the stomach applies in a minor degree to nitric acid.

In chronic enlargement of the liver nitric acid has been given with advantage, but it is less efficient than nitro-hydrochloric acid. In cirrhosis, also, it has been recommended, and it is said that it will augment the flow of bile "after the liver has struck work from the excessive use of mercury." Bateman and Zagli gave it with success in jaundice, and Dewees suggested warm baths acidulated with it for the jaundice of new-born children.

When taken internally nitric acid does not, like sulphuric acid, coagulate the blood; when injected into a vein it does so partially.

Nitric acid is less refrigerant than sulphuric acid. It has been given in malignant and typhoid fevers, and in typhus and scarlatina it has also been used, but its utility in these affections is questionable; it must be recorded, however, that in the latter disease Dr. Day found great benefit from nitric acid.

Dr. Baily attributed antiperiodic properties to nitric acid; he gave from six to eight drops of the commercial acid properly diluted once in the six hours. Testimony as to the value of nitric acid as a remedy in intermittent fever has been recorded by several writers, and Dr. Bedford Brown used it with success in remittent fever of an adynamic type.

Dr. Gibb recommended nitric acid in whooping-cough, and for this disease Dr. Arnold regarded it almost as a specific, an opinion shared in by many practitioners. It should be given in rather large doses, and its administration should be continued for some time after the cessation of the paroxysms.

In chronic bronchitis ten minims of the dilute acid with twenty of spirit of nitric ether given every six hours, as suggested by Dr. Glover, will often afford relief.

A few drops of the acid in a glass of sweetened water a couple of times daily will be found an excellent remedy for the hoarseness of singers. One of the largest fees ever received by the writer was for the latter prescription.

Nitric acid increases the secretion of the urine. It has been found of value in the treatment of dyspeptics whose urine contains oxalic acid. Cases of diabetes mellitus are recorded as having been cured by nitric acid.

Sir B. Brodie used injections of diluted nitric acid for the treatment of phosphatic calculi, and injections consisting of ten minims of the diluted acid in an ounce of water have been used with benefit in chronic inflammation of the bladder.

A bath with from two to eight ounces of strong nitric or hydrochloric acid is a powerful excitor of a torpid skin. Nitric acid induces salivation, perhaps owing to the direct action of the acid increasing the alkaline secretion of the salivary glands. According to Richter, baths of nitric acid sometimes produce salivation.

Nitric acid is less efficacious in relieving thirst than sulphuric acid.

In poisonous doses nitric acid acts as a corrosive, giving rise to effects and symptoms similar to, but exceeding in, violence those produced by sulphuric acid; in poisoning by the former acid the deep yellow stains of the tissues is a characteristic appearance. The same treatment is to be adopted as in poisoning by sulphuric acid.

Dr. Carmichael Smith first drew attention to nitric acid as a disinfectant. He directs equal parts of sulphuric acid and saltpetre to be mixed in a saucer placed in hot sand and to be used for a couple of hours every night and morning.

Clinical Records.

CLINICAL MEMORANDA.

Reported by John W. Martin, M.D., Dronfield,
Late Assistant-Surgeon Mayfield Factory, Portlaw, Ireland.

Epilepsia Abortiva.

A case of this nature fell under my observation the other day, which I think worth recording, from the strong impression left upon my mind at the time of the possibility of a violent attack being made by persons so affected, without any consciousness on their part of what was passing. There is no necessity for any detailed account of the symptoms, which are too well known to need description.

J. L., a young man, æt. 20, a miner by occupation, presented himself at my surgery, for medical examination, as a candidate for membership in the A.O.F. Society. His medical history recorded two attacks of rheumatic fever; one light, occurring some years ago, the other heavy, lasting thirteen weeks, from which he was only three weeks convalescent. A careful examination of the various organs detected nothing abnormal, beyond a slight increase in the area of cardiac dulness, and a weakening of the first sound of the heart.

The epileptic seizure took him almost immediately at the conclusion of the examination. During the attack, he retained control over the muscles of the lower extremities, being able to stand upright, had I allowed him to do so, throughout. The eyes were fixed and staring, pupils widely dilated, but their expression was not void of all intelligence. The muscles of the face, neck, and arms were strongly affected, the convulsive movements being very decided and severe. He also appeared to feel something at the epigastrium, as he placed his hand there frequently, making very strong pressure, as if to give relief. There was decided mental confusion, but the attack did not terminate in the usual state of stupor and sleep.

The general expression was that of a drunken man, who seemed doubtful whether he ought to be quarrelsome or friendly; at one time the former state of mind seemed so imminent, that I was quite prepared for a violent attack being made. The fit passed off in about ten minutes, when the patient seemed conscious of some thing unusual having taken place, but ignorant of its true nature. I afterwards learned that he has been subject to similar slight attacks since the first fit of rheumatic fever from which he suffered some years ago.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

FRIDAY, OCTOBER 27, 1876.

FATAL CASE OF GALL-STONES.

DR. DALY read a paper on this case, in which the question of a surgical operation for the removal of the stones had been raised during the life of the patient. Mr. Maunder had, however, declined to operate when called to the case for this purpose, as he was unable himself to feel a stone in the gall-bladder, which others had done previously. The patient, a lady, 38 years of age, had been for nearly two years under Dr. Daly's care, suffering most dreadful pain from biliary colic, and having a most severe attack of pain about every fortnight. At one hour she would be perfectly well, then violent pain would come on suddenly, followed in some hours by jaundice, chalk-like motions, and urine full of bile. The patient would not at first have morphia hypodermically; and in some attacks required as much as fifteen grains of opium; sometimes she had chloroform, taking more than an ounce of it, as well as large doses of chloral-hydrate. Diarrhœa was an almost constant symptom between the attacks of hepatic colic, and was little, if at all, relieved by treatment; bismuth, creasote, compound kino powder, and fluid extract of bael, all failed. The patient's sufferings increased; her aspect became very suspicious of malignant disease; and there was much exhaustion after the attacks, requiring plenty of champagne and brandy. Dr. Herbert Davies saw her in consultation; and, later on, Dr. Murchison and Dr. Hilton Fagge. Dr. Murchison suggested that the motions should be passed through a muslin sieve, as no gall-stone had ever been discovered, although every motion was most carefully examined after each attack. Dr. Murchison had no doubt as to the diagnosis; but thought that probably there was only one stone, too large to pass, which, of course, would explain why no gall-stone could be discovered in the evacuations. He also thought he could feel the stone in the distended gall-bladder; and this was done again frequently afterwards, the patient occasionally being able to feel it distinctly herself; and others did so also. Dr. Murchison advised her to have the morphia hypodermically instead of the opium, and she consented; and afterwards could not bear the least delay in having the injection when the pain came on. At first, half a grain of morphia immediately subdued the pain; but this had soon to be increased to a grain, and finally to a grain and a half, repeated three or four times during twenty-four hours. Between the attacks, she had occasionally an ephemeral febricula, the temperature rising to 104°, and the next day being normal; but she had no rigor at any time. The patient was a lady of great intelligence, and was well acquainted with the nature of her disease, having herself read up the subject; and she expressed a strong wish to see a hospital surgeon, that he might determine whether there was any possibility of removing the stone by operation. Mr. Maunder was consulted; and he said he saw no reason, having regard to the sufferings of the lady, if she fully understood the great risk, and her husband and family were willing, why it might not be justifiable, after the manner of gastro-enterotomy, to cut down on the gall-bladder, secure it to the side, and, after adhesion had taken place, open the bladder and remove the gall-stone. Mr. Maunder, however, being unable to satisfy himself that he could feel a stone in the gall-bladder, declined to operate; but he was prepared to do so if he himself could feel the stone. It was never felt afterwards. The progress of the case now became rapid; the exhaustion increased; and the mouth became aphthous. A fluctuating swelling was noticed below the margin of the ribs on the right side. Although the patient was fast sinking, she wished the swelling to be opened; so the aspirator was used, and fourteen ounces of pus were removed. Next day it had filled again; and two days afterwards the patient died. The *post-mortem* examination was made forty-eight hours after death. Dr. Hilton Fagge was present. The abdomen and thorax only were examined. The body was extremely emaciated, and intensely jaundiced. The liver and adjacent structures were removed *en masse*. The gall-bladder was closely adherent to the under surface of the liver; at first sight, it was very like a nodule of cancer; on cutting into it, it was found tightly contracted round, and closely united to, a globular stone, three-quarters of an inch in diameter; so firm indeed were the adhesions, that the shrivelled remains of the gall-bladder could only with difficulty be picked off with the knife. The cystic duct was of the natural size; the hepatic duct was dilated to the size of the thumb. The common duct was enormously dilated, and contained a stone rather larger than that in the gall-bladder, and having a certain range of movement. On cutting into the substance of the liver, the mouths of several large bile ducts were seen; besides these, and especially towards the inferior portion of the right lobe, there were numerous small abscesses, evidently of not very recent origin, and having tolerably thick and well defined cyst-walls. No communication could be traced between these and the bile-ducts. Dr. Hilton Fagge estimated that there must have been more than thirty of these small abscesses. Occupying the inferior margin of the liver, and covered externally by only a thin layer of hepatic substance, was a large abscess (that which had been aspirated during life) containing several ounces of fœtid pus. The kidneys were healthy. There was no trace of malignant disease, but a few nodules of obsolescent tubercle were found at the apex of the left lung. Dr. Daly exhibited the gall-stones; and, in answer to Sir Wm. Jenner, stated that the abscess was not connected with the gall-bladder, and was probably of recent origin, because the temperature had been taken up to within three weeks of death, and whilst it was so taken had not been found to be elevated. There were no rigors at any time.

DR. CAYLEY referred to a case in which dilated gall-ducts from obstruction produced suppuration in different parts of the liver. One of these rupturing into the peritoneum caused death.

MR. MAUNDER would state how he came to entertain the question of operative interference. He proposed to himself the theory that a gall-stone was pushed out of the gall-bladder into the common bile-duct, and gave rise to jaundice and hepatic colic; and that presently this stone regurgitated into the gall-bladder, and the previous symptoms disappeared. Having had great success in the performance of gastro-enterotomy, the result, as he believed, of attention to special details in operating, such as the stitching of a knuckle of bowel by its peritoneal coat close to the wound in the abdominal wall before opening the intestine, and allowing nothing, not even the point of a director, to enter the peritoneal cavity; he proposed to make a similar attempt on the gall-bladder. On the dead subject, he found, having exposed the gall-bladder by an incision in the abdominal wall over it, that he could pick up with his finger and thumb the peritoneal coat alone of this receptacle (just in the same way as one can pick up a hernial sac and let the contents slip away) and stitch it to the wound. Providing, then, that, on seeing the patient, he could feel the gall-bladder, he was prepared to repeat the operation on the living subject. He proposed, having fastened the gall-bladder to the wound, so to leave it for three days, that adhesion might take place before opening it, in order to prevent the passage of bile into the peritoneal cavity.

DR. BROADBENT remarked, that any operation would have been useless unless the other stone had been removed or else pushed onwards.

EMPYEMA, IN WHICH THE WASHING OUT OF THE PLEURAL CAVITY WAS FOLLOWED BY FATAL CONVULSIONS.

DR. CAYLEY detailed this case. The patient was a man, aged 36, who was admitted into the Middlesex Hospital five weeks after being attacked by right pleurisy. On admission, there were extensive effusion and great dyspnœa. Three days after his admission, his chest was punctured below the angle of the scapula, and twenty-three ounces of serum was drawn off by the aspirator. This gave great relief, but did not diminish the dulness in front and in the axilla, thus proving that the fluid was contained in different loculi shut off by adhesions. Four days afterwards, the chest was punctured again near the former puncture, and also in the fifth interspace, a little outside the vertical mammary line, and six ounces of bloody serum were obtained by each puncture. There still continued to be dulness and absence of expansion in front of the axilla below the level of the nipple, showing that a third cavity filled with fluid was present. The patient's dyspnœa was much relieved, but he became hectic, and lost flesh and strength. Eight days afterwards, the physical signs remaining unaltered, the chest was punctured in the sixth interspace at the anterior border of the axilla, and twelve ounces of fœtid pus were withdrawn. The cavity was now washed out daily with a weak solution of iodide, and half an ounce of equal parts of tincture of iodine and water, for which the undiluted tincture was afterwards substituted, was injected and left. Under this treatment, which had to be interrupted for a few days on account of the formation of a superficial abscess on the chest-wall, great improvement took place; the patient lost his hectic, gained flesh and strength; the discharge diminished and became quite free from fœtor. On the tenth repetition of the operation, however, while rather a larger quantity than usual of the dilute solution of iodine (half an ounce of the tincture to a pint of water) was being injected, the patient suddenly became deadly pale, his pulse slow, breathing gasping, and pupils dilated. Those symptoms were immediately succeeded by rigidity of the muscles and general convulsions. The pulse and breathing now became extremely rapid; the temperature ran up to 107 deg. in the axilla; he remained profoundly comatose, and died in sixteen hours. Nothing was found, on *post-mortem* examination, to account for the symptoms; there was neither thrombosis of the pulmonary veins nor embolism of the brain. Dr. Cayley then referred to three similar cases which had occurred in France; one proved fatal in six hours; in another, the convulsions soon passed off, but on again washing out the pleura, they recurred and ended fatally; in the thisd case they passed off, the treatment of the empyema was resumed, and a cure effected. In neither of the two fatal cases was any embolism or thrombosis discovered. Whether these convulsions were reflex or due to an embolism which had escaped detection, could not yet be decided. That embolism was liable to occur during pleurisy, both after paracentesis and where no operation had been performed, was proved by many cases on record, to some of which he referred. The practical lessons were, to perform paracentesis early where there is much effusion, and not allow the lung to be compressed so long as to undergo the formation of thrombi in the pulmonary veins; and, where it becomes necessary to wash out the pleural cavity, to use great caution in injecting. These convulsions having in every case come on while the fluid was being injected, and not while it was being withdrawn; and, in two cases at least, rather a larger quantity than usual was being used. The nature of the fluid used seemed to be without influence; in one case, it was a weak solution of iodine; in a second, warm water, to which a little alcohol had been added; in a third, a solution of carbolic acid; in a fourth, warm water only. In all the cases, the operaton had previously been performed many times with impunity; in one daily for three months.

EFFUSION INTO LEFT PLEURAL CAVITY: PARACENTESIS AND ASPIRATION OF EIGHTY OUNCES OF SERUM: SUDDEN DEATH, APPARENTLY BY SYNCOPE, THREE HOURS AND A HALF AFTERWARDS.

Dr. W. H. Broadbent read notes of this case. The patient, a shoemaker, aged 62, was admitted January 21st, 1876, into St. Mary's Hospital, complaining of cough with free expectoration, shortness of breath, and paroxysmal attacks of dyspnœa. The usual physical signs of considerable effusion into the pleural cavity on the left side were present; and aspiration was practised by Mr. Sworder, the resident medical officer. in Dr. Broadbent's presence, on the 26th, about 2 p.m. Eighty ounces of fluid were removed, without pain or any tendency to faint. No powerful suction was employed; and it was considered more prudent, on account of the patient's age and the attacks of dyspnœa to which he had been subject, not to attempt to empty the chest completely. The heart returned very nearly to its normal situation. The patient felt relieved, and was in excellent spirits up to 5 p.m., about which time he had tea. Half an hour later, he was found to be dead. The cause of death was apparently syncope from failure of the heart's action. The heart was large and flaccid, but not in any respect seriously diseased. There was no thrombosis of the vessels of the lung which had been compressed, nos embolism of the heart or cerebral arteries.

Dr. Theodore Williams had not had a similar case under his immediate treatment, but referred to a case in which he had been consulted. It was one of a child suffering from empyema, in which he recommended paracentesis. The pus was drawn off, the pleura washed out with a solution of carbolic acid, and a drainage tube inserted. The patient lived for some months, and the lung regained its resiliency when an epileptiform seizure occurred. Albumen and blood were then found in the urine for about two days, after which for a short time there was some relief from the symptoms, but ultimately coma ensued, and death took place in thirty hours afterwards.

Sir Wm. Jenner said he did not think that in Dr. Cayley's case the convulsions were produced by the injection, to which Dr. Cayley replied that death had occurred in several cases at the time of injection.

Dr. Weber suggested that death in these cases could not be put down to the operation, for such deaths often happened without the operation and when patients were doing well. In two such cases under his care a *post-mortem* examination showed embolism of the pulmonary and cerebral arteries, in one of which there were vegetations on the aortic valves.

Mr. Myers narrated the case of a man who, in an attempt to commit suicide by firing a rifle ball through his chest, had wounded the left lung, with the result of hæmorrhage in the pleural cavity. The blood decomposed was drawn off, and the pleura was injected. Hæmorrhage recurred, and the blood was again withdrawn, as often as five times, the patient at length dying from loss of blood.

Mr. B. Carter described a somewhat similar case. A young woman had three bullets in the right chest, blood was withdrawn from the pleura, and a drainage tube inserted; after a few days she was attacked with epileptiform convulsions, followed by acute mania. She was taken to an asylum, where she recovered the mania. Here the tube was removed, but a fistula remained, and on being released from the asylum putrid pus was discharged from the orifice whenever she coughed. A second tube was introduced at the London Hospital, and she ultimately recovered.

Dr. Goodhart narrated a case under the care of Dr. Pye Smith. The empyema was treated by a free incision. Recovery from empyema took place, but the patient died with abscesses on the brain.

Dr. Mahomed asked whether any pressure was used in the operation, if so, it might tend to displace a thrombus, and Dr. Douglas Powell thought it important not to use any pressure, but to allow the fluid to enter the chest by means of a syphon arrangement.

Subscriptions for the United States are received in New York, by Messrs. Willmer and Rogers; Baltimore, by Messrs. Kelly and Piet; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 8, 1876.

THE INTERNATIONAL MEDICAL CONGRESS.

In the October number of the *Virginia Medical Monthly* is a good report of the proceedings of the American Congress, compiled from the various reports that have appeared in other medical journals. This international meeting of medical men has attracted much notice in this country, as well as in America, and we shall therefore, with the assistance of the above and other reports which lie before us, endeavour to draw attention to some of the more characteristic features of that meeting, as well as to some of the papers which were read on the occasion.

The Congress was convened on September 4, 1876, in the chapel of the University of Pennsylvania, in Philadelphia, and the hall was densely crowded with delegates and visitors. Considering the Congress was held in America, we could scarcely expect that there would be so many and so eminent foreign delegates as there would have been had it met in London, or in some part of the continent. Nevertheless, among the list of visitors present we notice the names of Dr. A. R. Simpson, Mr. Joseph Lister, of Edinburgh, Dr. Barnes, Mr. R. Brudenell Carter, and Mr. Wm. Adams, of London, and Mr. Jolliffe Tufnell, of Dublin, while Prussia was represented by Hueter, Copenhagen by Engelsted, Christiana by Hjort, Vienna by T. Seneleden, St. Petersburg by Rudnew, Belgium by De Baisieux, Australia by Mr. R. F. Budson, and Japan by H. Miyake. If there are other celebrities whose names we miss it was not because they were not invited, as Dr. S. D. Gross, who delivered the address of welcome, remarked, invitations were sent out by the Centennial Medical Commission to every prominent medical society, and every distinguished medical man in the four quarters of the globe. The object was to bring together the benefits of their wisdom and the results of their experience and scientific investigations. If even a respectable minority of these representative men could have been there, "what," eloquently exclaims Dr. Gross, "a glorious spectacle would be presented! Men laying aside their ordinary pursuits, crossing vast continents and perilous seas, congregating to unite with us in celebrating our first medical centennial, in interchanging cordial salutations, in deliberating upon the best means of promoting the holiest and dearest interests of our profession, and in laying their contributions—the accumulations of years of study and observations—upon a common altar for the common good."

It was only natural that men who have, within the past century, made such vast strides in the colonisation and civilisation of a whole continent, as our American cousins have done, should take a pride in reviewing the rapid progress that has been made in the medical science and in the medical literature of their country, and in acknowledging the merits of their countrymen who have contributed towards the advancement of medical learning. Consequently, we find that what American physicians have done towards the advancement of various subjects connected with medicine and the collateral science has been by no means ignored by those who delivered the inaugural addresses.

It was not till after the commencement of the present century that there were in America any native works on medicine or the sciences, With respect to the previous century, many, observed Dr. Gross, will recall the words of the great English lexicographer, who, in speaking, in 1769, of the American colonies, exclaimed, "Sir, they are a race of convicts, and ought to be thankful for anything we allow them, short of hanging." Whoever crosses the Atlantic now will find a very different state of things to that which called forth the sneer of Dr. Johnson, and the discourses to which we have referred certainly show that the profession in the United States is "fully abreast with all the other pursuits that adorn the human mind, and shed lustre upon the scientific character of the nation."

In his address on medicine Dr. Austin Flint described the progress made by medicine in America towards the close of the last century. Soon after the revolutionary war Franklin interested himself in founding the Philadelphia Medical College, which, in 1791, was merged into the medical department of the University of Pennsylvania, and was modelled after the school of Edinburgh, and that of Leyden. Rush, who wrote original treatises and edited foreign works, was then the leading medical mind in America. So rapid, then, was the progress and cultivation of medicine that in 1800 there were already 20 medical schools and 2,000 medical students in the United States. There were also 20 medical journals, the number of which is even now only doubled.

One of the best addresses was that "On Hygiene and Preventive Medicine," by Dr. Henry J. Bowditch, President of the State Board of Health of Massachussets. In the course of his remarks Dr. Bowditch well said that in regard to medical social ideas, the past century divides itself into three epochs. The era of theory and dogmatism, from 1776 to 1831; of careful observation, from 1835 to 1869—an epoch often marked by bold and sometimes reckless scepticism—and the epoch from 1867 to 1876, distinguished for the interest that has been taken, and the progress that has been made, in state preventive medicine. The speaker especially recommended that more attention should be drawn to the adulteration of food—that we should endeavour to establish an international code of health; that there should be a national law for the enforcement of vaccination, to be adopted by every foreign nation; and that, as so much sickness originated in the packing together of people without any regard to cleanliness, the construction of tenement houses for the poor should receive particular attention. Dr. Bowditch calculated that about 200,000 people died annually in the United States from preventible diseases.

On the third day of the Congress, two very suggestive resolutions were passed; one that the Congress recognises the advantages which would result from the introduction of a gradual uniformity in the multiple and heterogeneous elements of physic, as posology, nomenclature, &c., and in the means and records of medical observation, and the other that three delegates be sent to the International Congress of 1877, with the object of presenting a schedule of the means of uniformity in physic applicable to all countries. And as one of the signs of the times, we may notice that on the same day a communication was received from the National Temperance Society, inviting a declaration to the effect that alcohol should be classed with powerful drugs, that it is in no sense a food to the system; and that total abstinence from alcoholic beverages be recommended to the several nationalities represented! We need scarcely say that this very ingenious invitation was politely declined. The congress committed itself to no such declarations. The communication was simply "tabled."

The Address on Surgery by Dr. Paul F. Eve, Professor of Operative and Clinical Surgery, was rather disfigured by a little American bounce. In acknowledging the claims of American surgeons upon the respect and admiration of the profession in Europe, the Professor remarked that "it has been reserved for American surgeons to teach the world how to relieve or prevent human suffering." "Fifty years ago," he added, "not half-a-dozen of the Americans were known abroad as surgeons; but in 1859, Dr. Reece, in preparing an American edition of Cooper's Surgical Dictionary, "introduced no less than one hundred and nine contributors." How the co-operation of so many writers in the mere editing of a surgical dictionary could conduce to the European reputation of American surgeons, we are at a loss to conceive. More happy was Dr. Eve in recalling to our minds some of the real achievements of transatlantic surgery, such for instance as the first ligation of the common carotid by Dr. Cogwell, of Hartford, in 1803, the first and successful ligation of the femoral for elephantiasis, by Dr. Carnochan, the first resection for bony anchylosis, by Dr. J. Rhea Barton, the excision of the whole scapula, by Dr. Mussay, in 1837, the first successftl treatment, by Dr. Jonathan Knight; of popliteal aneurism by digital compression, and several other operations which have certainly redounded to the credit of American surgery.

Undoubtedly, one of the most interesting and most powerful of these addresses was that on Medical Jurisprudence, by Dr. Stamford E. Chaillé, Professor of Physiology and Pathological Anatomy in the University of Louisiana. It is not often we have an historical retrospect of this department of medicine, and some of Prof. Chaillé's remarks were, in this respect, particularly worthy of attention.

Although, he said, the first seeds of medical jurisprudence were, in 1620, sowed in Italy by the hand of Zacchias, the Pope's physician, it was not till they had been transplanted to German soil that they sprung up, flourished, and bore good fruit. From 1620 to 1726 the authority of Zacchias was supreme. Until 1726, it was taught that in the presence of the murderer, his victim s wounds "did open their congealed mouths and bleed afresh," and courts accepted the evidence of medical experts to this miraculous bleeding of the corpse. Superstition, denouncing medico-legal autopsies even more fiercely than it now does cremation, did not permit these to become frequent until 1750. The highest medico-legal authorities taught belief in ghosts, witches, and possession by devils. On the other hand, the progress of medical jurisprudence in Germany has been rapid and systematic. In 1650, Michaelis delivered the first lectures on the subject, and as early as 1720, professorships of legal medicine were founded by the state. It is indeed no pleasing task to contrast the state patronage of forensic medicine in France and Germany with that which obtains in England and the United States. Whereas, in the latter countries the importance of medico-legal knowledge is almost ignored by their respective governments, as shown by their want of any system to secure the medical evidence of competent experts, Germany has long had an admirable organisation of medico-legal officials, who are entrusted with the duty of not only procuring the necessary evidence, but of esti- the value of the facts adduced; and who are specially educated and practically instructed in the duties they will be called upon to fulfil. The same may be said of France. From 1570 to 1692, laws have been enacted in that country which like those in Germany, have favoured the advancement of legal medicine; and since 1790, no nation has surpassed France in the cultivation of medical jurisprudence.

◆

MR. STOKES ON SPECIALISTS AND CONJOINT EXAMINING BOARDS.

From the rostrum of the School of the Royal College of Surgeons, Mr. Stokes, its Professor of Surgery, availed himself of the occasion afforded him by the delivering of the Introductory Address last week, to give expression with great emphasis to his views on two subjects upon which, with every respect for him and for the place from which he spoke, we venture, most decidedly to differ.

We are unable to give the lecturer's *ipsissima verba*, being unable to give space for his lecture in full, and he being indisposed to its publication in abstract, but we epitomise his remarks by saying, that the vials of his denunciation were poured out with even hand upon specialism and upon the scheme for a Conjoint Examining Board. Excepting, somewhat inconsistently we think, the surgery of the eye and the teeth, he stated in substance his opinion that practitioners who devote their attention wholly or principally to the study of special classes of disease, were necessarily backward as regards the general scope of surgery, were guilty of narrowing the domain of medicine, and *pro tanto* were ignoramuses, and not to be trusted as practitioners. It is not the first time that we have heard, nor is it difficult to understand why we should so often hear this outcry by general surgical practitioners against specialists, and it has become so *à la mode* in medical journals to echo this cry, that we gladly avail ourselves of the text of Mr. Stokes's observations to point out how unreasonable and unpractical it is, and what a narrow view of surgical history those take who take such a line of argument.

In the first place, as a matter of fact, we would ask Mr. Stokes who are those who have shed most lustre and achieved the greatest progress in medicine and surgery? Is it not the specialists who, according to his view, are necessarily but half educated in their profession? Where would surgery be but for the labours of Bowman, Czermak, Spencer Wells, Donders, Toynbee, Hinton, Von Gräfe, and a host of other men who practised exclusively in one class of disease, and on the other hand, will Mr. Stokes favour us with a list of a dozen general practitioners who have contributed discoveries, original ideas, or systematic investigations to special branches of surgery, and who have left their mark in the profession as specialists have. In fact, the class whom Mr. Stokes denounces do not exist at all, because there is a well defined public feeling that any of these departments is large enough to occupy the undivided attention and study of a surgeon, and that those who profess a general knowledge of these specialities in common with the whole domain of surgery, can only possess a smattering of information on them or any other subjects. Specialists are a necessity of society, and, in our view, so far from being regarded as narrowly educated traders, ought to take rank in the first order of scientific surgeons in virtue of the development of particular branches of our art which is due to their labours. It is not, we admit, every so-called speciality which is worthy of the undivided study of a surgeon, and it would be a calamity if surgery were to consist of a multitude of separate atoms, each receiving the peculiar culture of a few to the neglect of the great principles of the science, but the anti-specialists need fear no such event, inasmuch as specialism can never be a remunerative pursuit unless it be applied to a subject which is of large import to the public, and which the general surgical practitioner cannot be expected to pursue to perfection. A combination of general surgeons against specialists which has been suggested by some writers and speakers, would be not only ridiculous in itself but far more calamitous to the science of medicine than all the abuses to which specialism is liable.

Passing from this subject, Mr. Stokes entered upon a denunciation of the principle and practice of conjoint examinations. He was partly entitled to speak in this tone because a majority of the Metropolitan Fellows of the College of Surgeons had declared against the particular scheme of conjoint examination which was submitted to them. In doing so the Dublin teachers and lecturers were actuated, Mr. Stokes says, solely by the "sacrá fames" of surgery, and by a completely unselfish disregard for the financial result of conjoint examination upon themselves. If so, it is to be regretted that they were content to occupy a position of tacit approval for nearly three years of the incubation of the scheme, and did not awake to an appreciation of their duty to surgery, and to the "great old institutions" of their country, until the proposal of a reduction of lectures was made by the Conference Committee—a circumstance which Mr. Stokes strangely forgot to state. Mr. Stokes furthermore expressed himself as affectionately apprehensive of the depreciatory effect of conjoint examination upon the licensing corporations, and drew a picture of the profession as it will be when state or corporative tests become law. It might, we think, have occurred to him that conjoint examination is simply an effort to clear the ground of those abuses for which the "grand old institutions" are responsible, and that if they, in the aggregate, did their duty to the public, as guardians of the competency of medical men, instead of engaging in a mean and suicidal scramble for diploma fees, no one would think of any other method of qualification than that existent. Conjoint examination is, in fact, a praiseworthy effort to contest the field with the system of bad examinations, short study, cheap diplomas, low-class practitioners, sham certificates, grinder's education, and corporate competition, which are fast reducing medicine below the level of a scientific art, or a learned profession, and, in the absence of a strong arm and a better means to bring corporations to task, conjoint examination will serve our purpose. With the experience of the last quarter of a century before us it is too late to talk of our "grand old institutions." Those which are worthy of being considered will be anxious for licensing reform, and will not humble their policy before the financial temptations of their members—those who adhere to abuses because they are remunerative, and resist changes because they don't pay, deserve no protection, and ought to be dealt with without regard to the results to them. If Mr. Stokes, the Scotch colleges, the Queen's University, and the Dublin teachers deprecate a change of system, they must be prepared to show that matters are as they ought to be, or something approaching perfection, which they will need all their eloquence to do.

◆

SMALL-POX.

"It now becomes too manifest to admit of controversy that the annihilation of small-pox, the most dreadful scourge of the human species, must be the final result of this practice." Such were the words used by the immortal Jenner so far back as 1802, and eight years after his great discovery. We are now getting well on towards the end of the nineteenth century, and as the present epidemic too truly shows, we are yet far from having annihilated this still terrible disorder. As we stated in our last issue, 22 fatal cases occurred in the metropolis in the week ending on the 21st ult., and at that date there were at two of the small-pox hospitals 180 patients, against numbers increasing steadily from 72 to 175 in the six preceding weeks. How this epidemic may terminate, and what will be the mortality to which it will give rise, it is of course impossible to predict. But perhaps the distance we are off that desirable goal to which Jenner so sanguinely looked forward may be best appreciated by taking a glance at the epidemic which occurred as recently as 1871-3, and an admirable report of which is to be found in the Annual Report of the Local Government Board for the year 1874. That epidemic was not confined to this country. It was, says Dr. Seaton, a part of a general epidemic outbreak of small-pox of world-wide diffusion, marked wherever it occurred by an intensity and malignity unequalled by any previous outbreak of that disease within living memory. In the period which embraced the last quarter of 1870 and the first quarter of 1873, no fewer than 44,079 persons fell victims to this dreadful pestilence in England, and 10,287 in London alone. Nor was the malignancy of the disease less remarkable than the numbers to whom it proved fatal. The ordinary mortality of natural small-pox as observed at the Small-pox Hospital during a long series of years was thirty-five per cent. of the cases admitted, and of post-vaccinal small-pox seven per, cent. But so violent was the epidemic to which we are now referring, that in 1872 the mortality amounted to seventy-seven per cent. of the natural and ten per cent. of the post-vaccinal disease. Indeed, whoever was guided by the statistical and other details of that epidemic alone would lose all faith in the protective power of vaccination, and in the possibility of completely stamping out the disease. And yet when we come to inquire a little further into the matter, we shall have ample reason not only to congratulate ourselves on the wonderful success that has already attended Jenner's beneficent discovery, but to confidently assert that there is in the nature of the disease itself nothing to make Jenner's predication an impossibility, or to prevent its being one day fulfilled. It is man, and man alone, who stands in the way. It is human prejudice, and the obstinacy of human nature which are the great obstacles to the all but complete extermination of small-pox. Already vaccination has done much, and it is to the neglect or imperfect performance of this operation are to be attributed in a great measure our failure in obtaining those great results which were at first anticipated.

In comparing the mortality of the last epidemic, severe as it was, with the mortality from the disease in the last century, it appears that the *annual average* death-rate of this period was actually more than threefold the death-rate of that, in our time, quite exceptional outbreak. The estimated annual small-pox death-rate of England in the last century was 3,000 per million of population: the mean annual death-rate of our last epidemic was 928 per million. The average annual small-pox death-rate of the metropolis in the pre-vaccine period was from 400 to 500 per hundred thousand of the population, the mean annual death-rate during the epidemic of 1871-2 was only 148. And if an average be taken of the small-pox mortality of England for the whole 20 years (1854-1873) during which there has been a compulsory vaccination law, a period which includes the whole of that great epidemic, the annual death-rate is found to be 245 per million of population, or less than a twelfth of the rate of last century. It is, indeed, impossible to form an adequate idea of the great contrast between recent epidemics of small-pox, and those which formerly ravaged Europe, unless we peruse the accounts given of the latter by contemporary writers, and carry ourselves back to a time when an epidemic of small-pox created more terror and consternation among the community than the severest outbreak of pestilential cholera has done in more recent times. It was not merely the number of people attacked, the great mortality, and the loathsome nature of the disease, which particularly characterised the epidemics of the last century, or which made every victim an object of terror and aversion. From the earliest to the latest records of the disease constant mention is made of the taxes which it levied on the survivors. "Of many who outlive it," says De la Condamine, "many either totally or partially lose their sight or hearing; many are left consumptive, weakly, or maimed; many are disfigured for life by horrid scars, and become shocking objects to those who approach them." According to Sir Gilbert Blane, who quotes a report of the Hospital for the Indigent Blind, two-thirds of those who were, in his time, admitted to that institution, had lost their sight through small-pox. Nor can we fail to see that this dreadful scourge was a continual source of terror to those who had not been attacked by it before, for none escaped but those who had been previously affected. It spared neither age nor sex. At every rumour of an epidemic "men trembled for their lives or the lives of others." Its ravages were as conspicuous in the court as in the cottage, and perhaps nothing could better illustrate the havoc it caused among all classes of the community than the frequency with which members of the royal family and of the nobility were carried off by it. "The small-pox," says Burnet, in his "History of William and Mary," "raged this winter (1694-95) about London, some thousands dying of the disease. This gave us great apprehensions with regard to the Queen, for she had never had it. In conclusion she was taken ill." And how she died, and of all the circumstances attending that death, is it not recorded in the eloquent pages of Macaulay?

Notes on Current Topics.

Promotions for the Arctic Expedition.

It is very gratifying to find that the naval authorities have not been forgetful of the claims of the medical officers who accompanied the *Alert* and *Discovery*. Staff-Surgeon Belgrave Ninnis, M.D., has been promoted Fleet-Surgeon, and Surgeons Moss and Coppinger, staff-surgeons.

Cinchona Cultivation in Burmah.

This popular remedy having almost reached prohibitive prices, on account of its scarcity, and the limited area of cultivation, attention has been drawn to it by enterprising landowners of other countries, and its cultivation is now everywhere extending in the East. It appears likely that ere long Burmese quinine will occupy a prominent place in the market. According to Surgeon-General Gordon's new work on "Burmah," the soil and climate of many hill districts are found to be eminently favourable for the rapid growth of the best species of bark. The plantations in the Sittang Division are said to be especially a success. Last year there were 29,934 cinchona plants there, growing well, with a firm ripe bark. Ground for 25,000 more seedlings had been prepared, and there were in the nurseries 46,832 plants ready for transplanting. The local use of these trees is already making itself felt, for rough alkaloids prepared from small stripes of their bark, taken off without seriously injuring the young trees, are eagerly bought up by the natives, who are becoming fully alive to the wonderful efficacy of the bark in almost any shape as a febrifuge. Great exertions are being made amongst the Karens to induce them to take up cinchona cultivation on a large scale for themselves, and these exertions are already bearing fruit, and many small plantations are here and there springing up.

A Remarkable Occurrence.

In the current number of the *Veterinary Jour.*, a correspondent, an army veterinary surgeon, states that some men of the Native Infantry Regiment, stationed at Cawnpore, went out shooting, and in the course of the day came upon an antelope doe, which they immediately shot *dead*, and carried home. "On opening the animal for the purpose of preparing it for the pot, they released a strong healthy youngster from the uterus, washed it, and induced it to suck milk from ottle. This little fellow is still living and thriving well under the care of the bandmaster of the regiment, by whom the above was related to me. Now the peculiarity of the case is this—that the time from when the mother was shot until the young one was released could not possibly have been less than twenty-five minutes. I have taken every care to verify the story, and can find not the least exaggeration in it."

This is certainly a very uncommon occurrence, but we see no reason why, in a physiological point of view, we should doubt the above facts. Numerous instances have occurred in which animation of the new-born human infant has been suspended for a considerable time, and in which the resuscitation of these apparently still-born children, although long delayed, has been at last effected by means of artificial respiration, and other restoratives

In these cases the child is still alive, but with all its organic functions in a dormant state, and reduced to their lowest ebb. Le Gallois and Edwards have remarked that the tenacity of life in new-born animals is very great, and that they can live without air for a much longer time than an adult of the same species. And what is true of the human new-born child is still more true with respect to the vigorous offspring of a strong healthy animal. It is probable that, in the case under consideration, the death of the antelope doe was not so complete and immediate as was supposed. It is probable that the heart of the mother was feebly beating for some time after her apparent death, and to such an extent as to maintain for many minutes the fœtal circulation of her offspring. This circulation may have been of the feeble character compatible with the maintenance of life, and yet sufficient to respond to the stimulus of sudden exposure to the atmosphere.

Outbreak of Fever in the "Active."

The usual result of expeditions up the West African rivers has we imagine followed in this case. The ship's crew were much exposed in a notoriously unhealthy river, the Niger, where they imbibed the deadly poison now manifesting itself. At the time a very flourishing account of the health of the expedition was given, but it appears to have been forgotten by the narrators that malarial diseases do not become developed on the instant, but require some exciting cause and a certain interval of time to show themselves outwardly. We should hope that the crews are not suffering from malarial yellow fever, a very fatal disease, and one very common amongst palm oil traders.

Animal (Heifer) Vaccination.

According to the Report of the Milan Committee for Animal Vaccination, there have been vaccinated under their auspices during the period 1869-75, 69,740 individuals, 11,608 of these bein primary vaccinations, and 58,832 re-vaccinations. Of the 11,608 vaccinations, 8,912 exhibited genuine results, and 115 spurious results; in 288 no effect was produced, and in 2,293 the results were not verified. Of the 58,832 re-vaccinations, 18,169 furnished genuine results, 3,847 spurious results, and 22,960 no results at all —the remaining 13,156 not having been verified. After trail of all the various means for the preservation of the lymph, most decided preference is given to glycerine.

The Metric System.

The Hon. Mr. Yates, after protracted inquiry and investigations in the schools among those best able to judge of the matter, reported that the complete adoption of the decimal, in place of the present English, weights and measures, would save two full years in the school-life of every child educated.

Practical Lessons of the Arctic Expedition.

After reaching the limit of navigation, the Arctic *voyageurs* have been obliged to return. We find that sledge parties could only advance one mile daily, so rugged was the ice. The sun was absent 142 days, and four deaths occurred, one from frost-bite and the others from scurvy which attacked all the travellers. Animal life and the northerly migration of birds ended south of Cape Columbia. Fifty-nine degrees below zero was experienced for thirteen consecutive days. The lowest temperature was 104° below freezing point. In August a fine walrus was killed, which served for food, and was highly appreciated by the dogs. During the autumn sledging scurvy occurred, but not so severe as to interfere with the advance. Winter closed in early in October, but without interrupting the daily routine of the ship's duties. After a while the solitude of all around was "something appalling," not a living creature was to be seen. A great deal of fuel had to be expended in procuring water to cook the food of the sledging parties, who carried with them a tent, provisions, and duffle robes for sleeping in. These last were made from a thick and soft cloth. The only change of clothing made during the absence from the ship was a daily change of the frozen blanket wrappers which covered the feet under the mocassins to dry ones in the night. Illness produced by the total absence of fresh food combined with the unusually hard work and privations, appeared in the northern party. The western party also suffered after reaching a distance of 220 miles from the ship. The extreme scarcity of game was much felt by the sledging parties, only one bear having been met. The dogs were allowed to winter out, and did not appear to mind the cold in the least. The changes in the temperature were very rapid and remarkable, as much as 60° in a few hours. During the very coldest weather very thick underclothing of box cloth, very thick blue cloth trousers, or else sealskins were worn. The sun returned on the last day of February. On the hills near Lady Franklin's Sound some herds of musk deer were perceived, not one of whom could be shot, though at the time fresh food would have been most desirable owing to scurvy having manifested itself. Seals made excellent food, as it was succulent and nutritious, and the soup especially good. Molasses and rum with preserved meats formed a portion of the American stores. In the spring the inland lakes were visited, and large quantities of bears were met with, musk were shot on the hills, and hares were taken in abundance. Vegetables were very scanty.

The Local Government Board.

This board having come in conflict with the Hampstead Hospital Committee, upon the question of hospital management, Sir W. H. Wyatt, as chairman, at the meeting of the Asylums Board on Saturday last, rose to tender on behalf of himself and his colleagues, their resignation. They had found on the previous occasion the regulations of the Local Government Board during the raging of the epidemic so shocking, with regard to the engagement of officers, that they could not manage to get efficient people about them, and as the LocalGovernment Board seemed determined to continue to adopt the same principle, he and the committee felt that they could not satisfactorily discharge their duties, they must request the managers to accept their resignations.

Regret was expressed by the Asylums Board at the loss of so active and valuable a committee, but we do not see, under the circumstances, how a body of gentlemen, who entertain views above the pettifogging rest-and-be-thankful element of local place-hunting committees, could consistently submit to a perpetual course of snubbing, and hold their posts in spite of their better judgment. They have therefore our sympathy, and we hope their determined action will bring this immaculate board to a sense of its obligations to others.

Microscopic Examination of the Circulation.

At the last meeting of the London Medical Microscopical Society, Dr. Pritchard exhibited an ingenious form of microscope by which the circulation of the blood in the fixuum of the human tongue could be watched. The essentials of the instrument were a tube carrying an ocular and a No. 2 (Hartnach) objective; to the end of the latter was fitted a brass cap, from which a hollow rod of metal, of the size of a crowquill, and about an inch long, projected. The cap was centrally perforated. The narrow end of an ordinary ear speculum was presented to the extremity of this small tube and held adjacent to it by a wire clip, and so arranged that microscope tube, metallic rod, and ear speculum had each its axis in the same straight line. To use it, the frænum linguæ was placed between the hollow rod and the speculum (the latter condensing the light), and when focussed, the circulation could be watched. We thank and congratulate Dr. Pritchard in the name of the profession upon the ingenuity of his invention, which will prove a valuable help in histological investigation.

Foreign Quack Diplomas in England.

If the prosecutions of quacks by the Medical Defence Association yielded no other result, they would be very useful by their influence in instructing magistrates as to the law of medical qualification and registration, a subject which, judging from repeated utterances from the bench, seems to be with them an unperused page of legislation. Even Mr. Knox, the astute and learned magistrate of the London police court, seems to be quite shady on the subject; for we find him last week hinting at an acquittal of a quack of the name of Hamilton, on the ground that an American diploma, (which he alleged that he held) authorised him to practice in Great Britain and call himself a doctor. The magistrate gave him an adjournment for the production of the diploma, thus admitting the principle that its possession would alter the aspect of the case. Mr. Knox will no doubt satisfy himself, before the re-hearing, of the fact that in law, one or twenty foreign diplomas, no matter how good, would not authorise a person to practice medicine in our country. The law forbids anyone to represent himself as a physician unless he holds a guarantee of competency, and it recognises no such guarantee, under any circumstances, unless it be granted with the cognizance and under the supervision of the Medical Council. Foreign licensing bodies are not, and cannot be, submitted to such supervision, and, therefore, are not recognised, it being obviously impossible for a Council in Great Britain to answer for the examination and curricula required by them. Mr. Cowper Temple, in last session of Parliament, proposed to receive foreign diplomas as licences to practice in England, but, on the ground we have stated above, the Medical Council resisted the proposal, and the Bill was discouraged by Government and withdrawn. There is nothing one-sided or exclusive in the existing arrangement, for no foreign country will receive our degrees or diplomas without the imposition of a further test. Even so small a power as the Brazilian Government will not permit medical practice within their jurisdiction, except after their own examination.

Hot-Water Injections in Uterine Hæmorrhages.

The *Virginia Medical Monthly* draws attention to a paper in the *Allg. Wien. Med. Zeitung* by Dr. Windelband on this extraordinary method of treating uterine hæmorrhages. For two years Dr. Windelband has been in the habit of using these injections in all varieties of these hæmorrhages, and of all grades of severity, and he arrives at the conclusion that in this method of procedure we have a safe and invaluable remedy for all forms of uterine hæmorrhage, and that, moreover, this method is more rapid in its action than cold and astringents. He also thinks the hot-water treatment would be highly serviceale in some other affections of the female sexual organs, such as enlargement of the uterus, and the various forms of displacement of this organ. Dr. Windelband's mode of using the injections is to place the patient on her back and then pass the water into the vagina by means of an irrigator with considerable force. The temperature of the water at first should be 100° F., but in some cases he has raised it to 105° F. This method is also said to produce no chilling or unpleasant feelings, as cold always does, to be followed by no reaction, and to be very soothing and agreeable to sensitive patients. The American commentators on this plan of treatment remark that in some uterine affections, especially chronic congestions, it has been practised in America for some years past, and was originally proposed by Dr. Emmet.

Wherever and by whomsoever practised, we cannot help thinking that such opposite and paradoxical methods of treating the same disorder as have been proposed and practised in numberless instances, are calculated to make us doubt the real efficacy of any of these vauntd methods of treatment. With regard to hæmorrhages, we have long been of opinion that in ninety-nine cases out of a hundred where they have been apparently arrested by gallic acid or the acetete of lead, by opium or sulphuric acid, by iron or by ergot, by matico or digitalis, by cold or by heat, the arrest of the hæmorrhage has been of a spontaneous nature and due to causes which have been set in operation by the *vis medicatrix naturæ*. And when we read of such cases as those under the care of Dr. Windelband we are disposed to think we are not far wrong. We admit that, as a local stimulant, severe heat often acts in the same manner as severe cold, but there are few who can believe that hot water of the temperature that may be "comfortably" borne by the patient can be very efficient as a hæmostatic, especially when it is merely thrown up the vagina, and not into the vagina itself.

The Metropolitan Free Hospital.

This institution having shown its *raison d'être* by a sphere of usefulness in the midst of the poor and populous neighbourhood of Devonshire Square, City, for the last forty years, its managers now appeal for assistance to enable them to commence a new building, the present one having been taken by the Metropolitan Railway Company. A new site in Bishopsgate Street has been purchased at a cost of £7,000. After paying for the site the hospital has in hand more than £5,000 towards the rebuilding. The probable cost of building, completing, and furnishing an hospital to receive 150 beds, and to provide ample accommodation for the out-patients will be about £25,000, for obtaining which a meeting was convened under the presidency of the Lord Mayor at the Mansion House on Friday last. The Lord Mayor, in introducing the meeting, remarked that, at the request of some influential persons connected with the rebuilding of the Metropolitan Free Hospital, he had felt great pleasure in placing the Mansion House at their disposal with the view of promoting the good of this institution. He asked those present to subscribe to hospitals as they might be inclined, and he would make an appeal to ladies that they should, in their morning and afternoon calls, press upon their friends the claims of the Metropolitan Free Hospital, which had during the past year relieved upwards of 40,000 poor persons. His lordship's appeal was well responded to by those present, albeit we should have been glad to see a larger audience, and resolutions and the work of soliciting subscriptions duly arranged.

Non-Dieted Station Hospitals.

The Army Circulars published 1st October and just issued, contain the regulations for these hospitals which will be opened at stations where small detachments of less than 100 men are quartered. The patients will be placed under the medical charge of civil practitioners. As a rule the men will use barrack bedding and utensils, which will be in charge of a non-commissioned officer of the corps. The ordinary commissariat ration will be issued as an hospital diet with the following extras—viz., essence of beef, tea, sugar, oatmeal, arrowroot, brandy, barley, wine, mustard, pepper, salt, and condensed milk. No regulations as to the payment of the civil practitioners in charge are included, but we presume they will be given the pay of a surgeon in the army.

Dr. Sieveking will deliver the next Harveian Oration at the Royal College of Physicians of London, Dr. George Johnson will be the Lumleian lecturer, Dr. Brunton the Gulstonian, and Dr. Braxton Hicks the Croonian.

A writer in the last number of the *Quarterly Review*, in an article on "London Alms and London Pauperism," has fallen into the egregious blunder of stating that the out-patient departments of St. George's and the Westminster Hospitals have closed their doors.

"Dr." Slade, the spiritualistic leader, charged by Dr. Donkin and Mr. Ray Lankester under a clause of the Vagrancy Act, was committed with three months' hard labour by the Bow Street magistrate last week. Slade's counsel has appealed against the decision, and the prisoner is now on bail.

A little girl, whose parents reside in Birkenhead, has been accidentally poisoned in the Wirral Hospital for Sick Children. On Saturday morning the night nurse administered to the child a quantity of carbolic acid, which she mistook for a dose of medicine. The little sufferer, who had been in the hospital since February for lung disease, died before medical aid could be procured.

A medical conference in connection with the Church of England Temperance Society was held last week in the Sheldonian Theatre, Oxford, Dr. Acland, president of the Medical Council, presiding. Addresses were delivered by Dr. Richardson, F.R.S., Professor Rolleston, and others. Dr. Richardson stated the conclusion he had come to after lengthened experiments, was that alcohol was entirely useless from a medical point of view. Dr. Richardson's hearers were the reverse of unanimous on this point.

Correspondence.

ON THE PRESENT POSITION OF MILITIA SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The present position of militia surgeons requires grave consideration on the part of every member of the profession who happens to have the honour of holding a commission in "Her Majesty's Auxiliary Forces." The question is a complicated one, as all are not similarly circumstanced. Some may be lucky enough, from the resources of private practice, or "born with a silver spoon in their mouth," to be nearly or altogether independent of their appointment, whilst others less fortunately circumstanced may be solely dependent upon it. Such is the reverse of the picture. Between these two extremes there are so many shades, as I think, will justify the assertion—viz., "that it is more than probable no two cases would be precisely parallel." The pecuniary emoluments of militia surgeons vary considerably according to—firstly, the strength of the staff; secondly, the length of the training period; and, thirdly, the amount of recruiting.

Without entering into figures, which can easily be done, a militia surgeon costs the Government, at a rough estimate, from £150 to £300 per annum. During "the training period" either the surgeon, assistant-surgeon, or both, are on full pay.

I enter into the matter in detail, in order to expose what false economy it is in "The Army Medical Department" not to place militia surgeons on fixed salaries, when it can be demonstrated what their average cost per head is. It can matter nothing to the Government whether their officials are paid *regularly* or *irregularly* (as they at present are) if there is no increase of expenditure, yet the former would be a great boon to militia medical officers.

Under the existing "regime," where it is found so difficult to medically recruit H.M. regular army, their services might be utilised by transferring them from one militia regiment to another, and taking temporary charge of troops. At present they occupy a sort of hemaphrodite position between "the army medical officer" and "the civil practitioner." During the training period they are under the sole control of the Director-General; the remainder of the year they are civilians, and cannot be compelled to do any military duty.

Now that the long expected Royal Warrant has emerged from its thick-shelled "chrysalis," there are some slight points I will draw attention to.

I will not waste time discussing or re-illuminating the grievances, already so well shown up in The Medical Press and Circular and *The Irish Times*, but I cannot refrain from drawing attention to an article which appears in *The Broad Arrow* (August 19th, 1876), and which I wonder has escaped uncriticised. It states "that the assimilation of the medical duties of the army and militia is but a logical sequence of that principle of organisation which Lord Cardwell initiated." Now Mr. Cardwell, as he was *then*, distinctly pledged himself to take every man's case separately into consideration, thereby admitting not only that there were grievances, but *varied* grievances. In addition to those inflictions the Royal Warrant contains some doubtful clauses. Secretary of State's instructions, Clause 3, "Supernumerary officers shall be absorbed." I take it that it applies to both surgeons and assistant-surgeons; however, it is capable of either interpretation.

Then, again, any one who does not elect to have their name placed on the Departmental List before December are to have their names scratched (*vide* Clause 11), though the ukase did not make its appearance until the close of the session.

What stand do the profession intend taking? If we are to succeed, we should be unanimous, irrespective of creed, politics, or country, and go in for "a long pull, a strong pull, and a pull altogether."

I make these remarks conscious of my feeble powers as a scribe, but in the hope I may excite abler pens than mine.

An Ulster Militia Surgeon.

◆

RED TICKETS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Though what I am about to communicate is but a repetition of what has occurred to other poor-law medical officers, I think it right to add it to their experiences, in order to keep the eyes of the profession directed towards a great grievance under which we labour.

In 1875 I was summoned on a red ticket to attend two patients whose circumstances disentitled them to poor-law relief. One of them had on a former occasion feed me when I witnessed a will by which he inherited a considerable amount of property. I had the tickets duly cancelled, and at the last quarter sessions of Athlone (where Mr. Hamill presided) processed these persons.

The barrister declined to grant a decree, saying that the law did not allow it, as I had not attended *after* the cancelling. He added that "in such cases there is fraud committed by either of the two parties, the issuer of the ticket, or the person to whom the ticket is issued—the first, if the issuer is aware at the time of the solvency of the patient; on the part of the person who procures the ticket, if he has obtained the ticket by false representations, and that this was the first point to be settled, and then as the case might be, proceedings taken against the person who fraudulently exonerates a solvent party from paying a just debt, and "onerating" the rates with the amount." If his decision be in conformity with the law as it now stands, it clearly points to the necessity for a change, it being perfectly obvious that no such "onus" should be thrown upon a public officer. I need not say that he would expose himself to vexatious retaliation if he adopted any such course.

I remain, your obedient servant,
Edmund P. Sharkey.

Ballinasloe, October 31, 1876.

◆

THE PHYSICIAN'S HOLIDAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—So many of my professional brethren having asked me as to the nature of the *feeding* on board ship and at the American Hotels, I enclose one of the dinner *cartes* of the R.M.S. *Russia* (which I happen to have preserved), and also a *menu* of the Continental Hotel, at Philadelphia, premising that all the Cunard steamers, and each hotel afforded just as good dinners as those here set forth.

Yours truly,
Jolliffe Tufnell.

R. M. S. *RUSSIA.*

Soups.—Green turtle and gravy.

Fish.—Salmon and parsley sauce.

Boiled.—Mutton and caper sauce, ham, fowls, and parsley, ham and tongue, calves head and bacon, corned beef and cabbage.

Roast.—Beef and Yorkshire pudding, mutton and currant jelly, goose and apple sauce, pork and beans, lamb and mint sauce, ducks, fowls.

Entrees.—Curried chicken and hare, lobster patties, fried tripe and onions, escolloped oysters.

Vegetables assorted.—Mashed potatoes, boiled rice, boiled potatoes, green corn.

Puddings and Pastry.—Apple and plum pies, sweet omelets, calves'-feet jelly, Italian creams, plum and tapioca puddings, sweet sandwiches.

Dessert.—Water melons, mush melons, oranges and apples, bananas, walnuts, Barcelona nuts, raisins and almonds, figs and prunes, shell almonds.

Coffee and tea.

CONTINENTAL HOTEL, PHILADELPHIA.

Soup.—Chicken with fresh okra, Printaniere.

Fish.—Boiled salmon, genevoise sauce, filet of sole, sauce tartar.

Boiled.—Capon, parsley sauce, corned beef and cabbage, leg of mutton and capers, beef tongue, jole with vegetables.

Roast.—Lamb, mint sauce, ribs of beef, spring chicken, stuffed, ham, champagne sauces domestic duck, cider apple sauce.

Cold Dishes.—Roast beef, ham, beef tongue, pressed corned beef, boned capon, pickled lamb's tongue, beef, *à la mode*, lobster salad, *pate de foie-gras.*

Entrees.—Fillet of beef, larded, *aux champignons*, sweetbreads, *braisé*, sauce perigeux, baked pork and beans, reed birds on toast, with bacon, macaroni, *au fromage de Gruyère*, pan cakes *à la jellé.*

Relishes.—Worcestershire sauce, Halford table sauce, queen olives, cucumbers, pickled walnuts, chow-chow, horse radish, cole-slaw.

Vegetables.—Mashed potatoes, baked potatoes, boiled potatoes, lima beans, baked sweet potatoes, boiled hominy, onions, mashed turnips, stewed tomatoes, egg plant, beets, pickled and plain, boiled rice, green corn.

Pastry.—English plum pudding, brandy sauce, apple pie, pound cake, maccaroons, Boston cream puffs, wine cream, baked Indian pudding, peach pie, catawa wine jelly, Charlotte russe, kisses.

Dessert.—Vanilla ice cream, apples, peaches, peach water ice, filberts, grapes, water-melons, layer raisins, almonds, pecans, English walnuts, crackers and cheese.

French coffee.

◆

Literature.

DR. TILBURY FOX'S ATLAS OF SKIN DISEASES. (a)

(*Concluded from page* 268.)

In Arts V. and VI. we have illustrations of the other forms of eczema—viz., *E. impetiginodes, et E. infantile, Impetigo figurata et I. scabida, Impetigo rodens, Porrigo* (of Willan and Bateman) and *Impetigo contagiosa* (of author). In the former of these parts there is nothing calling for special attention, and none of the plates are entirely new. But in the 6th part, there is a good description and a capital illustration of impetigo sparsa of the scalp, one of the phases of the porrigo favosa of Willan and Bateman, or porrigo of moderns. It is portrayed in the Sydenham Society plates of skin diseases as Porrigo *contagiosa pediculis.* Porrigo Startinii is another name for it, so termed after the late Mr. Startin, who laid so much stress on its contagious nature. Dr. Tilbury Fox, however, says it may be, but is not always, excited by the irritation of pediculi. Nor does he believe that "it is in itself contagious," but that another form of eruption first described by him under the name of Impetigo contagiosa, and illustrated in the next plate, is often both mistaken for and complicated with it. But how this could be the case is difficult to imagine, for according to what we have seen in dispensary practice as well as to Dr. Fox's own illustration, there cannot be two diseases which differ more in appearance than those do. Parts VII. and VIII. are taken up with illustrations of the various forms of herpes, pemphigus, and ecthyma. In Part VII. there is a good illustration of a rare and curious variety of herpes, called *H. Iris*, in which the vesicles are small and so disposed in two or three concentric rings, surrounding a central vesicle as to give to each small round patch an iris-like appearance. In the next part we have a representation of a very rare form of pemphigus as it affected the head and neck in a case recently under our author's care in University College Hospital. Dr. Fox says the illustration is a good one, and if so, we must confess that this form of the disease, named pemphigus *foliaceus*, is a very remarkable one. It consists essentially of bullæ of various sizes, which affect the head and neck, and even spread all over the body by the development of successive crops of blebs. In consequence of the close packing together of the bullæ, and the drying up of their walls in admixture with the fluid which they contain, large flaky masses are formed, like patches of yellow parchment, or bits of French pastry or papyrus. An offensive odour is exhaled from the patient, and the skin beneath the bullæ is reddened and tender. Parts IX. and X. are chiefly confined to the representation of the various forms of psoriasis and pityriasis. The illustrations of psoriasis, in which three new plates are given, are very faithful portraits of the real disease. This is particularly the case with the drawing of psoriasis *guttata*, the mortar-like spots of which are well pourtrayed. The dirty-white incrustation of psoriasis *inveterata* is also very truthfully represented. In this part we have an illustration, and an excellent one of psoriasis *rupioides*, a variety to which Dr. McCall Anderson was the first to draw attention. Pityriasis *rubra* (the dermatitis *exfoliativa* of Wilson) is a new plate, and is a graphic portrait of a very obsinate form of skin disease. We have, moreover, in the tenth part of this Atlas, a good illustration of Lichen *rubra*, a disease which is often confounded with psoriasis.

(a) "Atlas of Skin Diseases," a series of Coloured Illustrations, with Descriptive Text and Notes on Treatment. By Tilbury Fox, M.D., F.R.C.P., &c. London: J. and A. Churchill. 1876.

We have as yet said nothing of the descriptive letterpress, which is entirely original, and suited in every respect to the requirements of such a work. The descriptions are clear and concise, and yet sufficiently long to draw attention to the most salient features of each case. The "Notes on Treatment" are also short, precise, and practical; while in respect of some of the more important affections of the skin, Dr. Fox enters more into details. Thus, in describing the treatment of psoriasis, the author gives his views of the pathology as well as of the treatment of that obstinate disease. "Psoriasis," he remarks, "is more nearly connected with a perversion of the regulative act, exerted by the trophic nerves over the cell nutrition, if the disordered cell-growth be not due to a misbehaviour or defective formative capacity on the part of the cells themselves. Be this as it may, clinically the growth is an evidence of want of proper nutritive capacity in the cuticular tissue; and to rectify this, such tonics as tend to give tone and activity through the nerve supply to the tissues themselves, are needed. In this consists the essential internal treatment of psoriasis. I do not think, as a rule, our treatment of psoriasis is sufficiently tonic."

In conclusion, we may remark that, after having carefully gone through the twelve parts of this Atlas which have been already issued, we feel warranted in stating that there is no work of the kind which is so handy, so practical, and so suited to the wants of the student and practitioner, as that to which we have now called attention.

LANDMARKS, MEDICAL AND SURGICAL. (a)

Not unfrequently valuable matter is to be found published in "Hospital Reports." It was through that source that Mr. Holden's "Landmarks" first saw the day. The title chosen for his book seems at first sight somewhat peculiar. But everything that Mr. Holden says and writes is peculiar, and the peculiarity consists in this, that all that he says, and all that he writes, is worth hearing, is worth reading. The sixty-nine pages of large print now before us are written in the author's usual happy style, and the only fault which we have to find with the work is that it has not been printed in a separate form long since. However, not a few students and other workers have known that in certain old "St. Bartholomew's Hospital Reports" most valuable information could be obtained on the position of deeply-lying parts, as ascertained from surface-markings. No doubt since the author has been an examiner at the College of Surgeons, he has seen the absolute necessity for students being more specially taught this form of anatomy. "For instance, ask a student to put his finger on the exact place where he would feel for the head of the radius, the coracoid process of the scapula, the tubercle of the scaphoid bone in the foot; ask him to compress effectually one of the main arteries, to chalk the line of its course; to map on the chest the formation of the heart, and the several valves at its base. . . . Questions such as these, even a good anatomist, unaccustomed to deal with the living subject, might possibly find himself at a loss to answer." But such knowledge is very necessary, and is now made a special feature in the Pass Examination at the College. The author shows his readers how to set about a practical solution of these various problems, and he tries to teach them to look right through the skin, and to see the subjacent structures just as clearly as they would be able to do in a dissection. He (p. 2) tells them that they will derive no real assistance from plates, but that they should examine their own body; or, which is better, that two of them should work together by the side of a skeleton, each student playing in turn the part of "model" and manipulator. Were we to call attention to all the valuable points in Mr. Holden's little book, our notice would attain an unusual length, but we would advise those who are interested in the subject, whether teachers or learners, to study it for themselves.

The 21st page is chiefly occupied by an outline drawing of the framework of the chest, on which is marked the relative size and shape of the lungs and heart. The position of the cardiac valves and of the aorta are also indicated.

Mr. Holden doubts if the normal kidney (p. 37) can be distinctly felt from the surface, either with dead or living subjects; he cautions the student against mistaking for it the liver or spleen enlarged, or the lumbar part of the colon distended with fæces. He gives also an account of the parts which may be made out by the finger introduced into the rectum. But as if this were not sufficient, Mr. Holden has added (pp. 70-73) remarks of Mr. Waltham's, who, by introducing his hand and forearm into the bowel, has been able to reach the left kidney. Though we do not speak from experience, we can readily imagine that serious consequences might follow on such manipulation, especially in those obscure and not uncommon cases of obstruction which are due to malignant disease of the gut. Dr. Godson adds a couple of pages at the end of the book on examination *per vaginum*. He tells us that the carunculæ myrtiformes are vascular membranous processes which are independent of the hymen. He says also that if the promontory of the sacrum can be felt, it is a sign that the conjugate diameter of the pelvis is abnormal.

◆

A PRACTICAL TREATISE ON URINARY AND RENAL DISEASES. (a)

Dr. Roberts is one of the first of provincial physicians of the present day. His book is a satisfactory demonstration that it is not necessary to live in London to do first class work. Dr. Roberts is thoroughly familiar with his subject, both as to its present and its past literature. His chapters are well written throughout, and the obvious result of a ripeness of knowledge. The whole work has been so carefully gone over that it is not easy to say where the new additions are to be found. The solvent treatment of uric acid calculi is given at length, and is a very interesting chapter. That on diabetes is also very instructive, and not the least so the appendix on "Milder Types of Diabetes." Here a number of cases are given where a condition of glycosuria has been slight, or temporary, in many cases ending in complete recovery. In a recent review of Prof. Garrod's work on gout, the relation of gout and diabetes were given. The whole subject of glycosuria is now attracting much attention, and the idea of thinking that a patient is going to die or even necessarily be very ill when sugar is found in the urine is now exploded. The indications to be derived from the presence of sugar are no more certain than are those furnished by albuminuria. We recommend Dr. Roberts's book as a safe guide to all readers on the subjects which he treats.

(a) "Landmarks, Medical and Surgical." By Luther Holden, F.R.C.S., Senior Surgeon to St. Bartholomew's Hospital, 1876. J. and A. Churchill.

(a) "A Practical Treatise on Urinary and Renal Diseases. By Wm. Roberts, M.D., Professor of Medicine in Owen's College, and Physician to the Manchester Infirmary.

◆

CLINICAL ARCHIVES.

AMONGST our American exchanges we have received the first two numbers of a new journal entitled *Archives of Clinical Surgery*, published by Messrs Routledge and Co., New York, and edited by Edward J. Birmingham, M.D. This journal is a monthly publication, and is devoted to surgery in all its special departments. The articles are well written, and deal with the subjects touched upon in an eminent practical spirit, for the most part giving the clinical experiences of the several writers. As examples we quote the following from the list of articles that have appeared :—

"Case of Naso-pharyngeal Tumour removed by the Galvanic Cautery: *Excision of the greater portion of the Superior Maxillary Bone to reach the Tumour—Operation preceded by the Introduction of Trendelenberg's Tampon Tracheotomy Tube—Ether administered through Tube.*" By James L. Little, M.D., Professor of Surgery, University of Vermont.

"Remarks upon the Enucleation of Uterine Fibroids, with illustrative cases." By T. Gaillard Thomas, M.D., Professor of Obstetrics, &c., &c., College of Surgeons and Physicians, New York.

"Transfusion of Blood in the Last Stages of Phthisis." By Joseph W. Howe, M.D., Chemical Professor of Surgery, University of New York.

"Formation of Artificial Hip-joints." By Albert G. Walter, M.D., Pittsburgh, Pa.

The other articles are of equal value and interest with those we have enumerated.

In addition, there are valuable "Hospital Records," "Analytical and Critical Reviews," &c.

We feel assured that this journal will be welcomed by all who are actively engaged in the practice of their profession, containing, as it does, so many useful suggestions for the treatment of cases which may at any time fall within the experience of every medical man. It has the further advantage of being printed on good paper, in bold clear type, and of being generally well got up. We wish its promoters every success in their new adventure, and trust that a long and useful existence awaits their journal.

◆

Medical News.

Vital Statistics.—According to the Registrar-General's returns during last week 5,911 births and 3,104 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,807. The mortality from all causes was at the average rate of 20 deaths annually in every 1,000 persons living. The annual death-rate was 12 per 1,000 in Edinburgh, 21 in Glasgow, 19 in London, and 19 in Dublin. In the other large towns the rates of mortality were —Birmingham 21, Bradford 25, Newcastle-upon-Tyne 20, Hull 20, Sunderland 20, Brighton 15, Bristol 19, Wolverhampton 15, Sheffield 22, Plymouth 18, Liverpool 21, Leeds 20, Portsmouth 17, Leicester 17, Norwich 21, Manchester 23, Nottingham 32, Oldham 30, and Salford 31. The annual death-rate from the seven principal zymotic diseases averaged 3·0 per 1,000 in these towns, and ranged from 0·5 and 1·1 in Brighton and Bristol, to 7·1 and 9·8 in Portsmouth and Salford. Scarlet fever continues fatally prevalent in Portsmouth, and an excessive number of deaths were referred to small-pox, measles, and diarrhœa in Salford. The deaths from small-pox registered in these towns were 32, of which 15 occurred in London, 10 in Liverpool, and 7 in Manchester and Salford.

Society for Relief of Widows and Orphans of Medical Men.—The usual half-yearly general meeting of the Society was held on Wednesday, October 25, in the library of the Royal Medical and Chirurgical Society, Sir George Burrows, President, in the chair. From the treasurer's statement it appeared that a sum of £1,245 10s. had been distributed during the past half year among fifty-eight widows and thirteen orphans. The expenses had been £135 15s.. A legacy from the Rev. H. C. Morgan of £1,000 had been paid and invested, and notice of another legacy of £500 from Mrs. Mary Davis Parker had been received. Eight new members had been elected. Four fresh applications from widows for assistance had been admitted. The funded property of the Society had been increased by the purchase of £792 13s. Metropolitan Consolidated Stock. A vote of £20 to Miss Armstrong, daughter of the late Dr. John Armstrong (a member of the Society from 1818 to 1829), was carried unanimously. The President announced to the meeting that the Directors had determined, owing to the amount of surplus income in the hands of the treasurer, to make a present at Christmas next of £5 to each widow in receipt of grants, £2 to each orphan, and £4 to each recipient of relief from the Copeland Fund. The President expressed his thanks to the members present for their attendance, and was pleased to see so many present, and hoped all future general meetings might be as well attended. A vote of thanks to the chairman was proposed and carried *nem. con.*

The Mortality of Foreign Cities. — The annual rates of mortality, according to the most recent weekly returns of the Registrar-General, were :—In Bombay 24, Madras 40, Paris 23, Brussels 20, Amsterdam 19, Rotterdam 19, The Hague 19, Copenhagen 23, Stockholm 24, Christiania 22, Berlin 24, Hamburg 23, Breslau 30, Munich 33, Vienna 22, Buda-Pesth 29, Rome 23, Naples 22, Turin 17, Alexandria 35, New York 22, Brooklyn 17, Philadelphia 21, and Boston 22. The fatal cases of typhoid fever in Paris, which had been 44 and 29 in the two previous weeks, rose again last week to 40.

◆

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

LAW RESPECTING PERIODICALS, NEWSPAPERS, &c.—1. Subscribers who do not give express notice to the contrary, are considered as wishing to continue their subscriptions. 2. If subscribers order the discontinuance of their periodicals or newspapers, the publisher or publishers may continue to send them until all arrears are paid up, and Subscribers are held responsible for all numbers sent. 3. If Subscribers neglect or refuse to take the periodicals or newspapers from the office to which they are directed, they are held responsible till they have settled their bills. Sending numbers back, or leaving them in the office, is not such notice of discontinuance as the law requires. 4. If Subscribers remove to other places without informing the publisher, and their periodicals or newspapers are sent to the former directions, hey are held responsible.

Differing only in Orthography.—An American contemporary says: A young lady recently on being asked what business her lover was in, and not liking to say he bottled soda-water, answered—"He's a practising fizzician."

ASCARIS LUMBRICOIDES.

To the Editor of the Medical Press and Circular.

Sir,—Such cases as those detailed by Dr. O'Connell in your journal of the 25th ult. are the most familiar of all which come under the treatment of dispensary doctors. I have in my register of cases notes of more than one such every week, and I find santonine so satisfactory in killing the worms that I rarely vary the treatment, and never have to give more than two or three doses before effecting the desired result.

The largest number I have known to be expelled at once was from ½ mim. of croton-oil given for another reason, but with the effect of causing fifty-four round worms to be passed in one motion of sizes from 11 inches long down to 4 inches. This was in a girl 13 years of age.

Tullow, co. Carlow,
Nov. 4, 1876.

I am, Sir, yours, &c.,
Wm. Hume Hart.

Betts *versus* the Medical Press and Circular.—This long pending action for libel will probably come on for hearing before the appearance of our next number.

Raid upon Quack Doctors.—In our last we gave particulars of convictions against a batch of quacks in Manchester. On Friday last another raid was made by the police, who seized several tons of obscene books and pamphlets, and hauled up the authors of them before the stipendiary for punishment under the Medical Act. As is usually the case, these quacks had adopted well-known professional names, in order to pass current with an ignorant public—thus, "Drs." Brodie, Dupré, and Henry. However, they were quickly stripped of their fine feathers, and each impostor was mulcted in a heavy penalty and costs.

Clinical Society of London.—On Friday evening, at 8½ p.m., Dr. C. Theodore Williams will bring forward the sequel of a "Case of Contracted Cavity in the Lung," communicated in 1871.—Dr. Gowers, "A Case of Lymphatic Leucocythæmia treated by Phosphorus."—Dr. Greenfield, "A Case of Hodgkin's Disease, with Increase of White Blood-cells."—Dr. Broadbent: Patients now under treatment with Phosphorus for Leucocythæmia.—Mr. Walsham, "A Case of Localised Hypertrophy of the Scalp."

VACANCIES.

National Dental Hospital, Great Portland Street, London.—Assistant Dental Surgeon. Apply to the Treasurer or Hon. Sec. at the Hospital. (See Advt.)

Dublin Fever Hospital.—Resident Medical Pupil. For particulars apply to the Registrar at the Board Room, Cork Street. (See Advt.)

APPOINTMENTS.

Benson, T., M.R.C.S.E., Medical Officer and Public Vaccinator for the Tanfield District of the Lanchester Union, Durham.

Buck, H. J., L.R.C.P.Ed., a Surgeon to the Saffron Walden Hospital.

Coates, W. M., M.R.C.S.E., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Wilts.

Day, H., M.D., F.R.C.P.L., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Stafford.

Fitzgerald, F. C., L.K.Q.C.P.I, L.R.C.S.I., Medical Officer, &c., for the Newtownbutler Dispensary District of the Clones Union, co. Monaghan.

Harland, J. T., M.D., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Stafford.

Harris, V. D., M.B., M.R.C.S.E., an Assistant Physician to the Metropolitan Free Hospital.

Hill, Dr. A. B., Public Analyst for Warwickshire.

Hughes, J. E., M.R.C.S.E., Medical Officer of Health for No. 2 Subdistrict of the Aberystwith Rural Sanitary District.

Johnson, H., M.D., Medical Visitor of Houses licensed for the reception of Lunatics within the County of Salop.

Kemm, W., M.R.C.S.E., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Wilts.

Mapother, E. D., M.D., F.R.C.S.I., Consulting Surgeon to the new Dental Hospital, Dublin.

Meehan, N. J., L.R.C.S.I., L.R.C.P.Ed., Medical Officer to the Workhouse, New Ross Union, co. Wexford.

Paxton, F. V., M.B., M.R.C.P.L., Medical Visitor of Houses licensed for the reception of Lunatics in the Western Division of the County of Sussex.

Probyn, J. S. H., M.R.C.S.E., L.F.P.S.G., Medical Officer for Nos. 4 and 5 Districts of the Thingoe Union, Suffolk.

Radcliford, R., M.B., C.M., F.R.C.S.I., Ophthalmic Surgeon to the Adelaide Hospital, Dublin.

Rawson, J., M.B., L.R.C.S.I., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Stafford.

Ryding, F., L.D.S., R.C.S.E., a Dental Surgeon to the new Dental Hospital, Dublin.

Sherlock, H., L.R.C.S.I., a Dental Surgeon to the new Dental Hospital, Dublin.

Smart, A., M.D., F.R.C.P.Ed., Lecturer on the Institutes of Medicine at the School of Medicine, Edinburgh, vice McKendrick, appointed Professor of Physiology at the University of Glasgow.

[illegible], G. B., L.R.C.P.L., M.R.C.S.E., Consulting Surgeon to the West Norfolk and Lynn Hospital, on resigning as Surgeon.

Toss, J., M.R.C.S.E., House Surgeon to the Lancaster Infirmary and Dispensary.

Turner, W. P., M.R.C.S.E., Assistant Medical Officer to the Kent Lunatic Asylum, Chartham.

Vores, W. M., M.B., M.R.C.S.E., Medical Officer for the North District of the Parish of Great Yarmouth.

Waylen, G., M.R.C.S.E., Medical Visitor of all Houses licensed for the reception of Lunatics in the County of Wilts.

White, A. O., M.R.C.S.E., Assistant House Surgeon to the London Lock Hospital (Female Department), Westbourne Grove.

Williams, A. G., M.R.C.S.E., House Physician to the Royal Hospital for Diseases of the Chest, City Road.

Army Medical Department.—Surgeon Major M. Combe, M.D., retires upon half-pay; Surgeon W. Wakefield, M.D., retires upon temporary half-pay; Surgeon R. H. Robinson, from half-pay, to be Surgeon; Surgeon P. Smith, M.D., resigns his commission. To be Surgeons-Major.—Surgeons T. Oughton, W. H. Jameson, M.D., W. W. Tomlinson, W. S. M. Price, T. F. O'Dwyer, M.D., J. P. H. Boileau, M.D., W. Keir, M.D., L. Corban, M.D., W. Taylor, M.D., J. M. McLean, M.D., P. Shepherd, M.B., W. S. Hedley, M.D., T. A. Purcell, E. O'Sullivan, J. McCreery, H. C. Gillespie, M.D., J. Hector, M.B., C. E. M. Shaw, K. Macaw, M.D., W. E. Riordan, I. Bourke, M.B., J. Murray, M.B., J. B. Kelly, D. C. G. Bourns, J. H. Hughes, M.D., J. W. Jones, A. B. Robinson, D. A. S. Thorburn, M.D., E. R. O'Brien, M.D., W. Blake, D. C. Grose, S. Flood, J. Candy, M.D., E. Eustace, E. Ward, J. Maturin, D. Renton, M.D., C. Healy.

Surgeon-Major M. Combe, M.D., who retires upon half-pay, to have the honorary rank of Deputy Surgeon-General.

Honorary Surgeon P. A. Minas, Bengal Medical Establishment, to have the honorary and local rank of Surgeon-Major.

Marriages.

Elliott—Hellard.—On the 2nd inst., at St. Thomas's Church, Portsmouth, Ernest Elliott, M.D., of Purbrook, to Elizabeth, eldest daughter of Charles B. Hellard, Solicitor, Portsmouth.

Roberts—Young.—On the 21st ult., at Trinity Church, Rathmines, Dublin, Browne Roberts, L.R.C.S.I., L.K.Q.C.P.I., to Frances Susan, youngest daughter of Richard Young, of 14 Leinster Square, Dublin.

Sproule—Fawcett.—On the 18th ult., at Fintona, co. Tyrone, Robert Sproule, M.D., R.N., Woodview, Fintona, to Frances Catherine, eldest daughter of the late John Fawcett, J.P., Drumaconnor Monaghan.

Deaths.

Allen.—On Oct. 28th, at Belper, Richard Rowland Allen, M.R.C.S.E., aged 60.

Altman.—On Sept. 24, at Bloomsbury Street, Henry Joseph Altman, M.R.C.S.E., aged 45.

Graham.—On Oct. 28, at Epsom, Thos. John Graham, M.D., aged 81.

Hall.—On Oct. 26, at Surrey House, Sheffield, John Charles Hall, M.D., aged 59.

Lyons.—On Oct. 17, at Blackrock, co. Dublin, Philip Paterson Lyons, M.B., Army Medical Department, aged 37.

Pilkington.—On Oct. 23, at Preston, John Pilkington, M.R.C.S.E., aged 64.

Rumsey.—On Oct. 23, at Prestbury, Cheltenham, Henry Wyldbore Rumsey, M.D., aged 67.

Smith.—On Oct. 22, Charles Carnegie Smith, Surgeon, of Norfolk Square, formerly of Highworth, aged 83.

The London Docks.—Arresting the attention of all visitors to the London Docks, there are now on the Crescent Quay two of the largest casks of wine—or, as they are technically termed, "tonnels"—ever seen in this country, and actually constructed and filled with wine in Spain and Portugal. A few coopers can remember casks as large in 1851, but these were made in England, and sent out to be filled abroad. One of the arrivals, the Brobdignagian sherry cask, contains 638 gallons, or a quantity sufficient to fill 3,828 wine bottles. It was shipped to the special order of the Victoria Wine Company from Cadiz, and was put on board nearly filled, the necessary appliances being at hand; its almost equally bulky neighbour, the cask of port, contains 590 gallons, or the contents of 3,540 wine bottles, and was also shipped to the special order of the above company by Messrs. Martinez, Gassiot, and Co., of Oporto. This monster had to be put into the hold of the vessel before it could be filled. The workmanship of these huge casks is very creditable to the skill of the Spanish and Portuguese coopers. The operations of the Victoria Wine Company, whose head offices are situate at Dunster House, Mark Lane, with fifty-five branch shops in London and the suburbs, are in keeping with the colossal casks to which we have alluded.

GENERAL NURSING INSTITUTE for TRAINED HOSPITAL NURSES.
5 Henrietta Street, Covent Garden, W.C.
A. EBSWORTH, F.R.C.S., Director.

RESIDENT MEDICAL PUPIL (DUBLIN).—An M.D. Dub. Univ., and F.R.C.S.I., who is intimately acquainted with the method of medical education in Ireland, will receive a young gentleman to reside in his house, for whose education he will, if desired, make all arrangements. Apply by letter to SOCIUS, 23 El P Dublin.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

FIRST or PRIMARY PROFESSIONAL EXAMINATION for the LICENCE.—The next Examination will commence on MONDAY, DEC. 4. Students are admitted to this Examination after the termination of the Second Winter Session of Professional Study at a recognised Medical School.

SECOND or PASS EXAMINATION for the LICENCE.—The next Examination will commence on MONDAY, DECEMBER 11. Gentlemen who have completed four years of Professional Study according to the College Regulations are eligible for admission to this Examination.

Every Candidate for the College Licence is required to produce a Certificate of having acquired proficiency in Vaccination, signed by a Vaccinator appointed or recognised by the Local Government Board.

Registered Medical Practitioners qualified before January, 1861, are admitted to Examination under special By-laws.

Candidates are required to give fourteen days' notice in writing to the Registrar of the College, with whom all certificates and testimonials required by the By-laws are to be left at the same time.

The Licence of this College is a qualification to practise Medicine, Surgery, and Midwifery, and is recognised by the Poor-law Board as a qualification in Surgery as well as in Medicine.

Pall Mall East. H. A. PITMAN, M.D., Registrar.

FEVER HOSPITAL AND HOUSE OF RECOVERY
CORK STREET, DUBLIN.

RESIDENT MEDICAL PUPIL REQUIRED. He must be a Medical Student of at least one year's standing.

Particulars of duties &c. can be seen at the Hospital.

Furnished apartments, coal, light, and attendance are provided.

Applications, with copies of Testimonials, to be lodged with me, on or before Nov. 8th, directed "*The Chairman of Committee*" and marked *outside* "Medical Pupil."

Personal attendance necessary at 9½ A.M. on THURSDAY, November 9th.

By Order,
G. PURCELL ATKINS, Registrar and
Resident Medical Officer.

Board-room, Oct 19th, 1876.

MERCER'S HOSPITAL, Founded A.D. 1750, WILLIAM STREET.

PHYSICIANS.

THOMAS P. MASON, M.B. Lond.; F.R.C.S.I.; Lecturer on Anatomy and Physiology in the Ledwich School of Medicine, and formerly Physician to the Cork Street Fever Hospital.

GEORGE F. DUFFEY, M.D. Univ. Dub.; F.K. & Q.C.P.I.; Lecturer on Materia Medica, Carmichael School.

SURGEONS

EDWARD LEDWICH, F.R.C.S.I.; Lecturer on Physiology and Surgical Anatomy in the Ledwich School of Medicine; Member of Council, Royal College of Surgeons in Ireland, &c.

E. STAMER O'GRADY, M.R.I.A., A.B., Ch.M., M.B. Univ. Dub., F.R.C.S.I.; Fellow and Member of Court of Examiners, Royal College of Surgeons, Ireland; Licentiate King and Queen's College of Physicians.

BENJAMIN F. McDOWELL, A.B., M.D. Univ. Dub; F.R.C.S.I.; L.K. & Q.C.P.I; Senior Surgeon to the Westmoreland Lock Hospital; Surgeon to the Sailor's Home, and Lecturer on Materia Medica in the Ledwich School of Surgery.

Visited punctually at Nine o'clock, a.m.

This Hospital is situated in the centre of the metropolis, in the midst of a densely crowded population, and its doors are open at all hours for the reception of accidents and of acute cases.

Further information can be obtained from any of the Medical Officers of the Hospital, or from the Medical Registrar.

By Order,
JAMES SHAW, Medical Registrar.
Mercer's Hospital.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £40 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote.

Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,

W. O'NEILL, Secretary.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE,

50 LINCOLN'S INN FIELDS, W.C.

BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.

&c. (KING'S COLL.), and Author of VIA MEDICA,

Has always upon his books a large number of desirable Investments and available Appointments for negociation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

LOCUM TENENS.—Dr. Langley has now organised a thoroughly reliable Staff of suitable Gentlemen to take full Charge of any Practice which may require it in the absence of the principal, at fees from £2 12s. 6d. upwards, according to age, experience, qualifications, &c. One of these gentlemen can be despatched by an early train after receipt of telegram or letter stating duties and terms. Office fee 10s. 6d., payable by the principal.

PRACTICES AND PARTNERSHIPS NOW OPEN

for Negociation (in addition to those advertised in Dr. Langley's List, which is sent post free on application).

A 219. LONDON, WEST-END. Well accustomed medical residence to be let on beneficial lease, 15 years unexpired. Rent, £100. The present Occupier retires from Practice, having secured ample means. The connection is special and is not offered for sale, but part of it could probably be obtained by a suitable Successor. The furniture and fixtures, &c., must be taken at a valuation, the assumed value being about £2,500.

A 217. YORKS. In consequence of ill-health, the Incumbent of a Practice yielding about £1,000 a year is willing to treath with a Successor on easy terms. Expenses small. No horse required. Convenient cottage. Rent, £25. Premium, £650.

A 216. In the Suburbs of a large city, a well-established PRACTICE. Receipts, average £800 a year. About 30 cases of midwifery a year. Fees, £1 1s. and upwards. All appointments declined. Residence situate in a main thoroughfare, it contains 12 rooms. Rent, £50. A good introduction will be given. There is scope for £1,500 a year. Hospital and medical school. One horse and carriage kept. No assistant. Premium, 1 year's purchase.

A 214. NOTTS. Old-established PRACTICE, yielding £420 a year. Patients, middle class. Convenient house, containing 14 rooms, with suitable offices, stabling, paddock, garden, &c. Rent, £55. Only one opponent. Terms, easy.

A 210. In a Sea-port Town, within 80 miles of London, with direct rail, one of the Leading Practices for Transfer. Receipts, upwards £1,000 a year. Patients, good class. No midwifery under £1 1s. One horse kept. The Successor may have a Partnership introduction if desired.

A 208. In a large Hospital town, with great Educational advantages, a SELECT PRACTICE, yielding upwards of £1,000 a year. Pleasant appointments bring in £50. Midwifery, £1 1s. and upwards. Visits, 5s to 10s. Patients, good middle class, resident within a narrow area. No horse or carriage, and no assistant. Convenient house in good repair, it contains 13 rooms. Rent, £50. Part of the premium may be paid by instalments.

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

REPORT OF THE PROCEEDINGS OF THE COMMITTEE OF COUNCIL,

DURING THE QUARTER ENDED 26TH SEPTEMBER, 1876.

MR. CHAIRMAN AND GENTLEMEN,—Since last meeting of the full Council, held June 9th, the Committee have held *nine* meetings, which were generally well attended. The month of August was devoted to vacation.

Although The Coroners' (Dublin) Bill had passed the House of Commons—it being still before the House of Lords—the Committee sent forward a petition to the House of Lords, similar to the one presented to the House of Commons, against the Bill. The Earl of Donoughmore presented the petition, but wrote to say he regretted he could not be of much service, as the Bill had been endorsed by Sir Arthur Guinness, whose local knowledge gave his name great weight. The Committee instructed the hon. secretary to communicate with Lord Redesdale as a last resource, but, unfortunately, the communication was of no avail; however, it is satisfactory to know that every protest which could be offered by this Association, in the interests of the profession, as well as of the public, has been made, although the desired results were not obtained.

The Committee having discussed the best course of action to be taken concerning the petition sent forward to the House of Commons in support of The Coroners' (Dublin) Bill, by the Corporation of Dublin, which contained some false statements affecting the credit and status of this Association, deputed two members to draw up a letter embodying the views expressed. This letter was adopted, and published in the Dublin daily newspapers, of the 21st of June, and was signed by Dr. Jacob, Chairman of Council. The Lord Mayor immediately addressed a letter to each of the Dublin daily newspapers, disclaiming all knowledge of the slurs cast upon the Association by the Corporation; but the *Freeman's Journal* published (22nd June) an article defending the Corporation, and reflecting upon the Association, to which Dr. Jacob replied, challenging the *Freeman's Journal* to make the exposure threatened, but no notice was taken of his letter, and the subject was allowed to drop, the Committee being satisfied that the character of the Association has been vindicated in the estimation of the public.

The balance of £46 0s. 4d., appearing to the credit of the Association in the late hon. treasurer's name, has been handed over to Dr. Minchin, the present hon. treasurer.

Owing to the statement made by the Corporation of Dublin, to the effect that this Association was an unknown body, comprising only a few individuals, the Committee thought it advisable to obtain information as to the expense and proceedings necessary to be incurred in having the Association made an incorporated society, under Act of Parliament. The Committee are informed that the expense would be about £40, and they desire to bring the subject under the notice of the Council.

The sum of £10 bequeathed to the Association by the late Sir William Wilde, has been received by the hon. treasurer.

The Bill drawn up by this Council, for the purpose of amending The Registration of Births and Deaths (Ireland) Act of 1863, having been favourably reported upon by the departments, has been introduced to Parliament by the Right Hon. the Earl of Donoughmore, at the instance of Sir Michael Hicks Beach, Chief Secretary for Ireland. The Bill has been printed, by order of the House of Commons, and will be brought under the notice of the legislature next session, when it is to be hoped and expected, in consequence of its having been favourably reported on, that it will be passed. The Bill provides increased remuneration to the registrars, with less trouble and inconvenience to them in the discharge of their duties, as well as greater facilities to the public; and, as far as desirable and convenient, will assimilate the law in Ireland to that in force in England. A new form of medical certificate of cause of death has been issued by the Registrar-General, which is similar to the form in use in England; it will, doubtless, be approved of by the profession generally.

A copy of the report of the Association for the past year has been sent to each member of the Association, and to every medical man in Ireland holding public appointments, who is not as yet a member.

The annual general meeting omitted to appoint two auditors for the current year; these appointments, therefore, devolve upon the Council to make this day.

Dr. Kerans, of Ahascragh, having permanently left Ireland, has resigned his seat on the Council. The name of Dr. Sharkey, of Ballinasloe, has been prominently brought under the notice of the Committee; it devolves upon the Council to fill the vacancy this day.

The proceedings of the annual general meeting of the Association were reported in the Dublin and several provincial newspapers. The *Ulster Gazette* published an article of a hostile nature concerning them, which has been replied to by Dr. Gray, of Armagh.

The Public Health (Ireland) Acts Consolidation and Amendment Bill was not proceeded with last session of Parliament, but it is likely that it will be again brought before Parliament early next session. Up to the date of its withdrawal, the Committee continued to examine its numerous clauses. The 10th clause was first considered, it being most important to professional interests. The designation, "medical officer of health," instead of that of "sanitary officer," was approved of, and the Committee agreed to recommend its adoption; also that all towns comprising a population of 20,00[illegible] inhabitants should appoint a "superintendent medical officer of health," who should be debarred from professional private practice, whilst eligible to hold a professorship, or to be attached to an hospital. It was further agreed upon to recommend that the duties of the "sanitary officers" should not include attendance at court, and that for such service they should be separately remunerated. It was also considered advisable that the salaries of the sanitary officers should be proportionate to the areas and populations of their districts. The Committee agreed to recommend that any two or more neighbouring districts comprising together a population of 20,000 inhabitants, might unite if they desired it, and appoint a superintendent medical officer of health for such combined districts. The clause suggested by the conjoint Committee of 1874 relating to the appointment of a staff of medical inspectors for sanitary purposes, was approved of, and agreed upon to be recommended. Clause 130 was considered, and the Committee agreed to recommend that the onerous and responsible duties, by this clause to be imposed on medical officers of health, should be advanced as a claim for additional remuneration to those officers, and that they should be empowered to obtain analyses, when they thought them necessary. The Committee thought it better not to make any recommendation concerning clause 146; but agreed that the rate of remuneration proposed under clause 150 was inadequate, whilst difficult to determine, and the system suggested not likely to work well, and that instead thereof a fee of one guinea should be paid to the medical officer of health for each inspection or visit made on board ship. The Dublin Sanitary Association having proposed that a conjoint committee, consisting of representatives from the several colleges and associations interested in the public health enactments, should nominate two representatives, the Committee nominated Drs. Speedy and Chapman to represent the Association on the conjoint Committee, and are glad to observe that several of the other representatives are also members of the Association. However, owing to the withdrawal of the Consolidation, &c., Bill (which was expected), the conjoint Committee has not as yet met. Notwithstanding the fact that the conjoint Committee will give its attention to all the points requiring consideration and amendment in the new Bill, the Committee of Council think it advisable to pursue their investigation, so that this Association may be in a position to put forward its views and recommendations independently. If each of the colleges and other associations interested adopt a similar course, the suggestions made to Parliament from so many different sources must have great weight, if they be (as may be expected) unanimous in their recommendations.

Almost all the members' subscriptions for the past year have been paid; a third application circular had to be sent to some; several new members have joined the Association, and, in consequence of the amalgamation of the Poor-law Medical Officers Association with this Association, the Committee expect to enrol a large number of new members this year.

The Prisons' (Ireland) Bill came under the notice of the Committee, and it being observed that, under clause 23, medical officers of prisons in Ireland were liable to be transferred from place to place, on pain of resigning their appointments, the Committee directed the hon. sec. to write to Sir Michael Hicks Beach on the subject, and explain that medical officers of prisons in Ireland were private medical practitioners, upon whom it would be an injustice to place such restrictions, and Sir Michael Hicks Beach replied that the matter should receive attention.

The Committee having observed that Lord F. Hervey had given notice in Parliament that he would call the attention of the Legislature to the qualifications and appointments of coroners, the hon. sec., at the request of the committee, communicated with his lordship, and, in reply, received a letter stating that the notice given referred only to the qualifications of coroners in England; but that his lordship would be glad to receive any information, submitted by the Council of this Association, bearing on the subject, and the hon. sec. was requested to afford all the information he could. A communication was received, requesting that the Council should endeavour to have certain modifications made in the regulations as to duties of workhouse medical officers, it being alleged that, owing to the wording of the regulations, the workhouse medical officers were placed in a position which, unnecessarily, rendered them liable to annoyances from workhouse masters, if ill-disposed towards them, whilst no good purpose was effected. The writer suggested a course to be taken, and the Committee obtained a report on the subject from a competent source; but, owing to pressure of other matters requiring more immediate attention, the Committee have not had an opportunity of considering this case up to the present time.

The whole subject of remuneration to civil medical practitioners in charge of troops in Ireland has also been reported upon; but, like the preceding case, and for the same reason, it has not as yet been dealt with by the Committee. These two cases shall receive early attention.

A letter was received, in which the Council was requested to endeavour to have the local constabulary appointments opened up to workhouse medical officers; under the existing regulations, these appointments can be held only by Dispensary medical officers. The writer is under the erroneous impression that this Association is too partial to the interests of dispensary medical officers, and that it has hitherto neglected those of workhouse medical officers. The hon. sec. tried to remove the erroneous impression, but the writer still appears to be unconvinced. The committee desire to bring this subject under the notice of the Council, and request that the matter may be decided upon by them, as they are of opinion that it is not desirable to seek for any change in the existing regulations, because the dispensary medical officer, being a *district* officer, is (in their opinion) more suited and has higher claims to an appointment requiring district visiting than the workhouse medical officer, who is an hospital surgeon; and, independently of this consideration, they fear that competition for these appointments might possibly result in a smaller remuneration being offered by the authorities.

A very important trial has recently been held with regard to the subject of "well-to-do" persons obtaining tickets for dispensary medical relief, "poor persons" *only* being entitled to receive it under Medical Charities Act, viz., Dr. Woods, of Monaghan, having received a dispensary visiting (or *red*) ticket to attend, in her accouchement, a Mrs. M'Geough, the wife of a national schoolmaster (she herself being national schoolmistress) residing in his district; Dr. Woods attended the case, and continued his attendance for several days, when the patient's husband demanded what appeared to Dr. Woods to be an unnecessary visit to the patient, which Dr. Woods declined to be coerced to make; M'Geough thereupon, called in another doctor; and, in due course, Dr. Woods reported the matter to his dispensary committee, who *cancelled the ticket*, on the ground that the patient, not being a "poor person," was not entitled to receive dispensary medical relief. Dr. Woods then sued M'Geough, the patient's husband, for the amount of his fee, but the chairman of the quarter sessions dismissed the case, and expressed his opinion that the guardian who improperly issued a ticket to a person able to pay for medical advice, was the person who should have been proceeded against; accordingly, Dr. Woods sued Mr. Crumley, the guardian who issued the ticket; and, the case having been heard, the chairman directed Crumley to pay Dr. Woods the amount of the fee which Dr. Woods admitted he would have consented to receive for his services had the case been one in his ordinary private practice, considering the patient's means, with costs; against this decision Crumley appealed. Dr. Woods then reported the matter to the Committee of Council, who directed the hon. sec. to telegraph to Dr. Woods to employ leading counsel in the appeal case, if not already so represented, at the expense of this Association, and the hon. sec. was instructed to inform Dr. Woods that the Council would gladly afford him all the assistance in their power, with the view to having the case tried. The appeal case was heard before Judge Fitzgerald, who dismissed it without prejudice, on account of a legal informality, the charge of *fraud* not having been set down in the summons and plaint. The judge expressed strong opinions against the unfair issue of dispensary medical relief tickets to persons able to pay for advice, and gave every encouragement to Dr. Woods to bring the case forward again; and the Committee instructed the hon. sec. to write to Dr. Woods, recommending him to obtain the opinion of his counsel as to whether it was advisable to proceed with the case as one of *fraud*. A full and verbatim report of the trial of this case was forwarded to the Committee by the editor of the *Northern Whig* newspaper, for which a fee of one guinea was ordered to be paid, and the report was forwarded to the editor of the MEDICAL PRESS AND CIRCULAR for publication. Dr. Woods has announced his determination to persist in the case until a final decision be arrived at.

The Committee agreed that it would be advisable to dispute the presentments to be made by the Corporation of Dublin as far as regards the payment of salaries to the coroners' medical witnesses, such mode of payment not being in accordance with the method laid down by Act of Parliament; but, before proceeding, they deemed it advisable to take counsel's opinion as to the prospect of success, and agreed to consult Mr. Purcell, Q.C. As yet no step has been taken with regard to this matter, as the presentments are not to be made until November, and the Committee preferred to have the views of the full Council expressed on the subject; besides which they considered it desirable to await the appointment of a solicitor.

It having been reported to the Committee that, on the 18th April last, Dr. Tagert, late of Carrickmacross, had resigned the appointment of consulting sanitary officer to Carrickmacross Union, and no candidate offering, the guardians have several times advertised without effect for candidates for the vacant office; first stating that the officer appointed would be paid by fees—one guinea for each consultation—which was subsequently rescinded, and a salary of £10 a year offered instead. This course having failed, advertisements and handbills for circulation were ordered, and a copy of the notice ordered to be sent to each dispensary committee, but up to the present time no candidate has offered to accept the office with such a paltry salary, and the guardians, on the 19th of Septembe, decided to take no further action in the matter. The Committee are aware that if a sufficient salary were offered, there would be no dearth of candidates, and accordingly directed the hon. sec. of Council to bring the matter under the notice of the Local Government Board, when it is to be hoped that Board will insist upon a proper salary being offered.

A large number of communications have been made to the Committee concerning matters which they do not deem it necessary to bring before Council, and needlessly occupy their time with the details. Many of these letters were on the subjects of fees for examining and certifying dangerous lunatics, and for giving evidence at prosecutions of defaulters under the Vaccination Acts; and all have been disposed of.

◆

BRIDGETOWN DISPENSARY.

A letter was read from the L.G.B., stating that Mr. O'Brien reports that the medical officer's duties are discharged in a very unsatisfactory manner. An extract from his report is enclosed herewith, which will place the guardians in possession of the facts relating to the subject; and it appears to the L.G.B. that having regard to what Mr. O'Brien reports, it is necessary, in the interests of the sick poor, that the medical officer, who is manifestly incapable of performing his duties any longer with any degree of efficiency, *be afforded an opportunity of availing himself of the provisions of the Medical Officers' Superannuation Act.*

EXTRACTS FROM THE INSPECTOR'S REPORT.

The Medical Relief Register is very imperfectly kept, the columns prescribed for recording the treatment and the result of the several cases being left blank, and the tickets are neither numbered or filed, as required by the several regulations.

The Medical Officer's Report and Attendance Book is not kept at all, and the Form of Notice (C) prescribed by Section 8 of the Vaccination Act has also, though absolutely essential, been disregarded in practice.

Dr. Furlong's Resignation.—Gentlemen,—During the last few days my failing health and growing infirmities have frequently urged me to resign the very onerous duty of medical officer of this large and populous district. Indeed, it has been the oft-repeated wish of my family, and as often frustrated by my inability to bring myself to sever the ties and associations of over thirty years.

I now feel that I must tender to you my resignation, and in doing so I may fairly say that I have grown grey in the service, and that I never spared myself either night or day, while it was God's will to leave me health and strength. It is now my duty to offer you, gentlemen of the dispensary committee, my most kind and sincere thanks for the very kind and courteous manner you have ever displayed towards me in the discharge of your official duties, and for the confidence always reposed in me.

I remain, gentlemen,
Your obedient servants
ANDREW FURLONG, M.D.

Mr. Walsh said as there had been a wrong impression upon the public mind respecting the considerations under which superannuation could be granted, he wished to read an extract from the Superannuation Act of 1869 which was the latest Act that had been passed on the subject. According to this Act it was perfectly clear that the Act was not compulsory. It was simply permissive, and if the Board of Guardians should decline to grant superannuation, it was not within the powers vested in the L.G.B. to compel them to grant it. It was also plain that the payment would come off the Union at large, and this was in his opinion not quite fair, as he thought this division would be doing an injustice by making other divisions contribute towards the support of its medical officer. It was altogether untrue, as had been stated that part of the payment of superannuation would come out of the consolidated fund, as it was clear, according to the emphatic terms of the Act, that all should come out of the rates. He considered it only proper to make these observations as rumours likely to mislead had been in circulation.

Dr Boxwell—But you know, gentlemen, that it does not concern us at all; the whole thing is vested in the Board of Guardians.

Mr. John Walsh—We can recommend it or not.

Dr. Boxwell—Yes, but the Board of Guardians may not pay any attention to your recommendation.

Major Harvey—We are here to consider the matter, and it is in our power to recommend it to the Board of Guardians; but no matter what our recommendations may be, whether for or against, the Board of Guardians can take it up afterwards and decide the question.

Mr. Harvey said,—Gentlemen, I intend proposing a resolution recommending that Dr. Furlong should receive superannuation. I have known him for a great many years, and perhaps have had more intimate knowledge of his services than many of you here present. He was appointed to this dispensary the very year I came to reside here, in 1846, and I can only say I have had opportunities of observing his conduct for a great number of years, indeed for the whole term since his appointment, with the exception of the last three years while I was from home, and I must say during that time, as far as my knowledge went, and it was no slight knowledge, I never saw a man more anxious to discharge duties on every occasion, and under every adverse circumstance, no matter at what inconvenience, whether night or day, he was always at his post. I could give you a great many instances which have come under my notice, but I shall only mention one. I have known Dr. Furlong to go to the Mountain in the chill of a wintry night on a midwifery case, for which he was to get no direct fee. Finding it a difficult case, he despatched a message for Dr. Crean, and when he (Dr. Crean) came next morning, he found Dr. Furlong at his post, after a weary night's watching by the bedside of his poor patient, and this is only one instance out of many in which he showed his care and anxiety, for the welfare of the poor, and for the careful discharge of his duties as a Dispensary Medical Officer. I recollect when it was considered that £100 was too large a salary of a dispensary doctor; but when we consider that the doctor was obliged to travel over 4,000 miles in the course of the year, and that this could not be done without a large expenditure of horseflesh, I am sure you will agree with me that the salary was not extravagant. Now, with regard to the superannuation, there are at present about sixty-five on the retiring-list, and of these there are none whose length of service comes up to Dr. Furlong. That of one comes up to thirty, another to twenty-eight, but the average is twenty years; whilst that of Dr. Furlong is thirty years. The average superannuation allowance is £54 16s., and Dr. Furlong's servitude is the highest of any. When I look back on these long services, I cannot but feel that it is only justice to Dr. Furlong to give him a suitable and fair superannuation allowance. It is, of course, very true that we should look to the interests of the ratepayers, but in doing so we should not act unjustly to an old and faithful servant. Mr. Walsh has remarked that it would be an injustice to other divisions of the Union, if we throw on them the burthen of paying part of the superannuation of our late medical officer, but I can see no injustice in this. It is our case to-day, but it may be the case of any of the other divisions to-morrow, and we shall be bound to bear our share of the cost. We have under consideration the case of a good and faithful servant, who has become worn out in our service; and with all due consideration to the interests of the ratepayers, I think we should do an act of injustice by refusing him the reward of his services, a reward which in our private capacity we would not refuse for services faithfully rendered. In my opinion this case calls loudly upon us for consideration. There is a passage of Scripture which forces itself upon my mind: "There is that scattereth, and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to penury." Do not suppose I want to force my opinion upon others, but I am quite sure you will bear with me, and take it in good part (hear, hear), when I say that I believe justice demands of us to give Dr. Furlong a superannuation allowance. I therefore propose that Dr. Andrew Furlong, late medical officer of the Bridgetown Dispensary, be granted a retiring pension of two-thirds of his former salary.

A division was then taken, when there were—for, 11; against, 8.

There were four who refused to vote.

Mr. Nunn said a recommendation from this place may be very good. There is no one in this room who more highly appreciates the services of Dr. Furlong than I do. I have known him for the last thirty-two years to be a faithful, honest man, but it rests with us only to recommend.

It was resolved unanimously, "That in consequence of the resignation of Dr. Andrew Furlong, the hon. sec. be requested to engage the services of Dr. John Crean, to take charge of the district, pending the election of a successor to Dr. Furlong."

◆

"ADVANCED THINKERS."—That single expression—advanced thinkers—will do more to establish theories and doctrines, and practices also, than learning and experience and wisdom combined. Let a man who differs from the mass be pronounced by common consent an advanced thinker, his fame is established, no matter how extravagant his notions. To say that a man is an advanced thinker, means, as a general thing, that he don't think at all, but is captivated with some popular idea or some popular scientist, or that he aspires at notoriety by identifying himself with such. Time was when advanced thinking was a dangerous business, which men did not dare except under penalty of martyrdom. Now it is the reverse. Advanced and original thinkers are really but few, and their advance is often more apparent than real. They often but exhume the old and install it as new. Our age has much need of individual and independent thought. Men are afraid to hold fast to the pass or the present in view of anything claiming to be in advance. It is so in theology, in general science, in medicine. Better maxim than this was never uttered: "Prove all things—hold fast to that which is good."—*Pacific Med. and Surg. Journal.*

MEDICAL DEFENCE ASSOCIATION.—This energetic Society has brought the notorious "Dr." Kahn before a magistrate, and is preparing for a more active campaign. Bravo! The College of Surgeons refused its permission to prosecute in its name. Shame!

PSOAS ABSCESS.—A NEW METHOD OF TREATMENT. (a)

By MR. EDMUND OWEN, M.B., F.R.C.S.,
Assistant-Surgeon, St. Mary's Hospital.

IN August last my attention was attracted by a short paragraph in one of the medical journals, in which it was stated that Mr. Callender had lately been treating cases of chronic abscess by hyperdistension with carbolised water, and that so far as the cases went, they showed that abscesses connected with caries of bone can be emptied and reduced to non-suppurating sinuses without causing any constitutional disturbance.

It was not long before a case which I considered to be very favourable for making a trial of this new method came under my care at St. Mary's Hospital. And I think it worth while to give a somewhat detailed account of the physical condition of the patient, together with an explanation of the method of treatment adopted.

On Saturday, 9th of September, a pale, sickly-looking boy, with patches of deepish ulceration on his cheeks, was admitted to the children's ward under my care. He was between six and seven years of age, and was carried into the hospital by his sister, who was scarcely bigger than himself. He was in a most pitiable condition, with an enormous abscess on the upper and outer part of the front of the right thigh. The skin in that neighbourhood was red and thin, and it was evident that unless something were done for him without much delay, the wall of the abscess would give way certainly if it met with any rough usage. There was angular curvature of the spine at the upper lumbar region, and great fulness extended up the flank under Poupart's ligament.

Up to within a short time he had been able to play about with his companions, but now he was in such an exhausted state that it would have been unsafe to have sent him away. He was therefore placed in bed, and on the following Wednesday, he having been placed under the influence of chloroform, an incision was made in the most prominent part of the swelling, and of sufficient size to admit one's finger. From this opening a large quantity of thick and healthy-looking pus escaped, and when the flow was becoming slow the nozzle of a large syringe was introduced, and the cavity completely washed out with a warm solution of carbolic acid and water. The edges of the wound also having been held securely over the syringe, the cavity of the abscess was more than fully distended with the injection, which was allowed to be retained "while one with moderate haste might tell a hundred." A drainage tube having been introduced well up into the loins, and the wound covered up with oiled lint, the boy was sent back to bed. When I went to see him an hour afterwards, he was half sitting up in bed playing with his toys, and talking to other children in the ward,

Next morning his pulse had risen to 108 beats a minute, and his temperature to close on to 100°. Mr. Coumbe, the house-surgeon, who has syringed out the cavity every other day, tells me that the boy's temperature has never reached 101°; and that he has been in no pain, but that he has eaten, slept, and drunk well. The drainage-tube does not pass as far up as it did at first, but it is generally kept in the wound. The discharge has continued sanious since the second dressing.

I may here state that the boy is still in the hospital, but I intend shortly to case his trunk in a large and stiff plastic splint, and to have him removed to his home.

The other case is that of a boy of seven years, named Ambrose, who was brought up from the country into my out-patient room at the Hospital for Sick Children on the 20th of last September.

From notes which were taken by Mr. Cant, the house-surgeon, it seems that he has five well-conditioned brothers and sisters, and that his father and mother are alive and well.

He himself had always been a healthy boy until a year ago, when some of his young friends had been amusing themselves by jumping on his back. Shortly after this he complained of pain, and walked lame. Two months since a swelling appeared on the front of his thigh, and this, at the time of his admission as an out-patient, was very extensive and pointing. The skin was red, thin, and very tense. There was well-marked angular curvature in the lower dorsal and upper lumbar region. It was evident, or at any rate highly probable, that if he were sent home the integument might give way on the journey.

(a) Communicated to the Harveian Society of London, Nov. 2nd, 1876.

His temperature was about normal, and his pulse 105. The tongue was coated, and the bowels were confined.

He was taken at once into the operating theatre and treated like the patient whose case I related just now, except that no oiled lint was applied over the wound.

Next day his temperature had risen to 101°, but gradually coming down, it remained at about normal for twelve days.

Every other day the sac was washed out; the boy remaining in very good health. At this juncture the drainage-tube slipped out, but was replaced, as nearly as the sister of the ward can remember, six days afterwards. But in the meanwhile his temperature had risen to 103°. For a few days it varied from 100° in the morning to 103° in the evening. At the present time the morning temperature is but little above the normal. The boy is dreadfully excitable, but eats and sleeps well. He still complains at times of pain in the back, but since he has been in the hospital his physical condition has greatly improved.

Remarks.—The great feature in this method of treatment of psoas abscess is its simplicity, and the absence of all special and intricate dressings. All that are required being a scalpel, the warm solution of carbolic acid, of the strength of one part in thirty, an ordinary enema syringe, a long probe, and a drainage tube. The best dressing consists in fine picked oakum for soaking up the subsequent discharges, and a bandage.

Of course one cannot attempt to predict the unfailing good results for all psoas abscesses treated in this way. On the contrary, I am strongly of opinion that nothing is more perversive of the truth in surgical practice than may be first successful cases. Still from what I have heard of this method of treatment of psoas abscess in Mr. Callender's hands, together with my own limited experience, I feel sure that we are advancing towards a happy solution of a most difficult question. Hitherto surgeons have, for the most part, dreaded interference with these abscesses of the spine. They have deferred active treatment of the abscess as long as possible. Nature has, indeed, often been allowed to step in and effect an outlet in her own way. Hectic, profuse discharges and death have then closed the scene. So-called valvular incisions, partial emptyings, and aspirations have been attended with no better result.

However carefully punctures or incisions may have been made, with a view to prevent communications between the cavity and the exterior being permanent, I have always found that the pus has taken advantage of them, and that a constant drain has followed shortly after.

Professor Lister has done much towards establishing a correct method of the treatment of chronic abscess. He has shown us what free incisions for the outlet of pus, the use of drainage tubes, and a due attention to hygienic matters can effect. The complication of antiseptic gauzes, many folds of "protective," and whatnot, have, however, placed his method of treatment beyong the reach of the single-handed and busy surgeon. Indeed, few dare call themselves thorough practitioners of his school, unless they have had the advantage of studying under his able guidance, and following him daily through his wards.

The simple treatment of psoas abscess which I have described, and which has been called the treatment by hpperdistension, seems to be antiseptic treatment carried to the furthermost limits of the disease; and a great part of its perfection consists in its absolute simplicity.

I do not imagine for a moment that my two cases of caries of the spine are cured, but I think I may say that they have been safely guided through a much-to-be-dreaded and critical stage of their disease.

What they want now is many months, perhaps years, of perfect rest and good feeding.

◆

THE ADULTERATION OF FOOD, AND BRITISH LEGISLATION RELATIVE THERETO.

By Dr. C. R. Alder Wright,

Lecturer on Chemistry at St. Mary's Hospital.

(*Continued from page 375.*)

Another point bearing on the above is the circumstances that the salary to be paid to the analyst is left wholly to the discretion of those appointing him, and the scale of fees usually paid is apparently modelled on the provision in the Act that any purchaser of any article of food or drink or drugs shall be entitled on payment of a sum not less than half-a-crown, nor more than half-a-guinea to have such article analysed by the public analyst for the district. Thus, the following table illustrates the salaries and allowances actually made (W. L. Scott, *Journal Soc. Arts*, XXIII., 434) (*a*):—

City of London, £600 per annum, as medical officer of health and analyst.

Metropolitan Vestries.

Paddington, Feb. 4, 1873, £150 per annum.
St. George's in the East, £100 per annum.
St. Giles, Camberwell, Jan. 31, 1873, 10s. 6d. to 21s. for analysis.
St. George's and St. Giles's, Bloomsbury, May 8, 1873, £100 per annum.
St. George, Hanover Square, Nov. 7, 1872, £350 per annum.
St. George the Martyr, Southwark, Jan. 25, 1873, 2s. 6d. to 10s. 6d. for analysis.
St. James and St. John, Clerkenwell, May 8, 1873, £100 per annum.
St. John, Hampstead, £50 per annum, and £1 1s. for analysis.
St. Leonard, Shoreditch, April 8, 1873, £50 per annum, and 10s. for analysis.
St. Luke, Chelsea, March 18, 1873, £250 per annum.
St. Luke, Middlesex, Nov. 5, 1872, £150 per annum.
St. Martin in the Fields, £100 per annum.
St. Mary Abbotts, Kensington, £50 per annum, and 5s. for analysis.
St. Mary, Islington, Dec. 6, 1872, £300 per annum.
St. Mary, Lambeth, Oct. 10, 1872, 2s. 6d. to 10s. 6d. for analysis.
St. Marylebone, Jan. 24, 1873, £100 per annum.
St. Mary Magdalen, Bermondsey, March 3, 1873, 2s. 6d. to 10s. 6d. for analysis.
St. Mary, Newington, April, 18, 1873, 2s. 6d. to 10s. 6d. for analysis.
St. Matthew, Bethnal Green, £51 per annum, and 7s. 6d. for analysis.
St. Pancras, Jan. 15, 1873, £100 per annum.

Metropolitan District Boards.

Fulham, 5s. to 21s, for analysis.
Greenwich, Dec., 1873, £100 per annum.
Lewisham, March 31, 1873, £50 per annum, and 10s for analysis.
Limehouse, Aug., 1873, £150 per annum.
Plumstead, May 16, 1873, £50 per annum.
Rotherhithe, 2s. 6d. to 10s. for analysis.
Strand, £100 for one year.
St. John, St. Thomas, and St. Olave, Southwark, April 18, 1873, £50 per annum.
St. Saviour's, Southwark, £105 per annum.
Wandsworth, Jan. 22, 1873, 2s. 6d. to 10s. 6d. for analysis.
Westminster, April 25, 1873, £100 per annum.
Whitechapel, March 11, 1873, 10s. 6d. to 21s. for analysis.

Boroughs.

Abingdon, April, 20s. for analysis and travelling expenses.

(*a*) It being 17 months since this article was written, and several changes having been made since in the number and character of these appointments, some of the above figures require slight modification.

Bedford, Jan. 15, 1873, £50 per annum.
Beverley, Feb., 1874, £10 per annum and fees.
Birmingham, Dec. 17, 1872, £150 per annum.
Bolton, £50 per annum.
Bradford, £100 per annum and expenses.
Bridgnorth, Feb., 1874, fees.
Bristol, Jan., 1874, £100 per annum, and £50 for expenses.
Buckingham, 20s. for analysis and expenses.
Cambridge, Jan., 1874, fees.
Canterbury, Feb. 26, 1873, 7s. 6d. to 10s. 6d. for analysis.
Colchester, 10s. 6d. to 21s. for analysis.
Cork, £50 per annum, and 5s. for analysis.
Dublin, March 6, 1873, £300 per annum, and £20 for expenses.
Edinburgh, June, 1873, fees and expenses.
Ely (Isle of), £5 5s. per annum, and 20s. for analysis.
Gateshead, £10 per annum; 6s. 6d. to 21s. for analysis and expenses.
Galway (City and County), £25 per annum.
Gloucester, Dec. 31, 1872, £30 per annum.
Gravesend, May 21, 1873, £15 per annum.
Hanley, £25 per annum; 6s. 6d. to 21s. for analysis and expenses.
Hastings, £200 per annum.
High Wycombe, £203 per analysis.
Ipswich, £25 per annum, and 5s. to 10s. for analysis.
Leeds, £30 per annum.
Leith, June, 1873, fees and expenses.
Limerick, £25 for one year.
Londonderry (City and County), £20 per annum.
Manchester, March 5, 1873, £150 per annum.
Oxford, April 7, 1873, 20s. per analysis and expenses.
Reading, £15 per annum and fees.
Rye, 5s. to 10s. for analysis.
Sheffield, June 17, 1873, £100 per annum.
Sligo, £25 per annum.
Shrewsbury, Dec. 30, 1872, 21s. per analysis.
Southampton, £40 per annum and fees.
Swansea, May, 1874, £100 per annum.
Tenby, Feb., 1875, fees, 2s. 6d. to 10s. 6d. per analysis.
Waterford, £25 per annum.
Wigan, £30 per annum.
Windsor, 6s. to 21s. per analysis.
Woolwich, £50 per annum and fees.
Wolverhampton, March 1, 1872, fees, 5s. to 10s. 6d. per analysis.

Counties.

Buckingham, 20s. per analysis and expenses.
Bedford, July 1, 1873, £50 per annum, and 6s. per analysis.
Berks, April 7, 1873 20s. per analysis and expenses.
Cambridge, £5 5s. per annum and fees.
Carlow, £25 per annum.
Carnarvon, April 2, 1873, £5 per annum and 21s. per analysis.
Cheshire, £100 per annum and 6s. per analysis.
Clare County, £25 per annum.
Cornwall, Sept. 1873, £1 1s. per analysis, and £2 2s. per quarterly report.
Denbigh, Jan. 2, 1873, 10s. 6d. per analysis and expenses.
Derby, April 8, 1873, 5s. to 15s. per analysis.
Devon, 7s. 6d. to 21s. per analysis.
Dublin, £50 per annum.
Durham, £10 10s. per annum, 7s. 6d. to 21s. per analysis.
Essex, Feb. 18, 1873, 6s. to 21s. per analysis.
Fermanagh, £25 per annum.
Hampshire, (main division) 10s. to 21s. per analysis.
Hampshire (Isle of Wight division) 10s. to 21s. per analysis.
Herts, Dec. 31, 1872, 6s. to 21s. per analysis.
Hunts, £5 5s. per annum and 20s. per analysis.
Kent, 6s. to 21s. per analysis.
Kerry, £25 per annum.
Kildare, £30 per annum.
Kilkenny, (City and County) £30 per annum.
Leicester, £60 per annum.
Longford, £25 per annum.
Mayo, £25 per annum.
Monmouth, 10s. per analysis.
Montgomery, 21s. per analysis and expenses.
Nottingham, 10s. 6d. to £2 2s. per analysis.
Oxford, 20s. per analysis and expenses
Portsmouth, £50 per annum.
Queen's County, £50 per annum.
Roscommon, £25 per annum.
Sligo, £20 per annum.
Salop, Dec. 30, 1873, 13s. 4d. per analysis.
Somerset, £100 per annum and £50 for expenses, &c.
Staffordshire, (North Division) June 30th, 1873, £100 per annum.
Staffordshire, (South Division) June 30th, 1873, £100 per annum.
Suffolk, (East) 10s. 6d. per analysis.
Surrey, Jan. 28, 1873, 10s. to 20s. per analysis.
Sussex, (East) 6s. to 21s. per analysis.
Sussex, (West) 6s. to 20s. per analysis.
Tipperary, £20 per annum.
Warwick, April 8, 1873, £75 per annum and 10s. per analysis.
Wicklow, £25 per annum.
Worcester, £100 per annum and fees.

With the exception of a few appointments, where a fair remuneration for a large portion of the times of a thoroughly trained man is offered (*e.g.*, St. George's, Hanover Square, £350 per annum, Dublin, £300 per annum and £20 for expenses; St. Mary, Islington, £300 per annum) the salaries paid are not such as to be worthy of the acceptance of first-class men who wish to make the Act effective, and not merely to do just what they must to show that their office is not a sinecure; St. Luke, Chelsea, offers £250 per annum; Hastings, £200; St. Luke, Middlesex, Limehouse, Paddington, and Manchester give £150 per annum each; whilst nearly all the remainder give from £20 to £100 a year. When the payments are by fees and not by salary the amount paid is mostly quite inadequate; thus, for five to ten shillings seems to be the average amount paid per analysis. Now, granting that some substances can be examined with sufficient exactness by the microscope alone (which is the case with very few), yet others (*e.g.*, milk) require a considerable amount of time to be expended in the *quantitative* determination of different ingredients, so that taking one thing with another, a fee of £1 1s. per sample all round is not at all too much. Guided, however, by the praiseworthy (but, in this case, however, most mistakenly adopted) desire to save rates, salaries, or fees are usually paid, the nature of which of necessity prevents the Act from being carried into execution as it should be in order to repress effectually the malpractices to which it is desired to put an end. If, in a given parish, for example, the inspectors made now and then a raid on every milkman, or every baker, &c., throughout their bounds, an enormous amount of analytical work would have to be done; the uncertainty as to when such a wholesale raid would be made would act far more effectively as a deterrent than the present system whereby the substances sold in two-thirds of the shops of a district are never examined at all, whilst of those shops that are sampled occasionally the majority are never visited a second time for long periods after the first inspection. To carry out this Act in this way, however, and to remunerate adequately the analysts under it, would probably require the doubling or trebling of even the highest rates of salary at present paid, whilst the average payment would have to be increased tenfold at least. The low average rate of remuneration is one great cause why the highest class of chemists have, as a rule, not come forward as candidates for such appointments, or have refused such posts when offered to them. Connected with this also is the circumstance that the fees paid to the analyst for attendance in court for cross-examination in cases of prosecutions are often absurdly low; if half-a-guinea is offered to a consulting chemist for doing that for which his usual fee is five or ten guineas, it is clear that the damage done to his consulting practice by the acceptance of a post which entails his non-refusal of the lower fee would far outweigh the advantages to be derived from the salary attached to the appointment.

Notwithstanding, however, the above and other objections to the practical working of the Act of 1872, the general result arrived at that considerable good has been done by it, imperfect as it may be in its own nature, and inadequately as its provisions may have been carried out; thus, the following table speaks for the improvement in the quality of the foods &c., now (April, 1875) met with in the market as compared with those examined by Dr. Hassall (*a*) :—

NAME OF DISTRICT.	Time Act has been in Operation.	Total Number of Samples Analysed.	Number found Adulterated.	Number of Convictions Obtained.	Percentage of Adulterated Samples to Total Analyses.	Percentage of Convictions to Total No. of Samples Examined.

From these numbers it is manifest that the 1872 Act has actually been beneficial to a considerable extent in checking adulteration; but the amount of good done in this way is far less than was hoped for at the time of its coming into force; this arises partly from imperfections in the bill itself, the clauses being sometimes loosely worded, so that the decisions of magistrates have not been uniform in character; partly from the circumstance that it has not been put into operation thoroughly and universally; and partly from the fact that at the time when it came into force there was not a sufficient number of properly and specially trained analysts in existence to meet the demand, whilst a large number of the higher class of analysts refused to have anything to do with the appointments, on account of the insufficient remuneration attached to them, and other objections; and again in some instances, the Act has been purposely stultified either by the intentional appointment of incompetent men, or by neglecting to procure any samples of food, &c., for analysis when an analyst has been appointed, whilst in other cases the same result has been unintentionally brought about through the vesting of the powers of appointment in the hands of boards or officials incapable of forming proper opinions as to the qualifications of the candidates.

Partly from motives connected with trade interests, and partly from the fact that in a few cases undoubted mistakes were made by some of the analysts, especially at first, a most vigorous opposition to the Act was organised; and as the last result a select committee of the House of Commons was appointed to inquire into the working of the Act, and to consider the steps to be taken for its amendment; numerous witnesses were examined, the evidence of whom did not show quite as much agreement on questions as to matter of *fact* as might have been desired; for example, Dr. Hassall and Dr. Voelcker were in favour of the prohibition of the facing of tea; the latter, however, did not consider one and a-half per cent. of facing (the usual average) as an adulteration. Mr. Wanklyn did not consider facing tea as adulteration at all, whilst Mr. Allen did not view the tinting green tea of a more bright hue than that naturally possessed as an adulteration; whilst he reprobated the practice of facing black tea so as to make it appear green. Again, Dr. Voelcker and Mr. Wanklyn utterly denied the possibility of detecting foreign fats in butter with certainty, whilst Drs. Hassall and Tidy were quite of the opposite opinion: in these as in most other cases, probably the proverb *via media tutissimus* holds; there can be little doubt that wholly artificial concoctions could be made in which nothing foreign to butter could be detected, whilst the admixture of certain substances with butter when present in any quantity might be detected with reasonable certainty, especially in *fresh* butter. With one exception (Dr. Tidy) all the witnesses agreed that the provision in the Act that an analyst must possess *medical* knowledge is wholly unnecessary; and, in fact, it is manifest that no

---

(*a*) W. L. Scott, *Journal Soc. Arts*, xxiii., 436.

knowledge of the healing art can be any use in the solution of what is either a purely chemical question, or one depending on familiarity with microscopic appearances; as well might a knowledge of surgery be considered indispensable. The question as to whether a given adulteration is likely to be injurious to health is one quite as likely to be answered correctly by a chemist as by a medical man; the former, if he knows his science at all, knows what substances are poisonous either as specific poisons or as corrosive or otherwise injurious bodies; and, indeed, the whole *rationale* of drug-giving depends on the performance of complex chemical reactions (unfortunately for the most part of very imperfectly known nature) in the organism; what there is of science therefore involved in questions as to the healthfulness or otherwise of certain admixtures, really appertains to the domain of chemistry and not to that of the diagnosis of diseases.

Differences of opinion thus existing amongst those most interested in the scientific part of the question deliberated by the committee, it is not much to be wondered at that the recommendations made by the committee on reporting were in some respects of an unsatisfactory nature, and that their conclusions, from the evidence before them, were somewhat hazy, and not always in accordance with the more recent experiments published by competent observers. One of the most objectionable of these recommendations was that disputed cases should be referred to the Inland Revenue Office Laboratory, in Somerset House. This proposal was most unpalatable to the public analysts, being viewed by them as grossly unfair, since some at least of the analysts are of high reputation, whilst the majority of the Revenue analysts are but little known by reputation out of their own walls; hence the reference to Somerset House was considered to be from a higher to a lower authority, somewhat as though the decision of a court of appeal were to be rendered liable to reversion by an ordinary magistrate, or as though the opinion of a leading consulting physician were to be publicly subjected to correction by an unknown village practitioner. Moreover, no provision was made that the referee should be cross-examined on oath. Another almost equally objectionable recommendation was that analysts should be compelled to pass an examination at South Kensington before appointment. Manifestly it would be unwise to let any one training school have a preference over others, unless it were one specially devoted to food analysis in particular, as well as theoretical chemistry and analysis in general, and this can hardly be said of the institution in question, although the systematic laboratory training given there undoubtedly is amongst the very best of its kind.

One immediate result of the report of the committee was that an association was speedily formed consisting of public analysts and others practising as analytical chemists, and this has since become known as the "Society of Public Analysts;" since its formation some eleven months ago it has accomplished a considerable amount of work; numerous discussions on the report of the Select Committee, the draught of the bill introduced by Mr. Sclater Booth (Sale of Food and Drugs' Act, 1875,) and the alterations made therein have taken place, and the resolutions passed have been in many cases adopted in this bill; in addition, many valuable papers have been read on points connected with food analysis and analytical chemistry generally, and thus an impetus has been given to the perfecting and elaborating methods of examination of various substances. Not only this, the society endeavours to raise its members in the public estimation by attempting to weed out from the ranks of the public analysts incompetent persons, and by demanding explanations and passing votes of censure in such cases as may require such stringent measures; a valuable *esprit de corps* is thus engendered whereby it is to be hoped that the complaints that have been made (not always without some cause) of incompetence amongst public analysts will soon become things of the past. Of course, amongst any body of men there will always be some unscrupulous persons; we have heard of an analyst who; on being asked to certify that a loaf was free from deleterious ingredients, coolly ate a portion for lunch, and then, feeling no worse for the meal, certified that he had not succeeded in detecting anything of an injurious character in the bread! and of another who systematically copied the published official analyses of water for the previous month, instead of actually performing them according to his agreement. The knowledge that such practices, if detected, would bring professional discredit, and consequently loss of income, would probably serve as a deterrent from such disgraceful proceedings, which for the rest are rare enough, if not altogether singular.

(*To be continued.*)

◆

THE PHYSICIAN'S PROBATION AND PROFESSION. (*a*)

By Francis R. Cruise, M.D., F.K.Q.C.P.,
Physician to the Mater Misericordiæ Hospital, Dublin.

It is but right to premise that I alone am responsible for the advice I shall give and the views I shall propound. If, perchance, they grate upon the opinions and sensibilities of any, I shall regret the pain they may give, but I will nevertheless offer them fearlessly to you as the honest convictions derived from a personal experience of nearly a quarter of a century devoted to the unceasing study and teaching of the profession you are about to undertake.

Taken in its most extended signification, the study of medicine includes all the various branches of human knowledge, which, united, enable us to recognise the countless forms of injury and disease that menace the destruction of life—which instruct us to predict and understand the course and final termination of those protean phases of evil—and which arm us to protect, to assist, and to comfort suffering nature in the combat with the myriad ills which descend as heir-looms to her fallen state.

A brief reflection analyses these motley elements of knowledge into three leading groups, in accordance with their final purposes, namely :—

First, those which qualify for the recognition of abnormal conditions, or for what is technically termed diagnosis.

Secondly, those which appertain to the nature and history of morbid states, or pathology.

Thirdly, those which instruct us to avert, so far as may be possible, the impending evils of disease, or therapeutics.

Reducing this analysis to the most practical application possible, let us reflect for a moment upon the three grand questions which the physician must answer whenever he stands by the bed of sickness :—*First*, what is the disease? *Secondly*, how will it result if left alone? *Thirdly*, what assistance can be rendered, and how?

I shall endeavour to point out as succinctly as possible the means whereby you may attain the grand end of answering these questions with justified confidence. In the first place, as regards *diagnosis*, if you would acquire the power of accurately recognising disease, you must in the commencement devote yourselves to the investigation of the structure and functions of the human body in health, and then to their contemplation in disease. In a word, you must begin with the study of anatomy and physiology, and subsequently pass on to that of pathology. Anatomy and physiology claim first attention, inasmuch as they constitute the grammar of all medical science. The truth of this statement scarcely needs illustration.

To learn anatomy is the first portion of the great task.

It is a much disputed point whether anatomical plates are serviceable to the pupil or not. I have no hesitation in stating my conviction of their great advantage, when properly used. They are no substitute for dissection, but in a course of anatomical reading I believe them to be

---

(*a*) Abstract of the Introductory Address delivered at the opening of the Session, 1876-7.

invaluable in guiding the student and rescuing him from inextricable and almost overwhelming confusion. At the same time attend the lectures and demonstrations, noting what you see and hear; occupy a portion of your evenings in writing out these notes, correcting and condensing them; finally, endeavour, either alone or with the assistance of others, to reduce your knowledge to the form of question and answer.

A system such as I lay down will prepare you to dissect with ease and advantage, and will save you from the heavy discouraging task of groping after parts, whose name, position, and relations are alike new and unknown. I am fully aware that many censure resort to the artificial aid I now suggest, maintaining that dissection alone is the means to proficiency. I admit the statement, and would merely qualify it by reiterating my conviction, derived from experience and observation, that to dissect to good purpose you must be prepared beforehand by a course similar to that I recommend.

On the subject of *dissection*, I can scarcely speak with adequate emphasis. This is the focus to which all your previous exertions must converge. To fit yourselves for it is the end and object of the preparation I have advised. It is the solitary means whereby a useful knowledge can be obtained, the only school in which dexterity and certainty in operation can possibly be acquired. Practise it incessantly; sacrifice everything for it, except hospital attendance. If you are juniors seek the assistance of those more advanced; if you are seniors dissect for those who are beginning. Be convinced that every hour so spent will abundantly repay you in the fulness of time.

It is a common delusion to imagine that a general knowledge of anatomy suffices for practical purposes. This is a fundamental error, replete with danger. If we aspire to follow medicine as a science, to benefit others and ourselves, our knowledge of it cannot be too minute or too accurate. You may ask, "How much knowledge of anatomy is absolutely requisite?" The question is difficult to answer. If I must give a precise reply, I would do so in the words of the illustrious Beclard:—"The surgeon should understand anatomy so thoroughly and perfectly, that, when he plunges his scalpel into any region of the body, he should be able to strike the part he seeks, and avoid whatever may be endangered, with as much certainty as though all were transparent, and his gaze fixed upon the point of the knife."

By an easy step we pass from the contemplation of normal structure and function to consider the various perverted conditions to which these are liable—in other words, to the study of disease, or pathology. In the prosecution of this division of our labour it is unnecessary for me to call upon you for increasing vigour and application. The end and object of your study is to enable yourselves to combat and alleviate disease. To do so you must first learn to understand its nature, causes, effects, and tendencies. How is this knowledge to be obtained? Whosoever hopes to win it must begin, as I have already set forth, by the study of anatomy and physiology, wherein alone are found standards with which to compare altered structures and functions, and measure the amount of their aberration from health. Thus prepared you must industriously investigate and patiently analyse disease itself by the bedside and in the dead-room.

Again, the natural desire to render the history as faithful a representation as possible of the case in point, educates and refines the power of observation, and gives quickness and accuracy to this, of all faculties, the most indispensable in the investigation of natural science. To comprehend fully its utility, bear in mind that in the several branches of *natural* science the mode of advance contrasts directly with that in mathematics. While in the latter we start with a few principles, and argue and construct from these; in the former we must begin by observing ultimate facts, then by reflection reduce them to classes, and ultimately arrive at general laws. It would be difficult for me to lay sufficient emphasis upon the incalculable importance of cultivating a reasoning and fruitful power of observation in the study of our profession. The sooner you acquire it, the more profitable your labours will become. Remember that it will avail you little merely to see the phenomena of health and disease. You must also learn to perceive their import.

It is hardly needful to quote illustrations in corroboration of what I state. The whole history of the advance of medical science is but a record of the reflective observation of its ablest and wisest followers. Many thousand years had rolled by from the creation of man; through ages and ages hundreds had dissected and beheld the structure of the human body; and yet it remained for the acute perception of William Harvey to discover, in the uniform direction of the valves in the venous system, a starting point from whence to reason out and demonstrate the circulation of the blood. What an amount of accurate knowledge of disease, previously unnoticed, has been contributed within the last half century by the labours of the keen observers who have shed the lustre of their genius upon medicine: such, for example, as the researches of Laennec and Stokes upon affections of the lungs; of Hope and Corrigan upon cardiac diseases; of Bright on renal degenerations; of Graves, Hudson, and Jenner on fevers; of Addison on melasma; of Brown-Séquard on nervous affections; and of a countless host of labourers in the same field of usefulness. For all this, and other progress, we are indebted to the simple fact, that these wise men profited by what others saw and passed unheeded for untold centuries. Remember that in every object there is inexhaustible meaning, but the eye only sees what the eye brings means of seeing. How different the universes that Sir Isaac Newton and his pet dog Diamond beheld; yet the images on the retina of both were probably the same. Learn, then, at the bedside to see with the mind as well as with the eye.

The habit of case-noting possesses many advantages in addition to those already instanced. It exercises constant personal familiarity with disease, engraves its lineaments indelibly upon the memory, and soon accumulates a mass of valuable experiences for reference and assistance in difficulty. The late Mr. Colles was remarkable for his extraordinary knowledge of disease—so much so, that patients were often astonished at the accuracy with which he was able to recount their symptoms. All this he attributed to his habits of case-taking. The late Sir Benjamin Brodie and Trousseau tell us emphatically that the records of cases noted during their pupilage, proved throughout their long and eminently successful lives constant and faithful guides in circumstances of perplexity and doubt.

Do not suppose, for a moment, that I undervalue the help you can obtain from your instructors; but, rest assured, the best teacher is he who teaches you to do without him—taking you a certain distance and leaving you, having put into your hands the means of going further if you choose to use them. In fine, keep before you Solomon's aphorism:—"Get knowledge, but, above all, get understanding."

Therapeutics—the last portion of our task, still remains to be considered. Of its importance you will form a just estimate on reflecting that your previous studies are but *means* to this *end*. You learn anatomy and physiology to prepare yourselves for the study of pathology. The sole utility of comprehending disease is to enable you to treat it upon a rational foundation. How, then, may a sound knowledge of therapeutics be acquired? As anatomy and physiology lead the way to pathology, so the latter prepares for therapeutics. In a word, we must add to a comprehensive knowledge of disease an acquaintance with the power and use of remedies.

I would venture to suggest the following method in pursuing the study of therapeutics:—

First, to ascertain the properties of medicines.

Secondly, to learn the indications in disease; and,

Finally, to labour in the acquirement of judgment in the use of remedies in particular cases.

Without a knowledge of medicines you cannot even approach the subject of therapeutics; therefore, I would advise you *forthwith* to study materia medica and its allied sciences—chemistry, mineralogy, botany, and pharmacy.

A clear perception of *indications in disease* is not easily acquired; in fact, it implies profound pathological information. Patient clinical observation, especially case-noting, is the certain means whereby to gain it. Without this knowledge your therapeutics can never be scientific; its absence originates the too frequent error of treating disease according to its *name* rather than its *nature.* I shall not spend time in quoting illustrations; many will soon strike you. Of two cases of pneumonia one may require blood-letting, tartar emetic, and mercury; the other wine and quinine—skill in recognising *indications* must guide your choice.

Judgment in the selection, combination, and application of remedies to meet the requirements of particular cases constitutes the ultimate reward of long-practised observation and reflection. In it consists *resource*, the qualification wherein probably physicians differ most, and which, beyond all others, determines professional rank.

It is a not unfrequent foible, even with some physicians, to depreciate the value of remedies. I warn you solemnly against this dangerous frame of mind. I once heard the most accomplished therapeutist I ever met say, that in his opinion the disbelief in the value of medicines arose from want of knowledge in their use. I have lived long enough to believe his words so firmly that I offer them to you as an aphorism, and I feel confident you will ultimately accept his doctrine.

Hitherto reasoning *a priori*, I have laboured to show that in the acquirement of a knowledge of our profession, the first step is to learn anatomy and physiology; thence to proceed to pathology; and, finally, to master therapeutics. From motives of convenience, and to economise time, these different branches are studied together; nevertheless, analysis of the mental process gone through in the management of each individual case verifies the order above stated.

Medicine and surgery have before them a magnificent future; all things tend to show that as years pass it will be their glorious task to diminish pain and lengthen life. A few hundred years ago childbirth was three times more fatal than now; small-pox decimated continents; plague, black sickness, and leprosy raged in Europe. How different now! Life is longer in every grade than formerly; small-pox is, to a great extent, annihilated as an epidemic—the plague is never heard of—and anæsthetics, the fairy-gift of chemistry, have robbed the surgeon's knife of all its terror.

Even within my own memory notable advances have been made in the healing art. I may quote a few instances:—The antiseptic dressing in surgery, so perseveringly worked out by Lister, has revolutionised previous experience, and rendered the immediate healing of large and dangerous wounds the rule in place of the exception—Esmarch's mode of applying compression to the vessels of the limbs enables us to perform tedious operations without the loss of a spoonful of blood—Torsion as a means of healing up bleeding vessels, popularised by Syme—blood transfusion in cases of extensive hæmorrhage, revived, simplified, and perfected by my friend, Dr. Robert M'Donnell, of Dublin—the extension of the subcutaneous method of administering medicines—the knowledge of the value of bromide of potassium in epilepsy—the re-introduction of ether as an anæsthetic by the late Dr. Morgan, of Dublin; and, last, not least, Leibreich's discovery of chloral hydrate as a sedative, have conferred real blessings on suffering humanity.

I have already spoken of the advantages of noting the cases in hospital, but you must do more. You must undertake their dressing and manual care, and, if possible, you should, in due course, become resident pupils. It is in after-life that you will fully realise the immense value of hand-to-hand contact with your work. If sufficiently prepared for this responsible post, I believe you will learn more that will serve you in the actual exigencies of life in six months of residency than in several years of ordinary attendance.

By it you will add to your knowledge that presence of mind which will enable you to meet emergency. In fact, you will supplement *Power* by the essential gifts of *Promptitude* and *Resource.*

We all feel the necessity of this, and can easily see how it applies to a general in the field, to a pilot in a storm, to a sportsman, to a fencer, to a debater. It is the same with an operating surgeon at all times, and may be, at any time, with the practitioner of the art of healing. You must be ready to deal with all emergencies—with the cases that rise up at your feet and must be dealt with on the instant or lost.

Dr. Henry Marshall tells a story which illustrates my words:—

A young and well-informed surgeon, attached to a regiment, went out professionally with two officers who were in search of what used to be called "satisfaction." One fell shot in the thigh, and half an hour after he was found dead, the surgeon kneeling pale and grim over him, with his thumbs sunk in the thigh *below* the wound, the grass around steeped in blood. If he had placed them two inches higher, or extemporised a torniquet with his sash, and the pistol's ramrod and a stone, he might have saved his friend's life, and his own—for he shot himself that night. Such was the result of want of presence of mind.

Béclard gives a similar sad instance:—A young surgeon hurriedly performed tracheotomy, to save a friend who was dying, but in his haste he carried his incision a shade too far down and opened the innominate vein. Thus, although for the moment he recalled his friend to life, he endured the agony of seeing him die of hæmorrhage, the penalty of his unsteadiness.

I need not dwell further on this topic.

Let me here explain the precise value I attach to lectures—Clinical lectures—which refer to the cases under your eyes, and original discourses on subjects specially investigated by the lecturer, are invaluable; but enforced attendance, year after year, on systematic lectures, I look on as a mere waste of valuable time—as a relict of those mediæval periods when books were not procurable. They are of service to a beginner, but for the advanced pupil their utility is most questionable. Nay more, unfortunately, they are so numerous and lengthy in your curriculum, that they would absorb much of the little leisure at your disposal, and seriously impede your progress.

Happily, for the most part, the student is treated considerately, and allowed to attend or not as he may find his interest; but recently, strange to relate, the University of Dublin has framed rules compelling attendance on systematic courses of lectures. So obsolete a policy reminds one of Washington Irving's quaint story of "Rip Van Winkle," and seems an astounding retrograde movement.

The reform we veritably need in our educational system touches the *Final Examinations.* These, so far from really testing whether the candidate is so disciplined in mind and in special knowledge as to fit him to undertake the business of life with benefit to others and credit to himself, are too often actually perfunctory—so much so, that, as teachers know well, the best informed pupils are sometimes rejected, while the most incompetent are allowed to slip through.

It is deeply to be regretted that, while legislators wrangle over details, and wage pigmy wars about trifles, they do not seem to go boldly to the root of the evil. It should matter nothing to the examining boards how, where, or when the candidate obtains his knowledge, but they should lay themselves out to ascertain whether he really possesses it or not. Of late years there is a movement towards the reform I advocate, but of a slow and halting nature, and, while so many licensing bodies exist, there must inevitably be, unless obviated by stringent legislation, a fatal tendency to competition *downwards*—in other words, to fix the *minimum* of knowledge which may be tolerated in the aspirant.

I dwell on this matter solely to make you comprehend that the object of your studies should be not merely to pass examinations—that values little—but to know your profession in real earnest.

I must not omit to add a few words on private teaching or "grinding." Properly used, I believe it to be invaluable, and I would recommend the student to adopt it from the beginning of his course. It must, however, be carried out honestly or it is worse than useless. The conscientious tutor who teaches you systematically by question and answer is your best friend, and many of the most esteemed lecturers pay tribute to his value by adopting his system to a great extent. It is only when the grinder descends to cramming with answers to suit special examiners that he becomes an evil—an evil, I regret to add, the natural outcome of the deficiencies of the existing system of examination.

There remains, gentlemen, a vital point connected with your studies regarding which I must claim your attention—I allude to the general mental training needful for the profitable study of medicine. Of all the evil influences which overshadow the education of the modern physician, none, I am satisfied, is comparable to the almost universal neglect of extra-professional mental culture. The licensing bodies at large, with a few honourable exceptions, vie with each other in setting at naught the general education of the student. Probably we owe this serious error, in great measure, to the utilitarian character of the age; but, surely, law-givers should stand above such an influence where so much is at stake. I allude to this point in order to impress upon your minds the need of prosecuting, on your own account, the cultivation of your intellectual powers, outside your special studies, if you desire to attain superiority in the profession of medicine. It requires but little reflection to understand the force of what I state—a glance exhibits the necessity, indirect and direct, of an enlarged education for success in the pursuit of our vocation. If, indeed, its subject-matter were definite and limited, it might with some plausibility, be urged that general education was not indispensably requisite. But, as I have endeavoured to show you, the physician is for ever engaged in a struggle to master a subject, which, from its very nature, is partly beyond his comprehension, and over which his control must be proportionate to the extent of his sagacity and the perfection of his mental training and resource. Moreover, he is in immediate need of a liberal education to fit him for the acquirement of that portion of knowledge which is actually within his command. Without an acquaintance with classics and modern languages the very phraseology of the profession is unintelligible, and many of the richest sources are cut off. Without the cultivation of the reasoning faculties it is impossible to attain that logical precision of thought which saves from error and guides in the search for truth. Without a competent acquaintance with physics, mathematical and experimental, no one can appreciate or profit by the characteristic improvements of modern medicine.

Just now the medical profession in Great Britain feels deeply a recent act of legislation, insultingly carried in the teeth of its protest, most uncalled-for, and specially calculated to impede progress in the higher branch of our studies—I mean the Vivisection Bill. This singular outcome of hysterical sentimentality tends seriously to limit those investigations by which, in the past, we have acquired nearly all our knowledge of the circulation, of vaccination, of the functions of the nervous system, of the significance of the sounds of the heart, and of the familiar facts which help us to save life and mitigate pain in daily practice, and to which we look in the future for the alleviation of the great scourges of cancer, tubercle, cholera, hydrophobia, snake poisons, and a host of miseries as yet beyond control.

It is well that no such ban existed in the days when Harvey worked out the great problem of the circulation of the blood, the very turning point of rational practice, which, he tells us, he accomplished *mainly* by experimenting on living animals.

Does it not seem strange, and significant of the real state of our progress, that in England, Harvey's native country, law-givers should now carry this Bill, thwarting those who work for humanity's sake, while they neglect to punish countless real odious cruelties, practised, not for the alleviation of human suffering or the prolongation of life, but for sheer sport, gluttony, or sordid gain.

The celebrated Dr. Arnold, of Rugby School, who enjoyed unrivalled opportunities of observing students, and of watching their career in after-life, has made the memorable statement that in his experience the difference between men was not in *ability*, but rather in *energy*. Carlyle, too, one of the profoundest thinkers of the age, has defined genius to be "the art of taking uncommon pains."

Still, my young friends, while I wish to encourage, I would not mislead you. I have no wish to multiply difficulties, but the selection of a permanent career is so important that I should fail in my duty if I did not inculcate the grave and urgent need of caution. If your *inclinations* do not call you to medicine, abandon it at once. Unless you find a special delight in your work, give it up and turn elsewhere. The prizes in our profession are not rich, and fall to the lot of few; an equal amount of industry, bestowed in almost any other department of energy, will secure a better return. If you finally decide upon it, be prepared for a life of labour and self-denial—such as is not dreamed of, I believe, in any other position in life.

Be prepared to risk your lives daily and hourly—if needful to go into the field of battle, and work under fire, like our noble brethren M'Cormac and M'Keller, at the siege of Alexinatz—to face scenes of harrowing pain, bodily and mental, amidst which you shall move, striving to do what good you can, succeeding sometimes, failing often, for such must be your lives, the grief and glory, the anxiety and consolation, mingled as the smoke and the flame.

Withal be not discouraged by the thought of the little you can accomplish individually. Cast from you this ruinous fallacy. Each of you resembles a link in a chain, a bee in a hive, a soldier in an army, contributing a mite to the common good.

Sad it is that most of what you know and are capable of must die with you, often untold and unfinished, as with Humbolt, Cuvier, Bichat, and a thousand others, but so long as you live you can and should add something to the world's inheritance of knowledge.

Those amongst you who are somewhat advanced, and approach the completion of your studies, may reasonably ask me—What, after all, are the material prospects of the profession of medicine?

In the first place, I would advise you to avoid the army, at home and abroad, and the Navy. These services, under existing regulations, appear to me beneath the notice of men of capacity. The social position is doubtful—the pay miserable—promotion tedious—the sacrifice of liberty for the best years of your life unbearable, and ultimately ruinous—the compensation on retirement, after the waste of the brightest and most fruitful period of your existence, preposterously inadequate.

The Indian army offers a better reward, but the risk of health is very great. I read formerly for the Indian service, and meant to enter it, though circumstances afterwards caused me to abandon the project. We were a goodly class—some twenty or so; I can recall most of their names. Of all who went to India and remained there, I believe but one still survives.

The Army service, as now appointed, is in bad repute, and able men do not offer themselves for it. My friend and colleague, Dr. Hayden, has placed in my hands a very remarkable table, which shows the steady decadence in the quality of the answering at the Army Board Examinations for the last few years. This is just what the profession expect, and what I think it should desire. Until the regulations of the military and naval services are amended, in favour of the officers, it would be a sad pity to see men of ability sacrifice their prospects by entering them.

Gentlemen, I have no inclination to inflict upon you a moral lecture, nor to remind you what conduct becomes you as students of medicine. Suffice it if I can succeed in making you feel the dignity and charity of your calling, and all that I could add follows, though unspoken. Then it will be needless to remind you of the kindness, gentleness, and conscientiousness with which you should treat the poor sufferers in the hospital wards, as those stricken by poverty, affliction, and suffering—as God's chosen ones—as your brethren—and as the living books from which you must learn all that will bring you success and distinction in after-life.

I hardly like to touch, even in passing, upon the fancied hindrances which are at times supposed to detract from the nobility of our calling. If I must allude to them at all it shall be briefly, and only to disabuse your minds of prejudices which a little time, without my aid, must dissipate. It is a not uncommon practice, with a certain class of the public, and even of the educated, flippantly to depreciate the profession of medicine, urging that it is wanting in scientific basis, evil in its tendencies, and of doubtful social position. We who understand better can afford to bear such aspersions in pity rather than in anger, because to all who take the trouble to understand it, apart from its mere practical art, medicine is a science, and the grandest of sciences. Day after day brings to light new proofs of the truth of its general laws, and of their co-relation and intimate connection with the dogmata of physics in general. Medicine is none the less a science because, being inductive, we have no universal axioms from which to deduce the individual facts of disease; because we are obliged to elucidate its laws synthetically by the comparison of a host of particular instances, and in many cases are forced to reason by analogy and hypothesis. Neither is it the less a true science because it is an imperfect one, perplexed and confused by the intermixture of vital with physical phenomena—in a word, by the immediate contact of the spiritual with the material.

I shall not dilate upon the social position of the profession of medicine. Unfortunately, it is too true that many influences—some difficult, if not impossible to remedy—some painful even to think of—have depressed in below the just standard. So far as this point is concerned, I think we shall act most wisely by accepting our vocation for its own sake; by struggling each one according to his ability, to elevate it in the estimation of those around us. For ourselves we need have no misgivings—most assuredly, if our calling has disadvantages, it also has wondrous attractions. That which can only be the occasional luxury of others—the relief of pain, the mission of mercy above all distinctions—is our daily task. That which is the recreation of few save the rich and leisurely, the wondrous operations of nature, it is our constant business to study and commune with; we follow no dubious principles of right and wrong; we are harassed by no scruples of mind or conscience; we truckle to no caprice, acknowledge no worldly dependency, but follow in freedom a life at once useful and bountiful to others—elevating and independent for ourselves.

◆

THE PRESENT AND FUTURE OF MEDICINE. (a)

By Lambert H. Ormsby, A.B., M.B., L.K.Q.C.P., L.R.C.S., &c.
Surgeon to the Meath Hospital, &c., &c.

There is no sound reason for supposing that the profession of medicine should not claim even a higher place in public estimation than that of the Church, the Bar, the Army, or Navy. Yet what are the facts? Is it not that the healing art, the Godlike profession, is generally placed last in comparison with the various callings before mentioned as regards State recognition or appreciation. In the House of Commons they found more than 120 barristers, 100 officers in the army, and but six medical practitioners. Among the many subjects that must be decided by Parliament before very long, and which emphatically demand the best attention of a sound medical opinion, are the following:—The health and management of prisoners, the treatment of habitual drunkards, the further restriction of the pollution of rivers, the opposition to compulsory vaccination, the position and qualification of coroners, and last, not least, the war cry of self-constituted humanitarians—the vivisection question, of which they heard so much in the present day, with its alleged abuses and needless barbarities. Such abuses, the profession were the very first to set their faces against, and to require and imperatively demand stringent State legislation; but certain painless experiments, under the administration of anæsthetics, on animals are absolutely necessary, considering the imperfections of our art, and the limited knowledge we have on certain subjects connected with it. If those who oppose all such experiments could witness the dreadful scenes of horror and anxiety that often occur in hospital and private practice, owing to a want of knowledge regarding the administration of certain substances their opposition might be considerably less. The life of the late Sir Robert Peel might have been saved had the action of chloroform or other anæsthetics been better known. What about pigeon matches, coursing, fox-hunting, and all such supposed manly pastimes? Is it more culpable to take life in the interest of science than of sport? Or, to go to another subject, what about the atrocities in Bulgaria, and the dark page of human anguish and suffering, and the bloodstained field of battle, where thousands of our fellow-men have bled and died, owing to a tumultuous wave of public opinion, or to cold-blooded diplomacy seeking to adjust the balance of power between jealous emperors and kings. The profession should be properly and fairly represented in both Houses of Parliament, as are the sister professions, to decide great and momentous questions. What decoration did the profession get in reward for scientific research? An occasional baronetcy or knighthood; and that too ofter conferred on some favourite connected by family or social position with those in power."

Dr. Ormsby then discussed the prospects of the younger members of the profession, who upon their admission were uncertain as to which branch they would commence life in. We naturally ask what prospects have we? In answer, he would mention they had the Army, the Navy, and the Indian Medical Services, foreign appointments, ship surgeoncies, poor law or hospital appointments, and, lastly, private practice in the country or city. As to the Army home service: it was the last position he would like to see any one fill in its present condition, as it offers but a poor and wretched provision for any duly qualified gentleman. By a royal warrant, dated April 28th, 1876, the pay of a surgeon on appointment is fixed at £250 per annum. On the completion of ten years' service, unless the surgeon be specially selected for further employment in the Medical Department of the Army, or if he be unwilling to serve therein, his services are dispensed with, and he is only entitled to receive the sum of £1,000 upon certain contingencies. The Home Army Medical Service is simply ruined, and he warned young men not to enter it under any conditions during the present regime. Rather let them wait, for, on the reassembling of Parliament there will be, doubtless, a motion for the appointment of a royal commission to inquire into the matter. The remedy is simple: if the gentlemen who have an ambition to serve their Queen would only hold back for a short time, they would compel the authorities to rectify these glaring and iniquitous defects. The Indian Medical Service he would recommend more to their notice. It gives a good provision, and merit receives a just reward, as a man is paid according to his labour. The Naval Medical Service ranked next in order of desirability. To those who do not care for a roaming life, and who would rather begin practice at once, the Poor Law Medical Department offers many inducements; but the service is by no means perfect. By the present system, educated professional gentlemen are, in many cases, left in the hands of illiterate and uncompromising guardians, who may worry the unfortunate doctor out of existence, if he dare disobey these keepers of property and health, who pride themselves in writing P.L.G. after their name, as if it was equal to a C.B., or any other highly distinguished title. These appointments are frequently filled more in regard to sectarian principle than anything else, as if a man's religion had anything to do with his professional knowledge. To make the service perfect it would be better to attach it to the Civil Service; and the appointments should be filled up by competitive examination as vacancies in Union dispensaries occurred.

(a) Abstract of Introductory Lecture delivered at the Meath Hospital, Dublin.

Clinical Records.

NOTES OF, AND REMARKS ON, CASES OF IDIOPATHIC PERICARDITIS.

By **James Barr**, M.B., L.R.C.S. Ed.,

Late House Surgeon Northern Hospital, Liverpool.

Case I.—P. T., æt. 27, fireman, admitted under the care of Dr. Dickinson, Sept. 18th, 1874, complaining of a feeling of "oppression" and pain in the precordia. He states that nearly four weeks ago his complaint began with severe "dull aching" pain in the cardiac region, and shortness of breath, which totally unfitted him for work, and he has not been able to do anything since. The pain has much abated of late, and he is now not troubled with dyspnœa.

He is a strong muscular man, employed as a fireman at sea, and ascribes his disease to cold and wet after sweating. He never had acute rheumatism, and has always previously enjoyed good health.

The cardiac area is much enlarged and the sounds are obscure. Along the left margin, during inspiration, there is heard a slight friction murmur.

He is now put on ordinary diet, and ordered a diuretic mixture of acetate of potash and sweet spirits of nitre.

21st.—Over the whole cardiac area there is a fine double friction murmur, which is also slightly perceptible to the hand laid over the precordia. The heart sounds are much obscured, but not attended by any endo-cardial murmur. The cardiac dulness extends from 1½ inches to the right of sternum to beyond the left nipple, and measures 6 inches transversely. Apex beat is not appreciable, but a diffuse impulse is felt over the cardiac area. Pulse 80 weak, tongue dry, and slightly coated, appetite fair, bowels free. Ordered emplastrum cantharidis to precordia.

28th.—The blistered surface has now healed. The transverse dulness measures 4¾ inches, and only extends slightly to right of mid-sternum. Apex beat in the sixth interspace, and within the line of nipple. The sounds are still somewhat obscured and have a ringing tone. The friction murmur is very faint, and only heard during inspiration. General condition good.

Oct. 3rd.—The transverse dulness measures only 4¼ inches, the sounds are clear and distinct, and there is no friction murmur. He is anxious to leave, and accordingly is discharged.

Case II.—W. A., æt. 26, 'bus-driver. Admitted under the care of Dr. Davidson, April 26th, 1875, complaining of pain in the precordia, shortness of breath, and faintness.

He was in this hospital last autumn with symptoms of intestinal obstruction; since then, he remained quite well up to a month ago, when he was suddenly seized one evening during the cold weather with pains in the left side and dyspnœa. He never had acute rheumatism. Pulse 90, weak; respiration, 32; he has a slight cough, but no expectoration.

The cardiac dulness is enlarged, especially towards the base, and over a great part of this area there is heard a loud double shuffling friction murmur. At the base of the left lung posteriorly there is slight dulness, diminished vocal thrill, and feeble breathing. Ordered a mixture of the iodide and acetate of potash.

After a short residence in hospital the patient was discharged well.

Remarks.—These cases are examples of a rare origin of a common affection, and may be justly called *idiopathic*, if such an appellation can be properly applied to pericarditis, but I think there is no more necessity for using such a term in connection with that disease than there is in the case of pleurisy arising under similar conditions. Pericarditis is so commonly associated with general diseases, such as acute rheumatism, Bright's disease, &c, that some writers believe it to be always a secondary affection. Markham says:—"That pericarditis, except in those rare cases in which it is the result of traumatic injury, or is excited by contiguous disease, is not a mere local inflammation, but is the consequence of some exciting cause operating generally in the body." Walshe says:—"I have never seen idiopathic pericarditis as a solitary disease," and Dr. Blakiston states that "such a disease is almost unknown unless induced by some local injury." Niemeyer says:—"It is extraordinarily rare for this malady to attack previously healthy persons as an independent isolated disease."

On the other hand, some such as Dr. Tanner set down, cold and damp—among the causes of the disease, but without adducing any evidence in support of their statement, Dr. Bellingham, in his treatise on "Diseases of the Heart," says: "Pericarditis may also arise under the same circumstances as acute inflammation of internal organs generally, such as exposure to cold and moisture when the body is heated, &c." Dr. Beale, in his "Archives of Medicine" (Vol. II., page 92, and Vol. III., page 43), records two or three cases of idiopathic pericarditis, and no doubt there are some others scattered through the pages of our literature. These cases, as well as the two which I have just described, leave no doubt that pericarditis sometimes, although very rarely arises, like pleurisy, as an independent isolated disease.

◆

RUPTURE OF THE UTERUS.

By **James Metge**, M.B., Inch-Gorey.

On Sunday, the 29th of October, about 3 o'clock a.m., I visited Mary G., of Ashwood, co. Wexford, æt. about thirty-five, and in labour with her sixth child. I found the funis presenting and pulseless. I passed a gum elastic catheter, without the stylet, but only obtained a few drachms of urine. I gave her a dose of ergot, and as she was cold and skin moist, ordered whisky punch. In less than an hour alarming symptoms set in—viz., hiccough. Her death took place so suddenly, that I think it was occasioned by internal hæmorrhage, consequent on rupture of the uterus.

Post-mortem.—I, assisted by Dr. Weldon, of Gorey, examined the remains about thirty-six hours after death, and on removing the muscles and peritoneum, by an incautious use of the scalpel, a considerable quantity of red fluid escaped about the bed. Next found the body of the fœtus, the head impacted in the pelvis, which required considerable force to remove. Further dissection brought to view the uterus, which was ruptured at the cervix. On the unruptured portion of the cervix I observed a black band-like mark, about four inches in breadth. I inflated the bladder, which was empty and uninjured, excepting a black mark on its surface, about the size of a florin. The placenta was found in the right hypochondrium, from which it was removed by traction on the funis.

Transactions of Societies.

THE PATHOLOGICAL SOCIETY.

At the meeting of this Society on the 7th inst., the attention of the members was drawn to some cases of great pathological interest.

Mr. Sydney Jones introduced a young man 23 years of age, the subject of multiple melanotic tumours. Three years ago the patient had a sore resulting from a graze of a black mole on the left leg. Six months later he applied to St. Thomas's Hospital with a small melanotic growth in the same situation. There was no enlargement of the femoral glands, and after the removal of the growth the patient soon left the hospital. Fifteen months afterwards he returned not only with a recurrence of the affection in the cicatrix, but with several small melanotic masses in the left groin. These had not long been operated upon before they made their appearance again, both in the cicatrix and in the groin, and were for the third time excised. Up to the present time there has been no return of the affection in its original seat, but there are numerous small, black, shot-like nodules in the skin of both thighs, thorax, and neck, which increase rapidly in size and then ulcerate. This case, in which there was no family history of tumours or cancer, Mr. Jones regarded as one of melanotic sarcoma, originating in an inflamed mole, and spreading by means of the lymphatic system.—Dr. Hilton Fagge inquired whether the urine had been examined for the presence of melanotic pigment. He exhibited two such specimens of urine, one taken from a patient who had a melanotic tumour, together with melanotic nodules in the lungs and mediastinum, and the other from a patient suffering from melanotic sarcoma of the liver. Dr. Fagge also referred to the obscurity in which the origin of the disease was shrouded. Virchow, he said, apparently doubts the identity of the urinary pigment with the melanotic formation, thinking that the former is due to indican, and to co-existent disease of the liver; but in Dr. Fagge's first case there was no affections of the liver, while the urine contained casts of the renal tubules of very black appearance. In reply, Mr. Jones said he had not met with melanuria in his case, but was quite willing to have the urine carefully analysed. The same member also brought forward a case of symmetrical shortening of the foot from disease of the bone.

Dr. **Hilton Fagge** exhibited a "Rare Specimen of General Osseous Anchylosis of the Dorsal Vertebræ and Ribs removed from a man 34 years of age." The patient was unable to lie down. His back formed a complete rounded curve, and there was scarcely any mobility either in the dorsal or in the cervical region, and the ribs were fixed. For more than a year before his admission the patient had suffered from pain in his abdomen and back, he began to stoop, to suffer from cough and purulent expectorations, and was obliged to relinquish his occupation. On admission, his breathing was entirely abdominal, and the difficulty of breathing so great that he soon afterwards died. In this case the dorsal vertebræ were found to be united by bone between their arches, the new bone being deposited outside the ligamenta subflava, and also between their articular processes and the ribs. One of the hip-joints was similarly anchylosed. The bronchi were dilated, but the lungs were not much affected, and the liver had become bent at a sharp angle upon the ribs. Cases of this kind are very rare. Reference was made to one recorded by a Dutch writer, and which closely resembled the one exhibited by Dr. Fagge, and Mr. Wagstaffe said that the museum of St. Thomas's Hospital contains several specimens of union of the transverse processes and laminæ of the vertebræ. The discussion which ensued turned upon the question whether these cases were due to rheumatic arthritis. The absence of pain in this case did not point to any such conclusion; but the President remarked that cases of rheumatic arthritis often occurred without pain being a prominent symptom. Dr. Fagge also exhibited a "Specimen of Aneurism of the Pulmonary Artery occurring in a child 2¾ years old, who suffered from phthisis and extensive emphysema, followed by profuse hæmoptysis the day before death."

Mr. Carr Jackson then showed a "Remarkable specimen of Repair after Fracture of the Spine twenty-six years before death." Twenty-six years ago the patient was admitted into the Royal Free Hospital under the care of Mr. Wakley, Mr. Jackson being house-surgeon. He then suffered from an injury to the lumbar spine from a box falling upon his back. There was great pain, slight prominence of the spinous processes of the second and third lumbar vertebræ, and complete motor paraplegia. Sensation remained perfect, and there was no paralysis of the sphincters. He was discharged about a month after his admission, and was then able to walk with a stick, but with a peculiar waddling gait, and his body slightly bent. During all the years above mentioned, Mr. Jackson did not lose sight of his patient, who continued to enjoy tolerable health, and after his recent death from bronchitis Mr. Jackson removed the whole of the spinal column and presented it to the Royal College of Surgeons. On examination, the second and third lumbar vertebræ had been apparently dislocated and partially fractured. There was considerable rotation of the bodies of the lumbar vertebræ, the four lower being twisted from right to left, and the upper from left to right. The first, second, and third were anchylosed, and the spinal canal was much narrowed between the first and second lumbar vertebræ. In reply to the President, Mr. Jackson stated that the man complained of great pain after the injury, but there was no loss of sensation. The man could walk quite upright, and he had always a straddling gait.

Dr. Pye-Smith showed a specimen of "Suppuration of the Brain and Cord" from a patient who had been cured of an empyema. A large amount of pus had been evacuated from the pleura, and the discharge had ceased, and the puncture had cicatrised, when he was suddenly attacked with vomiting, severe headache, and a rise of the temperature, followed by left hemiplegia strabismus, coma, and death. In the right hemisphere of the brain there was found two large abscesses, one of which had discharged itself into the lateral ventricles, which, with the subarachnoid space of the spinal cord, was full of pus. The manner in which the cerebral affection had originated was not very clear, as the empyema sac was lined with a thick false membrane, and there was an entire absence of septicæmic symptoms in which the cerebral abscesses, which were by no means recent, must have been forming. Dr. Pye-Smith thought it was a case of "metastatic abscess" without septicæmia, but other explanations were offered by some of the members present.

One or two other specimens were brought before the notice of the Society, after which an adjournment took place.

WEDNESDAY, NOVEMBER 15, 1876.

THE DUBLIN HOSPITAL SUNDAY DISTRIBUTION.

The Hospital Sunday Celebration in Dublin has again come and gone, and we have every hope that the appeal to the benevolent Protestants of the "second city in th empire" will prove to have been as successful as its objects deserve.

We have in successive years had much to say on this subject, and we have this year refrained from reiterating our criticism upon the management of the fund in Ireland, only because we did not desire to follow the foolish and uncharitable example of the antivivisectionists, who have endeavoured—with no success, we hope—to check by false inuendos and stupid conclusions the stream of charity flowing in so worthy a direction. The Dublin Hospital Sunday movement has almost everything to recommend it. It aims at satisfying the urgent wants of institutions which minister to the necessities of a large and helpless population of sick poor, and which, in the absence of endowments such as the London hospitals enjoy, are greatly overweighted by the claims upon them arising from the magnitude of that population.

But, as we have before said, the whole movement is discredited, the confidence of the public in its integrity shaken, their charity restricted, and the value of the movement to the sick poor curtailed, by the inconsiderate and unbusinesslike method in which the fund is distributed. We can readily comprehend the reasons which suggested the adoption of that method in the first instance. The most energetic and loudest-talking section of the Fund Council were the representatives of hospitals which did little work for the poor but kept up a great establishment of unnecessary officials, which had but a small clientele amongst the destitute sick, yet possessed large wards filled with half occupied beds, which enjoyed great facilities for begging amongst influential people, but few opportunities of relieving disease amongst the poor.

Such institutions happened to be ably represented by influential and plausible deputies, and, consequently, the distribution of the Fund was moulded to suit accurately the characteristics of these hospitals. In the first place, extern work was almost altogether ignored; secondly, the amount of private subscriptions which each hospital received was made a pre-eminent claim to the lion's share of the fund; and, lastly, the maintenance of a large number of beds—no matter what sort of cases might occupy them—was made the ground for a liberal subsidy. It will easily be understood that the practical working of such a system has been to divert the greater part of the hospital charity of the Dublin public away from the institutions which the donors of that charity would desire to support, and into the treasury of those for which the public care little as charities, however admirable they may be as teaching institutions.

Let us compare the effect of the present system upon two hospitals, each an actually existing representative of its class, which we shall—in order to avoid personality—designate as A. and B.

As to the amount of relief which each affords to the sick poor there can hardly be an equitable comparison. A. is situated in the centre of a closely packed and squalid district, and has always been in special favour with the poor who, in case of accident, are carried thither even from the doors of other equally good hospitals, its extern dispensary is, therefore, enormous, and the relief it distributes amongst the sick poor is widespread and valuable. B. is, on the other hand, placed in a locality in which there are comparatively few poor, being bounded on two sides by an unpopulated district, and on the other sides by the residences of wealthy people situated in fashionable localities. Its extern department is, therefore, necessarily small, and its work amongst the poor of Dublin contracted and comparatively unimportant. But A is small and B large, A has little money and B a great deal, and, ergo, while A is obliged to husband its space and its resources, and to take into its wards only cases of real urgency which have a strong claim upon its few beds and scanty funds, B has accommodation and resources to take in almost as many patients as are desired and to keep them as long as the medical officer likes. It will be easily seen that the actual amount of work done in the form of sick relief is greatly in favour of A, for each case which it treats in its wards represents dozens treated elsewhere, many of whom are of such gravity as would ensure their admission to a bed in B immediately on application. And yet the grant from the Dublin Hospital Sunday Fund to the large, well-fed, scantily-occupied hospital B has, on an average, been greater than to the hard-worked unfriended institution.

Our special objection, however, to the system of distribution is its complete disregard respecting the purposes to which the public charity is applied by the hospital to which it is granted. The Distribution Committee seems to consider that its responsibility is discharged when it hands over a share to an hospital, and the members would appear to hold that the committee has no right to inquire whether that share is or is not rightly used. In this view the Dublin Committee is at variance with all other hospital fund distributors who have, in London and elsewhere, shown by their acts that they attach the greatest importance to economy of administration, which the Dublin Committee entirely ignores, and it certainly appears to us that reason lies with the English system in this respect. Which of us, if he had but £1 to give in charity, would hand it to a person who would spend 15s. of it in superfluities and 5s. in necessities, and if we entrusted our limited bounty to a friend for distribution to deserving persons, should we not feel annoyed and distrustful if we learned that he had given it to such a recipient. Yet this is what the Dublin Distribution Committee does in a greater or less degree. It subsidises largely Cork Street and the Coombe Hospitals, in which only 5s. out of each £1 reaches the patient directly or indirectly, and it makes but a meagre grant to Steevens's, in which over 11s. goes straight to the sick man. It is equally liberal with Sir Patrick Dun's and Cork Street, in which each bed costs respectively £70 and £90 a year, and with Mercer's and the Meath, where the cost is only £44 and £37. It makes no distincion between Cork Street, in which it costs over £1,600, besides cost of maintenance, to "manage" forty-one beds. The Coombe, where it costs £388 to take care of seventeen beds; and, on the other hand, the City of Dublin Hospital, where it only costs £263 to administer fifty-three beds, and Steevens's, which keeps up 126 beds, with a supervisory expenditure of only £430.

The latest effort in England on behalf of Hospital charity—*i.e.*, the Saturday Fund, has proceeded on a principle diametrically opposed to the course thus illustrated. The London managers have taken their stand firmly on the principle that "*the distribution will be based solely upon the amount of relief afforded, the economy practised, and the efficiency attained.*" To assess the grant which each hospital shall receive, a close enquiry is made into its management, and returns are required of the number of officers, their salaries, and the money spent on their accommodation, and it is even required that hospitals shall admit an inspection of the institution and its books at all times, on behalf of the Fund Council. The necessary information having been thus obtained, the fund is distributed by a system of marks set forth by the Council as follows:—

> "The amount of relief afforded, being the question of *primary importance*, shall be first taken into consideration, and a proportion of the total moneys available for distribution, equal to £75 per cent., shall be allotted under the head of relief. The remaining £25 per cent. being allotted in equal proportions, under the heads of economy and efficiency. That, 3rd, The amounts to be awarded to each hospital or dispensary shall be determined by a system of marks on the following plan:—(A) Relief—Ten marks for every 25 in-patients, and ten marks for every 1,850 out-patients (1,850 out-patients being equal to 25 in-patients) relieved during the past twelve months. Marks to be totalled, and the £75 per cent. of moneys available for distribution, for relief afforded, to be allotted in the proportion of so much for each mark obtained. (B) Economy—That the hospital and dispensary marks shall be respectively awarded as follows—viz., hospitals, at which the cost of in-patients, *per bed per week* is 15s. or under, three marks, 20s. or under, two marks, 25s. one mark; of out-patients, *at which the cost per head* is 5s. or under, three marks, 8s., or under, two marks, and 15s. or under, one mark."

It thus appears that the London Council attaches great importance to out-patient work, which is almost altogether ignored in Dublin, and that it takes special cognizance of economy of management, which in Dublin is totally disregarded.

The London Council has, in fact, shown courage in grappling with abuses of hospital administration which the Dublin Committee have feared to take notice of, but which it is their plainest duty to deal with, before they pay away the money entrusted to them by the public.

Extravagance of management is to a certain extent outside criticism, as long as the money wasted is the gift of an individual. The donor has the opportunity of finding out where his charity goes to, and if he fails to do so, no one is entitled to take up the cudgels in his behalf, but the case is different when the money is a contribution to a general fund. In such cases the public cannot inquire for itself, and it confides to others the task of so doing. To fail in such a task, as the Dublin Committee have done, is peculiarly unfortunate, for not only does it result in the misapplication of charity which is insufficient for the pressing wants of the sick poor, but it dams the stream of benevolence which it is so desirable to enlarge. We are not a little surprised that the representatives of those institutions which execute the greater part of the hospital work of Dublin and receive little of the charity of the fund, have contented themselves with a silent acquiescence in a system which diverts from them the money to which they have an admitted right; and we hope that a method of distribution which is unique amongst Hospital Sunday systems in its unfairness will not be perpetuated. We do not hesitate to say that Hospital Sunday, as at present administered in Dublin, is little better than an incentive to clamorous begging and reckless extravagance, and, being so, does almost as much harm as good.

MR. GLADSTONE ON VACCINATION.

In the *East Anglian Daily Times* there is an extract from a letter received by an inhabitant of Ipswich from Mr. Gladstone, in which the right hon. gentleman says:—"I view with misgiving all new aggressions upon private liberty, unless upon a clear and certain proof of necessity, and I keep my mind open upon the question whether such proof has or has not been supplied in the matter of vaccination."

This is not the first time that Mr. Gladstone has hinted that his views on the subject of compulsory vaccination are very different from those which are held by persons who are most competent to pass judgment on the question, and which, after the most patient inquiries and repeated Government Commissions on the subject, have been found by the highest authorities, medical and statistical, to be conducive to the health of the community. It is to be the more regretted that the right hon. gentleman should publish his peculiar opinions on compulsory vaccination at a time when small-pox is again amongst us, and when it is all important that the faith of the public in the efficacy of vaccination should not be in the least shaken by the writings or speeches of those whose talents and position afford some presumptive evidence that their opinions may be right, and who are, on that account, very likely to warp the judgment of the ignorant and inexperienced. With regard to the infringement of the "liberty of the subject," on which so much has been said and written, we shall only remark that that liberty has already been, for the good both of the individual and of the public, so often trespassed upon, that its infringement, when the loss of thousands of human lives by the most frightful disease known is concerned, is certainly one of the poorest pleas that can be offered in favour of abolishing compulsory vaccination. With respect to the reasons for enforcing the adoption of this beneficent operation, we may venture to remind the great statesman that he is not the only one who would resent any aggression upon private liberty "unless upon a clear and certain proof of necessity." No good citizen and no good Government would think of restricting the liberty of the subject, unless such restriction was necessary to the public good, and unless the particular object in view was found to be unattainable by other means. And it is because they know that legal restrictions upon their personal liberty are merely slight sacrifices to the general welfare of the community, that a free people tolerate and even welcome the many compulsory Acts that are to be found in our Statute Book. Moreover, we may ask is there one of these Acts, the object of which is more praiseworthy, and the grounds for which are so strong, as that which has made vaccination compulsory throughout the land? Aggression is made upon private liberty in order to prevent people getting drunk. Was this upon a more "clear and certain proof of necessity" than that which aims at the prevention of disease? A man is not at liberty to sell tobacco or spirits without a license. The manufacturer cannot keep one of his young factory hands at work beyond a certain number of hours without incurring the penalty of the law. The father is compelled by law to place his sick child under medical attendance, whatever his private opinions may be as to the efficacy of drugs; he is compelled to send him to school after a certain age, nor can he even chastise him beyond certain limits without bringing down upon himself the vengeance of the law. But can one of these "aggressions upon private liberty" be regarded as half so important and half so necessary as that which prevents a whole community from being repeatedly devastated by pestilence, and thousands from being disfigured by disease. Would not a mother feel the loss of her child by small-pox, or its disfigurement for life, as a far greater affliction than any evil that would result from overwork, or the severest corporal punishment; and would not the consequences of abandoning education to the voluntary care of parents themselves be far less disastrous to a community than its total neglect of vaccination?

But if the liberty-of-the-subject argument is about as weak a one as could be brought forward on so momentous a question as that of public and compulsory vaccination, Mr. Gladstone's doubt as to whether proof of its necessity has been supplied is certainly most remarkable in face of the overwhelming mass of evidence that has been repeatedly adduced, both as to the efficacy and necessity of the operation. The efficacy of vaccination as a preventive measure has been proved to the satisfaction of all who have taken the trouble to inquire into the matter, and Mr. Gladstone must be well aware of this. And as to the necessity of compulsory legislation, as a means of ensuring the universal practice of the operation, the ignorant prejudices on the subject, which are to be found among a portion of the public, the mischievous doings of the anti-vaccinators, and even Mr. Gladstone's own views, are sufficient to show what would be the consequences of leaving the practice of vaccination to the caprice and prejudices of the community.

It would be a task of supererogation to enter into the details of the "clear and certain proof" on which Mr. Gladstone throws so much doubt, especially as we have elsewhere touched upon the subject; but we may draw the attention of the right hon. gentleman to the important and unanswerable fact that properly performed infantine vaccination, duly renewed at puberty, would virtually extinguish small-pox as a fatal disease among such populations as have recourse to it; that this belief, to use Mr. Simon's words, "rests on so vast a basis of well-established facts as not to have needed for scientific completeness that any further facts should corroborate it;" and that, we may add, in spite of this belief, in spite of the representations of the medical profession, and in spite of the Vaccination Laws, there is still a large amount of imperfect and insufficient vaccination and re-vaccination throughout the country. So what would happen if the compulsory system were given up we shall not venture to predict, but it may well excite apprehension in thoughtful minds, and makes us regret that any one of Mr. Gladstone's authority and position should lend his influence to the promulgation of opinions that cannot but have a mischievous effect upon the due execution of the laws relating to the public health.

AMENDMENTS IN THE POOR-LAW MEDICAL SYSTEM.

The Lord Advocate of Scotland, previous to his election, addressed to the constituency of the allied Scotch University, a letter which set forth his views as to Poor-law medical relief in his own country, and which seems well worthy of attention as the deliberate utterance of a man who speaks from an official stand-point, who has now a voice in Parliament, and who has no doubt carefully considered the possibilities and necessities of the subject.

He points to the Bill introduced into Parliament last session by Lord Gordon and Mr. Secretary Cross, as embodying his views, and expresses his satisfaction that the Government is under a pledge to re-introduce the measure next year. Two of the points which the Lord Advocate makes are of great importance to the Irish Poor-law medical service, and his fixing upon them as essential parts of the Bill shows that he is well informed respecting the faults of that system. He expresses his opinion, 1st. That there shall be a medical officer in every parish, with a salary fixed with due regard to its population and extent, and the number of paupers, and that it shall be exclusive of the cost of medicines and medical appliance. 2nd. That the medical officers shall no longer be removable at the will of the Parochial Boards, but only by the Board of Supervision, on failure or neglect to perform their duties, either through refusal or incompetency.

If the Government should legislate next session for Scottish medical charity, it is to be hoped that they will insist on these points, for experience in Ireland shows it is just here that the system is faulty. Irish dispensary salaries bear no proportion to labour gone through, or duties discharged, because they are fixed at the simple caprice of the guardians, whose only idea of their duty is that they should provide a medical officer of some or any sort on the cheapest terms. It would be reasonable to suppose that where the district was most extensive—the population proportionably largest—the paupers most numerous, and the chance of private practice least, there the salary should be largest; but in Ireland it is just the reverse, for it is in this very district that the poor rates are highest, the number of persons capable of paying them fewest, and the guardians naturally most parsimonious.

The inevitable consequence of leaving the fixing of salaries to the ratepayers is that there is no sort of uniformity in Irish Poor-law medical service. Some districts command the services of the best men because the salaries are better than in poorer places, while the duties are comparatively light and the private practice lucrative; other districts are obliged to be content with fifth-class medical officers because, while the functions to be discharged are immensely laborious and the expectation of private earnings *nil*, the salary is no better than in the more favoured locality.

For these reasons it should be insisted on, as the Lord Advocate suggests, that the salary should be fixed "with due regard to population and extent of district and to the number of paupers, and it should be exclusive of medicine and medical appliances."

The only tribunal capable of forming a just opinion in such a matter is the Local Government Board, and to it should the assessment of salaries be confided, on the understanding that it shall proceed on the principle approved by the Lord Advocate, and not on the haphazard system at present followed.

◆

Notes on Current Topics.

Jaborandi in Acute Pleurisy.

JABORANDI has proved very serviceable in several cases of pleuritic effusion, and in a late number of *La France Médical*, Dr. Michon reports two cases, the happy termination of which certainly appears to be due to the action of this drug. In both cases the patients were rather bad subjects, the symptoms severe, and other remedies unsuccessful. Five grammes (75 gr.) of jaborandi leaves were given in infusion, and in both cases this dose was soon followed by copious expectoration, salivation, and diaphoresis, together with marked absorption of the effusion, and speedy relief to all the symptoms.

The Bromohydrate of Quinine.

M. GUBLER (*Journal de Thérapeutique*) says that this drug corresponds to the sulphate of the same base, but is more soluble, and contains more of the alkaloid than the latter. It possesses the physiological property of the salts of quinine in general, and probably also the therapeutic virtues of its officinal congener. It produces, however, but little cinchonism, and has a marked tendency to act as a sedative and hypnotic upon the nervous system.

The Expectoration in Pulmonary Phthisis.

THE *Progrés Medical* of October 21st draws attention to a monograph by Dr. Georges Daremberg on the above subject. The reviewer justly observes that the ancients, who did not possess the precise means of physically examining the chest as we do, attached great importance to the study of the expectoration in thoracic affections. This study, however, has recently made great progress. If the histological examination of the sputa assists us in arriving at the diagnosis of phthisis (for we only find elastic fibres in the sputa of phthisis, pulmonary gangrene and hæmorrhagic infarction, the two last of which are easily eliminated by their special characters), the chemical examination of the sputa allows us to form a prognosis with respect to the progress of the disease. Such is the chief point brought out by the careful researches and analyses of M. Daremberg. He arrives at the conclusion that "the sputa may contain as much of the phosphates and of the chlorides as the urine does, and that, in phthisical patients, the expectoration is one of the channels by which the products of tissue waste (*dénutrition*) are expelled; it is not only one of the channels but one of the causes of this tissue-waste, a circumstance which affords prognostic and therapeutical indications of a precise nature." These and other considerations connected with special forms of phthisis are clearly explained in the remaining chapters of this little work, which should be in the hands of all who are specially interested in the subject. It is published by J. B. Baillière, of Paris, and may be had by applying to our own publishers, Messrs. Baillière, Tindall, and Cox, 20 King William Street, Strand.

A Battle Over a Bed-Bug.

THE *Pacific Medical Journal* says that a sprightly quarrel is in progress among the homœopaths on the subject of bed-bugs. A number of years ago this interesting animal was introduced into their materia medica, in company with *pediculus capitis*, *crotalus horridus* and other lively medicines. In spite of some opposition from individuals, it gained a footing, and now holds a permanent place in Allen's "Homœopathic Materia Medica," a standard authority. Dr. J. P. Dake, one of the strong men of the sect, wages war against it, his last demonstration taking the form of a long article in the June number of the *Hanhemannian Monthly*. In this, however, he almost surrenders, declaring that "as it has been admitted to the pages of the "Encyclopædia" by Dr. Allen, I will no longer protest against its remaining there, as it may be, after all, 'the right thing in the right place.'"

A Californian Country Doctor.

THE following account of himself, contained in a letter from a California doctor to his friend, is too good to be lost:—

"I am not situated like my metropolitan brethren. I am located in a little obscure country village, consequently am my own apothecary, and cannot supply myself with all the elegant preparations of modern pharmacy. I have but few medicines, but they are reliable, because I purchase them from parties whom I know to be trustworthy. It matters little how they taste or how they are got down, so that they do go down. I do not send prescriptions to druggists to have them spiced and flavoured to suit the taste. I never write prescriptions—the fact is I do not know how. I have no highly flavoured remedies to expel wind either up or down to suit the caprice of my patients. I do business in a plain and simple way, and when not professionally employed, I work in the field, barn-yard, garden our potato patch, cut wood, do chores, churn, and rock the baby."

"The ——— amongst the Tailors."

THE Board of Examiners of the "California State Medical Society of Homœopathic Practitioners" having brought suit against the members of the Board of Examiners of the "Pacific Homœopathic Medical Society of the State of California," have succeeded in obtaining a decision in their favour, which adjudges the latter body as "usurping the franchise and privileges of a corporation," and excludes them from the office of trustees. This leaves the former organisation master of the field.

The Benzoline Cautery.

THE *Students Journal* calls attention to one of the most beautiful instruments lately placed at the service of the profession known as the benzoline cautery. It is a French invention and may be thus described: A metal cautery of any shape is hollow, containing a double tube through which a current of benzoline vapour mixed with air, can pass, going forwards in one tube and returning by the other. The benzoline vapour and the air are mixed together and the mixture forced through the cautery by means of an apparatus like Dr. Richardson's spray-producer. In using it, the cautery is first heated by a spirit lamp to a moderate temperature, quite below red-heat. Then the lamp is taken away and the benzoline mixed with air pumped through the cautery by the contrivance described above. The mixture ignites and raises the cautery to a red-heat, which can be kept up as long as may be desired by simply working the "spray-producer." Everyone who knows what a troublesome and complicated affair the galvano-cautery is, will appreciate the value of this most elegant invention.

The Medical Degrees of the University of Dublin.

The following resolutions were adopted by the Council at the meeting, on November 8th :—

1. That the subjects for the half M.B. examinations should, after the 1st January, 1874, be three in number—viz. : (*a*) Botany and materia medica ; (*b*) Physics and chemistry ; (*c*) descriptive anatomy.

2. That the times for holding the half M.B. examinations should continue as at present arranged.

3. That one extern examiner (an extern examiner means an examiner not a teacher in the school of physic. Any person holding the appointment under the board; of teacher of their students in Sir Patrick Dun's Hospital, is a teacher in the school of physic, within the meaning of these resolutions) be chosen to examine in botany and materia medica.

4. That one extern examiner be chosen to examine in both physics and chemistry.

5. That one extern examiner be chosen to examine in descriptive anatomy.

6. That two only of the three teaching examiners in descriptive anatomy shall take part in the examination in that subject.

7. That, in addition to the regius professor of physic, two extern examiners be chosen for the M.B. examination, to examine in clinical medicine and institutes of medicine (including medical pathology), respectively.

8. That, in addition to the regius professor of surgery, one extern examiner be chosen for the B.Ch. examination, to examine in ophthalmic surgery, and also one in operative surgery.

9. That the professors of the school of physic shall furnish to the provost and senior fellows, before the 10th of December in each year, a list of twenty-one names of persons considered by them qualified to act as extern examiners, as follows :—Botany and materia medica, three names. Physics and chemistry, three. Descriptive anatomy, three. Clinical medicine, three. Institutes of medicine (including medical pathology), three. Ophthalmic surgery, three. Operative surgery, three.

10. That the extern examiners be appointed each year in the month of January.

11. That five per cent. marks be allotted at the B.Ch. examination, to each of the subjects of surgical appliances and surgical pathology, in lieu of ten per cent. of the marks hitherto gvien in general surgery.

N.B.—The courts of examiners would thus have the following compositions :—1. Botany and materia medica, externs one, teachers two. 2. Physics and chemistry, externs one, teachers two. 3. Descriptive anatomy, externs one, teachers two. 4. Medical degree, externs three, teachers six. 5. Surgical degree, externs three, teachers four.

12. That the report of the professors of the school of physic on the curriculum and examination for the M.A.O. degree in midwifery be adopted.

The report was as follows :—The professors recommend the following curriculum and examination for the new degree in midwifery.

Curriculum.—1. One winter course in midwifery. 2. Six months' practice in a recognized lying-in-hospital or maternity. 3. A summer course in obstetric medicine and surgery. 4. Two months' practice in the Cow-pock Institution. Existing graduates in medicine, of the standing of M.D., to be entitled to present themselves for examination, without complying with regulations 3 and 4.

Examination.—The Court of Examiners to consist of:—1. The King's professor of midwifery. 2. The professor of comparative anatomy and zoology. 3. An extern examiner to be appointed from time to time by the board, on the principles adopted on 17th of June, 1876, in the case of other extern examiners.

[The foregoing report was adopted by the Provost and Senior Fellows on the 28th of October, 1876.]

The Recovery of Fees in Quack Prosecutions.

At the last meeting of the Council of the Medical Defence Association, the secretary reported that he had applied to the Registrar of the Medical Council for the penalties recovered in the Metropolitan Police Courts, under the Medical Act, and had been informed that the penalties are retained by the Receiver of the Metropolitan Police Districts on the ground that the Medical Act of 1858 is overridden by the Act 2nd and 3rd Vict., cap. 71, which enacts that all penalties recovered in the Metropolitan Police Courts must be paid to the Exchequer. After some discussion it was resolved, that the Secretary be requested to write to the Medical Council asking the Council to receive a deputation from the Association in reference to the question. There can be no doubt that the framers of the Medical Act of 1858 intended that all fines recovered under the Act should be paid to the Medical Council, so that the Council might be able to meet the expenses of prosecution, and we shall be glad to hear that it has been decided to defend what appears to be the just claim of the Council to the fines thus recovered. If it is found that the fines must go to the Exchequer, the Act must become a dead letter, as far as London is concerned, for it will be found almost impossible to get the funds necessary to meet the heavy expenses incurred by the Defence Association in enforcing the provisions of the Acts in the metropolis.

Sanitary Teaching for the People.

With a view to enlighten the working classes on the laws of health, and following in the wake of Manchester and Birmingham, a series of twenty lectures will be given in London this winter, under the auspices of the National Health Society and the Trades Guild of Learning. The first lecture was given on Saturday evening before a very large and attentive audience in the large room of the Society of Arts, John Street, Adelphi, a fee of one penny per lecture only being charged to the working classes. For other members of the community the charge is one guinea for the course. Professor W. H. Corfield, of University College, has been selected to deliver the lectures, which are all to be in the simplest terms, that every labouring man and woman will be able to understand, the subjects being the structures of the body ; the separate work of the bones, muscles, &c.; the circulation ; brain work ; preventible diseases ; ventilation ; water supply ; drainage ; foods and drinks ; the arrangement of dwellings ; unhealthy employments ; disinfection, &c. The sympathies of the working classes having been appealed to and obtained, such a course of instruction cannot fail to exert a healthy influence upon the masses, and strengthen the hands of those who are engaged in an uphill hygienic warfare.

The Professorship of Midwifery in Galway College.

THE election of a Professor of Midwifery in the Queen's College, Galway, in place of the late Dr. Doherty, who, it will be remembered, died suddenly more than 12 months ago, was held, after an unexpected delay and a postponement, on the 5th inst. There were, we believe, sixty-two candidates, and from them Dr. Kinkead, of Tuam, was chosen as most fitting to succeed to the chair. Dr. Kinkead is a graduate in arts and a doctor of medicine in the University of Dublin, and holds the licenses of the Colleges of Physicians and of Surgeons in Ireland. He obtained his education in the School of Physic and the Royal College of Surgeons in Dublin, and at the Adelaide and Coombe Hospitals, and since his entrance into the profession he has proved himself at all times an advanced student, and an energetic and original practitioner. His appointment will ensure that the duties of the professorial chair shall be well discharged.

The Public Health of England and Wales.

THE following statistics from the Official Report of the Registrar-General for England and Wales will be read with interest. During the three months ending September last, 119,909 deaths were registered, equal to an annual rate of 19·6 per 1000 of the estimated population. This death-rate was 1·4 per 1000 below the average rate in the corresponding quarter of the ten years 1866-75, and, excepting the rate in 1873 (19·5), was lower than that which prevailed in any of those years; in the remarkably hot summer quarter of 1868 the rate was 23·7, and was 4·1 in excess of the rate last quarter. The average death-rate in the third quarters of the 38 years 1838-75 was 20·6 per 1000; the summer rates in these 38 years ranged from 17·2 in 1860, to 30·6 in 1849. The summer of 1860 was unusually cold and wet, and in 1849 a severe epidemic of cholera prevailed.

The 119,909 included 62,560 deaths of males, and 57,349 of females; the male death-rate was equal to 21·0, and the female rate to 18·3 per 1000 persons living of each sex. In equal numbers living, the deaths of males in the quarter were as 115 to each 100 deaths of females; the proportion in the corresponding quarter of 1875 was 114 to 100.

The deaths between one and 60 years was equal to 10·5 per 1000 persons living at these ages, and was 0·5 below the rate that prevailed during the same period of 1875. Among persons aged upwards of 60 years the rate of mortality in England and Wales averaged 55·7 per 1000, against 57·3 and 54·8 in the corresponding periods of 1874 and 1875.

The 119,909 deaths from all causes in the quarter included 14,755 which were referred to diarrhœa, 3772 to scarlet fever, 2443 to fever, 1683 to measles, 1491 to whooping-cough, 601 to diphtheria, and 543 to small-pox; in all 25,288 deaths resulted from these seven principal zymotic diseases, and were equal to an annual rate of 4·1 per 1000, which was 0·7 below the average zymotic rate in the six preceding corresponding quarters.

Public Baths.

UNDER this title Mr. Francis Vacher, medical officer of health for Birkenhead, has published a small pamphlet, in which he calls attention to the great need there is of cheap and commodious baths for the poorer population of all large towns. It is really a reprint of a paper read at the recent meeting of the British Medical Association, but the subject is an important one, and too great publicity cannot be given to it. Not long ago we took occasion to reflect upon the dirty habits prevalent among a large number of the lower classes, and we, therefore, heartily endorse all that Mr. Vacher has said on the advisability of doing what we can to encourage among them habits of cleanliness and a wholesome liking for plenty of soap and water. Mr. Vacher directs attention to an old Act of Parliament of which the public are most probably ignorant, and of which, unfortunately, the various municipal corporations have not taken due advantage. This Permissive Act, under which boroughs, cities, ports, towns, &c., are empowered to erect public baths, sought to promote a healthy appetite for bathing among the inhabitants of the poorest districts, and with this intention a scale of charges was laid down and other provisions made, which, if carried out, would have put the benefits of these baths within the reach of the poorest inhabitant. But we regret to say that in ninety-nine cases out of a hundred these provisions have been perfectly ignored; while in others the obvious aim of the Legislature in passing the measure seems to have been quite lost sight of. While the enabling powers sought to provide for that class only which had neither baths of their own nor money to take them to those already in existence, the local authorities thought only of erecting large, handsome, and expensive buildings, which, on account of their great expense, not only often ended in their not being built at all, but when built afford no accommodation for those for whom public baths are most desirable, and for the benefit of whom the Act above mentioned was exclusively framed. Mr. Vacher shows that whereas some of these large buildings, with their imposing frontages, &c., cost between £17,000 and £20,000, a suitable site, building, water-service, &c., might all be provided for about £2,500. He gives a plan of such a building, and says:—

> "If a building on this pattern had been erected close to the most thickly populated part of the district, who can doubt but that the people would soon have learned to use it? Then another might have been established in another crowded locality, and by-and-by another. After the township had put up half-a-dozen such buildings, had as many been required, but £15,000 would have been spent, or £2,000 less than the estimated cost of the splendid architectural triumph the health committee long since came to the conclusion 'would ultimately be at once the most economical and best' for the town. Even as an experiment—not a very venturesome one—an outlay of £2,500 would surely have been justifiable."

Those who wish to know the structural details of the public baths proposed by Mr. Vacher must refer to the pamphlet itself. We will only observe, in conclusion, that a building constructed on his principle would suffice for—say 10,000 inhabitants of any urban district; that it would, in his opinion, meet the requirements of the labouring classes better than any other form of bath-house, and that it would cost considerably less than those heavy and expensive establishments, which are chiefly patronised by the middle ranks of society.

Religion and Doctoring.

It has long been notorious that the majority of those whose business it is to select a medical attendant for the sick poor in Ireland make their choice not at all of the best man, but of the man who professes one or other religion. Such a system is an abominable perversion of a very simple duty, and, whether perpetrated by Protestant or Catholic, a gross abuse of the confidence which the country has been foolish enough to repose in such persons. Nothing can so completely damp the ardour of a student or a practitioner as to find that his labour and the guarantees of fitness which he holds are as nothing beside the imprimatur of the parish priest or parson, and yet this is the actual state of affairs in many districts in Ireland. We have long been aware of the fact but have not dwelt upon it, being hopeless of the Local Government Board desiring or attempting any better system; but it behoves us to notice the subject when we find a journal which ought to have influence impudently suggesting that doctrine should oust medical fitness in such a competition. The *Tipperary Free Press*, referring to a recent election, says:—

> "It was felt, and with ample reason, that the medical officer selected to minister amongst the poor should be of the same religious persuasion as themselves, one who, when the shadow of Death was nigh, would be conscientiously solicitous for their spiritual well-being in accordance with the tenets of their faith, while in other emergencies, when the necessity for conditional baptism, &c., should arise, a —— doctor alone, at such a crisis, could afford that consolation in the homes of the poor which would deprive natural sorrow of its most bitter sting in cases of domestic bereavements."

Medical science has no religion, and ministers alike to Pagan and Christian. Let us hope that the fanatics of one or other doctrine will fail in the attempt to supersede surgical skill by special forms of piosity.

Prison Discipline for Chronic Patients.

Medical men frequently send their patients abroad for the restoration of their health, remarks our comtemporary, the *Observer*, but they never send them to prison; yet there can be little doubt that no more salutary prescription could be given to many an invalid than a few weeks or months incarceration in one of our gaols, where not only temperance, regularity, and cleanliness often exercise a beneficial effect on the constitution weakened by irregularities, but the general arrangements are such as conduce in a marked degree to the restoration and preservation of health. A hint to this effect is given by the Directors of Convict Prisons in their report for the past year, just issued. It may, as they point out, perhaps be said that for many years sanitary considerations and sanitary laws were attended to in prisons when little or no attention was paid to them in any other quarter. The result is summed up in a passage in the report of the medical officer of Millbank Prison, who says:—"On looking through the Annual Medical Statistics of these prisons for the twenty years 1855-74, I find that only eight deaths are ascribed to enteric fever, or 0·4 per annum in a population, male and female, averaging 7,913. During the five years 1870-74 only two deaths were caused by this disease in an average population of 9,509. If the sanitary securities enjoyed by the inmates of the convict prisons could be extended to the general population of the country many thousands of lives would every year be saved." In other words, invalids would derive incalculable benefit from committing an offence against either property or person.

A New Defence for a Poacher.

At the Armagh Petty Sessions, a prisoner accused of shooting a hare without leave or licence, put in a plea of guilty, but submitted that he heard a certain portion of a hare, if injected into the ear was an undoubted "Elixir" for deafness, with which his father was afflicted, and that he merely killed this "little hare" to get at the needful fluid.

The magistrate desired to know the result of the remedy, and hoped that if it succeeded, that Parliament would make a special change in the game laws in favour of obtaining the "fluid" if it really was a success.

Dublin Obstetrical Society.

The First Meeting of the Thirty-ninth Annual Session will be held on Saturday evening, the 18th inst., in the Hall of the Irish College of Physicians, at eight o'clock, Dr. Lombe Atthill, President for the past session, will deliver an address; and the election of officers for the ensuing session will be held. The Council has invited a number of visitors.

The Council recommend that Dr. Thomas Darby be elected President. and that Dr. Madden and Dr. MacSwiney be elected Vice-Presidents. They also recommend that Dr. Roe be re-elected as Treasurer, and that Dr. Kirkpatrick be re-elected Secretary.

During the quarter ending October 1st, the number of deaths in hospitals, asylums, and workhouses was 10,037, or 8·4 per cent. of the deaths registered during the quarter.

Typhoid is assuming alarming proportions in Paris. During the last three weeks the deaths from this cause have steadily risen from 29, 40, to 59.

The deaths from small-pox rose in London from 15 in the previous week to 21 last week. The mortality from the same cause in Liverpool remained stationary, namely, 10 each week.

The deaths referred to accidents, violence, &c., during the last quarter numbered 4,590 in the United Kingdom. There were also 6,459 inquests held during the same period.

Nature furnishes its readers, this week, with a complete report of the Arctic Expedition. A carefully drawn map shows in detail the various geographical discoveries made by the exploring parties. This account has been furnished by Captain Nares, and is therefore all the more valuable, and of a highly interesting character.

Dr. L. S. Forbes Winslow has just issued a pamphlet *apropos* of the prevailing mania, under the title of "Spiritualistic Madness," which, if attentively perused by the general public, is calculated to produce healthy results. The opinions there expressed, together with the cases adduced in proof, are provoking considerable discussion in literary circles.

Some of the persons who were so active in the recent fruitless agitation in reference to the Hampstead Hospital being made a receptacle for small-pox patients, are about bringing an action at common law against the Asylums Board, claiming damages for injury to property surrounding the hospital. For this purpose a guarntee fund of £2,500 or £3,000 is proposed to be raised, of which it is reported more than £1,000 has been subscribed.

On Friday last a deputation of some of the Marylebone vestry waited upon the President of the Local Government Board to protest against the guardians erecting a new infirmary at Bayswater, at a cost of nearly a quarter of a million to the ratepayers, contending that the present provision for the sick was not inadequate, and that, at all events, a site could be obtained nearer to the workhouse. The President combated the arguments as to the necessity for increased accommodation, which, he said, had been fully proved, but as to the question of site, he would give the matter consideration.

The Council of the University of Dublin has found it necessary to take notice of the prevalence of "copying" in the medical examinations, and have resolved—"That the medical registrar be requested to bring under the notice of the Professors in the Medical School the fact that sufficient precautions are not taken to prevent copying at the medical and surgical examinations, and to request them to suggest, if possible, adequate precautions against this abuse

During the Slade prosecution we announced that another *soi-disant* "Dr." had been apprehended at Huddersfield for fraud, under the disguise of spiritualism. This said individual, Francis Ward Monck, was indicted before the magistrate on Friday last with having by subtle means imposed on certain persons. The articles seized on the prisoner's premises, and acknowledged to be his property, consisted of a fishing rod—used to wave a tambourine about—an electric battery, fairy bells, gloves to which elastic was attached, and other articles. The prisoner was remanded.

The election of the Council of the Surgical Society of Ireland took place last week at the Royal College of Surgeons in Ireland. The following gentlemen were elected:—Charles Benson, Philip Bevan, William Colles, Humphrey Minchin, M. Harry Stapleton, Richard G. Butcher, George H. Potter, B. Wills Richardson (Hon Sec.), J. Stannus Hughes, J. H. Wharton, Albert Walsh, Jolliffe Tufnell (Hon Sec.), Rawdon Macnamara, John Barker, Edward Hamilton, Edward D. Mapother, Henry G Croly, Henry J. Tyrrell, William Stokes, Anthony Corley, Benjamin Francis McDowell. It will be observed that Dr. Bennett, Professor of Surgery in the University of Dublin, lost his seat, and was replaced by Mr. Tyrrell.

THERAPEUTICAL PREPARATIONS.

AERATED WATERS.

Mr. W. Hay, of Hull, has forwarded for our analysis samples of his highly aerated waters. The Lithia water contains an appreciable quantity of the Lithia salt: it is well aerated and pleasant to the palate. Both the potass and soda waters hold in solution a definite quantity of either potass or soda alkalies. Their flavour is agreeable, and they retain their briskness for a considerable time after the bottles are uncorked. The lemonade is of an exceptionally good flavour and quality, and the ginger-beer of a perfectly transparent solution, having a fine, delicate flavour of ginger, quite unlike the article usually sold under the name of ginger-beer. The latter is usually made with the essential oil of ginger of commerce, and never very long retains its flavour or transparent appearance. There is, however, another article, sold under the name of ginger-beer, which is transparent; but this is a different preparation altogether, and scarcely deserves the name by which it is called. Jamaica ginger consists of an aromatic, volatile essential oil, in which all the aroma and flavour of ginger exists—a non-volatile, acrid, pungent and somewhat bitter resin, besides a quantity of mucilaginous fermentable matter. The second mentioned component (the resin) exists in large quantities in the essence of ginger of the shops; and this it is which is separated from and rejected in this preparation used by Mr. W. Hay in the manufacture of his ginger-beer. This precaution has enabled him to supply a superior article, with an improved and agreeable flavour, and which is not liable to undergo further change by keeping.

Literature.

AURAL SURGERY. (a)

This work is in part a reprint of communications which have appeared in our columns, and which were well received by our readers. Several of the chapters discuss subjects of peculiar interest to all practitioners of medicine, inasmuch as they treat of diseases with the remedies for which it is the duty of every general practitioner to acquaint himself. By a short and simple explanation it is shown that every one without acquiring any deep knowledge of the speciality of aural surgery, may readily learn sufficient to recognise among the forms of deafness which will present themselves before him, many amenable to a simple treatment which he himself can apply, and many others which hitherto looked upon as hopelessly incurable will assuredly prove curable under certain definite forms of treatment.

The first chapter shows how a novice may examine a patient suffering from impaired hearing, what he will be likely to see, and the conclusions to be drawn from the appearances presented.

Chapters follow on aural catarrh and its results, and here we notice the description of a very simple method of applying the Eustachian catheter.

Warm the catheter in hot water and introduce it into the inferior meatus of the nose (best done by depressing the patient's lip), pass it along the floor of the nares until it reaches tha posterior wall of the pharynx, then turning the point of the instrument inwards, withdraw it until it impinges upon the septum nasi; if it is then rotated, the point being turned downwards, then outwards and a little upwards (a position shown by the ring on the handle of the catheter), the mouth of the Eustachian tube will be easily found.

(a) A Treatise on the Curable Forms of Ear Disease. By Geo. P. Field, M.R.C.S., Aural Surgeon to St. Mary's Hospital, and Lecturer on Aural Surgery in the Medical School. Henry Renshaw, Strand.

The last chapter treats of tinnitus aurum, narrating its causes and their treatment.

The work will doubtless command a ready sale, for it renders a long list of painful diseases now known only to the few at once simple, recognisable, and remediable.

Correspondence.

ALCOHOL IN THE ARCTIC REGIONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Dr. Quinlan, in his lecture at St. Vincent's Hospital, on Nov. 1st (as reported in the Medical Press and Circular, Nov. 8th, speaking of alcohol), says, ". . . facts throw a strong light upon the folly of using large quantities of alcohol on the part of persons exposed to cold and hardships. They could not use a worse thing, and this fact is well known to all Arctic voyagers." Before the expedition left England, you kindly permitted me to draw attention to this subject in your issue of January 27th, 1875. I am sure a favour would be conferred on advocates of abstinence from intoxicating liquors if some of the medical gentlemen who were with the expedition and who I am glad to see, by your columns, have been recognised and promoted for their services,—would tell us their experience. It has been stated that where alcohol was not used in former Arctic voyages, no death occurred; but as I believe the contrary has been the case on board the ships just returned, it is I think a fitting subject for enlightenment from those who are so well able to give it as the gentlemen referred to.

Yours truly,

H. P. Gibson,

Medical News.

The Mortality of Foreign Cities. — The annual rates of mortality, according to the most recent weekly returns of the Registrar-General, were:—In Calcutta 24, Bombay 26, Madras 35, Paris 24, Brussels 22, Amsterdam 22, Rotterdam 29, The Hague 22, Copenhagen 18, Stockholm 25, Christiania 16, Berlin 26, Hamburg 23, Breslau 24, Munich 36, Vienna 22, Buda-Pesth 34, Rome 19, Naples 20, Turin 18, Alexandria 46, New York 21, Brooklyn 16, Philadelphia 20, and Boston 23. The fatal cases of typhoid fever in Paris, which had been 29 and 40 in the two previous weeks, further rose to 59 last week.

Vital Statistics.—From the Registrar-General's returns we learn rhat during last week 5,939 births and 3,374 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,615. The mortality from all causes was at the average rate of 22 deaths annually in every 1,000 persons living. The annual death-rate was 17 per 1,000 in Edinburgh, 20 in Dublin, 21 in Glasgow, and 21 in London. In the other large towns the rates of mortality were—Sunderland 16, Birmingham 19, Hull 19, Portsmouth 19, Bristol 20, Brighton 20, Nottingham 21, Bradford 21, Newcastle-upon-Tyne 23, Liverpool 24, Manchester 24, Norwich 24, Leicester 25, Plymouth 25, Leeds 26, Sheffield 26, Oldham 28, Wolverhampton 29, and the highest rate 40 in Salford. The annual death-rate from these diseases averaged 2·8 per 1,000 in these towns, and ranged from 0·8 and 1·2 in Bristol and Oldham, to 7·2 and 11·7 in Wolverhampton and Salford. Scarlet fever caused 10 more deaths in Portsmouth. Forty-six deaths were referred to small-pox, against 32 in each of the three preceding weeks, and included 21 in London, 10 in Liverpool, 14 in Salford, and 1 in Manchester.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Betts *versus* The Medical Press and Circular.—This case is expected to come on for trial this day (Wednesday). We intend giving a full report in our next.

Glasgow and Aberdeen Universities Election.—At the close of the poll on Friday last at Glasgow and Aberdeen, the numbers were:—For Lord Advocate Watson, 2,392; for Dr. Anderson Kirkwood, 1,787. The majority for the Conservative candidate being 604.

CORONERS' INQUESTS.

To the Editor of the Medical Press and Circular.

Sir,—I am anxious to bring under your notice, as well as that of the readers of your journal, a resolution adopted by "The Board of Superintendence" of a county gaol in the province of Munster, as to my mind it injuriously affects the interests of our profession, and tends to render the finding of coroners' juries less reliable.

The following is a copy of the resolution—viz.: "In future the Board of Superintendence recommend that in case medical evidence is roquired by coroners' juries that the foreman of said jury endorse the voucher of the medical man so examined, and that the grand jury be requested to insert a minute to this effect in the county book."

With a view to elicit opinions on this matter I would ask the following questions, to which, I am sure, you, with your usual kindness, will give your attention:—

1st. How are the jury to decide whether medical evidence is required?

2nd. Having heard it, can the forman refuse to *endorse* the voucher?

3rd. The foreman having refused to endorse the voucher, how is the fee recoverable?

I am, Sir, yours, &c.,

A Medical Man.

[Such an order is illegal and of no force. The coroner is authorised by the Act to call to his aid a medical witness when he sees fit, and the jury have no authority to interfere unless they shall consider further evidence necessary, in which case they can compel the coroner—by a written requisition—to summon a second medical witness. The coroner's presentment for a fee for a medical witness may be opposed before the grand jury; but it has been decided by Chief Baron Pigott, Baron Fitzgerald, and Mr. Justice O'Brien that the jury have no power to disallow a fee paid by the coroner except they shall consider that he did not act *bonâ fide* and to the best of his judgment in calling the witness. Thus it appears, that the coroner need not comply with the order quoted by our correspondent, and that the payment of the fee is no better, in law, with the endorsement of the juror than without it; that the juror might or might not refuse without altering the legality of the claim, and that the grand jury could not refuse payment in consequence of such refusal. The action for recovery of the fee would lie against the coroner, who could obtain a recoup from the grand jury by an appeal to the fiating judge.—Ed. M. P. & C.]

H. L., Athlone.—We decidedly think one guinea a day a totally inadequate payment for a day's delay, annoyance, and responsibility as a witness in a court of law. The Council of the Irish Medical Association has the question of fees to medical witnesses under consideration at this moment, and is about to take steps to repeal the official instructions if possible. If our correspondent will address the Secretary, his case may strengthen the hands of the Council.

Deaths.

Barlow.—On Nov. 8, at Salzburg, Henry Clark Barlow, M.D., late of Newington Butts, Surrey, aged 70.

Fincham.—On Nov. 10, at 68 Loudoun Road N.W., Eliza, younger daughter of the late George Fincham, M.R.C.S., of St. John's Wood.

IRISH POOR-LAW INTELLIGENCE.

MONAGHAN QUARTER SESSIONS.

[Before W. M. BARRON, Esq., Chairman.]

ALLEGED FRAUD.

W. Woods, Esp., M.D., v. *William Crumley.*

THIS was an action for fraud, brought by Dr. Woods, the medical officer of Monaghan Dispensary, against William Crumley, an ex-Poor-law guardian, and member of the Dispensary Committee.

It may be recollected that this case has been twice previously before the public. In the first instance it was brought on the civil side of the court and the same chairman gave a decree for three guineas. From that decree the defendant appealed, the going judge of assize and Mr. Justice Fitzgerald reversed the decree, and dismissed it without prejudice, to enable the plaintiff to bring it properly before the Court. He said the case was one of fraud, and if it came again before him he would afford the utmost latitude in the discussion of it. The case now came again before the chairman, charging the defendant with having, in November, 1875, fraudulently issued a red ticket directing the plaintiff to attend at the residence of Bernard McGeough, a national schoolmaster, and afford advice, attendance, and medicine gratis to his wife in her confinement, the said Bernard McGeough not being "a poor person" within the meaning of the Medical Charities Acts.

Mr. Givan and Mr. Joseph Wright appeared for the plaintiff, and Mr. McLoughlin, barrister-at-law (special), instructed by Mr. John Reilly, and Mr. J. B. Ross, for the defendant.

Mr. Givan said the question to be tried was one of law, and he had a very powerful opponent in Mr. McLoughlin, and he would ask the forbearance of the court in respect of anything he had to say. The case was tried at last sessions, and again before Mr. Justice Fitzgerald at the assizes—

Mr. McLoughlin—We are now trying a new case. The last decree was reversed by the going judge of assize, and because he dropped a hint you are not going to ask the chairman to recollect what was tried then.

Chairman—I know nothing of the case now before me, and you had better let us get into it.

Mr. Givan said the defendant was last year a Poor-law guardian of the Monaghan Union, and as a warden he was also a member of the Dispensary Committee ex-officio, and had power to issue dispensary tickets; and the plaintiff was the medical officer of the dispensary. He was prepared to prove that he issued those tickets broadcast to everybody, and that he gave them to persons who were not intended to come within the meaning of those who were contemplated by the Poor-law, which distinctly stated the doctor was not bound to visit any except "poor persons." One of these was a national schoolmaster named McGeough, who was at the time in receipt of a salary of £60 or £70. So well was he off that when an observation was made by Dr. Woods refusing to treat his wife in a way prescribed by him, he went away and employed Dr. Ross, who, without consulting Dr. Woods, or making any intimation to him whatever, went and undertook the treatment of his patient, whose life had been with the greatest difficulty saved by Dr. Woods, and whom he had been visiting once every twelve hours for five or six days. He might mention that since Mr. Crumley's appointment there had been an enormous increase in the number of dispensary tickets issued.

Mr. McLoughlin objected to this. He did not like to interrupt Mr. Givan, for there was no man had a higher respect for Mr. Givan than he had. It was a common thing for barristers to say that about attorneys, whether they believed it or not, but in this instance he happened to believe it.

Mr. Givan said he was stating nothing but what he would prove in evidence. The North-East bar does not know law as well as the North-West—

Mr. McLoughlin—That is not true. They know it a great deal better, and I happen to be serious when I say that also.

Mr. Givan—According to the rules of the Local Government Board—

Mr. McLoughlin—I object to that.

Mr. Givan—You object to rules made by the Local Government Board, made under the authority of an Act of Parliament.

Mr. McLoughlin—Prove that.

Chairman—They are autocrats.

Mr. Givan—But they are autocrats by law and under acts of Parliament. He read the 12th section of the Acts which empowers the Local Government to make such rules and alterations of rules for the government of dispensaries as they may think fit.

Mr. McLoughlin—We are not in the same case now as at the last Quarter Sessions at all.

Chairman—I want to see what we are trying.

Mr. Givan—The defendant appealed from your worship's decision last time. It was fully argued before Judge FitzGerald, and we were turned round and ordered to come before you again because we did not impute fraud to the defendant. We are now imputing that technically—that is, we charge Mr. Crumley with having acted *ultra vires*, and outside the power and authority given to him by the statute, and by acting outside the power given to him he has perpetrated a legal fraud on the plaintiff, as distinguished from an intended fraud, or a dishonest act. He put upon Dr. Woods a duty that was not required of him by law, and thereby perpetrated a legal fraud on him and on the ratepayers. Will you now allow me to read what Judge FitzGerald stated at the assizes in reference to his idea of the law.

Mr. McLoughlin objected, and the Chairman refused to hear it.

Mr. Givan read the direction given to the member of committee as printed on the back of the ticket, to the effect that it was his duty to ascertain the circumstances of the party, as the doctor was not bound to visit any but "poor persons" contemplated by the Act.

Mr. McLoughlin said he would show what "fraud" was, from an authority immediately.

Chairman (to Mr. Givan)—Show, first, that he has issued this ticket, and then was the person a poor person.

Dr. Woods examined—I am medical officer of the dispensary of Monaghan; I know Bernard McGeough; he is a national teacher, his wife is also a teacher in Rakeeragh school, on the Rossmore estate: I know Crumley the defendant, he was last year a member of the dispensary committee of the Monaghan district; a ticket signed by him was presented to me in McGeough's name.

Mr. McLoughlin—Introduce it.

[The ticket was here produced together with 1,150 other tickets which the defendant had issued within a year.]

Is that the ticket? Yes.

Is it in the handwriting of the defendant? Yes.

Mr. McLoughlin—We admit it is.

Did you in pursuance of that ticket visit Mrs. McGeough? I did.

It was at the time of her confinement? Yes.

Where did she live? In Killygoan.

Where is that? Three quarters of a mile from Monaghan.

Was McGeough in comfortable circumstances? Yes, I should say so. I paid eleven visits to his wife; the case was of extreme difficulty. I had great difficulty in saving the life of the woman and her child. I paid the same attention to her that I would have paid to any private patient. When I found that McGeough was a man in comfortable circumstances I took steps to have the ticket cancelled. I had been at his house on the evening of the 9th November. I had to use a catheter every twelve hours. I saw her every evening at eight o'clock and every morning at eight, or between seven and eight.

Did you, on the last occasion you saw her, consider it necessary to see her before eight o'clock the following morning? I did not, it was not necessary. The next morning at four o'clock. Mr. McGeough called on me and said his wife was suffering very much from retention of urine, and demanded that I should go at once and relieve her. I said it was quite impossible that she could be for I had relieved her the previous evening at eight o'clock; and I told him that even if I were there I would not do anything. He told me if I did not go at once he would go instantly and employ another doctor, and report me to the Local Government Board. I said he might report me as soon as he pleased, but told him to leave my house at once, that I was the proper party to decide when I should see his wife and not he: and I told him he was an ungrateful man to speak to me in that way after all I had done for his wife. Next morning I was at his house at eight o'clock, Before entering the house, I asked if another medical man had been there. I was told that Dr. Ross had been there. I told McGeough he was most ungrateful after the manner I had attended his wife; and I said that any medical man who had come in to see my patient under such circumstances had acted unprofessionally. I had never done it myself, and had never known it to be done under such circumstances.

To Mr. McLoughlin—I heard what McGeogh's salary was.

Mr. McLoughlin—Well, I object to your telling what you heard.

Witness—I was present at the next meeting of committee when the ticket was cancelled.

Mr. Givan—After Mr. Crumley was appointed a member of committee were your duties largely increased?

Chairman—I dont think that is evidence.

Mr. Givan—We have proved the number of tickets issued, and we have them here.

Mr. McLoughlin—You are proceeding here for the value of your services? I don't think what I am proceeding for would be the value of my services. I never appeared in court in a case of this kind before.

I have been frequently offered payment by dispensary patients. I have been offered fees by the persons whom Mr. Crumley gave ticket to as dispensary patients. and was obliged to refuse them because I could not attend to them. What time did M'Geough call on you? It may have been two or four o'clock in the morning.—You did not think he was acting when he asked you to go to see her? No.—Did he tell you she was crying out with pain? No; he said she was in pain, and I told him it was hysteria. I told him I would see her at the usual hour, which was eight o'clock in the morning.—I am not finding fault with your attention to her; because I believe you were most attentive, as you are in general, but may I ask you were you very courteous with M'Geough? No; I was courteous with him till he threatened me. He threatened to report me to the Local Government Board, and said he would go for another doctor. I told him he might go where he liked.—Did you say at the last trial that you did not send him to hell which was next door to Dr. Ross's? No, that was Mr. Reilly's observation; he was cross-examining me.—In fact, did you tell him to go anywhere? I told him he might go to hell.—Last time you said he might go to the devil, thinking, I suppose, that he would find the owner of that place at home? Very likely. The dispensary committee is composed of elected and non-elected guardians. At the time referred to Mr. Crumley was a guardian. He has now ceased to be a guardian, and consequently he has ceased to be a member of committee.—I hope you had no hand in putting him out, doctor? None whatever.—Well, doctor, I will not trouble you further.

Mr. Foster Dunwoody, hon. sec. of the dispensary committee, gave evidence of the cancelling of M'Geough's ticket by the committee on the 10th November. Up till that time Dr. Woods was obliged to attend his patient. The committee only meet once a month.

Have you the tickets that were issued by Mr. Crumley during one year of office? I have (produces them).—How many are there in that bundle? 1,150.

Chairman—1,150! Is it in two years?

Witness—No, but in one year.

Chairman—It would be fair to hold that he did not use discretion in the exercise of his powers.

Mr. M'Loughlin—That is not the question.

Examination continued—The ticket was cancelled because Mrs. M'Geough was not a proper object for relief. My sole object in bringing this return is to put a stop to the wholesale issue of tickets to parties not entitled to them.

Bernard M'Geough was then examined, and said he was a national teacher; so, also was his wife. Their combined salaries in 1875 was £60.

Mr. Givan—Did you get any money with your wife?

Mr. M'Loughlin objected.

Mr. Givan—I want to know was he a "poor person?"

Chairman—Quite legitimate.

The witness said he may have got £10.

Mr. M'Loughlin then addressed the Court at considerable length, and quoted authorities defining what "fraud" was and what constituted it, and he read the following from Banks's "Compendium of the the Poor-law"—"That no action or suit shall be commenced against any commissioner or any other person, for anything done in pursuance of or under authority of this Act, until twenty-one days' notice has been given thereof in writing to the party or person against whom such action is intended to be brought, nor after sufficient satisfaction or tender thereof shall have been made to the party aggrieved, nor after three calendar months next after the act committed for which such action shall be brought."

The Chairman gave judgment on Friday, dismissing the case on the point raised by Mr. M'Loughlin in the above extract.

Dr. Woods appealed to the assizes.

◆

CERTIFICATES OF DANGEROUS LUNACY.

A CORRESPONDENT appeals to us upon the following case:—

The lunatic's father was anxious to have him sent to asylum, but two of the magistrates were in England. On Monday, the 6th inst., I left home to visit lunatic, but before doing so I drove about five miles, to the residence of a magistrate, who thought the best arrangement was to have the lunatic brought to Petty Sessions, and committed by the presiding magistrates. I then called at the Constabulary Barracks, and arranged with the constabulary to have the lunatic brought to Petty Sessions to-day, and the necessary witnesses. I visited the patient the following morning in the Barracks, was an hour in the Court-house, returned a second time to the Barracks with the magistrates, spending at least two hours this morning to facilitate the lunatic's committal, and now the Justices refuse to sign an order on the guardians for my fee. Surely the certifying for this fee ought to be compulsory, and not optional as at present.

[It certainly ought to be so, and no doubt the Irish Medical Association will not spare an effort to make it a claim as of right. Our correspondent should recollect that is only two years since medical men were compelled to certify in such cases "without fee or reward." However, we believe that the medical officer has the remedy in his own hands. The Act of Parliament orders that he, and no person, shall be called upon, and there is nothing in the Act, or in the Medical Charities Act, or the Dispensary Regulations to oblige him to go unless he likes. If he is refused payment he may, we believe, decline to attend again, and the lunatic will remain uncertified.

We express our belief, founded on an examination of the Acts, but we do not speak *ex cathedra*, nor would we wish our advice to be acted on without further consideration.]

◆

CORRESPONDENCE.

COMPULSORY SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your late numbers contained letters from several gentlemen regarding the above subject. These letters should have been very interesting to most of the workhouse and dispensary medical officers in Ireland, as the matter they refer to concerns them so much. It is to be regretted, however, that the writers did not give their names; as if they had, probably some private correspondence might have taken place, with the view of making a strong and united effort to carry out the contemplated project to a successful termination. I am only surprised that such a result has not been arrived at long before this!

After what has been so often stated in favour of the just claim that Poor-law medical officers have for obtaining superannuation, it is unnecessary for me tos ay anything. I would, however, beg to direct the particular attention of those gentlemen to the excellent letter signed "Dispensary Doctor," given in your issue of the 1st inst. I entirely agree with the writer in believing that, if a strong effort was made on the plan that he suggests, the desired object would be obtained. I venture thus to express my opinion with the hope that some influential gentleman may be induced to do what may seem to him best. I am, Sir,

Your obedient servant,

Abraham Kidd.

Ballymena, November 4th, 1876.

◆

CLONMEL ST. MARY'S DISPENSARY.

A meeting of the Committee of Management was held to elect a medical officer in the room of Dr. Scully, deceased. The following are those from whom applications were received:—

T. D. Stanistreet, M.D., Gordon Street, Clonmell; T. F. Sparrow, M.D., Peter Cutler, H. Borthistle, and Matthew James Hewetson.

A poll having been take, the following was the result: For Dr. Cutler, 16; for Dr. Hewetson, 16; for Dr. Stanistreet, 2; for Dr. Sparrow, 2.

A second poll was taken between Drs. Cutler and Hewetson, when the four gentlemen who voted for the other two candidates voted for Dr. Hewetson. Thus the voting was—Dr. Hewetson, 20; and Dr. Cutler, 16.

◆

WEXFORD UNION.

THE DRUG CONTRACT.

Mr. J. M. Vicary said—I have had some conversation with the medical officers, and they said to me—what is a fact—"that there are a great many things used by them which are not upon the list, and that when application is made to the druggist for them they charge treble the price." One of the medical officers told me he had ordered some brown Windsor soap from Dublin for which he was charged three times the amount it could be had for in Wexford, and which he very properly sent back.

It was resolved—"That the medical officers meet on a convenient day to consider the medicine tender and revise the list."

CARRICK-ON-SUIR UNION.

DANGEROUS LUNATICS.

The Clerk read an order from two magistrates for the payment of £1 1s. to Dr. Alexis Fitzgerald for his examination of a dangerous lunatic, named Kiely. It appeared that Kiely was seen in the first instance by Dr. Keatinge, who had come from Callan, a distance of eight miles. The Relieving officer informed the board that Kiely had been arrested by the Glenbower police and conveyed to Carrick, where Dr. Fitzgerald examined him.

It appearing by a section of the Act that magistrates are empowered to make an order for payment in such cases, it was decided to refer the matter, on the motion of Mr. Lalor, to the Local Government Board to know if they were bound to pay.

THE CORONERSHIP IN WATERFORD.

A body was discovered on Sunday, and an intimation to that effect was immediately sent to the Coroner, with a view to the holding an inquest on Monday. "His worship," however, was not accessible, and the friends of the deceased, the jurors, and the police, had to wait for him till this morning. This is not the first, or even the fifth time, that such delay has been caused, sometimes to the serious inconvenience of the relatives of the deceased. If the duties of the office are too great for Mr. Power, he should apply for a colleague, or, if his other avocations prevent him from attending to the coronership, he should resign the position, and let the public secure the services of some one who will mind their business. At least, an explanation of the cause of these delays is due to them.—*Waterford Citizen.*

DISPENSARY RELIEF.

(*Wexford Independent.*)

Some time ago the medical officer for Broadway Dispensary received a red ticket from a member of the committe, marked "urgent," directing him to visit a sick person. It was dark when the doctor received it, and the ground covered with snow. It being some miles to the patient's house, the Doctor had to saddle his horse and ride there in a heavy snow storm. On his arrival he found the patient sitting at the fire and complaining of toothache. We believe the charity of medical men is often abused; but a correspondent of the *Medical Times and Gazette* makes a statement which is startling. He states that the seven following instances of persons who are able to pay for medical attendance, but who have applied for and received out-door gratuitous medical relief, are cases which have occurred in his own practice:—

1. The wife of a geentleman who resides in one of the best houses in the suburbs, and has a private income of £800 a-year.
2. The wife of a gentleman who, besides other means of living, has a salary of £400 a-year.
3. The daughter of a musical instrument maker who has two establishments and employs a number of hands.
4. The wife of a grocer, in business.
5. A lady living upon her household property.
6. A publican doing one of the best trades—if not the largest—in his neighbourhood.
7. A tradesman just now recovering from an illness during which he stated that in the event of his death he had his family "comfortably provided for."

Another correspondent in the same journal states "that it is common for persons in good position to borrow their servants' clothes, and thus obtain medical aid for nothing." In giving tickets for medical relief to such parties, the giver of the ticket is committing a fraud on the ratepayers. He is the means of making the doctor give medicines at the expense of the ratepayers to persons well able to pay for them. To put a stop to such the members of the Dispensary Committee ought to examine carefully into each case on the doctor's books, and inquire into particulars, such as residence, employment, &c. Out-door relief in Wexford was at one time up to £14 or £15 a week; it is now reduced to one half that sum. A similar saving might be effected by attending at the Dispensary. It is very hard to ascertain who is a fit object for out-door relief, and many good persons may have been driven to part all they possessed by stopping relief from them, but it is different at the Dispensary. The gentlemen who have the power of giving tickets ought to study the words of Mr. Justice Fitzgerald at the last Monaghan Assizes, who laid it down as law that a person authorised to issue dispensary tickets is not only liable to a civil action, but is also guilty of misdemeanour, and liable to a criminal prosecution should he give a ticket to a person not entitled to medical relief.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF OCTOBER, 1876.

OCTOBER 2nd.—Nichols, John Moore, Louth Union Workhouse, Dublin. Lic. R. Coll. Surg. Irel. 1873, Lic. Apoth. Hall. Dub. 1875.

3rd.—Moore, Frederick Flood, Royal School, Cavan, Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876.

4th.—McParland, Owen Aloysius, Armagh, Lic. R. Coll. Surg. Irel 1875, Lic.. 1876 and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.

5th.—Ross, David John, Midleton, co. Cork, Lic. R. Coll. Phys. Edin. 1874, Lic. R. Coll. Surg. Edin. 1874.

6th.—Fisher, John Baptist, Meath Hospital, Dublin, Lic. Apoth. Hall, Dub. 1873.

9th.—O'Grady, Standish Thomas, Erinagh, Castle Connell, co. Limerick, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876 and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.

9th.—Ross, Charles Emilius, 3 Grosvenor Place, Rathmines, co. Dublin, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876, and Lic. Mid. 1876 K. Q. Coll. Phys. Irel.

9th.—Deacon, William Oliver, Barrack Street, Armagh, Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876, Lic. Apoth. Hall Dubl. 1876.

11th.—Falkiner, Thomas Falkiner, 40 Clarinda Park, East Kingstown, co. Dublin, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876, and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.

17th.—O'Flynn, Philip, 26 Lower Gardiner Street, Dublin, Lic. R. Coll. Surg. Edin, 1876, Lic. and F. Phys. Surg. Glas. 1875.

18th.—Jones, Wilmot John, Kilmore Rectory, Nenagh, co. Tiperary, Lic. R. Coll. Surg. Irel. 1872, Lic. 1875, and Lic. Mid. 1876, K. Q. Coll. Phys. Irel.

18th.—Crean, John, 21 Main Street, Wexford, Lic. R. Coll. Surg. Irel. 1875, Lic. R. Coll. Phys. Edin. 1876.

18th.—Calwell, William, 54 Eglinton Street, Belfast, Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876.

18th.—Ingham, Hugh John, Belturbet co. Cavan, and 96 Pembroke Road, Dublin, Lic. R. Coll. Surg. Irel. 1876.

18th.—Franks, Kendal Matthew St. John, 42 Fitzwilliam Place, Dublin, Lic. R. Coll. Surg. Irel. 1875, M.B. 1875, and M.D 1876, Univ. Dub.

20th.—Burke, Richard John, Shamrock Lawn, Douglas, co. Cork, M.D. 1876 and M.Ch. 1876 Q. Univ. Irel.

20th.—Riordan, Thomas Francis, 37 Shandon Street, Cork, M.D. 1876, and M.Ch. 1876, Q. Univ Irel.

20th—Molony, Henry, Clonmore, Tulla, co, Clare, M.D. 1876, and M.Ch. 1876, Q. Univ. Irel.

20th.—Walply, John Jagoe, Kilronan, Dunmanway, co. Cork, M.D. 1876 and M.Ch. 1876, Q. Univ. Irel.

23rd.—Collings, Michael, Lakeview, Moylerigh, co. Galway, M.D. 1876, and M.Ch. 1876, Q. Univ. Irel.

24th.—Dwyer, John Henry, Kilcor, Castle Lyons, co. Cork, M.B. Univ. Dub. 1876.

27th.—McVittie, Robert Blake, Steeven's Hospital, Dublin, Lic. R. Coll. Surg. Irel. 1876. M.D. Q. Univ. Irel. 1876.

28th.—McIvor, Robert, Union Hospital, Belfast, M.D. 1876 and M.Ch. 1876 Q. Univ. Irel.

30th.—Leeper, George Reginald, 4 Kildare Place, Dublin, M.B. Univ. Dub. 1876, Lic. R. Coll. Surg. Irel. 1876.

30th.—Adams, John James, co. Infirmary, Monaghan, M.D. Q. Univ. Irel. 1875.

30th.—Camac, Robert John, Dervock, Ballymoney, co. Antrim, M.D., 1876 and M.Ch. 1876 Q. Univ. Irel.

31st.—McGeagh, William, 18 Claremont Terrace, Belfast, M.D. 1876 and M.Ch. 1876 Q. Univ. Irel.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING NOV. 4, 1876.

Total registered deaths in Dublin and suburbs * ...	118	
Ten years average of same week	145	
Decrease of mortality below average	27	
Ratio of deaths, suburb of Rathmines ...	17·0	per 1,000
" " " Donnybrook †	25·8	"
" " " Blackrock ...	14·4	"
" " " Kingstown ...	25·3	"
" " Entire Dublin district ...	19·5	"
COMPARATIVE RATIOS—London	21·0	"

THE ADULTERATION OF FOOD, AND BRITISH LEGISLATION RELATIVE THERETO.

By Dr. C. R. Alder Wright,

Lecturer on Chemistry at St. Mary's Hospital.

(*Continued from page* 397.)

The following definitions and regulations as to limits have been adopted by the Society of Public Analysts (*Chem. News*, XXXI. 59).

Definition of an Adulterated Article.

An article shall be deemed to be adulterated—

(*A*) In the case of food or drink:—

1. If it contain any ingredient which may render such article injurious to the health of a consumer.
2. If it contain any substance that sensibly increases its weight, bulk, or strength, or gives it a fictitious value, unless the amount of such substance present be due to circumstances necessarily appertaining to its collection or manufacture, or be necessary for its preservation, or unless the presence thereof be acknowledged at the time of sale.
3. If any important constituent has been wholly or in part abstrated or omitted, unless acknowledgment of such abstraction or omission be made at the time of sale.
4. If it be an imitation of, or be sold under the name of, another article.

(*B*) In the case of drugs:—

1. If when retailed for medicinal purposes, under a name recognised in the "British Pharmacopœia," it be not equal in strength and purity to the standard laid down in that work.
2. If when sold under a name not recognised in the "British Pharmacopœia," it differ materially from the standard laid down in approved works on Materia Medica, or the professed standard under which it is sold.

Limits.

The following shall be deemed limits for the respective articles referred to:—

Milk shall contain not less than 9·0 per cent., by weight, of milk solids not fat, and not less than 2·5 per cent. of butter-fat.

Skim Milk shall contain not less than 9·0 per cent., by weight, of milk solids, not fat.

Butter shall contain not less than 80·0 per cent. of butter-fat.

Tea shall not contain more than 8·0 per cent. of mineral matter, calculated on the tea dried at 100° C., of which at least 3·0 per cent. shall be soluble in water, and the tea *as sold* shall yield at least 30·0 per cent. of extract.

Cocoa shall contain at least 20 per cent. of cocoa-fat.

Vinegar shall contain not less than 3·0 per cent. of acetic acid.

These limits are derived from the results obtained by the investigations made by numerous analysts on substances of known purity: thus, in the matter of milk, out of many hundreds, if not thousands, of analyses made, not more than two or three specimens have ever been obtained from cows (under the most varied conditions as to breed, mode of feeding, length of time since calving, &c., &c.) containing less than 9·0 per cent. by weight, of "solids, not fat;" and of these the difference from 9·0 per cent. is excessively small (8·9 or 8·8), only occurring in exceptional cases with single cows: most milks yield numbers perceptibly higher than 9·0 per cent. by weight, whence it is evident that *average* milk, such as would proceed from a farm or dairy where many cows are kept, could not possibly contain a lower quantity of solids than this; if therefore a sample of purchased milk is found to yield only 8·0 per cent. of solids not fat, to every 8 parts of genuine milk, *at least* 1 *part of water must have been added*, or 12·5 *per cent.* Again, skim-milk has been found to differ from ordinary milk only in the quantity of cream present, the "milk solids not fat," being the same in each.

As the result of the labours of the Select Committee, a Bill was introduced into the House of Commons on

Feb. 12th, 1875, by Mr. Sclater Booth, under the name of the "Sale of Food and Drugs Act, 1875." From the guise in which this Bill first appeared, it was evident that "trade influences" had been largely at work in its production; and indeed it has been said with some justice that had it been proposed to legalise every conceivable form of adulteration, to bar most effectually every remedy for the grievances suffered by the population in consequence of the practice, and to undo everything that the 1872 Act and all previous legislation had accomplished, these objects could hardly have been obtained in a more complete way than by passing this Bill as it originally stood, inasmuch as it commenced by repealing the previous Acts, and then substituted no efficient prohibitions, whilst the wording of certain clauses was such as to render convictions impossible. Thus the following extracts from the original Bill may be given as a proof of this:—

"Whereas it is desirable that the Acts now in force relating to the adulteration of food should be repealed, and that the law regarding the sale of food and drugs in a pure and genuine condition should be amended:

"Be it therefore enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

"1. From *the commencement of this Act* the 23 & 24 Vict., c. 84, 31 & 32 Vict., c. 121, s. 24, and the 35 & 36 Vict., c. 74, shall be repealed, except in regard to any appointment made under them, and not then determined, and in regard to any offences committed against them, or any prosecution or other act commenced and not concluded or completed, and any payment of money then due in respect of any provision thereof.

"2. This Act shall not apply to Scotland or Ireland, except as herein provided.

"3. The term 'food' shall include every article eaten or drunk by man, other than drugs:

"The term 'drug' shall include medicine for internal or external use:

"The term 'county' shall include every county, riding, and division, as well as every county of a city or town, not being a borough.

"The term 'justices' shall include any police and stipendiary magistrates invested with the powers of a justice of the peace.

Description of Offences.

"4. No person shall knowingly mix, colour, stain, or powder, or order any other person to mix, colour, stain, or powder, any article of food with any ingredient or material of a nature injurious to health, with intent that the same may be sold in that state, and no person shall knowingly sell any such article so mixed, coloured, stained, or powdered, under a penalty in each case of *fifty* pounds for the first offence; every subsequent offence, after a conviction in such penalty, shall be a misdemeanour, for which the person, on conviction, shall be imprisoned for a period not exceeding six months with hard labour.

"5. No person shall knowingly, except for the purpose of compounding as hereinafter described, mix, colour, stain, or powder, or order any other person to mix, colour, stain, or powder, any drug with any other ingredient or material of a nature injurious to health, with intent that the same may be sold in that state; and no person shall knowingly sell any such drug, so mixed, coloured, stained, or powdered, under the same penalty as in the last clause for a first and subsequent offence.

"6. No person shall knowingly sell any article of food or any drug which is not of the nature, substance, and quality of the article demanded by the purchaser, under a penalty of *twenty* pounds, except as herein excepted and provided; that is to say, except—

"Where any matter is mixed therewith for the purpose rendering it portable, or of preserving it;

"Where a harmless ingredient is mixed with it for the purpose of rendering it palatable or of improving its appearance;

"Where according to the usage of trade it is sold in a mixed state;

"Where it is the subject of a patent in force, and is supplied in the state required by the specification of the patent;

"Where British, colonial, or foreign spirits are reduced from their ordinary strength by persons licensed and paying duties under the excise;

"Where a drug is compounded either in conformity with a prescription of a registered medical practitioner or otherwise, according to the usage of trade;

"Where the article is unavoidably mixed with some extraneous matter.

"7. No person shall sell any article mixed for any of the purposes mentioned in the exceptions above set forth, if the matter mixed be more than is ordinarily required for the purpose, under a penalty of *ten* pounds.

"No person shall sell any article of food which by the usage of trade is sold in a mixed state, unless the ingredients shall be mixed in the proportions required by such usage, and no person shall sell any compounded drugs, except the same shall be compounded according to the prescription in writing submitted for that purpose, or in accordance with the regulations prescribed by the British Pharmacopœia issued by the General Medical Council, or with a basis to be laid down by the Pharmaceutical Society, or the Local Government Board, or the Privy Council, subject to a penalty of *twenty* pounds.

"8. Provided that no person shall be guilty of an offence in respect of the sale of an article mixed with any ingredient not injurious to health, whether the case may or may not fall within any of the above mentioned exceptions, if at the time of delivering such article he shall supply to the person receiving the same a notice to the effect that the article is mixed, by a label written or printed on or with the article.

"9. No person shall knowingly, and with the intent that the same may be sold in its altered state without notice, abstract from an article of food any part of it so as to affect injuriously its quality, substance or nature, and no person shall knowingly sell any article so altered without making disclosure of the alteration, under a penalty in each case of *ten* pounds."

Clause 1 here manifestly repeals all previous enactments on the subject.

Clause 3 is so worded as to include *water* amongst the substances to be examined by analysts under the Act, whilst it might be contended that tea, coffee, and similar preparations are not included amongst these substances, inasmuch as the articles sold are, *as sold*, not "articles eaten or drunk by man other than drugs."

Clause 4 is so worded that the use for flavouring purposes, &c., of substances injurious when taken in any quantity, but harmless when only present in minute proportions, would be punishable: thus, a confectioner who used essence of almond in his wares might be thus subjected to penalties; moreover, any benefits that might accrue from the prohibitions in the clause are wholly vitiated by the use of the word *knowingly*. In ninety-nine cases out of a hundred it would be impossible to prove that the seller of an adulterated article actually knew that the substance was so adulterated.

Clause 5.—The latter remarks on Clause 4 apply here also.

Clause 6.—Here also not only is the whole object of the clause lost through the use of the term "knowingly," but also adulteration of every possible kind is legalised by the special exception that any article of food or any drug may be sold which is not of the nature, substances, and quality of the articles demanded by the purchaser, "when *according to the usage of trade it is sold in a mixed state.*" Hence if it is the custom in the milk trade to add 50 per cent. of pump water, it is legitimate so to do; if it is usual to sell a mixture containing 75 per cent. of chicory, roasted acorns, starch, and such like abominations as ground coffee, the dealer is authorised to do so. Where the "usage of trade" cannot be pleaded it might be concluded that in the adulterated substance the objectionable "matter is mixed therewith for the purpose of rendering it portable or of preserving it:" thus a baker might plead that he used alum along with damaged flour and rotten potatoes in order to prevent the bread from rapidly becoming unsaleable; or he might contend that a minute amount of alum is harmless, and that "a harmless ingredient is mixed with 'the bread' for the purpose of rendering it palatable, or of improving its appearance."

Clause 7 is simply absurd, in so far as it relates to articles of food and drink, it being impossible to say what proportion of an adulterating substance "is ordinarily required" for admixture, the proportion being simply regulated by the "usage of trade."

Clause 8 provides a further door for the escape of sellers of adulterated articles, it being only necessary to add to the contents of the package sold, a label written or printed giving notice that the article is a mixture to escape all consequences. Nothing in the clause specifies that the attention of the purchaser is to be called to the label, or even that it is to be affixed where it can be seen. It might be wrapped up in the centre of a pound of coffee, for instance, and still it would be delivered "*with* the article."

Clause 9, like several of the preceding, is rendered of no avail through the use of the word "knowingly."

The clauses relating to the appointment and duties of analysts, and the proceedings to obtain analysis, also contained several objectionable phrases. Thus, various authorities are named who "may as soon as convenient after the passing of this Act . . . and when required to do so by the Local Government Board, shall, for their respective city, districts, counties, or boroughs, appoint one or more persons possessing competent knowledge, skill, and experience, as analysts of all articles of food and drugs sold within the said city, metropolitan districts, counties, or boroughs, and shall pay to such analysts such remuneration as shall be mutually agreed upon, and may remove him or them as they shall deem proper." Here the appointment of analysts is *optional* and not compulsory, whilst no stipulations are made as to the amount of work expected from the analyst, or the rate of payment to be made. The remarks made in a former part of this paper on these points as regards the working of the 1872 Act, as well as on the not infrequent unfitness for the office of the appointing authorities, equally apply here. It is, however, noticeable that the necessity of "medical knowledge" on the part of the analyst is no longer insisted on.

As regards the obtaining of samples, the instructions were unsatisfactory. Any one of certain officers "may procure any sample of food or drugs, and if he suspect the same to have been sold to him contrary to the provision of the Act, shall submit the same to be analysed." Hence, if the officer were of an unsuspicious nature, or were amenable to a bribe from the seller, he is not compelled to take the samples to the analyst at all, and the analystship might thus become a sinecure under the Act! Again, the purchaser of an article is directed to have three parcels made of it—one to be left with the seller, one to be taken to the analyst, and the third to be retained by the seller: hence the analyst's reputation rests entirely on the non-corruptibility of the purchaser. If by virtue of a bribe from the seller the latter allows the two samples retained to be tampered with (a kind of thing which has been known to occur even under the more stringent provisions of the 1872 Act), the certificate of the analyst must necessarily be disproved by the analysis made by any other analyst who receives for examination the sample tampered with. The system of making the analyst divide and seal the sample and retain a sealed portion himself is far preferable. For convenience, if the analyst reside more than two miles from the person requiring the article to be analysed, the sample may be sent through the post-office as a registered letter, from which it would seem that the post-office would be bound to carry as registered letters such articles as gallon beer bottles or quartern loaves.

In the matter of proceedings against offenders also, no provision was made for fees to be paid to the analyst for attendance in court, such attendance being compulsory if required by the defendant. The analyst of any adjoining district was liable to be called on to examine any article of food or drug as though it came from his own and not from a totally different district (*i.e.*, extra work was forced on him without any extra payment), and, moreover, this second analyst must attend to give evidence if required. On the other hand, chemists not already public analysts are apparently intended specially to be omitted as witnesses and referees in such cases: and hence, from the causes mentioned in a former part of this article, the highest chemical opinions and knowledge are practically excluded from the cases.

Finally, it is provided that if any seller of an adulterated article can prove that he purchased it as genuine with a warranty for its freedom from adulteration, he is to be discharged from the prosecution; but no provision whatever is made for the punishment of the giver of the warranty! If, however, a warranty be *forged*, a punishment is inflicted on conviction of imprisonment for a term not exceeding two years, with hard labour.

IDIOPATHIC GLOSSITIS, COMPLICATED BY ABSCESS IN THE ROOT OF THE TONGUE.

By Jas. P. Byrne, M.R.C.S., Eng., Aughrim, Co. Wicklow.

Dr. Croly's report of a case of glossitis in a late impression of the Medical Press recalls some cases of a similar nature which occurred in my practice; and, therefore, as endorsing his excellent description of symptoms and treatment, I trust they may be deemed sufficiently *à propos* for insertion in your columns. The utter helplessness of a person affected with this disease at once arrests our sympathy, and exemplifies the benefits derivable from surgical interference.

The case that heads this brief communication came under my notice on Saturday, the 1st of last April. The patient was a married woman, residing twelve miles from here, whose previous history afforded evidences of a somewhat impaired constitution, occasioned by protracted recoveries from difficult parturitions and some severe attacks of erysipelas. On seeing her, the usual symptoms of glossitis presented themselves, without any marked constitutional disturbance. Ascertaining that the swelling had existed in a minor degree for two or three days—that the sense of "choking" was not alarming, and that fluids could be swallowed without extreme difficulty, I determined to temporise with the use of the knife. I directed the throat, which was very hard and œdematous, to be poulticed externally, and hot water held in the mouth as hot as could be borne and with as little intermission as possible. Hot milk and chicken broth *ad libitum*, ordered—

Mist. pot. chlor. c. tinct. aconiti.

Leaving instructions that I should be sent for immediately in the event of urgent symptoms arising I arranged to see her again on Monday, the 3rd April. I accordingly went on that day, and, unfortunately, found matters had not improved, but rather the reverse; tongue filling up the entire mouth, and protruded between the teeth; viscid saliva and mucus dribbling away; frequent expressions of sensation of "choking," with much uneasiness and anxiety. There was no serious impediment to respiration, a fact I have noted in connection with the other cases I have witnessed. Anatomically considered, there is no reason why the disease should prove fatal by suffocation, unless in some very extraordinary instance.

Explaining the nature of the disease, and expressing my most absolute confidence in the mode of relief, I made two *long* and *deep incisions* (one on each side of the raphe) as

C

far back as possible. Relief was immediately experienced, but not to the extent I before observed, and I left the patient (and myself) in the full hope that all apprehensions of danger were at an end.

Much to my surprise, on the following day (Tuesday), I received word my patient was no better, and that I should visit her again without delay. Arriving at 8 o'clock, p.m., same day, I naturally felt disappointed and chagrined with the result of the scalpel, and began to lose confidence in the treatment so concisely and plainly laid down by Mr. Erichsen. Alarm and anxiety were now depicted on every countenance. Symptoms had reached a climax. Deglutition and articulation were alike out of the question. Tongue swollen as large as before the operation, but not protruded. In this dilemma I had some difficulty in again reconciling the patient and her friends to the cutting operation, which seemed to offer the only chance of escape from imminent suffocation. However, on examining the swollen organ before using the lance, I discovered a hard ridge on the left side of the raphé, more defined towards the back of the palate, but presenting no feeling of fluctuation to the touch. This being a new feature in the case, and suspecting a deep-seated abscess, I at once passed Syme's knife down to the haft, as far back in the ridge as I possibly could, and drawing it forward a little, had the gratification of liberating a large quantity of thick healthy pus, but the horrible fetor of which (*horresco referens*) I have never seen anything to equal. I need scarcely add that this operation terminated the sufferings of the patient, and that convalescence speedily followed.

As this paper seems too long already, I shall not give details of the other cases, which presented no unusual difficulties. Two yielded to the use of the knife, one of which required the operation twice. This case I saw in consultation with a medical friend, by whom the operation was boldly and skilfully performed. The external application of leeches was also useful in this case. Two more subsided after the assiduous retention of hot water in the mouth, poultices, and purgatives. One of these occurred after an operation for ranula by a Dublin surgeon. The others were purely idiopathic, and all well-marked examples of glossitis.

◆

ON INCISIONS IN SOME DISEASES OF BONE.

By Thomas Laffan,

Surgeon to the Union Hospital, Cashel.

The late Sir P. Crampton, in an article in one of the old Dublin Hospital Reports, was one of the first to advocate free incisions in inflammatory affections of the periosteal coverings of bones in cases where after due trial other treatment had failed. Brodie advocated a similar practice. Quite recently the distinguished French surgeon, M. Gosselin, inculcated in a course of clinical lectures the same treatment. The French surgeon goes, however, further, and proposes free incisions in purely painful affections, where no inflammation whatever is suspected. A case which has occurred in my own practice may perhaps merit notice.

Case.—Early in July, 1875, I was summoned to see a farmer named F., living near the village of Drom, in the north of this county. On arriving at the house, I was ushered into the presence of a man who seemed to me aged and spent to an extreme degree. He complained of great pain in the left knee, which had existed for three weeks; he had not slept all that time; his appetite had failed, and from being a hale, strong, stout man, of forty years, he had become in that short period of his illness the prematurely aged in appearance and spent patient before me. The slightest touch caused the most excruciating pain in both condyles. There was no swelling in the joint, nor were there any obvious appearances of matter anywhere. There was no satisfactory history to account for the attack. The patient had not had rheumatism. The usual treatment appears to have been tried previous to my seeing him. I directed poultices, which the patient had been applying, to be continued. I prescribed an opiate, and informed the patient's friends that an operation should be performed. The opiate having failed, and the patient's condition permitting of no further delay, I determined to make free incisions into the bone, and proceeded to operate on the 4th July. There was this difficulty. The condyles were affected through their whole length, and the point was how the incisions were to be carried out without opening up the synovial membrane of the knee. After some care the limits for the incisions were made out, and these were marked in ink on the patient's knee. My hospital dresser, Mr. O. Dwyer, put the patient under ether. Esmarch's bandage was then applied. The knife was then entered upon the outer condyle, in a line parallel with the patella, but external to the lateral reflexion of the synovial membrane. All the overlying soft parts were freely incised, and the knife entered well into the bone, through its whole length. A second incision was now made, external to the last. Just at the moment when the soft parts had been cut through, and the bone was being well incised, pus welled up the side of the knife. About a glass came away altogether. The cut vessels were then secured, the parts dressed, a splint applied, and the patient removed to bed. All pain had fled, and the patient slept that night. His progress towards recovery was uninterrupted. He has had for months back perfect use of the limb. He walks to the neighbouring town of Thurles, a distance of seven Irish miles, to attend fair and market. Last spring he married. There is now no trace whatever of any weakness in the joint. In conclusion, we will only say that had a less active method of treatment been pursued in this case, it is not permitted to us to doubt what would have been the result.

Clinical Records.

ST. THOMAS'S HOSPITAL.

Infecting Sores in Anomalous Positions.

(Under the care of Mr. Francis Mason.)

Our readers will probably remember that in the "St. Thomas's Hospital Reports for 1873" Mr. Mason gave the details of about forty cases of infecting sores on the lips and in other anomalous positions that he had culled from the medical journals during the past twenty years. Such cases are extremely rare, and especially interesting on account of the importance of at once recognising their true nature. Since the publication of that paper, Mr. Mason has met with four other cases—one occurred in a medical practitioner on whose forefinger of the right hand was a well-marked indurated sore with enlargement of the glands at the elbow, unaccompanied with suppuration. This gentleman subsequently had a roseolar rash on the abdominal wall, and afterwards psoriasis on the palm of the hands and slightly on the soles of the feet.

The second case was that of a woman, aged 19, who applied as an out-patient at St. Thomas's Hospital in January, 1875, with a circular raised sore situated under the right breast. The axillary glands were indurated. At the time of her application there was no secondary eruption, but in about five weeks from the first appearance of the sore patches of psoriasis were seen on the part of each elbow and on the trunk. She also had the well-marked raised semi-circular white patch on each side of the soft palate. She made a good recovery after a course of perchloride of mercury and iodide of potassium.

The next two cases are at present attending as out-patients under Mr. Mason's care at St. Thomas's Hospital.

E. H., aged 19, single, applied on Oct. 23, 1876, with a circular raised sore on the left side of the face situated over the malar bone. She is an ironer in a laundry, and says she was quite well until two months ago when she noticed a pimple on the face. She "picked it," and then it began to increase in size. It never gave her any inconvenience, but she pointed to the enlargement of the submaxillary glands. The diagnosis was arrived at without questioning the patient in any way. A further examination detected psoriasis on the arms and in the palms of the hands. This patient is improving rapidly under drachm doses of the liq. hydrarg. perchlor. given three times a day.

The fourth and last case is that of N. L., aged 18, married. She applied at St. Thomas's on Nov. 2, 1876, for a sore situated on the left side of the upper lip. She cannot account for it in any way, but says she is in the habit of biting her lip, and about four months ago in a fit of passion she bit it more vigorously than usual and made it bleed. She attached little importance to the condition until she observed that the glands under her chin were somewhat enlarged. Hence she applied at the hospital. The diagnosis of the case was readily made, and a well-marked enteroid secondary eruption was noticed on the abdominal wall. This eruption appeared about two months after she first noticed the sore on the lip. She is also being treated like the last case, with the perchloride of mercury, and is going on most satisfactorily.

◆

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

Unusual interest was attached to the meeting of this Society, on the 14th inst., it being known that a paper was to be read by the President, Sir James Paget, on a rare affection of the bones. The attendance was large, and Sir William Gull, Mr. Brudenell Carter, and Mr. Barwell joined in the subsequent discussion.

The paper was "On a Form of Chronic Inflammation of Bones (osteitis deformans)," illustrated by several cases which had been for many years under the author's observations. The first was a gentleman who had enjoyed pretty good health, and with the exception of one of his sisters having died from chronic cancer of the breast, his family history was good. When forty-six years of age he began to complain of pain in the lower extremities, and twelve months later he noticed that the left shin was somewhat out of shape. In 1856, or two years from the commencement of his illness, he was seen by Sir James Paget, who found some enlargement and irregularity of the left tibia and lower part of the left femur, but there was no tenderness, and the patient, although prematurely grey, was otherwise in health. The urine deposited lithates, and on the supposition that the case was one of chronic periostitis, iodide of potassium was given but without relief. For the next seventeen years the symptoms, and more especially the deformity, very gradually increased; but he suffered little, and even up to 1876 he continued in good health, and enjoyed a fair appetite. The left tibia and femur became larger, longer, and curved anteriorly, but the whole limb was about one quarter of an inch shorter than the right. After a while the deformity became more marked, the right side became similarly affected, and the knees gradually bent. The skull was also increased in size, the spine curved and rigid, the stature diminished by as much as four inches, the chest narrow and shortened, the head bent forward, and the arms, not being affected, out of proportion to the rest of the body. In 1870 the left knee-joint became actively inflamed. In 1874 he suffered partial loss of vision, from retinal hæmorrhage, and also from partial deafness. In 1876 he suffered from pain and swelling in the upper part of the radius, which soon proved to be due to a cancerous growth, and on the 24th of March, after suffering from effusion into the pleura, he died. On a *post-mortem* examination the head was retracted to a level with the sternum, and the lower extremities rested upon the nates and heels, owing to the great arching of the bones. Little visceral disease, however, was found beyond a few nodules of cancer on the lungs, an atheromatous condition of the mitral and aortic valves. Cancerous nodules were also found in the skull, the sutures of which were obliterated, the skull itself being remarkably porous on its surface, and four times its natural thickness. The periosteum, the medulla, and the cancellæ of the long bones were natural, but their surface was finely nodulated and perforated extensively for the transmission of vessels; and the compact substance was much increased in thickness. A chemical examination discovered nothing remarkable, but a microscopical examination showed a diminution in the number of the Haversian canals, which were much enlarged and confluent.

The second case was also that of an elderly gentleman, the bones of whose lower extremities had been increasing in size for years, and who died from medullary cancer of the humerus.

The third case was a very similar one, except that there was no cancerous affection. The fourth case closely resembled the first, as regards the extension of the disease to nearly all the bones, and there was an epithelioma of the dura mater. It is recorded by Dr. Wilks in the 20th volume of the Path. Trans., under the name of "osteo porosis," or "spongy hypertrophy." The symptoms in the fifth case, which was that of a carpenter, sixty years of age, did not differ much from those above described, but he had been for five years subject to slight attacks of gout.

With regard to the general character of these affections, Sir James Paget drew attention to its slow progress, its occurrence about middle age, the good state of the general health, the cerebral functions included, the chief seat of the disease,—viz., the long bones of the lower extremities and the skull, the symmetrical nature of the affection, the misshapen limbs, which are nevertheless strong enough to support the trunk, the rheumatic or neuralgic character of the pains, and the absence of pyrexia, and the apparent inflammatory nature of the changes in the structure of the bones. With respect to the diagnosis of these cases, the length of bone affected and the retention of good general health, chiefly distinguish them from those which have a strumous, gouty, or syphilitic origin. Rheumatic arthritis, rachitis, and osteo-malacia can scarcely be mistaken for osteitis deformans. In the different museums are to be found many examples of great porous skulls due (1) to osteitis deformans; (2) to osteo-malacia and distinguished by its softness and lightness; (3) to rachitis, the skull, however, being light and friable, with a fine felt-like surface; (4) to a disease in early life, characterised by the great thickening porosity of both the cranial and facial bones and diminished cranial capacity; and (5) to enormous, bossed, and nodular outgrowths from the skull, as described in the 17th vol. of the "Transactions of the Pathological Society."

Mr. **Brudenell Carter** said, that three years ago he saw the case described by Sir James Paget. As regards the eye, all that could be detected was a number of small hæmorrhages at the periphery of the retina, and which were apparently due to the cardiac hypertrophy.

Mr. **Barwell** said, that the bones appeared to have lost substance interstitially, with increased deposit in other parts. The Germans, he observed, now call chronic rheumatic arthritis "arthritis deformans." Sir Wm. Gull, in reference to this case, doubted the propriety of calling the affection an osteitis. There was little pain, the urine was normal, and it had none of the characters of inflammation. It might be a low physiological process.

Dr. **Goodhart**, whose remarks in our opinion were truly philosophical, drew the attention of the Society to the fact that in three out of the five cases the patient had died from cancer. He advanced the hypothesis that the disease was a sort of generalised tumour—a diffused growth of osseous connective tissue, analogous to the diffused growth of fibrous tissue seen in molluscum fibrosum. In reply, Sir James Paget said that the total weight of the bones was much increased; that he had no doubt as to its being an osteitis, and that the textural changes answered to the gross definition of inflammation which was an increased production of imperfect structures; but he admitted that its etiology and exact pathology were obscure. It had little resemblance to chronic rheumatic arthritis, and Dr. Adams had shown that in no case does the latter affection affect the shaft of the bone. In reply to Dr. Goodhart, he said that it would be enlarging the field of tumours to include this disease; and the occurrence of cancer in these cases appeared to him quite accidental.

Before the adjournment, a very favourable report by the delegates of the Society at the recent Medical Congress at Philadelphia was read by the secretary.

◆

CLINICAL SOCIETY OF LONDON.

Friday, November 10th, 1876.

Sir **William Jenner**, Bart., M.D., D.C.L., F.R.S., President, in the Chair.

SEQUEL OF A CASE OF RAPID CONTRACTION OF A CAVITY IN THE LUNG.

(*Communicated to the Society in* 1871.)

Dr. **Theodore Williams** read a further account of this case. He said that, in 1871, some eminent Fellows of the Society had expressed doubts as to the existence of a cavity, in spite of the physical signs narrated; but the death of the patient, in 1875, which permitted an inspection of the lungs, cleared up all doubts. The patient, a widow, aged 53, was admitted into the Brompton Hospital, in April, 1871, with a history of pleurisy of twelve years' standing, and of phthisis of one year's duration. Dulness was detected over the whole left side; cavernous sounds were audible from the first to the third ribs and rhonchi and *râles* below, and also in the right lung. Subsequent examinations showed a gradual diminution of the cavernous sounds; and, in July 1871, *i.e.*, three months after admission, they had entirely disappeared. No marked displacement of adjacent organs was then to be found; but, a few months later, the heart and stomach were drawn up, the right lung being drawn across the median line, and some shrinking of the side was visible. In 1872, the patient had survived a severe attack of capillary bronchitis; but died of congestion of the right lung in 1875; the physical signs before death indicating great shrinking of the left lung. The necropsy showed an old puckered cavity, about the size of a date stone, near the apex of the left lung, underlying the portion of the chest-wall where the cavernous sounds had formerly been audible. The bronchus leading to the cavity was blocked and obliterated, and the greater part of the lung was in a state of fibrosis; the right lung, drawn across the median line, was partly emphysematous and partly congested. The heart was drawn up, and the left chest measured one inch and a half less than the right in circumference. Dr. T. Williams remarked that, in this case, each step of the contractile process had been noted by physical signs; and the *post-mortem* examination thoroughly confirmed the diagnosis. The fibroid process may have had its origin in the old attack of pleurisy, and was the means of limiting the caseation and arresting the disease. The cavity-sounds were quite distinct; and he could not understand the existence of a cavern being doubted. Cavities were overlooked during life by accomplished auscultators; but this arose either (1) from the bronchus leading into them being blocked, or (2) from their being small and deep-seated, or (3) from the development of emphysema in the neighbourhood. On the other hand, consolidations should not be mistaken for cavities, the difference in the expiration note, the succussion sound, the gurgle, and examination of the sputum being easy means of distinction. Dr. T. Williams remarked, in conclusion, that far more cavities were overlooked than erroneously diagnosed.

LOCALISED HYPERTROPHY OF THE SCALP.

This case was shown by Mr. **Walsham**. The patient, a boy, aged 16, presented on the left side of the head a peculiar hypertrophied condition of the scalp, appearing as a soft loose mass, which could readily be pinched up from the parts beneath, was doughy yet elastic to the touch, not painful except on being handled, and did not pulsate. In front, it presented a peculiar lobulated appearance, the lobulated portions being raised, irregular, and of a pinkish white colour. The hair follicles appeared enlarged and further apart than usual; but the hair itself was healthy. The temporal and posterior auricular arteries were not involved in the disease. Two enlarged glands could be felt at the lower part of the swelling. The pericranium was not affected. The temperature of the part was slightly raised. This affection was said to have begun some eight or nine years previously as a small lump behind the ear, and was attributed by the friends of the patient to the application of a blister in this situation for an affection of the eye. It was said to have increased at first slowly, but afterwards rather rapidly. Mr. Walsham was inclined to regard the disease as an hypertrophy of the scalp and adjacent cellular tissue, probably of the nature of the so-called fibroma molluscum, as it bore some resemblance to the cases of fibroma shown by Dr. John Murray before the Royal Medical and Chirurgical Society in March 1873. The non-congenital history of its origin, and the absence of any pulsation or visible enlargement of the vessels precluded the idea of its being of a nævoid nature. The tumour was roughly confined to the distribution of the auriculo-temporal branch of the fifth nerve; and, as the disease appeared to have followed some affection of the eye, a reflex irritation of this nerve was suggested as a possible origin. Continuous pressure and partial excision were suggested as methods of treatment.

HÆMOPHILIA.

Sir **William Jenner** reported this case, which was that of a lad, aged 13, who was admitted into University College Hospital on November 4th, on account of hæmorrhage from the bowel. He was known to be suffering from the hæmorrhagic diathesis, having been several times in the hospital on account of severe hæmorrhage from slight causes. He had also often suffered from spontaneous bleedings from the nose and mouth, and also from frequent swellings of the joints; of late the left knee had been permanently affected. A brother of the boy also suffered from the same condition, but no other member of the family. On admission the boy was pale and prostrate, with numerous subcutaneous ecchymoses and considerable swelling of the right thigh. The hæmorrhage from the bowel, generally of dark blood, continued, in spite of an ergotin injection and turpentine and acetate of lead by the mouth, employed before the boy was seen by Sir William Jenner, who ordered an injection of perchloride of iron into the rectum, and gallic acid to be given internally. The injection returned in ten minutes, but there was no more hæmorrhage, although small stools were passed. The boy, however, became paler, weaker, and more restless, and died twenty-four hours after admission. At the *post-mortem* examination blood was found in moderate quantity on each side of the heart, and the clots were firm. The lungs presented no consolidation, but many peculiar pale patches, sharply defined, a little raised, with some adjacent hyperæmia, containing air, fluid, and a little more solid than the adjacent parts. The lower part of the rectum contained a very firm clot, and all the blood had evidently come from the lower six inches, where the mucous membrane was undermined by extravasations which had broken through it. The liver and spleen were healthy. The left kidney was absent; its supra-renal body was disc-shaped. The right kidney was hypertrophied, weighed seven ounces, and presented traces of fœtal lobulation. The aorta was rather small but healthy, and the arteries and veins were also healthy in appearance. The enlargement of the right thigh was due to an enormous extravasation of blood beneath the fascia. The clot was two inches thick, and very firm. The left knee-joint was found full of purple blood and stringy synovia. The synovial membrane was stained an ochre-brown. The cartilages presented evidence of chronic inflammation. Sir William Jenner remarked that the case resembled in its general features several other cases which had come under his notice; resembled them, too, in the seats of the hæmorrhage, in the character of the blood lost, and in the joint affections. The joint affections were of three kinds, and the boy suffered from the two forms which were most characteristic of the disease—spontaneous swelling, tenderness, and general puffiness of the joint, such as occurred in rheumatism; and swelling, the result of successive secretion, with hæmorrhage, the result of a slight injury. A rarer form sometimes seen in the disease was much simple effusion. The firmness of the clots in the heart and rectum illustrates the important fact that the blood in a case of hæmophilia, after death and during life, did not lose its power of coagulating firmly. The case lent no support to the view that the walls of the arteries were in these cases of abnormal thinness. In most of the cases Sir William Jenner had seen, the bleeding was venous, not arterial. The source of the blood, the lower part of the rectum, was a point of great practical importance, and so also was the firmness of the clot which was found, a firmness probably due to the effect of the perchloride of iron, the best local styptic in these cases. It was very doubtful whether death in this case resulted from the hæmorrhage from the bowel; the extravasation into the thigh probably assisted, and the peculiar state of the lungs and bronchial tubes might have been the immediate cause of death. The points in the pathology of the disease which had been impressed on Sir William Jenner by the cases he had seen were—1. That the tissues were all soft, so that they bruised easily; 2. That the blood was rather slow in coagulating, although it coagulated as firmly as in health; 3. That the blood is formed rapidly; that there was a tendency to plethora of the smaller vessels, and that when the patient was looking his best was the moment when injuries had the worst effect, and spontaneous hæmorrhages were the most likely to occur. With regard to the etiology of the disease, in some cases, as in this one, it was certainly impossible to trace it back to the ancestors of the patient; but, when once developed, it often affected more than one member of the family; Sir William Jenner had known it transmitted by a daughter who was not herself the subject of the disease. The most important points in the treatment of the disease, as distinguished from the hæmorrhages, were the administration of a mercurial and saline sulphate of soda aperient every three weeks, and the latter repeated once a week; that the diet should be rather dry, with a considerable proportion of white fibrinous meats; and that plenty of open-air exercise should be taken, with the greatest care to avoid mechanical injuries.

Mr. Christopher Heath referred to cases of hæmorrhagic diathesis which had come under his care. He then gave the genealogy of a hæmorrhagic family, showing that women were never bleeders though they transmitted the bleeding tendencies to their male children. He had at the present time a case under treatment, in which one of these children was losing blood freely from a slight wound near the knee; granulations were now springing up, and it was from these that the hæmorrhage took place. The treatment he had invariably adopted was tr. ferri. mur. and acid. mur.

Mr. Howard Marsh referred to a case of hæmorrhagic diathesis under his care, in which the elbow-joint suppurated, probably as a result of hæmorrhage into the joint.

Sir William Jenner, commenting on Mr. Heath's treatment, said he did not agree with the internal use of tr. ferri mur.; as a local remedy it was a different matter; in fact, in cases of intestinal hæmorrhage, in which the bleeding was invariably from the rectum, he always advised the injection per rectum of that drug.

Dr. Greenhow referred to a family of six children, of whom five had died from this disease. The sixth was now healthy and well. Not one member of her parents' family had suffered from hæmorrhage. He recollected that one of the children had died from epistaxis and another from exhaustive hæmorrhage, due to the extraction of a tooth, and that in both these cases styptics and compression had had no effect.

Sir William Jenner, in reply to a queston put by Dr. Stewart, said that only one injection of ergotine of four grains had been given, and without any appreciable result. Sir William added that a Brussels physician had advised the plan of relieving the vessels by periodical bleeding. He had asked this gentleman what was the result in the cases in which he had tried the plan, and ascertained that of five or six cases all had died.

Medico-Legal Intelligence.

COURT OF EXCHEQUER, WESTMINSTER.

Thursday, Nov. 16th.

(ADVICE AND MEDICINE AT 4D. PER HEAD.)

BETTS *versus* THE MEDICAL PRESS AND CIRCULAR.

This was an action for libel brought by James Oliphant Betts, M.R.C.S. Eng., L.S.A., the owner of a private dispensary in Tysoe Street, Clerkenwell, against Albert Alfred Tindall, publisher and manager of The Medical Press and Circular for publishing certain articles which plaintiff considered libellous, and for which he claimed damages £1,000.

Mr. Baron Huddleston was the Judge, the plaintiff being represented by Mr. Day, Q.C. and Mr. Bigham, the defendant by Mr. Serjeant Parry and Mr. Anderson.

The following are the articles complained of by plaintiff:—

> A correspondent of the *Students Journal and Hospital Gazette* refers to a provident dispensary opened by a Mr. Betts, in Clerkenwell, at which he undertakes to give his priceless advice and the material which he describes as medicine for the reasonable charge of *fourpence.*
>
> The first part of his contract he no doubt fulfils, and we wish his constituents joy of the advice they get; the second undertaking, we unhesitatingly say, he does *not* and *cannot* fulfil, unless he is content to pay away his own money for the sake of humanity, a sentiment which one does not look for in a high state of development in a Clerkenwell fourpenny dispensary. He might, perhaps, give a little nasty-tasting liquid and a dose of salts, but anything more efficient is impossible if a profit is supposed to be made. The strange part of the story is that large sums of money are really made by these dodges.
>
> Some may imagine, says our informant, that these charges can't pay, but I am assured by those who know the working of the system, that handsome profits may be made. A few days ago, I heard of a man who gave £700 for the goodwill of one of these fourpenny dispensaries situate not more than a mile from Finsbury Square, less than twelve months ago. The profits of the concern have since enabled him to pay back the purchase-money and put £400 in the bank.—*November 10th*, 1875.

> In our issue of November 10th we quoted from the *Students Journal and Hospital Gazette* a statement with reference to a fourpenny dispensary, conducted by a Mr. Betts, in Clerkenwell, and we commented upon the value of the advice and medicine which was likely to be represented by that fee, expressing our doubt that medicine alone of real therapeutic value could be supplied at a profit for that sum, even if no proportion of the fee was deducted for the professional advice. Our publisher has been favoured with a solicitor's letter threatening an action at law, and we have thereupon re-perused the article in question, and are unable to find in it any statement or inference which can be disputed. Our statement was that Mr. Betts "might give a little nasty-tasting liquid and a dose of salts, but anything more efficient is impossible if a profit is supposed to be made."
>
> This remark may not be true as to an individual case. There are patients to whom three-pennyworth of physic (allowing 1d. for the profit) would be advantageous; but we believe it is strictly accurate when applied to a large number of patients suffering from a variety of diseases. We do not believe it possible that at the current prices of the best drugs a number of patients can be supplied as often as may be necessary, and in as great quantity as is necessary, with the most active and best therapeutic agents for any such sum as 3d. per head, and this sum leaves only 1d per head for both advice and profit. It is possible—as we said—that Mr Betts may be "content to pay away his money for the sake of humanity," in which case no doubt his patients might receive any quantity of pharmaceutic value, but on any other hypothesis we are unable to see how it can be done.—*December 1st*, 1875.

> In The Medical Press and Circular of November 10th, 1875, we quoted from our spirited contemporary the *Students Journal and Hospital Gazette*, the statement of a correspondent in reference to a dispensary kept by a Mr. Jas. Oliphant Betts, at 53 Exmouth Street, Clerkenwell, at which he purported to give advice and medicine to his patients for *fourpence*, and we expressed ourselves in terms of disapproval of such line of practice, declaring our belief that, though it was quite possible for him to give his advice for such a sum, it was not *commercially* possible to supply medicine of the best quality, of the necessary efficiency, and in sufficient quantity to a promiscuous assemblage of patients at 4d. per head if a profit were supposed to be made. Shortly after the publication of this extract, with our observations

thereon, we received a legal communication demanding the name of the author.

On re-perusal of the statement which we had made, and on consideration of what we owe to our own independence of speech, and especially to the feeling of the profession, we felt ourselves obliged to refuse this request, and to accept the task of establishing—if necessary—at law the truth of our statement and the *bonâ fides* of our intention, which we have every confidence that we shall do if Mr Betts sees his way to a contest with us. We have received the usual legal documents, intimating Mr. Betts's determination to sue for £1,000 damages, and, acting under advice, we have taken the necessary steps for defence, and we shall feel it a satisfaction to be permitted to defend in open court the profession and the public against the sort of practice which we have condemned in Mr. Betts. As to the personal bearings of the matter, we may say that we never even heard the name of this gentleman until it had been brought under notice in the *Students' Journal.* We performed a public duty in a manner which we are prepared to justify, and we apply our censure equally to all practitioners engaged in similar practice—if such there be, feeling confident that on this, as on several previous occasions when our public duties have forced us to speak out, we shall be backed by the support of the whole profession.—*Januarg 12th,* 1876.

James Oliphant Betts examined—I am the plaintiff in this case, and carry on my business in Tysoe and Exmouth Streets, Clerkenwell. In November, 1875, my attention was called to an article in THE MEDICAL PRESS AND CIRCULAR in which it was stated that I might be able to give my *priceless advice,* but to include proper medicine for the patients who came to my dispensary at 4d. per head was impossible, thereby inferring that I did not give the medicines I ought to give. After the appearance of this article my business fell off considerably.

In cross-examination plaintiff said—I have carried on the dispensing for about seven years. I charge less in the morning because my patients are generally children; adult working classes come in the evening. If I visit patients at their own homes I make a higher charge. The usual charge by medical men in the neighbourhood for this is 1s. 6d. a visit. I receive on the average forty patients a day at the dispensary, and I give them the best advice for their ailments, and the result is a reasonable profit to myself. I am aware that the usual charge by other medical men in Clerkenwell for advice and medicine at their dispensaries is 1s. a head. I give my patients six-ounce bottles of mixture, which contain enough doses for two days. I give them whatever medicine their disease requires, even if it cost as much as a shilling, relying for my profits upon the whole supply. I believe I could furnish a patient with a mixture of quinine for two days for 4d. and make a profit.

When pressed to show his books in order that the medicines he prescribed for his fourpenny patients might be ascertained, plaintiff said—I do not keep books of any kind, I do not enter what I prescribe in any book, nor do I keep a record of the cases or the diseases seen. I trust entirely to my memory, and to the bottles as they are brought or sent by patients from time to time. My object in opening the dispensary was to make myself known, to get a connection together, and then, when sufficiently established, to close the dispensary, and keep that portion of the practice which paid me best. This is not an uncommon proceeding in London, I know several who do it, and who rarely fail in establishing a lucrative practice.

James Turle, M.D. Edin.—I am not at present in active practice, having sold my practice at St. John's Wood and retired about eighteen months since. I believe the articles complained of would injure the plaintiff, especially if shown round the neighbourhood by other surgical men, jealous of his dispensary. I firmly believe that proper medicines can be given by medical men to patients at fourpence per head, even including expensive drugs, and a large profit be made out of it. It can be done at about a penny per head amongst a large number of patients. I myself started a similar dispensary many years ago, at which I gave my advice and medicine to all comers without any charge whatever, the result being that I became well known in the neighbourhood, and obtained a large and lucrative practice, which at the time I sold it was yielding £2,000 a year. Plaintiff was a pupil of mine many years; he is a legally qualified surgeon, and I believe him to be an average practitioner.

Mr. J. R ss.—I am an auctioneer. My house joins plaintiff's. I entirely approve of his line of practice, and believe he does good amongst the poor thereby. Cross-examined—I approve of Mr. Betts because I am a guardian of the poor, and as plaintiff vaccinates for nothing he keeps our rates down. The medical men in the neighbourhood don't like it at all because he takes their patients.

Mr. Moreland—I am an engineer by profession, and am honorary secretary of the Finsbury Provident Dispensary, which was established at the end of the last century. We have many thousands of patients annually at the dispensary, which is partly self-supporting and partly supported by the public; taking the number of patients who visit the dispensary and the cost of drugs supplied, I find the average cost of medicine is 1¾d. per head.

This was the case for the prosecution.

For the defence :—

Archibald Hamilton Jacob, M.D., F.R.C.S.I., was called, who said: I am a graduate and doctor of medicine of the university of Dublin, a Fellow and Councillor of the Royal College of Surgeons. I am editor of the department for Ireland of the MEDICAL PRESS AND CIRCULAR, and author of the articles complained of. I do not know Mr. Betts, and until I saw his name in the *Students' Journal* was not aware such a person was in existence. I considered it discreditable that any member of an honourable profession should descend to such practices as advertising to give advice and medicine to patients for fourpence per head; and in my position as a public journalist I felt compelled to condemn such proceedings. Besides my duties as Dublin editor of the MEDICAL PRESS AND CIRCULAR, I am engaged specially in the treatment of eye and ear diseases. For several years I was an assistant surgeon in the City of Dublin Hospital, and afterwards full surgeon, in charge of the eye and ear department. Like other large public hospitals, we had immense numbers of patients, and upon computing these with the wholesale cost of drugs bought in the cheapest market—of which a private practitioner is unable to avail himself—I found the cost per head for medicines, &c., was over 5d. I am now surgeon to the Dublin Eye and Ear Infirmary, to the patients at which the contract price by a large firm of wholesale druggists for medicines is about 6d. per head per visit. These figures are all exclusive of house-rent, taxes, servants, wear and tear, profit, &c., which a private practitioner would have to take into consideration.

Cross-examined by Mr. Day—Who do you refer to when you mention our spirited contemporary?

Dr. Jacob—*The Students' Journal.*

Mr. Day—Why did you write the article in the first instance?

Dr. Jacob—Because I considered the practice highly discreditable to a member of the profession, and dangerous to the public.

Mr. Day—Did you take into consideration the amount of injury you would inflict upon Mr. Betts in so writing?

Dr. Jacob—I did not.

Mr. Day—Perhaps you thought it would do him good?

Dr. Jacob—Certainly not.

Mr. Day—You probably didn't care?

Dr. Jacob—I should care to injure any one, especally a member of my own profession. I have a public duty to perform, and when necessity arises I never shrink from it. I considered Mr. Betts' doings censurable, and I acted accordingly, without for an instant thinking of the personal bearings of the case; what I condemned in him I have done, and should do, in others.

Mr. Day—You say that the medicines given to patients at the hospitals at which you have been or are engaged as ophthalmic surgeon cost from 5d. to 6d. per head; now are they not more expensive medicines than are given at general hospitals?

Dr. Jacob—No; the treatment is similar.

Mr. Day—Do you mean to tell me that you treat patients suffering from eye complaints through their stomachs?

Dr. Jacob—Very frequently. The system must first be attended to before we operate. Frequently a course of medicine and diet sets the patient right without recourse to operative interference.

Mr. Day—But suppose I came to consult you for an eye disease; do you mean to tell me that you would physic me as if I were suffering from a stomach complaint?

Dr. Jacob—When you consult me, and pay my fee, I will enlighten you. (Laughter.)

Mr. Day—Well, putting that aside, how would you do it?

Dr. Jacob—Not at *4d.* a head! (Roars of laughter, in which judge, jury, and the court joined heartily.)

Mr. Defriez, examined—I am dispenser at the Royal Westminster Ophthalmic Hospital. I make up all the medicines for the patients at that Institution. I have computed an ordinary day's dispensing, the cost of drugs at wholesale price with the number of persons to whom such medicines were given, and I find it comes to about 4¾d. per head prime cost. My opinion is, that if proper medicines are given in all cases, it cannot be done at 4d. per head, putting aside profit.

Mr. Anderson, in the unfortunate absence of Mr. Serjeant Parry, then addressed the Court on behalf of defendant, and said—

Gentlemen of the jury,—I ask you to look at this question on its broadest basis. Let us first take the writer of the articles complained of. Here you have a gentleman of the highest possible attainments, against whose character or veracity not a word has been breathed, who, in his capacity as a public journalist, a guardian of professional honour and integrity, sees in the first instance in a contemporary, a comment upon the proceedings of a member of the same profession as himself who is keeping a 4d. dispensary, advertising and distributing handbills for support. Was this a thing which any man who valued the dignity of his profession and thought of the welfare of the public could stand aloof from, without raising his voice in protestation? Was it to go forth to the world that the rest of the profession who charged and lived by reasonable fees were swindlers? No, gentlemen, he took the earliest opportunity of stating his honest conviction that such proceedings were disreputable, and that the profession, of which he was only the spokesman, would have none of it. Did he do this in a spirit of malice or vindictiveness? In his examination, Dr. Jacob has told you that he did not know the plaintiff, and that he had never even heard such a man was in existence until his attention was drawn to him in *The Students' Journal;* he thereupon expressed his opinion upon what he considered an abuse; he did this honestly and fearlessly, and, when threatened with legal proceedings, he did not attempt to shuffle out of it as a less scrupulous journalist would have done with a humble apology, but came forward manfully to defend this opinion in which he felt himself supported by a conscientious discharge of the public duty entrusted to him, and by the voice of the profession he represented. And was this gentleman who, without malice or intention to injure, to be condemned for the simple yet fearless discharge of a public duty? Ought he not rather to be held up as a pattern which other journalists would do well to copy? If you attempt to cripple the hands of men in such responsible positions as Dr. Jacob, believe me, you will do an incalculable amount of mischief, and undermine that freedom of the press which is the boast of our country.

Mr. Day, Q C. in reply, showed that the stings of the articles were, stigmatising the advice of plaintiff as "priceless," stating that "he did not and could not give proper medicines to patients for the sum of fourpence per head," and then following up these disgraceful opinions by justification and refusal to apologise. After an eloquent and telling appeal in which he insisted upon the humanitarian principles which actuated Mr. Betts in giving his valuable advice and medicines to patients who could not afford to pay more than fourpence, he concluded by calling upon the jury to give substantial damages to his client for the great injury the articles had done him in his profession and the loss occasioned to his practice thereby.

The Judge then proceeded to sum up the case for the jury. First propounding to them the law of libel, and then explaining to them the bearings of the case, His Lordship remarked that the case differed from most others that came into court. Plaintiff was a medical man, a member of the College of Surgeons, against whom nothing was alleged except that he had gone out of the beaten track of the profession, and had advertised to do what defendant insisted that he could not do *honestly;* that was an imputation upon his character, and was consequently a libel. There was also a sneer at his competency in the remark, "we wish his constituents joy of the advice they get." Then gentlemen we have the evidence of Dr. Turle, who has testified that plaintiff (a former pupil of his) is a man of average competence, and that large practices can be made out of this class of patients, and that a good profit can be made out of this class of patients at 4d. per head. Mr. Moreland has also shown that at the Finsbury Provident Dispensary with which he is connected, the average cost per head per patient is only 1¾d. On the other hand, you have to consider the case of the defendant. We have first to deal with the paper he represents; and remember that this is not one of those petty scurrilous publications, which are here to-day and gone to-morrow; but a scientific periodical of nearly forty years' standing, of large circulation and influence, with as I perceive contributions by gentlemen of education and position, and conducted by gentlemen of undoubted ability. Next we have the writer of the article, Dr. Jacob, a Doctor of Medicine of Trinity College, Dublin; one of the most distinguished Universities in the world, and a Fellow and Councillor of the Royal College of Surgeons. He does not attempt to shield himself under the editorial "we," but comes manfully forward to meet the charge, stating frankly as a gentleman, "I am the writer of the articles, and am prepared to justify what I wrote. I did not, do not know the plaintiff, and had no malice nor could have any in the matter. The opinions I therein enunciated are those I honestly believe to be right in which I feel I am supported by the voice of the profession at large." This gentleman has given his evidence in a straightforward manner, and I am bound to say that were I a juryman I should believe every word he has said. You must first satisfy yourselves that the articles are or are not libellous; then, if they are, according to your judgment, with what intent were they written; and you must well discriminate between what is sometimes written with malicious intent, and that which a writer in his public capacity feels it incumbent upon him to bring under the notice of his readers; having satisfied yourselves that the latter is the correct view, moderate damages would certainly meet the case. I commend the matter to your calm consideration, and trust you will arrive at a correct verdict according to law.

The jury having conferred together for about twenty minutes, gave a verdict for the plaintiff. Damages, £50.

During the past fortnight 86 fresh cases of small-pox have been received at the Stockwell Hospital, and 147 at the Hampstead Hospital.

* * *

The appointment of Medical Superintendent of the Middlesex County Lunatic Asylum has just been conferred on Dr. Claye Shaw, B.A. Lond., M.D., M.B., M.R.C.P. Lond., &c.

* * *

An interesting presentation has taken place at the Manchester Royal Infirmary which the following inscription sufficiently explains: "This silver cup was presented, October, 1876, by the Baron Barreto, of Brandon Park, Suffolk, to Joseph Henry Irvin, Esq., at the Infirmary, Manchester, as a remembrance of his heroic bravery in allowing twenty-five ounces of his own live blood to be taken from him at the risk of his own life to save the life of a fellow-creature, which was infused into the veins of the poor dying man, whereby his life was saved, and he quite recovered."

* * *

At a meeting of the Asylums Board on Saturday, a report from the new committee appointed for the Hampstead Small-pox Hospital was brought up. It stated that under the apprehension of danger to the workmen, arising from the reception of small-pox patients, the committee had stopped the works of the permanent building and had the building closed, and recommended the board to confirm that decision. After some discussion, a resolution was carried not to sanction the action of the committee in stopping the works of the permanent building, but to refer their report back to them, with instructions to resume the works and carry them out to completion with the least possible delay.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 22, 1876.

THE ACTION FOR LIBEL.

THE relation of journalism to the public is undergoing a continuous and inevitable change, side by side with the growth of the circulation of the press, the extension of special journalism to each particular class, and the consequent great increase of the influence of the fourth estate. Half a century since, public opinion was but a small power, because there existed but limited means of giving expression to it, and a still more limited intercommunication of ideas amongst the general public. All this is now changed. Public opinion is the power which makes or mars reputations, and that power is wielded almost wholly by the press, which is thus invested with an influence unthought of a century since. With these enlarged powers of the press, the responsibility of newspaper management has greatly increased in weight, and the editor, who fifty years ago derived protection from his obscurity, is to-day subjected to the full risk of the consequences of independent expression of his opinions. This is not a condition of things of which either the journalist or the public should complain, for it inculcates caution on the part of the writer, and demands that he shall restrain his impetuosity and fortify himself with a full knowledge of his subject, and thus gives him confidence in the statements which he has made, adds value to his opinion, makes him ready to defend his views, if necessary. Legal responsibility is, nevertheless, a very serious matter for journalists in the present day, and a glance at the law reports of the daily newspapers will be enough to satisfy any person that those who consider themselves aggrieved by the voice of criticism enjoy ample facilities for setting themselves right with the public, if they can do so.

For the first time in a life of nearly forty years, the MEDICAL PRESS AND CIRCULAR has been ca[illegible]answer for its editorial criticism in a court of law; and, although the decision of the jury was technically in favour of the plaintiff, and consequently the transaction will involve a considerable expense to our journal, we cannot say that we feel either regret at having criticised Mr. Betts, shame for the opinions we expressed, or repentance for having submitted the arbitration between him and ourselves to a court of law. It may be in the recollection of our readers that the practice of Mr. James Oliphant Betts was first brought within our notice this time last year by the *Students' Journal*, in which was published a condemnation of his practices of nearly equal emphasis with our own, of which he complains. The indignation of our contemporary was evolved, we presume, by a perusal of the handbill issued by that gentleman, and which—as a curiosity of professional advertising—we print here *literatim*.

64, ST. JOHN'S ROAD,
HOXTON.

SELF SUPPORTING
DISPENSARY.

J. OLIPHANT BETTS,
SURGEON & ACCOUCHEUR,
RESIDENT SURGEON OF THE
SELF-SUPPORTING DISPENSARY,
7 Tysoe Street, Clerkenwell,

Attends EVERY DAY (Sunday excepted) from 11 till 1 Every Morning, and from Half-past 4 till Half-past 6 Every Evening; also at 7, TYSOE STREET, Clerkenwell, from 9 till 10 Every Morning, and from 7 till 9 Every Evening.

To meet the working expenses, the charge for each Patient will be **Fourpence** in the Morning and **Sixpence** in the Evening, or **One Shilling** per Week if preferred.

THESE CHARGES INCLUDE ADVICE & MEDICINE

HOME VISITATION.

A Single Visit	**1s. 6d.**	
Two Visits	**2s. 6d.**	**per Week.**
Three Visits	**3s. 6d.**	..
Six Visits	**6s. 0d.**	..

These Charges include ADVICE and MEDICINE, and are for visits made during the day only, and within a Mile of the Dispensary.

ALL FEES TO BE PAID IN ADVANCE.

Upon perusal of the observations of the *Students' Journal*, it seemed to us that Mr. Betts' line of practice was so objectionable and his method of advertising so unprofessional that it could not—when once brought under public notice—be permitted to pass uncriticised, and we called the attention of the profession to that gentleman's way of doing business in the following paragraph :—

A correspondent of the *Students' Journal and Hospital Gazette* refers to a provident dispensary opened by a Mr. Betts, in Clerkenwell, at which he undertakes to give his priceless advice and the material which he describes as medicine for the reasonable charge of *fourpence*.

The first part of his contract he no doubt fulfils, and we wish his constituents joy of the advice they get; the second undertaking, we unhesitatingly say, he does *not* and *cannot* fulfil, unless he is content to pay away his own money for the sake of humanity, a sentiment which one does not look for in a high state of development in a Clerkenwell fourpenny dispensary. He might, perhaps, give a little nasty-tasting liquid and a dose of salts, but anything more efficient is impossible if a profit is

> supposed to be made. The strange part of the story is that large sums of money are really made by these dodges.
>
> Some may imagine, says our informant, that these charges can't pay, but I am assured by those who know the working of the system, that handsome profits may be made. A few days ago, I heard of a man who gave £700 for the goodwill of one of these fourpenny dispensaries, situate not more than a mile from Finsbury Square, less than twelve months ago. The profits of the concern have since enabled him to pay back the purchase-money, and put £400 in the bank.—*November 10th*, 1875.

We did not publish these words without due deliberation, for we believed that it was not commercially possible to make a profit by supplying advice and medicine to a promiscuous assemblage of patients at 4d. a head if *the medicine were sufficient in quantity, of the best quality, and of adequate efficacy for the treatment of their diseases.* Following hard upon the publication of our remarks, we received a communication from Mr. Betts's solicitor. Mr. Betts, it would seem, was more anxious for legal vengeance upon us than for the rehabilitation of his character as a medical man, for he did not afford us any opportunity of reviewing our first opinion of him, but plunged at once into the quagmire of the law. Having received his legal missive, we applied ourselves—as may be readily assumed—to a careful reconsideration of the facts and of our own language, but with every desire to do Mr. Betts justice, we could find no reason in fact or in sentiment which would justify us in withdrawing from our expressed opinion. We, therefore, replied to his solicitor's letter in the following editorial note:—

> In our issue of November 10th we quoted from the *Students' Journal and Hospital Gazette* a statement with reference to a fourpenny dispensary, conducted by a Mr. Betts, in Clerkenwell, and we commented upon the value of the advice and medicine which was likely to be represented by that fee, expressing our doubt that medicine alone of real therapeutic value could be supplied at a profit for that sum, even if no proportion of the fee was deducted for the professional advice. Our publisher has been favoured with a solicitor's letter threatening an action at law, and we have thereupon re-perused the article in question, and are unable to find in it any statement or inference which can be disputed. Our statement was that Mr. Betts "might give a little nasty-tasting liquid and a dose of salts, but anything more efficient is impossible if a profit is supposed to be made."
>
> This remark may not be true as to an individual case. There are patients to whom three-pennyworth of physic (allowing 1d. for the profit) would be advantageous; but we believe it is strictly accurate when applied to a large number of patients suffering from a variety of diseases. We do not believe it possible that at the current prices of the best drugs a number of patients can be supplied as often as may be necessary, and in as great quantity as is necessary, with the most active and best therapeutic agents for any such sum as 3d. per head, and this sum leaves only 1d. per head for both advice and profit. It is possible—as we said—that Mr. Betts may be "content to pay away his money for the sake of humanity," in which case no doubt his patients might receive any quantity of pharmaceutic value, but on any other hypothesis we are unable to see how it can be done.—*December 1st*, 1875.

This statement simply reiterated our belief as to the impossibility of doing full therapeutic justice to a mixed constituency of patients at something under 4d. each, and it did not touch the question of Mr. Betts' line of action as a medical man respecting which there can be no second opinion among persons who regard medicine as a gentleman's profession and as a science, not as a shallow pretext for a cheap trade in drugs.

Holding strongly the opinion that such practices not only tend to lower the position of our profession but are in danger of being fraught with the worst results to the artisan classes of the community, we could not find it incumbent on us to offer an apology to Mr. Betts for the calm expression of opinions which we held advisedly, and believing that to do so would be to stultify the principles on which our journal has been always conducted, and to humiliate our professional feelings before the threat of legal proceedings, we determined to meet Mr. Betts on his own platform, and accept the consequences of our acts. We, therefore, published the following further note on the subject in our editorial columns:—

> In The Medical Press and Circular of November 10th, 1875, we quoted from our spirited contemporary, the *Students' Journal and Hospital Gazette*, the statement of a correspondent in reference to a dispensary kept by a Mr. Jas. Oliphant Betts, at 53 Exmouth Street, Clerkenwell, at which he purported to give advice and medicine to his patients for *fourpence*, and we expressed ourselves in terms of disapproval of such line of practice, declaring our belief that, though it was quite possible for him to give his advice for such a sum, it was not *commercially* possible to supply medicine of the best quality, of the necessary efficiency, and in sufficient quantity to a promiscuous assemblage of patients at 4d. per head, if a profit were supposed to be made. Shortly after the publication of this extract, with our observations thereon, we received a legal communication demanding the name of the author.
>
> On re-perusal of the statement which we had made, and on consideration of what we owe to our own independence of speech, and especially to the feeling of the profession, we felt ourselves obliged to refuse this request, and to accept the task of establishing—if necessary—at law the truth of our statement and the *bonâ fides* of our intention, which we have every confidence that we shall do, if Mr. Betts sees his way to a contest with us. We have received the usual legal documents, intimating Mr. Betts's determination to sue for £1,000 damages, and, acting under advice, we have taken the necessary steps for defence, and we shall feel it a satisfaction to be permitted to defend in open court the profession and the public against the sort of practice which we have condemned in Mr. Betts As to the personal bearings of the matter, we may say that we never even heard the name of this gentleman until it had been brought under notice in the *Students' Journal*. We performed a public duty in a manner which we are prepared to justify, and we apply our censure equally to all practitioners engaged in similar practice—if such there be, feeling confident that on this, as on several previous occasions when our public duties have forced us to speak out, we shall be backed by the support of the whole profession.—*January 12th*, 1876.

Mr. Betts has appealed to a petty jury, and has received his answer, which we accept as a technical rebuke, but as a moral victory. Mr. Betts asked the jury to take the view that his course of practice was professional and upright—to say that he might, if he chose to do so, give good medicines for 4d. a patient, and to punish The Medical Press and Circular, and soothe his wounded feelings with a verdict of £1,000. The jury complied in part with his request, but by fixing the damages at so small a sum as £50, they expressed—we have a right to assume—that the plaintiff was entitled to no more sympathy than that indicated by a nominal recompense.

From such a result we derive rather satisfaction than chagrin. We believed that Mr. Betts's practices, though legal, were objectionable, and such as to call for censure. We entered upon a contest in which we suspected that the law might be against us, but in criticising we acted conscientiously, and we felt assured that the feeling of the profession would be with us. We maintained our respect for our public function as journalists, at the expense of some annoyance and a certain outlay of money, and we shall consider these sacrifices well repaid if we are assured of the feeling of our brethren that we have acted rightly, and sustained the public character of our journal.

◆

THE QUEEN *v.* THE KEIGHLEY GUARDIANS.

At last the case of the Keighley Guardians has terminated in a manner which, although more favourable to them than they might have expected, is quite satisfactory so far as the ends of justice are concerned. These worthy gentlemen have already found to their cost that the arm of the law is too strong for them, and that there is no use in their trying to defy it even if supported by the votes of their constituents.

Our readers will remember that, in consequence of their opposition to the due carrying out of the Vaccination Acts, a writ of mandamus was issued against the defendants ordering them to give directions to the vaccination officer to prosecute such persons in the district as refused to have their children vaccinated, and that, owing to their defiance of this writ, they were arrested in August last and imprisoned for a month. Last Thursday they appeared before the Court of Queen's Bench to receive the decision of the Court on their application for bail. They urged that they had suffered in their businesses and had been put to considerable expense owing to their imprisonment, and they submitted that they had purged their contempt, and that, as the writ had now been fully obeyed during their incarceration by the other guardians, the Court should not subject them to further punishment. Among the defendants Mr. Milner, Chairman of the Keighley Board, Mr. Jeffrey, and Mr. Sedgwick addressed the Court, and endeavoured to vindicate their conduct as best they could. As a security against their rescinding, on their return to the board, the resolution which was passed in their absence, they offered to resign. In reply to this, the Lord Chief Justice dwelt upon the necessity of enforcing obedience to the laws of the realm; but in deference to the conscientious convictions which had actuated their conduct, and in consideration of the punishment they had already undergone, his lordship and in behalf of the Local Government Board the solicitor-general were willing that the defendants should enter into their own recognisances to come up to receive sentence when called upon—but they would not be called upon provided they did nothing to rescind the existing resolution and order of the Board of Guardians. So the case terminated; and as the Lord Chief Justice observed, it was a very liberal and generous termination on the part of the Local Government Board. Unquestionably they had laid themselves open to a much severer punishment than any they have as yet experienced. At the same time, as we have observed on more than one occasion, the great and beneficent object of the Vaccination Acts will not be furthered but rather frustrated by treating these misguided men with more severity than the ends of justice and the interests of the public demand. Anything approaching persecution would only fan the flame of bigotry and prejudice which is at the foundation of this contemptible and paltry anti-vaccination movement.

We were glad to see the Lord Chief Justice from his high position, and in his judicial capacity, enforcing that opinion of vaccination which every person must hold who is at all acquainted with the subject. "It may be," he said, "that here and there some mischief may have resulted from the practice of vaccination to which these persons are so strenuously opposed. But when we bear in mind that which historically we know—perhaps they do not—that before vaccination was instituted the small-pox was one of the greatest plagues and curses that ever affected humanity; that it swept away its victims by thousands and tens of thousands, and was a source of fear and dread, and terror to the whole community, of both sexes and all ages, and that that prodigious plague has been, practically speaking, put an end to by this mode of anticipating it and dealing with it, this must influence the minds of all who reflect upon it, as it has influenced the Legislature and the more enlightened and educated members of the community. We proceed upon the ground that it is for the subject to obey an Act of Parliament, and for this Court to enforce obedience if obedience be withheld. Here it has been withheld, and the law and the order of this Court must enforce it. However, I am very glad that in this case the matter has been brought to an issue in which we are relieved from the necessity of passing the severe sentence which it would otherwise be our duty to pass on each of the defendants."

It is to be hoped that this case will be a warning to those who may feel induced to follow the bad example that has been set them by the Keighley Guardians and their followers.

It is right that these ignorant enthusiasts should know that if they wish to do away with an Act which is repugnant to their feelings and their faith, they must do so by creating, by legitimate means, a large public opinion in favour of their peculiar doctrines, and not by openly violating the law while it is in force, or throwing obstructions in the way of carrying out the provisions of the Vaccination Acts. It will, however, be a long time before their strange and perilous views are shared by the great bulk of the community, and perhaps it is the consciousness of the isolation in which they stand, that makes them resort to those violent and impotent measures which, like the wild and indiscriminate blows of unskilful swordsmen, only place them at the mercy of their opponents. The testimony in favour not only of vaccination, but of compulsory vaccination, rests on such a sure foundation that we should be surprised that any one in their senses should attempt to shake it, did we not know that there are people who believe that the earth is flat and other paradoxes which have from time to time excited this ridicule of all who have received even the most elementary education.

◆

Notes on Current Topics.

The Metropolitan Water Supply.

An influential meeting of delegates from the various vestries of the metropolis took place last week to consider what steps should be taken with regard to the extension of the water supply, and the charges of the water companies. The action of the Metropolitan Board of Works, it was stated, had as yet not been productive of any results in favour of the consumers; and, after some discussion, the following resolution was moved and carried :—

> "That, as the increased assessment of the metropolis is giving unlimited power to the water companies to increase the charge for water, it is necessary, in order to check any further augmentation of the price now paid, to take steps to obtain more equitable terms, and for that purpose a memorial be presented to the Home Secretary by this meeting, praying for an alteration of the law with respect to the water supply of the metropolis."

It was contended that the meter system should be adopted, by which means every one would have the amount of water he paid for. On the other hand, it was urged that large establishments, making large profits, and only using a small quantity of water, being charged on the meter system, would, as ratepayers, if that system were adopted, have to pay for all the water that ran down into the sewers. It was held, moreover, that a great waste of water was one of the greatest blessings of the metropolis. It was ultimately suggested that inquiry should be made whether the companies had at all exceeded their limits in charging, and also that the deputation should ask for a select committee to inquire into the whole matter.

After some further discussion, it was resolved to form a sub-committee, selected from the Committee of the National Chamber of Trade, and which, together with one delegate from each vestry, shall draw up a memorial, and make arrangements for its presentation to the Home Secretary by an influential deputation, and take further steps in the matter. It was thought that by an organised agitation the Government would be compelled to take steps in the matter. An agitation once commenced should be carried on until it was successful.

The Water Companies' Act, 1871, provides power to compel companies to give a constant water supply, and any customer can, if he thinks fit, be supplied by meter. Dr. Frankland's report on the quality of the water was of a more favourable character. The only water of which complaint is made is the Southwark and Lambeth. The water of both these companies was slightly turbid, and contained moving organisms.

Control Department and Medical Officers.

Complaints continue to reach us of curtailment of military surgeon's allowances by this incompetent department. This is a direct infringement of the late warrant, and it is simply impossible for the heads of the medical service to administer it when such one-sided interpretations of it are being constantly made to the disadvantage of army medical officers.

"Soothing Syrup" Slaughter.

The *Pharmaceutical Journal* publishes last week two more instances of the abuse of opiates in children's cases. In the first, the child was not killed because it, prudently, spat out the laudanum which the chemist had given in place of "quietners." In the second, the prisoner was a nurse, who ought to have known better, and yet poisoned a child by giving it three drops of laudanum, for which she was sent to jail for six weeks. When it is recollected that such cases are less than one per five thousand of those in which risk is run by the improper administration of opium to infants, it may be conceived how wide-spread and disastrous is the abuse of opiates by the working-classes. It is really time that the Government should endeavour to contol in some way the slow poisoning of babies by lazy and careless mothers, who purchase the luxury of a gossip or a promenade to the public-house by drugging their infants into a state of coma.

The Destruction of Illusions.

Under the above heading *The Doctor* draws our attention to a paper in the *Comptes Rendus*, in which he says: "De Carvalho describes an apparatus for ozonising the unhealthy air of dwelling-rooms. Such air is to be passed, by means of an aspirator, through a tube, in which the silent discharge of a Ruhmkorff's coil takes place; and the author is of opinion that air subjected to this treatment will be freed from the organic matter suspended therein and its harmful characters destroyed. To his paper are appended some remarks by P. Thenard, who says he considers it is high time (*il serait grandement temps*) that not only the public, but learned men, should be made acquainted with the erroneous nature of the views generally held respecting the action of ozone on organisms. So far from having a beneficent effect, ozone is one of the most energetic poisons known; and the grave accidents which have happened in his own laboratory do not leave the slightest room for doubt about the matter. While leaving the physiological aspects of the question to M. Arnould Thenard, who has a work on the subject in preparation, he confines himself to stating that under the influence of ozone, even when very largely diluted, the blood corpuscles rapidly cohere, and even change their form, the pulse beats more slowly and in so very marked a degree that in the case of a guinea pig, where the beats were nominally 148 per minute, they fell to 1-30th after the exposure of the animal for a quarter of an hour. In the present day, when medicine possesses in a knowledge of temperatures so excellent an indication of the stage of a disease, it is possible, he considers, that an agent may be found in ozone for controlling them when too high. To introduce, however, without further consideration ozone into our rooms with the fallacious notion of thereby destroying bad air is highly dangerous. While the most powerful poisons, when rightly administered, constitute some of our best remedies, we must first have learnt how to apply them, lest we fall into error as regards the right time for application and th strength of the dose. Thenard then asks the questio

Are we sure that there is ozone in the air? Its presence in our atmosphere is determined by the change in the depth of colour of prepared paper. Do we know that there are no other substances in air which can affect the paper in the same way? By passing a current of air through a gas-blast, Wittman obtained air which acted on the prepared paper as ozonised air does; while, however, this air disinfected putrid water without rendering it acid, ozone, so it is stated, did not disinfect it, but turned it acid. Moreover, it is known that ozone cannot exist above 200°, and yet the air modified by Wittman's method had been exposed to the temperature at which glass softens. Although he is not prepared to deny the possible presence of ozone in the atmosphere, he holds it rash to regard as proved what is still vague and uncertain, and may be dangerous.

The Repetition of Prescriptions.

The *Pharmaceutical Journal* says that a decree has recently been issued by the Minister of the Interior for Saxony, abolishing former regulations as to the repetition of physicians' prescriptions in that country, and replacing them by more inclusive rules.

With respect to medicines for internal administration pharmacists are now forbidden to repeat, without a special order from the original prescriber or another qualified physician or surgeon, any prescription, ordering, in any dose whatever, any of the substances included in Table B (*medicamenta cautissima asservanda*) of the German Pharmacopœia. This table includes arsenic and its preparations, mercurial compounds, phosphorus, strychnine, atropine, coniine, veratrine, and to these are also now added digitalis and chloroform (whether for inhalation or internal administration). The same rule applies to articles in Table C (*medicamenta caute servanda*) if the dose ordered exceed by one-fifth the official maximum dose. Chloral hydrate is not to be repeated when the maximum dose of 4·0 grains is exceeded; or secale cornute if the dose exceed 6 grains, or extractum secalis if the dose exceed 0·3 grains. Neither are the prescriptions of homœopathic physicians up to and inclusive of the third dilution to be repeated.

As to medicines for external use dispensers are prohibited from repeating prescriptions containing any dose whatever of an article in Table B, before referred to, with the exception of red oxide of mercury, white precipitate, and veratrine; or a prescription for subcutaneous injection of a solution of a substance in Table B or Table C.

Artificial Tobacco.

According to the *Scientific American*, artificial tobacco leaves are now being produced in New York for the manufacture of Havana cigars. The material used is a kind of brown wrapping-paper, made especially for the purpose. This paper is saturated with the juice pressed from tobacco stems and other offal, and then rolled through a machine, which gives them the appearance of he tobacco leaf, with the peculiar spots printed on them as on calico. The paper thus prepared is especially adapted for the wrappers around the cigars, and for that purpose is even preferred by the Havana cigar makers to the genuine leaf, and import it largely from New York. According to our authority as much as 30,000 reams of this artificial tobacco leaf have been occasionally exported. It is further stated that this tobacco-flavoured straw paper makes also a filling superior to the genuine leaf, and that the paper leaves no residuum other than a pure light grey or nearly white ash, just like that of the best quality of tobacco.

Gastrotomy.

A correspondent in Paris of one of our daily contemporaries gave recently an interesting case of this rarely successfully performed operation. The patient, a lad of seventeen, had inadvertently swallowed a quantity of the solution of caustic potass. This occurred in February, and in spite of the most skilful treatment, the constriction at the upper orifice of the œsophagus became so complete, that death from inanition must inevitably have ensued without an operation, which was accordingly performed on the 26th July, by Dr. Vernouil, in the Hôpital de la Pitié, Paris. On the 10th September the patient was in good health, remaining up all day, and even helping the hospital assistants in their work; he had almost as much strength and energy as he had before the accident. His diet, composed of soups, fine-chopped meat, mashed vegetables, and drink, was injected through a large elastic tube inserted in the incision made in the stomach. Under this treatment he gained upwards of 10lbs. in weight between the 18th of August and the 14th of September. At the moment of the injection of food a flow of saliva in the mouth is produced, in the ejection of which a motion curiously resembling the action of chewing is remarked; he can distinguish between warm and cold substances, but otherwise all are indifferent to him. It is stated this is the first time the operation has been successfully performed; the last time it was attempted, but unsuccessfully, was in 1849, by M. Sedillot, Professor of the Faculty of Medicine of Strasburg.

Cervical Dislocation in Hanging.

In the discussion of the question as to the method by which instantaneous death by hanging may be most readily produced, it has been urged that the long drop, *i.e.*, from ten to fourteen feet, according to the weight of the convict, is necessary to cause dislocation of the cervical vertebræ, and that fall has therefore been adopted in most recent executions. If a report which we find in the *Ceylon Times* be reliable, it would seem to be established that the vertebral dislocation may take place under particular circumstances, with a very short drop.

A man, Nana Saibo, was executed in August last, with a fall of two and a-half feet, the knot being at the back of the head. A horrid scene took place, one executioner pulling on by the victim's legs, and the other forcing the neck against the noose with all his force, a proceeding which was not only disgusting, but quite useless, for it is stated to have turned out, on *post-mortem* examination, that the neck was broken. Inasmuch as few natives exceed nine stone ten pounds in weight, we entertain some doubt of the accuracy of this statement, especially as the rope was put in a position which afforded least likelihood of cervical dislocation.

Another Victim of the "Quietners" and the Quacks.

An inquest was held at Worsley, last week, on the body of a child, aged one year and eight months.

The child's mother stated that she had been in the habit of giving pills to all her children to "sleep" them. She purchased the pills from one Crompton, a shoemaker and farmer, but did not know what were their ingredients. Crompton had never told her to be cautious in the use of the pills. On Saturday last she purchased a box of the pills from him, and, having given one to deceased and one to her twin brother, left the box, in which were twenty-two pills, on a chest of drawers. About one o'clock on Sunday afternoon her daughter Ellen called her attention to the fact that deceased had got the pills by standing on a chair. She saw deceased with a paper containing eleven of the pills in her hand, and another pill was lying near her on the floor. Deceased became very sleepy, and was taken to the surgery of Dr. Martin, where she died.

Dr. Martin said he found the deceased child perfectly comatose when brought to his house. The child's mother had informed him that half of one of the pills would "give the children a good night's rest," and assuming the deceased had taken ten of the pills, he was decidedly of opinion that that number would be dangerous. A pharmaceutical chemist had analysed one of the pills and had stated that it contained opium. Witness considered that the sale of opium, by persons ignorant of its effects, to persons equally ignorant, without proper caution being given, was highly dangerous.

The jury returned a verdict that the deceased, being a child under the years of discretion, had died from the effects of poison inadvertently administered by herself. The jury recommended *that the police be requested to call upon the man Crompton* to inform him that they highly disapproved of his indiscriminate sale of the pills, and that they suggested he should discontinue the practice and destroy all the pills in his possession.

Food Poisoning in India.

It is not generally known that the *Datura Stramonium* is used by a certain class of criminals in India for carrying out those nefarious practices which were formerly committed under the system of Thuggism. The effect of this plant in causing a peculiar form of delirium, stupefaction, and even fatal symptoms, is well known to most of our readers, although it is by no means a poison which they would expect to be adopted for criminal purposes. We are indebted to the *Globe* for the following account of a case which recently came before the Janna Sessions Court: Two native travellers on their way to Bhewndy foolishly allowed themselves to be entrapped into an acquaintanceship with another native whom they met on the road. On arriving at a town one evening, they purchased some flour in the bazaar and left it in charge of their new friend while they went for a stroll. On their return, they proceeded to make bread with the recently purchased flour, and having partaken of it, they at once became delirious. One was absolutely insensible, but the other retained sufficient consciousness to be aware that their false friend was quietly appropriating whatever valuables they had about their persons. The sessions judge who tried the case expressed his belief "that a system, analogous to the Thuggee system, is at work in this Presidency, of datura poisoners joining parties of travellers, and mixing datura with their food and robbing them."

We find that Dr. Taylor, in his work "On Poisons," has given a full account of this food poisoning on the authority of Dr. Brown, of Lahore, Dr. Chevers and Dr. Irving, of Allahabad. The poison is not administered by the Indian robber with the intention of destroying life, but to facilitate the perpetration of their robberies; and so well do they manage their business, that, according to Dr. Chevers, the cases rarely prove fatal. Out of 51 instances of poisoning by *dhatoora* at the Bombay Hospital in one year, only one proved fatal, but four presented alarming symptoms. On the other hand, Dr. Brown states that out of 92 cases no fewer than 21 proved fatal, and it is probable, he says, that many which result in death are never known. It appears that the *datura fastuosa* and *alba* are the principal sources of the poison in India, the powdered seeds being given in cakes, or a strong decoction of them in curry or some other article of food. The Thugs employ the poison with the object of rendering their intended victims helpless. As administered by the skilled professional poisoners of India, it causes a profound lethargy resembling coma, with dilated pupils, and the person is rendered completely powerless. These symptoms may continue for two days and yet recovery take place. A man under the care of Dr. Chevers drank two mouthfuls of a poisoned liquid, complained of bitter taste, and fell down insensible within forty yards of the spot where he had taken the liquid. He did not recover his senses until the third day after. In these cases the seeds are probably given in a large dose, either in solution or a very fine powder.

A Lunatic Critic of the Doctors.

It cannot but be profitable to medical men as to others to "see ourselves as others see us," even if the picture we view be not a very complimentary one, and it will be a useful lesson to us if the imperfections of ourselves or the inefficiency of our art can be plainly put before us and brought home to our appreciation.

In this view we print the following letter, critical of the medical profession, written by a lunatic inmate of an Irish district asylum. We don't know for what form of lunacy our critic is under restraint, but it is plain that there is much method in his madness with reference to doctors and doctoring. For the effusion of a half-educated tenant farmer it is an amusing satire, and it remains to be decided how far he has succeeded in proving the truth of the *naive* conclusion to which he gives expression in the fourth line of the letter:—

To the Resident Medical Superintendent of the ——— District Asylum.

Sir,—Pardon me for the liberty of writing on the following important subject, namely, the members of the medical profession. A body of gentlemen, which I believe the one half of are fools, and though they may be perfectly competent to attend a lady in confinement, set a fractured bone, or treat an outward wound or sore, they are entirely unfit to discover or properly treat with medicine an internal disease of the body.

To prove the truth of this assertion I give you my own case, and the different opinions of a number of professional gentlemen on it.

In the month of April last I gave up work and called in Dr. —— ; his opinion on examining me was that all members of the body were sound except the heart, which, he said, was slightly affected, and prescribed a course of medicine accordingly. After about a month, finding myself nothing better, I went to another professional gentleman, Dr. C—— ; his opinion on examining me was different to Dr. —— both in the state of my disease and the medicine which he had prescribed for me, which he said was entirely too strong for me, and therefore injurious to my health. While under the care of Dr. C—— another gentleman, Dr. G——, saw me ; he at once on examining me found the cause of my illness, and directed Dr. C—— to change to another course of medicine. I next, by the wish of my landlord, Mr. —— went to Dublin, to Dr. B—— ; he, again, differed from the rest, pronounced my liver to be sluggish, and prescribed another different course of medicine. The opinion of the next, Dr. N—— (I believe the best of the lot), agreed with Dr. B—— as to the disease, but that the liver was enlarged, and said that the medicine prescribed by him was wrong. Let me also add that those lungs which are now pronounced sound by five medical gentlemen were in the year 1871, five years ago, declared by Dr. W—— to be diseased, and one, the right, to be *gone* for *ever*.

Now, sir, presuming that all medical works on the internal diseases of the body are the same, that the symptoms and means by which they are to be discovered are the same, and that the mode of treatment prescribed for each kind of disease is the same, how is it that those six gentlemen all differed from each other, either as to the disease or the mode of treatment of the one body.

This question, I think, cannot be answered with credit to all the members of the medical profession, but I think it should be considered by the board of gentlemen who have the granting of diplomas to students, and that they should, along with knowing that each student has learned off by heart the name of every disease, its effect on the body, and the means and treatment for its removal, also see that each student perfectly understands what he has learned, that his mind is given to his profession, and that he is possessed with a keen intellect to discover and distinguish every disease of the body before they send them forth on the world to do more injury than actual service. For common sense must allow that a quantity of medicine taken for a disease that does not in reality exist, or two different kinds of medicine taken in succession, or one kind of disease (as there are often two kinds of medicine which in themselves may not do much harm, but when combined may be very injurious) must be most injurious, and perhaps fatal, to the constitution of the body.

I may have made some very wrong observations, but I doubt not but that you will admit that there are some truth in what I have written, and allow me to remark, would it not be better for everyone to have one clever professional gentleman, who would have a talent for his profession, than two thick-headed men, who are merely doctors because it is an honourable and money-making profession. Had I met with one of the first-mentioned five years ago I would be a useful member of society to-day, instead of being a patient in Maryborough Asylum, and a burden and a cost to the community at large.

Hoping you will excuse this liberty,

I am, Sir, your most obedient servant,

A. W.

The Conjoint Scheme for Ireland.

We learn that the Conference Committee appointed by the University of Dublin, and the Colleges of Surgeons and Physicians of Ireland, for the purpose of framing a conjoint system of examination, has decided upon and approved a proposal for a triune diploma. We find it impossible this week—as we should have desired—to give the scheme in full. Its leading features are a very liberal concession of privileges by the University of Dublin, which is ready to make the conjoint examination compulsory on its graduates, and is content with a share in the Arts Examination, and a reduction in the lectures on Anatomy, Physiology, and Surgery to two courses each, but with an equivalent increase of fee to compensate the Professors.

There are many other important clauses which we shall give next week. The scheme of course may or may not be rejected by the Fellows of either or both of the Colleges, on its being submitted to them, but we think that the party who opposed a Conjoint Examination on a former occasion, will act with discretion for the ultimate advantage of the profession and the public, and not for the benefit of individual teachers.

Supply of Vaccine Lymph in Ireland.

It will be seen by the following circular-letter just issued by the Irish Local Government Board that the Cow-pock Institution at Dublin will cease to exist next April, and their grant of £400 a-year will go to the Local Government Board. The circular-letter is as follows:—

"Local Government Board, Dublin,
14th November, 1876.

"Sir,—The Local Government Board for Ireland desire to acquaint you, for the information of the Board of Guardians, that the question of the gratuitous supply of vaccine lymph has been for some time under the consideration of her Majesty's Government, and that a communication has been made by direction of his Grace the Lord Lieutenant to the Directors of the Dublin Cow-pock Institution, to the effect that it is proposed to vest the administration of the grant for the supply of vaccine lymph in the Local Government Board for Ireland, whose duties in relation thereto will commence on the 1st April next, the grant hitherto received by the Cow-pock Institution ceasing at the termination of the present financial year, the 31st March, 1877, after which date the unions and dispensary districts will cease to be supplied by the Directors of the Institution with lymph, and will make known their wants in that respect to the Local Government Board.

"It is not intended in supplying lymph gratuitously hereafter to workhouses and dispensaries to supersede or interfere with the practice of vaccination from arm to arm, where feasible, or, in the second place, the practice of storing in capillary tubes, or otherwise, lymph chosen by the vaccinators themselves from the best sources available, a practice which now most extensively prevails with dispensary medical officers ; but it is hoped that the parliamentary grant will be found sufficient to keep up an adequate supply in Dublin to meet demands arising from deficiency of lymph casually arising throughout the country.

"Hitherto such demands have been supplied mainly by lymph procured in Dublin, but the change about to be made will render the entire country available for the collection of lymph from the most eligible sources, with the assistance of a select number of dispensary officers to be duly remunerated for their trouble.

"The only expense which the Board of Guardians are likely to incur hereafter for the supply of vaccine lymph will be incurred as heretofore in the supply of capillary tubes to dispensary officers on the requisition of their respective committees.

"By order of the Board,
"B. Banks, Secretary.

"To the Clerk of each Union."

The next Meeting of the Pharmaceutical Society of Great Britain will be held on Wednesday, Dec. 6th, at half-past eight precisely. The following paper will be read:—"A new mode of making Grey Powder." By Mr. A. Bottle, of Dover.

The Law of Libel as it is.

APROPOS of one or two actions for libel against newspapers (including this Journal) last week, *The Echo* gives an able *resumé* and opinions of the law as it at present exists, from which the following extracts will, we hope, be read with interest:—

"The law of libel, as it applies to newspapers, needs serious revision. The law was created by judicial precedent, at a time when newspapers—the fourth estate of the realm—had not come into existence, and we cannot admit that Lord Campbell's Act goes far enough in the protection of the Press. It is obviously absurd to treat a newspaper on the same footing as a private individual. If a person in private life writes or prints a statement injurious to another, and that statement is false, the law very properly infers that it is dictated by malice. But a newspaper mentions daily a large number of persons who are utterly unknown to the editor, and against whom no conceivable animosity can be entertained. A newspaper has a character to sustain both for accuracy and fairness, and is urged by a motive far stronger than the fear of lawsuits to supply the public with the truth and the whole truth. If a newspaper is made the vehicle of personal spite, it neither deserves nor receives much indulgence; but such a case is rare, and where there is no malice a newspaper should not be punishable. Lord Campbell's Act recognises the exceptional character of newspapers, but it does not go far enough. The only advantage it gives to a newspaper over a private libeller is that if a satisfactory apology is inserted, and a sufficient sum in name of damages is paid into Court, the jury are to find a verdict for the defendant, and that will carry the costs of the action.

"As a general rule, it is simply a farce to pretend to calculate the loss sustained by a libel. For this reason a newspaper that has, without ill-will and without negligence, published an injurious statement, should not be required to pay damages. Another defect of the law is in throwing upon the newspaper the burden of determining what is a satisfactory apology. It ought to be quite enough if the newspaper opens its columns to any contradictory statement offered by the complainant; and it should be for him to prove that he asked for a contradiction before the action was brought, or, if asked and inserted, that it was insufficient. If mischief has been done to him by publicity, then the proper cure for that is publicity. A newspaper should be punished, like an individual, not merely for actual malice, but also if it has been guilty of gross negligence. Except, however, in these cases, it ought to be exempt from actions for libel if it opens its columns to any contradiction of an erroneous report that it has circulated. The subject is one that urgently demands the consideration of Parliament."

ACCORDING to the Reports presented to the Metropolitan Asylums Board on Saturday last, there are at the present time 2,125 patients in the Leavesden Asylum, 2,084 in the Caterham Asylum, and 333 in the Clapham and Darenth Asylum for Children.

Correspondence.

BETTS *VERSUS* THE "MEDICAL PRESS AND CIRCULAR."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As an old subscriber, permit me to express my regret at the result of the above case (which by the morning papers I see is given against you), and my admiration of the manner in which you have always upheld the dignity of the profession. I certainly think the profession ought to show their appreciation of your honourable conduct, and it will give me great pleasure to hear of a fund being formed to defray your expenses. If you will allow me, I shall be proud to send you a guinea as a commencement.

Yours truly.
W. T. GREENE, M.B.

218 Old Kent Road, London, S.E.

⁂ It affords us much gratification to receive the sympathetic letter of Dr. Greene. We had no personal interest in the case, but defended our opinion to the last in the honest conviction that we were upholding the dignity of the profession and the welfare of the public. Should it be the desire of the profession, we shall have great pleasure in allowing a fund to be started, according to the suggestion of Dr. Greene, to meet at least a portion of the expenses, which will probably amount to some hundreds of pounds.—ED. M. P. & C.

◆

THE ISLE OF MAN AS A WINTER RESORT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you allow me by means of your valuable paper, to recommend to all invalids, from any cause whatever, the salubrity of this island. It will save the "*mal du mer*," and all other inconveniences, and restore the invalid to health and strength, if that be at all possible or attainable. I came here two years ago, got well and returned to England, four months afterwards I became ill again, and had to return, and I am happy to say that now I really enjoy good health. In my humble opinion this island is far beyond anything Continental. The pure air is continuous, and you can enjoy every luxury you can wish. But there is a something indescribable which this island enjoys, and which I have found nowhere else, and I enjoyed the Mediterranean for two years and a half. All I can further add is this—let them give this island a trial, for the winter is exceedingly mild.

I am, Sir,
Yours most obediently,
ALEXANDER LANE, M.D.,
Retired Surgeon, R.N.

Douglas, Isle of Man.

◆

RELIGION AND DOCTORING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Nothing can be more *apropos* than your remarks in last publication under the title of "Religion and Doctoring." Truly it is as you say that *Medical science has no religion, and ministers alike to Pagan and Christian*, and for the country or the people which, in this nineteenth century, ignores this principle, there is no hope morally, civilly, or nationally.

In most cases in England neither the religion of the practitioner nor his nationality prove any bar to his progress if he be otherwise competent and eligible. Nor are they generally *by themselves* reasons why patients of his own faith or country should employ him in preference to the stranger. I will briefly relate my own case, as it may serve to enlighten the bigots of the *Tipperary Free Press* and others whether Protestant or Catholic who cling to similar arguments.

I am an Irish Catholic practitioner doubly qualified, and I practise in a country town in England; the population of the town by itself is about 6,000, and of the parish about 30,000 persons, comprising several nationalities and many sects; and there are places of worship in the district for catholics, members of the Church of England, dissenters, and Scotch presbyterians. The catholics are, in point of *number*, a respectable minority, and would be, in fact, capable of maintaining a doctor by themselves, and yet to my gross income of £500 to £600 they don't contribute among them £150. This, to an outsider, may seem odd, but it is of easy explanation. First, our pastor, who is a truly good and pious man, leaves them in the matter of their commercial affairs to deal with whom they please, and also to call in, in their needs, any doctor they please. This is the more remarkable, as clergymen of other denominations *don't* always do the same. But interference of clergymen in the civil affairs of life I hold to be most impertinent. Secondly, almost the whole catholic population in my neighbourhood are from the western province of Ireland, and it is my "luck" to belong to an eastern county, and thus being not of "themselves," they appear to hold more antipathy to me than they do to the genuine Saxon. Lastly—and I believe the chief reason—my fees are larger than any of my neighbours—qualified or unqualified—and my compatriots, who often spend their money freely for drink and similar "necessaries," are not such fools as to employ dear doctors, although they sometimes swallow dear "physic," and thus they trouble me but seldom with their calls.

I specially ask the attention of the *Tipperary Free Press*, and those who place doctrine before surgical competence to my simple statement; and I apologise for asking so much of your space.

I am, Sir,
Very truly yours,
Nov. 16th, 1876. Θυτή.

◆

Literature.

HAY-FEVER, OR SUMMER CATARRH. (a)

As a collection of cases, and as a history of the disease in America, Dr. Beard's work will form a valuable addition to the literature of hay-fever. If, however, it was intended to be a thoroughly scientific investigation of all the circumstances connected with the disorder, we cannot congratulate the author on having achieved any great amount of success. His plan of collecting and arranging the information on the causes of the malady is open to the gravest objections. A list of supposed causes is presented to the patients, and from these they are at liberty to choose those that, in their opinion, seem to be the most active. In the answers thus obtained there must of necessity be a large amount of guess-work. Then in dealing with the evidence obtained even in this doubtful manner, there is a want of that logical acumen, as well as an absence of that rigid system of induction which ought to pervade any work of a truly scientific character.

Moreover, in some instances, the facts which the author gives are, as it seems to us, more or less opposed to the conclusions he draws from them. We also notice that, although there is a very liberal use made of the facts first brought under notice by other observers, there is not an equally liberal acknowledgment of the source from whence they have been obtained. Among the list of causes heat takes a prominent place, but in examining the evidence Dr. Beard brings on this point, we notice that "June cold" commences before the heat of summer properly comes on, whilst the Autumnal catarrh often attains its highest point of severity whilst the heat is actually declining. Residence in the centre of a large city gives marked relief to sufferers, but according to Dr. Beard, "the heat of a city is greater than that of the country." Then, again, we notice that in numerous instances where the patients have removed during an attack from a northern to a southern and warmer State, there has been a marked improvement in their symptoms, amounting, in some cases, to a complete cure for the time being.

Patients often escape the malady at the sea-side. "Sea air," Dr. Beard says, "is tonic and sedative; in mid-ocean, in high latitudes, it is always cool, even in midsummer, and vegetable irritants are not found." But according to the testimony of numerous patients they do escape attacks at the sea-side, when they are consequently not in mid ocean, nor yet in high latitudes, and where the air is not cool.

As an example of the strange way in which the author views some of the facts he has to deal with we may cite the following:—Dust is said to be one of the most potent causes of the malady, and in connection with this matter the following question is asked, "Do you ever have during the winter or spring, when exposed to any of the exciting causes, as dust, &c., attacks resembling 'hay-fever' in a mild form lasting perhaps for a few minutes or hours?" On this question the author remarks:—A point strongly in favour of the parasitic or vegetable theory is the peculiar periodicity of the symptoms. The almost mathematical certainty of the coming on of the disorder, in some cases on a fixed day or hour, and the subsidence of the symptoms at definite times, suggests to almost anyone the possibility that some parasitic or vegetable emanation appearing only during the season of the disease might be the cause.

If it could be shown that some at least of the symptoms were felt at other than those so-called catarrhal seasons; if sufficient evidence of the occurrence of certain phases of the malady in the winter and spring could be obtained, the parasitic and vegetable theories would be seriously shaken." The author then goes on to say:—"This evidence is here given. The hay-fever symptoms that are in winter excited by exposure to the dust of hay or the house or to animal emanations are usually, if not always, of a transient character, lasting but a few minutes or hours; but for this brief time they are characteristic of the disease. A medical man with whom I have conversed on the subject tells me that at any season it is impossible for him to curry a horse without bringing on at once the usual symptoms of the disease. Others cannot at any time go into a barn without suffering the penalty of sneezing and distress for several moments or longer."

We have always imagined that if dust of a vegetable origin would be met with anywhere it would be in a barn, and although the dust raised by an American doctor in currying his horse may by the author be considered to be an animal emanation, some will believe it to be largely composed of hay-dust. We can scarcely suppose the author can be in earnest when he gives the above examples to show that the vegetable theory of the exciting cause of hay-fever is "seriously shaken" by them.

The pet idea of the author is that the disease belongs to the neuroses, and every possible opportunity—favourable and unfavourable—is taken of bringing this idea prominently forwarded. That the predisposition is due to some peculiar condition of the nervous system is stated by all previous writers on hay-fever, but that this involves the necessity of placing it among the neuroses has not yet been shown. Some of the patients whose cases Dr. Beard gives differ entirely from him as to the nature of the malady and its exciting cause. A portion of the observations of one of these we quote as follows:—"My experience and observation do not tend to confirm Dr. Beard's theory that the disease depends upon the state of the nervous system. It appears to me that hay-fever is caused by some poisonous or irritating quality, emanating from vegetable matter in actual contact with the mucous membranes of a small portion of our community, who are predisposed by their peculiar organisation to be affected by such contact. It may be that the nerves have some agency in this predisposition. I believe that vegetable matter is the exciting cause, because . . . . . . if rain sets in and if long continued I am relieved; so if the wind for several hours prevails from the ocean, near which I live, I am relieved. I believe most sufferers are relieved while at sea; and I think the reason why sufferers are relieved in mountainous regions is because they are above, or out of the range of, the space in which this poisonous matter moves. After watching the hay-fever through a long lifetime, I am satisfied that the vegetable matter in contact with the mucous membrane irritates, inflames, and swells the tissues, and obstructs the respiration."

In summing up his conclusions on the causes of the malady, Dr. Beard says:—"Of the threefold factors that seem to be necessary for the production of the disease—predisposition, the depressing influence of heat, and external irritants of some kind—no two are sufficient to excite the symptoms in any degree unless one of the two be the predisposition. . . . . The sum of all is that there is no one exciting cause which can be regarded as the exclusive factor in starting the symptoms in a predisposed subject; there are, indeed, no two or three causes—there are at least thirty distinct substances or influences that are known to act on different persons with varying intensity. This is certainly proved by the replies to question 19 (p. 54). It is not improbable that further researches may extend the list to fifty or even one hundred."

(a) "Hay Fever, or Summer Catarrh: its Nature and Treatment; including the early form or 'Rose Cold,' the later form or 'Autumnal Catarrh,' and the middle form or 'July Cold,' hitherto undescribed." By George M. Beard, A.M., M.D., &c. London: Sampson Low, Marston, Searle, and Rivington. New York: Harper and Brothers.

In our first notice of this work two errata escaped our notice. At page 306, first line, "the Autumnal Catarrh," should read "Autumnal Catarrh." In the last paragraph but one in the first line, "other external remedies" should read "other nternal remedies."

We can well believe that, on the plan followed by Dr. Beard, the list of causes may be extended even to a much larger number than he gives, but we are far from thinking with him that the mere utterance of an opinion by patients on the cause of their malady amounts to a proof. This is, in fact, what it does not do, and the grand mistake the author has made is that he has taken the expression of an opinion for the proving a fact. With the exception of a very few experiments made by Dr. Wyman (*a*) not a single trial has been made with any one of the causes named in a way that would unmistakably prove that it has the power to bring on hay-fever when all the other causes, save the predisposition, are absent. With a disease that affects a larger number of persons and is present for a much longer portion of the year than in any other part of the world, this might and ought to have been done. With ample material at hand the author has let pass a grand opportunity, and we can only hope that either he or some one else, who is able and willing to investigate the subject more thoroughly in America, will take up the question again and complete what has been left unfinished.

CYCLOPÆDIA OF PRACTICAL MEDICINE. (*b*)

As has been stated in our notices of other volumes, this great work is to consist of fifteen parts, published quarterly. This, the fourth volume of the English Translation, followed the fifth, which contained articles on pneumonia and phthisis. Now we commence the diseases of the respiratory organs—at the beginning, so to speak—with consideration of affections of the air-passages.

The first article describes very fully and carefully the general diagnosis and therapeutics of the nose, pharynx, and larynx, and is written by Dr. Fraenkel, of Berlin, who the preface informs us, has worked with Cohnheim, in experiments on the transmission of tubercle.

As regards laryngoscopy, it is satisfactory to learn that nothing better can be had, even in the land of Czermak and Turck, than the simple concave mirror, with a focal distance of six or seven inches for the forehead, and laryngeal mirrors of different sizes.

For the lecture room a large mirror is attached to the lamp (gas, paraffin, or oxyhydrogen), but generally the spectacle frame or forehead-band is used for supporting the apparatus.

In inspection of the naso-pharyngeal space the author employs an ingenious arrangement of the usual laryngeal mirror, which is so contrived that it can be introduced straight, and made to turn up, after passing under the palate; a small spear is attached to the instrument to hold up the uvula. This part of the work is well illustrated, not only with pictures of the various kinds of apparatus, but with good diagrams of the parts capable of being inspected; the laryngeal region, the back of the palate, openings of nasal passages, &c.

The subject of therapeutics comprehends cauterization, pencilling, syringing, and douching, and inhalation, of vapour and atomized fluids, but there is very little which will be new to English medical men.

In the section on diseases of the nose, there are descriptions of stenosis of the air-passages, and its importance when occurring in infants; coryza, and its tendency to lead to permanent stenosis, if neglected; and here the author dwells on the use of the nasal douche giving caution as to the amount of fluid to be used, the amount of pressure, and the position of the head. We are also reminded of the association between the brain and the nose, believed in by the older physicians, and perpetuated in the French name for coryza, "Rhume de cerveau," and the beautiful (?) custom of wishing a hearty "good health" to him who by a vigorous sneeze has embraced the shortest way of clearing up his brain.

For the treatment of *chronic rhinitis*, or *ozæna*, it is recommended to use solution of common salt, or carbonate of soda, chlorate of potash, or salammonia (from two to ten grains to the ounce of water) in douche, injection or spray. Glycerine is also employed by itself, or combined with other drugs.

Various other disorders of the nasal passages receive attention in this exhaustive work:—Abscess, ulcerations, nose-bleeding, tumours, concretions, and parasites, but there is nothing in them demanding special notice.

Acute and *chronic catarrh* are the only affections *of the larynx* systematically treated in the present volume; the subject is to be completed in another part of the work.

For the treatment of milder cases of chronic laryngitis, atomised solution of tannin is given by means of Siegle's apparatus; for the severer cases the writer uses nitrate of silver, fused on the end of a laryngeal caustic holder, or brushed over the parts in strong solution.

Bearing in mind the discussion which took place some time ago in this country on the unity or distinctness of diphtheria and croup, we turn with special interest to Steiner's treatise on croup in this volume. The writer does not take a very decided position, as may be seen from the following extracts:—"These two affections are only varieties of one and the same process" . . . "making its appearance at one time in a sporadic form—at another as a wide-spread epidemic." . . . "Everyone who has observed many cases of croup and diphtheria must admit that these two affections often occur together" . . . "that in the larynx itself croup and diphtheria are observed to shade into each other, &c." A few pages later, "primary true croup is not a contagious disease, though it is so regarded by Bohn-Gerhardt and others." . . . "Diphtheritic croup, however, possesses this quality in a marked degree."

In discussing the morbid anatomy of croup, he says:—"According to E. Wagner, whose numerous investigations have shown that there is no sharp dividing line between croup and diphtheria" . . . "the croupous-membrane is composed of a thick network of very delicate threads, whose interstices are occupied by numerous bodies like pus corpuscles" . . . "produced in croup just as in diphtheria by a peculiar metamorphosis of the epithelial cells, at first becoming enlarged, then developing long prolongations, by the coalescence of which a network is formed." The parasitic fungi found on these false membranes are regarded as in no way essential to the disease, but merely accidentally present.

As to treatment, Steiner takes the active side, applying nitrate of silver, chromic acid, hydrochloric acid, and chloride of iron to the throat in fluid or spray, cold-water compresses round the neck, emetics, and, finally, tracheotomy. In the children's hospital at Prague there were 30 recoveries out of 100 operations. Among 1,698 cases of tracheotomy collected by Duchek, 428 recovered, being about 25·2 per cent. This is, we think, a much better result than could be shown by statistics of the operation in this country.

(*a*) Dr. Wyman made experiments with the Roman wormwood (whether it was with the pollen or some other part of the plant, Dr. Beard does not say) in the White Mountain region. The symptoms of itching, sneezing, coughing, and asthma were produced, but they soon passed away.

(*b*) Cyclopædia of Practical Medicine. Edited by Dr. H. von Ziemssen. Vol. IV. Diseases of the Respiratory Organs. London: Sampson Low, Masters and Co. 1876.

The affections of the trachea and bronchi are introduced by a chapter on the physiology of cough, and on exploration of the windpipe.

Bronchial catarrh (tracheitis, bronchitis) is minutely described, in all its various forms by Dr. Riegel, of Cologne. He mentions, among the symptoms, "bulging forwards of the supra and infra-clavicular regions, and the indistinctness of the respiratory movements in these parts of the thorax." The article is written with great care, and fullest details; but there is little which calls for notice, except the extensive application of local treatment to this disease, as by insufflation, inhalation of vapours and atomised fluids, and respiration of condensed and rarefied air. And it would appear that the administration of medicine from a bottle *is* sanctioned in this disease (we have remarked with pleasure that many diseases treated of in this work are not supposed to require the usual amount of dosing). "Tempora mutantur," when cold douches are recommended "to excite deeper respirations" in acute bronchitis, and expectorants are stated "to afford little benefit," we can imagine some of our friends adding "et *nos* mutantur."

Croupous, *pseudomembranous*, or *fibrinous bronchitis* has a long chapter devoted to it.

Having shown that the affection is one occurring generally in the second and third decades of life, the casts are described as consisting of hyaline basement membrane, containing many cells like pus corpuscles. The only decided indication in the way of treatment is the inhalation of lime-water, lactic acid, or the alkaline carbonates.

In the article on stenosis of the trachea and bronchi, Riegel notes the fact that the most yielding points of the thoracic walls being drawn inwards with each inspiration, the circumference of the upper thorax is gradually diminished in time, quoting from Stokes's "Diseases of the Heart" a case in which marked retraction of the left chest occurred with an aortic aneurism, which compressed the bronchus of that side.

The chapter on foreign bodies has about six pages of bibliography, most interesting as showing by the notices of recorded cases how graciously tolerant a trachea may be, *e.g.*—"Coin—retention a year and a half—Expulsion—recovery."

The leading theories as to the causation of *bronchial asthma* are fully discussed. The usual opinion that the disease consists in bronchial spasm is warmly opposed by Wintrich, Bumberger, and others, who hold that the diaphragm and respiratory muscles are the seat of the spasm, the glottis being occasionally affected as well. Their strong points, in support of this view are, the immobility of the lower margin of the lung in asthmatic respiration, and the hardness of the abdominal muscles. Another theory attributes the symptoms to sudden quasi-catarrhal swelling of the bronchial membrane, in connection with the morbid conditions (diaphragmatic spasm, cardiac insufficiency, &c.).

Under the head of treatment, we have formulæ for Espic's cigarettes, the therapeutic method of Trousseau, and the supposed composition of Auberrs' remedy. This latter contains much iodide of potassium, 11 grains being given in each dose, with lactucarium or brandy and opium. And the use of compressed and rarefied air is mentioned favourably.

The diseases of the *pleura* are given by Fraentzel of Berlin—the article on pleuritis occupying 140 pages—and is written with the fulness and thorough grasp of the subject which characterises all parts of the Cyclopædia.

Hæmorrhagic pleurisy is described as a relapsing inflammation of the affected membrane, in which the development of blood-vessels is rapidly advancing, with an alkaline fluid effusion, containing many blood corpuscles. It is pathologically related to pachymeningitis hæmorrhagica (Virchow), and retro-uterine hæmatocele.

The pathognomonic symptom—the friction sound—is continued, of course; but we are pleased to observe that Wintrich (of Erlangen), who appears to be an authority on chest diseases, has only heard this friction sound four times in twenty years!! Dr. Fraentzel cannot subscribe to this testimony; but he confesses that it is very much like a rhonchus; therefore, students need not be disappointed if they *never* hear this mysterious sound.

Treatment—bleeding, cupping, leeches—digitalis and calomel, and full doses of nitrate of potash. The calomel may be replaced by mercurial ointment to salivation; drastic purgatives, such as compound infusion of senna. "We must never give opiates in acute pleuritis to relieve the dyspnœa". . . "if for persistent sleeplessness, subcutaneous injection of morphine" is the best. A tolerably active line of treatment, for the medical part, we think. Surgically, the removal of effused serous fluid by aspiration (the instrument with the bottle being preferred) is to be practiced, not earlier than the end of the third week, the point of puncture being above the sixth rib, between the mammary and axillary lines; not more than 1,500 cubic centimetres are to be taken at a time. The removal of pus is to be effected by an incision, two inches in length in the fourth or fifth space, passing outwards from the mammary line. When the cavity is empty, pass in two Nelaton's catheters, and wash out the sac with pure water at 100°F. Then fix a canula in the wound, having first protected the skin by some Lister's plaster, that the syringing may be repeated once or twice daily; this method of treatment is described in the minutest details in the book.

Hydrothorax, hæmatothorax pneumothorax, and cancer of the pleura conclude a volume which this sketchy review very inadequately represents, and while we cannot agree with the author's line of treatment, it is interesting to receive new ideas on old subjects.

◆

VITAL MOTION AS A MODE OF PHYSICAL MOTION. (*a*)

The generally received ideas as to the influence of nerve muscle as to contractility, and other inherent properties of muscle, have been controverted by Dr. Radcliffe during the last few years. In his work on "Dynamics of Nerve and Muscle" and other works, he has demonstrated that the normal state of these structures is that of electrical *charge*, which is brought about by the blood, and by which the structures are kept in a state of rest.

In the present volume he first considers the subject of vital motion historically, giving the ideas of the old seekers after truth, from Hippocrates and Aristotle, down to Galvani and Volta, whose discoveries are fully (one might say affectionately) depicted.

Then the writer records some observations of his own, undertaken with a view to ascertain the electrical relations of movements in the lowest forms of life; the conclusion being that "amœboid movements may be the consequence of expansion and shrinking in obedience to the oscillations in potential of the atmosphere." Then the subject is studied in the tissues themselves, this part of the work being an abstract of Dr. Radcliffe's works on Vital Dynamics, above alluded to. The author next appeals to the principles of rhythmic motion, in the heart and elsewhere, and then in the chapter of the book details his experiments on the electrical state of lung tissues when subjected to each and all of the different forms of electricity; and concludes by saying "that they (Franklinism, Voltairism and Faradaism, and natural Electrisation) agree in acting not by polarisation, or by any other working of the constant current; but by the charge or discharge of free electricity, the charge causing the state of rest, and with it more or less expansion, by keeping the charged molecules in a state of mutual repulsion, the discharge bringing about action, by leaving the new chargeless molecules free to yield to simple

---

(*a*) "Vital Motion as a Mode of Physical Motion." By C. B. Radcliffe, M.D., Consulting Physician to the Westminster Hospital. London: Macmillan and Co. 1876.

molecular attraction. Consideration of the action of blood on living tissues leads to the conclusion that "blood produces relaxation of muscle by producing (through its oxygen) that electro-motive condition in nerve and muscle which antagonises the state of action.

The physiological part of the work is summed up by saying that in vital motion, "elasticity and electricity seem to be everything," and "that what is called electricity is only a one-sided manifestation of the workings of a single, central, cosmical law; which without confusion of substance binds all things together in the very closest communion.

It is very pleasant to read such thoughtful argumentation, many interesting facts are called in support of the author's theory, and the novelty of the present aspect of vital motion gives it great attractiveness.

Under the head of pathological manifestations, the convulsive disorders (epilepsy and tetanus) and tremors are shown to be indications rather of *want* of blood (and therefore of want of electromotive action) in the nervous centres and muscles than of the hyperæmia of fever and inflammation.

For instance, the tremor of delirium tremens, as usually seen in mild cases, where there is certainly depression, is contrasted with the absence of that symptom in the more feverish cases where meningitis supervenes.

At the end of the work the evidence is summed up, and the conclusion which has been impressed on the reader over and over in the course of the argument, is once more announced in the "Epilogue." The smooth cloth cover, the printed paper label, the old fashioned type, the rough paper, with the division of the subject matter into "Prologue," "Argument," and "Epilogue," combine to form an artistic background of age, which brings out more forcibly the "strong" lights of Dr. Radcliffe's very novel theory.

The physician will read this work for new ideas on nervous disorders, and for a new application of the galvanic current, and the physiologist will find fresh subjects for research.

Wickham, Henry, L.S.A., Tetbury.
Wilkie, D. W. B., M.B., Melbourne
Young, Archibald P., Norwood.

The Mortality of Foreign Cities. — The rates of mortality, according to the latest official weekly returns, were:—In Calcutta 22, Bombay 24, Madras 36, Paris 31, Brussels 24, Amsterdam 24, Rotterdam 24, The Hague 29, Copenhagen 20, Stockholm 21, Christiania 24, Berlin 26, Hamburg 19, Breslau 20, Munich 37, Vienna 24, Buda-Pesth 34, Rome 18, Naples 20, Turin 18, Alexandria 49, New York 23, Brooklyn 19, Philadelphia 19, and Boston 22. The fatal cases of typhoid fever in Paris, which had been 29, 40, and 59 in the three preceding weeks, rose last week to 171. It will thus be seen that with the exception of Alexandria, Salford in our own country has the highest recorded rate of mortality at the present time in the world.

University of London.—The following gentlemen have passed the recent Second M.B. examination:—

First Division.

Burton, Samuel Herbert, University College.
Edwardes, Edward Joshua, St. Mary's Hospital.
Ferrier, John Christian, Guy's Hospital.
Fox, Thomas Colcott, University College.
Hancock, John Gatchell, King's College.
Harrison, Charles Edward, St. Bartholomew's Hospital.
Hellier, John Benjamin, Leeds, and University College.
Hunt, Joseph William, University College.
Jones, Arthur Henry, Guy's Hospital.
Kidd, Walter Aubrey, Guy's Hospital.
Lamb, William Henry, Guy's Hospital.
Pepper, Augustus Joseph, University College.
Pinnell, Thomas Mark, University College.

Second Division.

Blake, Henry, St. George's Hospital.
Boddy, Hugh Walter, Roy. School of Med., Manchester.
Briggs, Harry Beecham, King's College.
Duke, Herbert, Guy's Hospital.
Langley, John Geoffrey, University College.
Parry, Thomas Sharp, University College.
Pughe, Rhinallt Navalw ap Joan, L'pool Royal Infirmary.
Rogers, Thomas King, University College.
Rossiter, George Frederick, St. Thomas's Hospital.
Seward, William Joseph, University College.

Vital Statistics.—From the Registrar-General's returns we learn that during last week 5,660 births and 3,713 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 1,947. The mortality from all causes was at the average rate of 24 deaths annually in every 1,000 persons living. The annual death-rate was 18 per 1,000 in Edinburgh, 21 in Dublin, 23 in Glasgow, and 24 in London. In the other large towns the rates of mortality during the same period were—Norwich 13, Newcastle-upon-Tyne 17, Hull 19, Brighton 20, Sunderland 21, Leeds 21, Bristol 22, Nottingham 22, Wolverhampton 24, Leicester 24, Birmingham 24, Sheffield 25, Oldham 26, Plymouth 26, Portsmouth 27, Manchester 27, Liverpool 27, Bradford 28, and again the highest rate during the week 40 in Salford. The annual death-rate from the seven principal zymotic diseases averaged 3·0 per 1,000 in these towns, and ranged from 0·6 and 1·3 in Norwich and Bristol, to 6·7 and 9·4 in Portsmouth and Salford. Scarlet fever caused 11 more deaths in Portsmouth, and measles showed fatal prevalence in Bradford. In these large towns 61 deaths were referred to small-pox, against 32 and 46 in the two preceding weeks, and included 48 in London, 5 in Liverpool, and 8 in Manchester and Salford.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

ARMY SURGEONS.—The next examination for commissions in the Army Medical Department will be held in the University of London on the 12th of February. The emolument is £250 per annum and extras. Full particulars will be found on reference to our advertising columns.

PHYSIOLOGIST.—Küss' "Physiology" is published both in English and French by Messrs. Baillière and Co. The French edition is, we believe, much cheaper of the two.

DR. H. A. G.—As soon as space permits.

◆

MEETINGS OF SOCIETIES.

HUNTERIAN SOCIETY.—This evening, at 8 p.m., Mr. Jonathan Hutchinson, "On Colles's Law with reference to the Transmission of Syphilis."

ASSOCIATION OF SURGEONS PRACTISING DENTAL SURGERY.—This evening at 8½ p.m.. Mr. Cartwright (President), "On Teething and its Complications."—Mr Edgelow, "On a remarkable Case of Maxillary Disease."—And other communications.

CLINICAL SOCIETY OF LONDON.—On Friday evening, at 8½ p.m., Sir W. Jenner, "On a Case of Leukæmia treated by Phosphorus."—Dr. Gowers, "On a Case of Lymphatic Leukæmia treated by Phosphorus."—Dr. Greenfield, "On a Case of Hodgkin's Disease, with Excess of White Blood-Corpuscles, treated by Phosphorus."—Mr. Brodhurst, "On Cases of Subcutaneous Section of the Neck of the Thigh-bone."

◆

VACANCIES.

East London Hospital for Children.—Resident Medical Officer. Salary, £60 per annum, with board, lodging, and washing. (See Advt.)

Glasgow Western General Infirmary.—Superintendent. Salary, £250, with board and furnished apartments. Testimonials to the Secretary, 30 Gordon Street, Glasgow.

Bridgend and Cowbridge Union.—Medical Officer. Salary, £58, with extra fees. Address the Clerk to the Union, Bridgend, Glamorganshire.

North Riding Lunatic Asylum.—Assistant Medical Officer. Salary, £120, with board and lodging. Address the Medical Superintendent, York.

Royal Albert Infirmary, Wigan.—Assistant House Surgeon. Salary, £60, with board and lodging. Address the Hon. Sec.

Rotunda Hospital, Dublin.—Assistant Physician. Honorary. Applications to the Master.

Chester Infirmary.—House Surgeon. Salary, £80, with board. Address the Chairman of the Board.

Queen's Hospital, Birmingham.—Physician on the Staff. Honorary. Applications, Testimonials, &c., to the Secretary.

Midland Free Hospital for Children, Birmingham.—House Surgeon. Salary, £80, with board, &c. Applications to the Medical Committee.

◆

APPOINTMENTS.

CARRINGTON, R. E., M.R.C.S., an Assistant Demonstrator of Anatomy at Guy's Hospital.

CLEAVER, W. J., M.B., C.M., a Medical Officer to the Sheffield Free Hospital for Sick Children.

DENTON, A. H., M.R.C.S.E., L.R.C.P.Ed., Assistant House Surgeon to the Sheffield Public Hospital and Dispensary.

DUN, Mr. W. G., Resident Physician to the Western Infirmary, Glasgow.

GODRICH, A., L.R.C.P.L., M.R.C.S.E., a Clinical Assistant to the Central London Throat and Ear Hospital.

GUNN, R. M., M.A., M.B., C.M., M.R.C.S.E., House Surgeon to the Royal London Ophthalmic Hospital, Moorfields.

HARRISON, H. B., M.R.C.S.E., a Clinical Assistant to the Central London Throat and Ear Hospital.

HEMMINGS, W. D., M.R.C.S.E., a Clinical Assistant to the Central London Throat and Ear Hospital.

HIGGINS, T. J., M.D., L.R.C.S.Ed., Medical Officer and Public Vaccinator for the Welton-le-Wold District of the Louth Union, Lincolnshire.

HITCHINS, T. J., M.R.C.S.E., a Clinical Assistant to the Central London Throat and Ear Hospital.

JONES, W. J., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer, Public Vaccinator, &c., for the Silvermines Dispensary District of the Nenagh Union.

KERR, J. K., M.D., C.M., a Clinical Assistant to the Central London Throat and Ear Hospital.

MACPHERSON, B., M.B., C.M., Resident Surgeon to the Western Infirmary, Glasgow.

MOFFATT, R., M.B., C.M., Resident Physician to the Western Infirmary, Glasgow.

NEWMAN, Mr. D., Resident Surgeon to the Western Infirmary, Glasgow.

O'KEEFFE, D. J., L.R.C.P.Ed., L.R.C.S.Ed., a Medical Officer to the Sheffield Free Hospital for Sick Children.

OSBORN, S., M.R.C.S.E., a Clinical Assistant to the Central London Throat and Ear Hospital.

OWEN, W. G., M.B., C.M., Resident Surgeon to the Western Infirmary, Glasgow.

WORTH, T., M.R.C.S.E., L.S.A.L., Medical Officer to the Nottingham Union Workhouse.

◆

Marriages.

BLADES—BAKER.—On the 15th inst., at St. Mary's-in-the-Castle, Hastings, William Parker, fourth son of Charles Blades, M.R.C.S., of Tattershall, Lincolnshire, to Sarah, widow of Major Alfred Baker, Bombay Civil Service.

CARSON—PARKER.—On the 14th inst., at St. John's, Hammersmith, Robert James Carson, of St. Anne's, Belfast, to Laura Rebecca, second daughter of the late Stephen John Peach Parker, M.D., of Hammersmith.

PINK—FARMER.—On the 15th inst., at St. John's, Margate, Thomas Pink, Resident Surgeon of the Royal Sea Bathing Infirmary, Margate, and eldest son of Henry N. Pink, M.R.C.S.Eng., of Greenwich, to Emma, second daughter of Joseph Farmer, of Chapel Hill House, Isle of Thanet.

◆

Deaths.

FOX.—On Nov. 9, at Cross Street, Whitehaven, Thomas Fox, M.R.C.S., aged 92.

HEELAS.—On Nov. 7, at Fellows Road, South Hampstead, London, Martin Luther Heelas, M.R.C.S., aged 83.

HORNE.—On Nov. 13, at A well, Torquay, Thomas Benjamin Horne, M.R.C.S.E., aged 57.

JONES.—On Nov. 9, at the Grove, Menai Bridge, E. Jones, M.R.C.S.E., of Liverpool, aged 73.

LEE.—On Nov. 8, at Wem, Salop, Henry Lee, Surgeon, aged 73.

MARSHALL.—On Nov. 8, at Lennoxtown, Stirlingshire, Allan Marshall, L.F.P.S.G., aged 67.

ROWE.—On Nov. 9, at Hartland, Chas. Henry Rowe, Surgeon, aged 70.

TORRANCE.—On Nov. 8, at Airdrie, Thomas Torrance, L.F.P.S.G.

ARMY MEDICAL DEPARTMENT.

18th November, 1876.

AN EXAMINATION of CANDIDATES for COMMISSIONS in the MEDICAL DEPARTMENT of HER MAJESTY'S ARMY will be held in London on the 12th February, 1877, and following days.

1. Candidates having two qualifications—one to practise Medicine, and the other Surgery—under the Medical Act, and who are not under 21 nor above 32 years of age at the date of the London examination, are eligible to attend.
2. Those gentlemen who may be selected for appointment will receive £250 per annum and allowances in addition after passing the examination at the Army Medical School at Netley.
3. The tenure of appointment will be limited to 10 years, and on the completion of that period of Commissioned Service, Surgeons, unless they be specially selected for further employment in the Department, will be entitled to receive, in lieu of all Pension on Retirement (Pension for Wounds excepted) the sum of £1,000.
4. Application for admission to the examination should be made in writing without delay to the Director-General of the Army Medical Department, London, by whom a printed Schedule, containing further particulars, will be furnished.
5. There will be 50 Appointments offered for competition.

(Signed) W. M. MUIR,
Director-General.

GENERAL NURSING INSTITUTE for TRAINED HOSPITAL NURSES.
5 Henrietta Street, Covent Garden, W.C.
A. EBSWORTH, F.R.C.S., Director.

SURGICAL SOCIETY of IRELAND.—The next Meeting of the Society will take place on Friday Evening, the 24th day of November, 1876.

Chair will be taken at Half-past Eight o'Clock, precisely.

By Order,
B. WILLS RICHARDSON, } Hon.
JOLLIFFE TUFNELL, } Secs.

Royal College of Surgeons,
20th November, 1876.

THE DENTAL HOSPITAL of DUBLIN.—For the Treatment of Diseases of the Teeth and Deformities of the Mouth, BERESFORD PLACE.

There is now established in Dublin an Hospital solely devoted to the Treatment of these Diseases, which will afford Gratuitous Relief to the Suffering Poor. Open daily from 9 till 10 a.m.

CONSULTING PHYSICIANS.

Thomas Hayden, Esq., Fellow and Vice-President of the King and Queen's College of Physicians in Ireland, and Physician to the Mater Misericordiæ Hospital.

George F. Duffey, Esq., M.D., F.K.Q.C.P.I., Physician to Mercer's Hospital.

CONSULTING SURGEONS.

Edward D. Mapother, Esq., M.D., Surgeon to St. Vincent's Hospital.

Henry Gray Croly, Esq., F.R.C.S.I., Senior Surgeon to the City of Dublin Hospital, Member of the Court of Surgical Examiners, Royal College of Surgeons.

DENTAL SURGEONS.

Mark J. Bloom, Esq.
Francis M'Clean, Esq., L.F.P. and S. Glasg.
John O'Duffy, Esq., M.O.S. Gt. Brit.
Frederick Ryding, Esq., L.D.S.R.C.S.E.
Henry Sherlock, Esq., L.R.C.S.I.

As the maintenance of this Institution depends solely upon voluntary contributions, the public are earnestly requested to consider its importance.

Subscriptions and Donations will be received by any member of the Staff, or may be lodged to the credit of J. H. Longford, Esq., Hon. Treasurer, in the Royal Bank, or any of its Branches. Hon. Secretary—John O'Duffy, Esq.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H. THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office.

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £40 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote.

Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,
W. O'NEILL, Secretary.

RESIDENT MEDICAL PUPIL (DUBLIN).—An M.D. Dub. Univ., and F.R.C.S.I., who is intimately acquainted with the method of medical education in Ireland, will receive a young gentleman to reside in his house, for whose education he will, if desired, make all arrangements. Apply by letter to SOCIUS, 23 Ely Place, Dublin.

The Medical Press & Circular.

ON THE VALUE OF JABORANDI AND GELSEMINIUM SEMPERVIRENS AS THERAPEUTIC AGENTS. (a)

By Thomas Stretch Dowse, M.D., F.R.C.P.E.,

Physician Superintendent Central London Sick Asylum, Highgate.

Jaborandi.—This plant belongs to the natural order, Rutacæ, of which four or five species are recognised—namely, the Pilocarpus Selloanus, P. grandiflorus, P. macrocarpus, and P. pinnatifolus, but that which yields the jaborandi of commerce is said to be the Pilocarpus Selloanus. It is a native of Brazil, and its botanical characters are minutely described by Martius in his work entitled "Flora Brasiliensis."

Senor Domingo Parodi, a Pharmaceutist in the Argentine Republic, gives an account of its properties in the "Revista Farmaceutica." It is generally used in that country for marsh fever, and the expressed juice is applied for the bites of poisonous reptiles. It was introduced into Europe some few years since, and was first used by Professor Gubler, of Paris, in the Beaujou Hospital.

M. Rabuteau then made a chemical analysis of the leaves, and stated that they have an odour due to a volatile principle, which is not analogous to the essential oils contained in aromatic plants, and that it has a bitter taste, due to a principle soluble in water and in alcohol.

M. Bryassou, in a paper in the *Repertoire de Pharmacie*, gives the result of his investigations into the chemical nature of this plant, stating that the active principle in jaborandi leaves is due to a viscous aromatic alkaloid—having an acrid bitter taste and capable on distillation of being carried over like nicotine by the vapour of water in the presence of ammonia, but I believe the credit of first isolating the active principle of jaborandi is due to M. Gerard, the teacher of Pharmacy to University College Hospital, who, at the suggestion of Mr. Holmes, gave to it the name of Pilocarpine.

There seemed to be some difficulty in isolating this substance in a state of purity unless in combination with one of the mineral acids (particularly nitric acid). The nitrate of pilocarpine was first used by Dr. Ringer, and produced effects similar to other preparations of the plant in doses of half a grain.

Of all parts of the plant the leaves appear to yield the largest amount of pilocarpine, although the bark from the stem as well as the roots are of some medicinal value. The pharmaceutical preparations are the infusion which may be made with hot or cold water (jaborandi leaves, (1½ dr., water, 1 oz.), and given in doses varying from 1 to 2 ounces every three or four hours. The extract may be given in doses varying from 3 to 10 grains every three or four hours. The alkaloid (nitrate of pilocarpine) in doses varying from ⅛th to ¼th of a grain.

Before considering in detail the therapeutic value of jaborandi, it will be essential to note its physiological action, which is of the utmost importance relative to certain principles laid down by physiologists in reference to vaso-constrictor and vaso-dilator branches of the great sympathetic nerve trunk.

In order to do this with some degree of precision, we must compare the action of jaborandi with that of belladonna, and we shall find that in essential particulars they are diametrically opposed to each other, hence it is fair reasoning to infer that each drug acts upon separate nerve fibres.

Belladonna dilates the pupil of the eye.

Jaborandi, when given internally, does not affect the pupil, but when it is applied to the conjunctiva it produces contraction of the pupil. Vulpian says, when injected into the veins, it dilates the pupil, which is due to the irritation originating in the viscera, especially in the gastro-intestinal canal.

Belladonna checks the action of the sweat glands of the skin, produces dryness of mouth, fauces, throat, and bronchial and pulmonary mucous surfaces.

Jaborandi excites profuse sweating, profuse salivation, lachrymation, and increases the secretion from the mouth, fauces, bronchial and pulmonary mucous surfaces.

(a) Read before the Harveian Society.

Belladonna excites delirium delusions and hallucinations by its action upon the brain.

Jaborandi has not been known to act in a similar manner.

Belladonna influences the circulation by the power which it possesses of inhibiting the pneumogastric nerve; it lessens arterial tension, and increases the action of the pulse.

Jaborandi has been said to lessen arterial tension and increase the action of the pulse, but this has not been my experience. It is also said to increase the flow of bile and pancreatic juice, but this even is doubtful. In very extreme doses it has been known to produce tetanic convulsions. Its influence upon the body temperature has given rise to considerable discussion; for instance, M. Robin, in *Gazette Hebdomadaire*, states that the temperature increases in ten or twenty minutes, rising from 37° to 39° or 39·8° centigrade. How M. Robin could find a rise in temperature equal to 5° or 6° Fahrenheit I am quite at a loss to understand, for in over 100 of my own recorded cases I have rarely found the temperature to vary more than 2 or 3-10ths of a degree. It is true that in some cases where the drug has produced vomiting, and in some so excessive that partial collapse has supervened, the temperature has been sent down one or two degrees.

The question now arises as to the action of jaborandi—in other words, the physiological or causative action.

How is it produced? Does it act upon the cerebral hemispheres, the spinal cord, the cerebro-spinal centres, or the vaso-motor system of nerves.

We have at present no evidence to show that the brain is in any way affected by it, neither can we prove that it influences the medulla or spinal cord otherwise than in poisonous doses, so that its power seems to be expended upon the vaso-motor system of nerves.

Its action differs altogether from pyrethrum and other sialogogues, for the action of these medicines is not like jaborandi, through the circulation, but by their influence on the mucous membrane of the mouth, and then by reflex action on the salivary glands. That jaborandi acts through the circulation and not by reflex action is proved by its re-secretion through the submaxillary gland. A patient of mine who was taking jaborandi, made the voluntary statement that if he was expectorating freely and did not perspire, all that he had to do was to swallow the saliva, and profuse perspiration followed. This fact of the secretion of pilocarpine from the blood by the salivary glands, appears to have escaped the attention of so careful an observer as M. Vulpian; and we shall see that it determines in a most marked manner the way in which this drug acts. M. Hardy made an analysis of the submaxillary saliva which M. Vulpian collected in one of his experiments on jaborandi, and found not a trace of alkaloid in it. He also made an analysis of the bile, and the result was negative. Hence M. Vulpian came to the conclusion that jaborandi did not act directly on the cells belonging to the gland by bringing on likewise vaso-dilator reflex adjutant phenomena as stated by M. Gubler, but that it acted on the secretory action of the gland in an indirect way, through the medium of the nervous system, and M. Vulpian's opinion was based upon the fact that M. Hardy's analysis gave no evidence of pilocarpine. Had he been aware of the result of my own experiment just narrated, he would probably have promulgated a different opinion. The same view holds good with regard to the action of jaborandi upon the sudoriparous glands, seeing that M. Vulpian has come to the conclusion that it does not act upon the secreting cells of these glands, it must act by paralysing the peripheric extremities of the sympathetic nerve fibres, which proceed to the sudoriparous glands, whilst atropia, on the contrary, excites those fibres. To quote M. Vulpian's own words, he says the sudoriparous glands must be looked upon as having a tendency to secrete continuously in the normal state. The sympathetic nervous system not only intervenes as a check, but it acts in a persistent manner, in variable degrees in restraining, moderating, or keeping down the secretory work of those glands. It is in a state of constant activity, which may be compared to the similar state of the nerve fibres which keep up the vascular tonica. The variations of this moderating tonic action of the sympathetic fibres proceeding to the sudoriparous glands, produce corresponding effects in the activity of the secretory work of these glands, a work which increases when the same action of the sympathetic fibres is relaxed. If the curb be tightened; that is, if the great sympathetic be excited, the secretion stops. If the check be relaxed or abolished, as, for instance, by cutting the great sympathetic, the sudoral secretion is increased. The action of jaborandi and atropia are actions of that nature. Jaborandi acts by paralysing the sympathetic fibres which innervate the sudoriparous glands, whilst atropia stops the perspiration by exciting these fibres. The following experiment of M. Vulpian's shows decisevly that jaborandi has a paralysing action upon the heart. An index was placed in contact with the heart of a dog (which had not been subjected to any drugging), through the thoracic walls, then forty grammes of water in which four grammes of pulverised jaborandi leaves had been infused, were slowly and carefully injected towards the heart.

By the aid of the index, the movements of the heart were seen to be agitated, become very irregular, and at the end of some seconds very much slackened, from 120 to 130 per minute, the numbers had fallen to five or six in the same space of time. Almost immediately, two centigrammes of sulphate of atropia in a solution of about fifteen grammes of water, were injected into the same vein by the heart. In less than half a minute the movements of the heart had regained their frequency and their normal condition, they even became more rapid than before the injection of the jaborandi. These facts are of considerable physiological interest, and I hope you will pardon me for occupying your time with them. So far we have seen that jaborandi acts very powerfully on the secretions, but especially upon the salivary and sweat glands. That it acts upon the liver and the kidneys, to the extent that some authors have ascribed, seems doubtful, and I look upon its action as purely mechanical, quite as much as that of a Turkish bath, or a hydragogue cathartic. In fact, jaborandi furnishes the means of obtaining at pleasure sweating and salivation to an unlimited extent; yet I am bound to make the statement from my own experience, that although it possesses such a decided physiological action, its influence as a therapeutic agent is of comparatively little worth, as I will now endeavour to show. There are, however, some exceptions which it will be well to bear in mind. Dr. Sydney Ringer's experience of the use of this drug is of great practical value, and the following description of two cases which were under his care are worth noting:—A lad was admitted into University College Hospital, poisoned by atropia, having taken one grain of the alkaloid five hours before treatment. His tongue and mouth were quite dry. A quarter of an hour after taking 30 grs. of jaborandi his mouth became much less dry, and in an hour he was sweating freely and his mouth was naturally moist. Belladonna, it is well known, arrests the secretion of milk, and jaborandi was administered to a patient to see how far it would promote the activity of the mammary glands.

Thirty grains of jaborandi were administered to a woman 38 years old, confined of her ninth child four months previously. During suckling she had very little milk, and the quantity had become much less of late. The medicine was administered to her at 10 a.m. She had suckled her child seven hours before. In ten minutes the drug produced its usual symptoms; in half-an-hour her breasts, which were previously flaccid, became tumid and distended, and on pressure yielded considerably more milk. In forty minutes the increase was still more marked, jetting forth in four or five streams. In eighty minutes the milk was less abundant though considerably more so than before the experiment.

It is remarkable that jaborandi like belladonna can be given in considerable doses without producing any very decided effect. Dr. Féréol, of the Maison Municipale de Santé, contributes an article on the use of this drug in the *Journal de Therapeutique*, and states that in some cases it possesses the property of diminishing the amount of urea; and M. Robin even goes so far as to say that in chronic Bright's disease it decreases the amount of albumen. I am right in stating that these results differ from those of myself and other observers. The late Dr. Laycock, of Edinburgh, stated that it was useful in decreasing the secretion of urine in cases of polyuria. I have tried to discover its value in this respect, but I have been disappointed. From what has been stated I think we are now in a position to inquire—

Can we cure disease or relieve pain by the administration of jaborandi or pilocarpine. To say that we have a specific in this drug is totally out of the question. In cases of rheumatism, articular or muscular, it certainly relieves pain, but it has little tendency to cure the disease. The following case is typical:—A. C., æt. 45, suffering from osteo-arthritis, with muscular rigidity, and unable to move a limb. He complained of aching tearing pains in the joints, for which he was ordered 5 grs. of jaborandi three times a day in mucilage. In the course of five minutes after taking the first dose he felt a burning heat in the head. This was succeeded in half-an-hour by profuse perspiration, and was quickly followed by profuse salivation. He then felt light and buoyant as though a load had been removed from him, and quite free from pain; there was profuse lachrymation for a few minutes. The temperature was carefully taken, but it varied only from 2·10ths to 6·10ths of a degree. The urine secreted in the 24 hours was increased for two days. This patient continued to take the jaborandi in increased doses for three months, until finally he was taking half a drachm of the extract three times a day. He states that it did him a great deal of good.

A. Baged, æt. 18, a pale-looking lad, with thick strumous lips, had rheumatic fever five years ago, associated with heart disease. On admission, under my care, he was suffering from sub-acute rheumatism and pericarditis. (I beg to call attention to the state of sub-acute rheumatism, where the blood was evidently charged with the rheumatic poison.) The joints were extremely painful, but only slightly swollen. The skin was covered with a greasy sweat, with the well-marked odour. The urine of high colour and scanty. It was evident that the rheumatic poison was centering itself upon the pericardium, and that there was no tendency on the part of the skin to eliminate it. His temperature was 103; pulse, 86; resp., 24. He was ordered 10 gr. doses of the ext. of jaborandi three times a day, with the usual effect of profuse salivation and sweating. This was on Sept. 5. On the 6th, temp. was 102 4-10ths; on the 7th, 100 3-10ths; on the 8th, 102 6-10ths; on the 9th, 100; on the 10th, 99 1-10th; on the 11th, 98 2-10ths, when the patient was convalescent. There is nothing exceptional in the recovery of this patient; but I am sure of this, at least, judging from my own experience, that it is in such cases as these that jaborandi will be found more useful than in any other, and especially in combination with free doses of the bicarbonate of potash and any other drug which might be required.

So it will be seen that I have little faith in jaborandi alone as a curative agent, yet as an adjuvant to promote elimination it will, I think, be of essential service. I have given it in cases of diabetes, where the skin refuses to act as well as in desquamative nephritis, and after scarlet fever, but it has failed to be of any signal service. Yet in chronic Bright's disease, associated with dry skin and painful joints, the sweatings produced by this drug certainly relieve pain, and reduce the articular swellings. The following case is typical:—Jane Atkinson, æt. 73, suffering from renal disease; urine pale, gr. 1010; albumen copious. Microscope showed—Hyaline casts, and fat cells; the action of the heart was irritable; dyspnœa troublesome; œdema of the base of lungs and extremities; mouth parched, and skin dry. She was ordered a pill of 5 gr. of the extract of jaborandi three times a day, with alkali and digitalis. Sweating, salivation, and lachrymation came on in the ordinary way, and she certainly improved rapidly. I might add that the joints also were swollen and painful. I thought at one time that we had a valuable agent in jaborandi to reduce the body temperature in phthisis, but further experience has taught me that it was fallacious. With this, gentlemen, I must conclude my remarks, merely stating that the action of this drug is of far greater interest to the physiologist than it is to the therapeutist.

(*To be continued.*)

PLEURITIS INFANTUM.

By H. Cripps Lawrence, L.R.C.P. Lond., &c.,
Honorary Physician to the North-West London Free Dispensary for Sick Children.

Pleurisy is a much more frequent affection than is generally evident in statistics, and a wide variation will be found as regards the age at which pleurisy may occur. Various too are the etiology and forms of the disease, and authors concur in stating that idiopathic pleurisy is rare in childhood as a primary disease. It is admitted, however, that the rarity is more apparent than real, and obscurity and diversity in the physical signs and symptoms may account for the presence of a pleuritis being overlooked. Primary pleurisy in infancy has been the subject of much contention, its rarity as stated by Bouchut being mooted by "Cælius Aurelianus, Aretæus, Triller, and Morgagni, was adopted by pathologists and transmitted to modern authors." Then followed physicians who regarded pleurisy as "impossible" amongst children. After this, pleurisy in childhood and infancy became duly ackowledged by Billard, Rilliet, Barthez and others.

It is necessary to distinguish two forms of pleurisy in infancy—one primary, idiopathic, involving inflammation of the pleura, which rapidly spreads over its entire surface; the second form is much more common than the preceding, and is virtually a symptom of some other affection to which it is secondary.

In this communication a few cases are recorded of idiopathic pleurisy occurring in the new-born infant.

Case I.—On December 15, 1873, Mrs. F., a healthy multipara, was delivered of a male infant at the eighth month. Labour normal to the third stage, when the placenta was adherent, requiring removal by the hand; the adhesion was due to a tough cartilaginous degeneration of the placenta; the funis was thick but unhealthy in structure.

The infant was healthy, but of feeble vitality; he, however, sucked the breast well, had normal evacuations, and caused no anxiety until 5 p.m., December 17, 1876, when he was seized with a convulsion, difficulty of respiration, with rolling of the eyes, clenching of the thumbs. At 8 p.m. I saw and found the infant in a convulsed state, head cool, fontanelle depressed, respiration 52 and shallow, circulation very feeble, lips livid, dysphagia, no cough or sneezing.

The right side expanded feebly compared with the left one, but complete examination anteriorly was postponed owing to the intense cold prevailing. Posteriorly less air entered the right than the left side. Rhoncus audible at the base of the left lung.

At 11.30 p.m. respirations less hurried and deeper, the right side expanded less than the left one, but this was less marked, probably than it would have been, for now the left lung was found to expand less fully than at the previous visit, and a pleural friction sound was distinctly audible at the base of the left lung anteriorly. The infant died at 7 a.m. the next day; no *post-mortem* examination was made.

Case II.—Mrs. T., mother of one child, and who had once miscarried, was delivered by me on December 10, 1874, of a male infant at full term. The placenta was morbidly adherent owing to morbid degeneration and required removal by the hand; the funis was normal. The infant, otherwise apparently healthy, was the subject of imperforate anus, owing to simple occlusion by membrane half-an-inch from the orifice; this yielded readily upon gentle pressure with the finger, after which the evacuations passed naturally.

The mother, who had never suckled her offspring, wished this infant to be fed with Swiss milk, which was given, properly diluted, in the bottle from birth.

At birth the infant seemed in good health, and for some days the evacuations were normal; the funis appeared healthy; food was taken well; no sickness occurred; sleep was natural.

On December 15th, five days after birth, the infant became restless in the evening, seemed in pain, and would not suck the bottle. The bowels being constipated, the nurse gave it a teaspoonful of castor-oil, which produced a healthy action.

On December 16th, at 3 a.m., a convulsion occurred, and as convulsions recurred I was summoned to see the baby. At 8.45 a.m. I found him strongly convulsed. Head cool, fontanelle normal, pupils moderately dilated, but sluggish to the action of light, marked carpo-pedal contractions, general stiffness of all the muscles of the body, and extremities alike; also well-marked trismus, but no opisthotonos or pleurothotonos; foaming visible at the mouth; the tongue and lips were livid; dysphagia evident, and attempts to swallow invariably induced a convulsion.

Respiration hurried, irregular in frequency, shallow and jerking, evidently causing pain.

The right side expanded less than the left one; a pleural friction sound was audible over the front of the right lung.

At this stage the treatment comprised a warm bath, mustard plaister over front of right lung, followed by linseed-meal poultices.

℞ Hyd. subchloridi, gr. ss. statim;
Sp. ammon. aromat., ♏. xx.;
Ex. lactis cyatho, ℥j. P. r. n.

The respirations became less hurried and the convulsions less marked.

At 2 p.m. I found the convulsions had been frequent, pupils dilated, eyelids contract forcibly on attempting to separate them; head cool; fontanelle normal; Marked trismus, with rigidity of the whole muscular system; dysphagia for some hours; bowels had not acted.

At 7.30 p.m., *funis separated normally this evening.* Able to swallow a little milk and brandy; inspiration causes evident pain, producing wry mouth; the carpo-pedal contractions continue; the trismus has been less marked and intermittent.

A distinct pleural friction sound was audible over the whole of the right side, anteriorly and posteriorly; a pleural friction sound also audible at the base of the left lung anteriorly. Less air enters base of right lung. An enema ordered to relieve the bowels, to be followed by nutrient enemata if necessary.

December 17th.—The convulsions continued with hurried respiration, occasional trismus and dysphagia until 1 a.m., when the infant died.

A *post-mortem* examination revealed general inflammation of the right pleura, with slight adhesion to the ribs, the right lung engorged at the base; commencing inflammation of the left pleura anteriorly. The umbilicus and umbilical vessels apparently normal and free from inflammation. No other parts were examined.

The probability of syphilis could not be established by any evidence obtainable from the parents, but after delivery an offensive lochial discharge occurred, and lasted for several weeks, coupled with a thickened and indurated condition of the anterior lip of the cervix uteri. In addition to this, the cartilaginous degeneration of the placenta suggest in syphilis a possible explanation of the character of the convulsions in the infant. There are other features, however, to which reference will be made hereafter, in relation to the etiology of the convulsions.

Case III.—Mrs. B., mother of one child, who was stillborn at the eighth month, was delivered by me on December 31st, 1874, of a female infant at full term, after a tedious labour. The placenta was healthy. The infant, though healthy, was placed under unfavourable circumstances; the mothers milk failed, extreme cold prevailed, and the birth occurred in a draughty room with several ventilators.

On January 10th, 1875, double pleuro-pneumonia occurred; counter-irritation followed by jacket; linseed-meal poultices subdued this, but exhaustion with anæmic convulsions terminated fatally on January 15th.

Case IV.—On February 3rd, 1875, an infant five months old was seen by me for the first time. In the previous intensely cold night the mother noticed the infant breathed hurriedly and with difficulty, and became blue and cold, At 12.30 noon on my arrival a severe convulsion (the first one) had just occurred, for which the mother had sensibly employed a warm bath, but feared the infant was dead. Upon examination the circulation was extremely feeble, respiration virtually *nil*, extremities cold and livid. Sinapisms restored animation somewhat, and upon auscultation a pleural friction sound was audible over both sides of the chest anteriorly. This condition of extreme collapse lasted for an hour, when life became extinct.

Remarks.—1st. In two of the above cases adherent placenta in the mothers, without concomitant symptoms, would not serve to establish a pyæmia origin for the pleurisy. Three of the four infants were of feeble vitality; in three cases a convulsion was the important and initial symptom; in the fourth (the third narrated) the convulsions were secondary to the lung attack, and symptomatic of exhaustion. Two infants were breast-fed, two nourished by cow's milk. In all the cerebral symptoms did not suffice to explain the initial convulsions which corresponded to a chill or rigor in the adult. The complication of trismus and persistent convulsions in the second case requires explanation—Were they attributable to syphilis? Or to cold? Or did the relief of the imperforate anus afford a traumatic origin for their occurrence?

2nd. The etiology of the above cases was to be found in the intense cold prevailing, which furnished the exciting cause, while a lowered vitality acted as a predisposing cause.

In cases of adherent placenta occurring in cold weather special provision should be made that the infant be protected against exposure to cold. Again, ventilators in lying-in rooms should be carefully closed in cold weather.

In two of the cases death was accelerated by the ventilators being unclosed.

3rd. No evidence occurred in any of the cases of inflammation connected with the umbilicus or umbilical vessels.

4th. In two cases a convulsion immediately preceded the detection of a pleural friction sound. The implication of one pleura after the other in two cases, in one of which congestion of lung was also speedily manifest, indicate how seriously rapid the nature of such inflammation is! and how, when both sides so soon become involved simultaneously, the respiration must become fatally embarrassed.

5th. The text-books in England regard pleurisy in the infant as very rare, one hinting that possibly some cases are overlooked. The occurrence of a convulsion probably misleads the practitioner as well as the friends to regard the brain rather than the chest as the seat of mischief.

Early inspection of the fully undressed thorax of the infant and *early auscultation* thereof will go far to render diagnosis exact.

6th. The cases narrated above illustrate the occurrence of idiopathic pleurisy in the new-born, and urge the necessity of prophylaxis against cold.

The pulse being so variable in the new-born, is of little prognostic value, and Wünderlich regards the temperature of little diagnostic value in pleurisy. Might it not aid the prognosis and the differential, if not the essential, diagnosis of pleuritis infantum ?

◆

THE ADULTERATION OF FOOD, AND BRITISH LEGISLATION RELATIVE THERETO.

By Dr. C. R. Alder Wright,

Lecturer on Chemistry at St. Mary's Hospital.

(*Continued from page* 415.)

The utterly absurd and wholly nugatory provisions of the Bill necessarily caused much adverse comment, not only in the daily press, but in the scientific journals, especially those from their nature most nearly connected with the subject ; deputations from the Society of Public Analysts waited on Mr. Sclater-Booth to represent to him the conclusions arrived at by the council of that Society after much deliberation and careful thought, and many suggestions made by them, by the *Chemical News*, *Times*, *Lancet*, and other papers, were duly taken into consideration ; and as the final result of this, the Bill was reprinted for commitment with many important alterations, in particular the "knowingly" being omitted, and many of the other points adverted to above being duly attended to ; during the debates in committee further alterations were made, the chief of which was the insertion of a proviso that, in case a further analysis of a sample should be required, the article should be referred to be analysed by the "chemical officers in the employment of the Inland Revenue," such reporting officers being liable, like the analysts under the Act, to be called upon to give their evidence upon oath and to undergo cross-examination. After the third reading in the House of Commons the Bill had assumed a very different form and bore a very different purport from that first presented by it. The following points illustrate most of the important changes made other than those of a merely formal character ; the alterations, saving omissions, are printed in italics ; the numbers of the clauses, too, are different from those in the draught bill :—

Clause 2. The term "food" shall include every article *used for food or drink by man* other than drugs *or water*.

3. No person shall mix, colour, stain, or powder, or order or permit any other person to mix, colour, stain, or powder, any article of food with any ingredient or material *so as to render the article injurious to health*, with intent that the same may be sold in that state, and no person shall knowingly sell any such article so mixed, coloured, stained, or powdered, under a penalty in each case *not exceeding* fifty pounds for the first offence ; every offence, after a conviction for a first offence, shall be a misdemeanour, for which the person, on conviction, shall be imprisoned for a period not exceeding six months with hard labour.

4. No person shall, except for the purpose of compounding as hereinafter described, mix, colour, stain, or powder, or order or permit any other person to mix, colour, stain, or powder, any drug with any ingredient or material *so as to affect injuriously the quality or potency of such drug*, with intent that the same may be sold in that state, and no person shall knowingly sell any such drug so mixed, coloured, stained, or powdered, under the same penalty *in each case respectively as in the preceding section* for a first and subsequent offence.

Clause 6, as originally drawn :—	Clause 5, as it now appears :—
No person shall knowingly sell any article of food or any drug which is not of the nature, substance, and quality of the article demanded by the purchaser, under a penalty of *twenty* pounds, except as herein excepted and provided ; that is to say, except—	No person shall sell to the prejudice of the purchaser any article of food or any drug which is not of the nature, substance, and quality of the article demanded by such purchaser, under a penalty not exceeding twenty pounds, except as herein excepted and provided ; that is to say, except—
Where any matter is mixed therewith for the purpose of rendering it portable, or of preserving it ;	Where any harmless matter or ingredient is mixed therewith for the purpose of rendering it portable or palatable, or of preserving it, or of improving its appearance, unless such matter is used to conceal the inferior quality of the article ;
Where a harmless ingredient is mixed with it for the purpose of rendering it palatable or of improving its appearance ;	
Where according to the usage of trade it is sold in a mixed state ;	
Where it is the subject of a patent in force, and is supplied in the state required by the specification of the patent ;	Where the article named is a proprietary medicine or is the subject of a patent in force, and is supplied in the state required by the specification of the patent ;
Where British, colonial, or foreign spirits are reduced from their ordinary strength by persons licensed and paying duties under the excise ;	
Where a drug is compounded either in conformity with a prescription of a registered medical practitioner or otherwise, according to the usage of trade ;	Where a drug is compounded as hereinafter described ;
Where the article is unavoidably mixed with some extraneous matter.	Where the article is unavoidably mixed with some extraneous matter in the process of collection or preparation ;
	Provided that no article shall be deemed to be within any of the exceptions above set forth, if the matter or ingredient mixed therewith shall have been added with intent fraudulently to increase the bulk, weight, or measure of the article.

6. No person shall sell any *compound article of food which is not composed of ingredients in accordance with the demand of the purchaser, under* a penalty not exceeding twenty pounds.

No person shall sell any compounded drugs except the same shall be compounded *in accordance with the demand of the purchaser, or with* the prescription in writing *of a* registered medical practitioner, or with the regulations prescribed by the British Pharmacopœia issued by the General Medical Council, or in Great Britain with a basis to be laid down by the Council of the Pharmaceutical Society of Great Britain, or the Privy Council, *or in accordance with the provisions of the Pharmacy Act*, 1868, *or in Ireland in accordance with the Act of the* 33rd *Session*, *Vic.* 34, *Chap.* 26, under a penalty not exceeding twenty pounds.

7. Provided that no person shall be guilty of any such offence as *aforesaid* in respect of the sale of an article *of food or a drug* mixed with any *matter* or ingredient not injurious to health, and *not intended fraudulently to increase its bulk, weight, or measure*, if at the time of delivering such article, he shall apply to the person receiving the same a notice, by a label *distinctly and legibly* written or printed on or with the article, *to the effect that the article is mixed*."

8 (9 of Draught Bill). "Knowingly" is omitted throughout, and the penalty increased to *twenty* pounds.

In the 9th Clause, providing for the appointment of analysts, the following has been added, "provided that no person shall hereafter be appointed an analyst for any place under this section who shall be engaged, directly or indirectly, in any trade or business connected with the sale of food or drugs in such place."

By the 11th Clause, a purchaser is entitled, on payment to the analyst for his district, under the Act, "of a sum not exceeding ten shillings and sixpence, or, if there be no such analyst for such place, to the analyst *of another place of such sum as may be agreed upon between such person and the analyst*, to have such article analysed by such analyst, and to receive from him a certificate of the result of his analysis." Of course such a certificate could readily be used as a trade advertisement, no matter how unwilling the analyst might be to have his name mentioned in connection with such practices; this single provision would effectually tend to prevent first-class chemists from taking appointments under the Act, even were there no other objections in their eyes.

17. The certificate of the analysis shall be in the form set forth, or to the like effect.

FORM OF CERTIFICATE.

To*

I, the undersigned, Public Analyst for the
do hereby certify that I received on the day of
18 , from†
a sample of for analysis (which then weighed‡), and have analysed the same, and declare the result of my analysis to be as follows:—

I am of opinion that the same is a sample of genuine,

Or,

I am of opinion that the said sample contained the parts as under, or the percentages of foreign ingredients as under:—

Observations §

As witness my hand this day of
A. B.,
at

---

* Here insert the name of the person submitting the article for analysis.

† Here insert the name of the person delivering the sample.

‡ *When the article cannot be conveniently weighed, this passage may be erased, or the blank may be left unfilled.*

§ Here the analyst may insert at his discretion his opinion as to whether the mixture (if any) was for the purpose of rendering the article portable or palatable, or of preserving it, or of improving the appearance, or was unavoidable, and may state whether in excess of what is ordinary, or otherwise, and whether the ingredients or materials mixed are or are not injurious to health. *In the case of a certificate regarding milk, butter, or any article liable to decomposition, the analyst shall specially report whether any change had taken place in the constitution of the article that would interfere with the analysis.*

21. The justices before whom any complaint may be made under this Act may, upon the request of either party, in their discretion cause any article of food or drug to be *sent to the Commissioners of Inland Revenue, who shall thereupon direct the chemical officers of their Department at Somerset House to make the analysis, and give a certificate to such justices of the result of the analysis; and the expense of such analysis shall be paid by the complainant or the defendant, as the justices may by order direct.*

24. If the defendant, in any prosecution under this Act, prove to the satisfaction of the justices or court that he sold the article in the same state as when he himself purchased it, and that he purchased it as the same article in nature, substance, and quality as that demanded of him, and with a warranty in writing to that effect, he shall be discharged from the prosecution, *but shall be liable to pay the costs incurred by the prosecutor, unless he shall have given due notice to him that he will admit at the hearing the matters charged against him in the information.*

25. Every penalty imposed and recovered under this Act shall be paid in the case of a prosecution by any officer, inspector, or constable *of the authority who shall have appointed an analyst or agreed to the acting of an analyst within their district, to such officer, inspector, or constable, and shall be by him* paid to the authority for whom he acts, and be applied towards the expenses of executing this Act, *any Statute to the contrary notwithstanding; but in the case of any other prosecution the same shall be paid and applied in England according to the law regulating the application of penalties for offences punishable in a summary manner, and in Ireland in the manner directed by the Fines' Act, Ireland,* 1851, *and the Acts amending the same.*

26. Any person who shall forge, or shall utter, knowing it to be forged for the purposes of this Act, any certificate or any writing purporting to contain a warranty, shall be guilty of a misdemeanour, and be punishable on conviction by imprisonment for a term of not exceeding two years with hard labour;

Every person who shall wilfully apply to an article of food or a drug, in any proceedings under this Act, a certificate or warranty given in relation to any other article or drug, shall be guilty of an offence under this Act, and be liable to a penalty of twenty pounds;

Every person who shall give a false warranty in writing to any purchaser in respect of an article of food or a drug sold by him, as principal or agent, shall be guilty of an offence under this Act, and be liable to a penalty of twenty pounds;

And every person who shall wilfully give a label with any article sold by him which shall falsely describe the article sold, shall be guilty of an offence under this Act, and be liable to a penalty of twenty pounds.

34. This Act shall commence on the first day of October, one thousand eight hundred and seventy-five.

35. This Act may be cited as "The Sale of Food and Drugs Act, 1875."

The chief difference between this Bill and the one of 1872 are briefly that, whilst the 1872 Act took for its basis the *Act of fraud*, this is ignored in the preamble of the later Bill. Under the 1875 Act no public analyst can be called upon to examine water. Mixtures must be accompanied by a label legibly printed or written, declaring the admixture (verbal declaration has been usually held by the courts to be required by the 1872 Act). The abstraction of any part from an article of food so as injuriously to affect its quality without the same being declared to the purchaser, is specially forbidden (in the 1872 Act this was not distinctly forbidden, though convictions have been obtained for skimming milk, &c., by straining this Act). Purchasers bring their samples direct to the analyst (instead of to the inspectors, &c.), and the analyst receives the sum paid (not the inspector who had to account for it to the authorities appointing him); the analyst also gives the certificate made out to the purchaser himself, and not to the inspector as formerly. Persons engaged in the sale of food and drugs are in future ineligible as analysts. An inspector purchasing samples has discretionary power as to whether he takes them to the analyst or not, instead of being compelled to take them. Medical officers of health and policemen may act as inspectors. Vendors refusing to serve samples to an inspector are liable to penalties. A defendant or his wife can be examined as a witness. An annual report must be made to the Local Government Board giving particulars as to the working of the Act in each district. A retailer of adulterated articles goes free on production of a warranty from the wholesale dealer, and the forgery of such a warranty is subject to heavy penalties. Fines go towards the working of the Acts.

Two other most important differences are the following: the mode of dividing samples under the new Act is different from that under the old, and, as explained above, is liable to abuse on the not impossible case of a corruptible official or other person being the purchaser; secondly, in cases of dispute Somerset House is made the reference, but it is not obligatory on parties to send disputed samples there, nor is it prescribed that the revenue analyst *must* attend for cross-examination (although such was the intention of the introducer of the Bill); nor is any special form drawn for his use, although one is prescribed for the public analyst.

Whether the new Act will be found in practice to be a more powerful repressant of adulteration than the older ones remains to be seen; but it seems at any rate clear that whilst in some respects it offers slight advantages to the general public over the older one, the main defects in the 1872 Bill which prevented that Act from being as beneficial as might have been hoped are uncorrected in the new Act, whilst some additional points render it probable that the highest class of chemists will be less likely than ever to accept appointments under the Act.

◆

Clinical Records.

KENT AND CANTERBURY HOSPITAL, CANTERBURY.

(Under the care of Mr. Wacher.)

Incised Wound of the Knee-joint. Union by the First Intention.

Reported by Messrs. S. J. Thomson and Rayley Owen.

A. H., æt. 11, was admitted August 15th, 1876, on account of a severe injury to the right knee-joint. The patient, a girl, the very picture of health, while at work in the harvest fields, five miles off, fell on to a scythe, which entered the right knee at an acute angle, passing upwards beneath the patella, the ligamentum patellæ being necessarily divided. On further examination, it was found that the joint had been completely cut into and exposed, the synovial fluid trickling out. Two fingers could with ease be introduced into the joint, the condyles of the femur being seen at the bottom of the wound, which extended right across the knee; the lateral ligaments had escaped injury. There was not so much bleeding as might have been expected, the popliteal vessels having escaped. Mr. Wacher, on seeing the case, determined to try and save the limb, and ordered the clots which had formed in the wound to be cleaned out, and the joint to be syringed with an injection of carbolic acid (1 in 40). The edges of the wound were then approximated with ease, owing to the "cleanness" of the cut, and five sutures applied. Only one small artery, presumably one of the internal articular branches, required a ligature. A pad of lint soaked in pure tincture of benzoin was applied under a pad of oil silk and cotton wool, the leg being then placed on a back splint. Tr. ferri perchlor., ♏v., in half an ounce of water to be given every four hours.

Aug. 16*th.*—There has been no bleeding, and patient had a good night; feels "quite comfortable." Temp., 99·8; pulse, 100.

17*th.*—Is progressing most favourably; wound looks healthy, and union by first intent has taken place. Tr. benzoin applied again. Temp., 99·4; pulse, 90.

18*th.*—There is evidence of slight suppuration to-day, due to the ligature acting as a seton: this with the sutures were therefore removed. Bowels regular; tongue clean. Temperature and pulse under 100.

20*th.*—Is much better, the threatend attack of suppuration having disappeared.

From this time the patient made uninterrupted progress to recovery; by the end of September there was only the cicatrix of the wound to be seen, and she was allowed to move about though not to bend the knee, which still remained rather stiff. At first the tr. benzoin was applied fresh every two days.

On October 10th a Hide's splint was applied, and she was discharged cured on October 24th, the injured knee being as good as the other, with the exception of a slight stiffness.

Remarks.—The success of this case was due to the following points:—

1. The wound was a clean cut, with no contused or jagged edges, which could in consequence be most perfectly approximated.

2. The fact that the child was in good health, and had not to contend against bad air.

3. The presence of the clots perhaps had something to do with the good results, as they prevented the entrance of air into the joint.

4. Importance must be attached to the antiseptic washing with carbolic acid, and then the wound being hermetically sealed with the tr. of benzoin.

◆

Transactions of Societies.

THE MEDICAL SOCIETY.

Nothing very remarkable occurred at the meeting of this Society on the 11th inst. Dr. Crisp showed some specimens of croupal membrane, and said that croupal membrane was always on the surface, while that of diphtheria extends into muscular tissue. This was a statement that was not likely to go unchallenged, and we are not surprised that Dr. Lawson and Dr. Semple were of a very different opinion.

The President, Mr. W. Adams, read a communication from Dr. John Ashurst, of Philadelphia, in which this gentleman said he had performed Mr. Adams's operation of subcutaneous division of the neck of the thigh-bone on the left side, and Mr. Gant's operation of subcutaneous section of the neck of the femur below the trochanters on the right side, on a child nine years of age, with anchylosis of both hip-joints. Although the case was one of the bad strumous kind, the result of the operation was beyond his expectations, and he hoped the child would soon be able to use crutches.

An adjourned discussion then took place on Dr. John Brunton's paper on Pelvic Hæmatoma. In that paper the author described three cases of the intra-peritoneal variety of this affection. One case terminated favourably, by a spontaneous opening into the rectum, by which the blood was discharged; another yielded to repeated doses of the spirits of turpentine, and the third ended fatally, although no signs of peritonitis were found after death. Dr. Brunton thought the diagnosis of these cases should rest on the suddenness and severity of the attack, and upon the absence of fever, and of increase in the temperature. The prognosis was always unfavourable, but a fair trial of the spirits of turpentine was strongly recommended. The hæmorrhage was probably of ovarian or tubal origin, or due to a rupture of enlarged or varicose vessels in the broad ligaments. Dr. Rogers and Dr. Routh had a high opinion of the utility of puncturing the rectum in these cases.

◆

EPIDEMIOLOGICAL SOCIETY.

The first meeting of this Society was held on the 8th inst., when a paper on the present condition of epidemiological science was read by the President, Mr. Netten Radcliffe. Mr. Radcliffe drew particular attention to the great importance to be attached to the discovery of the difference between typhoid and typhus fever, inasmuch as that discovery had exercised very great influence on the study of epidemiology. It showed that a due discrimination of disease led to successful research into its etiology, and in respect of epidemics, into the conditions of their prevalence. The method of investigation by which this discrimination had been made had governed all recent investigations of a like nature, although the older method, which attributed epidemics to telluric and atmospheric agencies, had not been given up. Mr. Radcliffe protested against the term *epidemic*, as well as to the terms *epidemic constitution* and *epidemic influence*, as various and fallacious meanings were attached to them, and he urged that it was time that the profession came to some agreement as to the proper use of these words. He animadverted upon the loose use of the word "epidemic," in the official Nomenclature of Diseases, and suggested that the word should be merely used in its literal sense, *i.e.*, "common to or affecting a whole people, or a great number in a community; prevalent; general" (Webster). Dr. Léon Colin, the professor of epidemiology at Val de Grâce, has truly said that "it is the disease which constitutes the epidemic, not the epidemic the disease," and therefore, in accordance with this view of the case, the successful study of epidemiology must depend upon that of the several diseases which are liable to become epidemic, and of the conditions upon which their prevalence depends. Mr. Radcliffe further insisted upon the great fertility of this method of research, as shown by the history of the small-pox epidemic of 1869-73.

The above is but a brief outline of Mr. Radcliffe's long and able address. Some of his observations were very full and exhaustive, and we regret that want of space forbids our giving a longer abstract of them.

◆

STATISTICAL SOCIETY.

The first monthly meeting of the present Session was held on Tuesday evening last, at the Society's Rooms, in the quadrangle of King's College, Strand, and was numerously attended. The President, James Heywood, F.R.S., in the chair.

After a long list of candidates had been unanimously elected Fellows of the Society, the President delivered his opening address, in the course of which it was stated that the Howard Medal for 1876-7 (with £20) had been awarded to Dr. J. C. Steele, Medical Superintendent of Guy's Hospital. At the close of the address, the medal referred to was presented to Dr. Steele, and the subject of the essay for next year's medal was announced. "On the Condition and Management—past and present—of the Workhouses and similar Pauper Institutions in England and Wales, and their effect on the Health, Intelligence, and Morals of the Inmates."

Afterwards Dr. F. J. Mouat, the Foreign Secretary, read a report on the International Statistical Congress, recently held in Budapest, to which several Fellows had been appointed delegates of the Society.

◆

DUBLIN OBSTETRICAL SOCIETY.

The thirty-ninth session of this Society was inaugurated on Saturday evening, October 18th, 1876, in the College of Physicians.

The President of the Society, Dr. **Lombe Atthill**, occupied the chair.

The **Hon. Secretary** (Dr. J. R. Kirkpatrick) read the report of the Council, which dealt with the business of the Society during the past session, stating that nine papers had been read. The report also announced the fact that the Society had lost seven members by death, and expressed regret at the loss the Society had sustained by the death of Drs. Ringland and Sibthorpe.

Dr. **Cranny** moved that the report be received and entered on the minutes. He congratulated the Society on its continued prosperity, and on the interesting nature of the papers that were read during the past session. Although there was much in the report for congratulation, yet they had to deplore the loss of so many members, one of them one of their most distinguished—an ex-President—Dr. Ringland—a man whose opinion they all looked up to with the greatest deference, and who used to enlighten their debates by his splendid oratorical powers.

Dr. **M'Cann** seconded the motion, and said it was pleasing to think that perhaps their branch of the profession had made more advance of late than any other, and also that of all places Dublin should be one of the places that should be foremost in [illegible] in any attempt at progress in obstetrics or gynæcology. [illegible]ame time, when one felt that, and looked back and [illegible] he would remember that the Dublin school had been in the van, even when the Rotunda Hospital stood alone, and of late years it had found a worthy rival in the Coombe Hospital. He was bound to say on listening to the report, that it could hardly fail to strike one that nine papers had been read before the Society at eight meetings, and that was hardly sufficient at all events to show a very ardent desire on the part of members of the Society to bring cases before it. That was due, he feared, to diffidence on the part of younger members, who feared bringing their cases imperfectly before the Society. He hoped that in future they would have an increased number of papers brought before the Society. The papers read were very good, but at the same time the Society was not advancing apace with the other branches of the profession.

The motion was adopted.

The **President** then read the Inaugural Address, when in his prefatory remarks he alluded to the great loss the Society had met with in the demise of Dr. Ringland, who was a most valued member of their Society (of which he was ex-President, and had taken a prominent part in their debates, and of Dr. Sibthorpe, who had been the respected treasurer of the Society. The President then proceeded to comment at length on the papers read during the past session on Obstetric Science, and concluded by expressing the belief that the past year had not been a barren one in the matter of research, and returning thanks to the members for the honour they had conferred upon him in having elected him President of the Society during the past two sessions.

The **President** then declared the result of the ballot as follows:—President, Dr. Thomas Darby; Vice-Presidents, Dr. T. More-Madden, Dr. MacSwiney; Treasurer, Dr. Roe; Secretary, Dr. J. R. Kirkpatrick; Committee, Dr. Denham, Dr. Johnston, Dr. Kidd, Dr. M'Clintock, Dr. Atthill.

The newly-elected President then took the chair, and briefly returned thanks for the honour that had been done him.

Dr. **M'Clintock**, in moving a vote of thanks to the outgoing President for his admirable address, as well as for the efficient and courteous manner in which he had discharged the duties of President of the Society during the past two years, said he was glad to accord his feeling of thankfulness, and was sure he re-echoed the words of all present to the College of Physicians for the privilege they had accorded to the Society for many years in allowing them to hold their meetings within their walls, with such comfort and satisfaction to the members of the Society. (Hear, hear.) They had all listened to the President's address with feelings of pleasure and satisfaction, and they all endorsed what he had said in such feeling terms of the loss which the Society had sustained by the death of Dr. Ringland. Though not a constant contributor to the Society, yet Dr. Ringland was a pretty frequent attendant, and when present, he nearly always took part in their debates, and he was one of those who never got up to speak that he had not something to say, and he could express his sentiments in remarkably clear and perspicuous language. Dr. M'Clintock then spoke of the most satisfactory manner in which the retiring President had discharged his duties, being seldom, if ever, absent from their meetings, communicating papers to the Society, and being always fully alive to what was brought under the notice of the Society by other members.

Dr. **Byrne** seconded the motion, and re-echoed what Dr. M'Cann said as to the desirableness of more material being provided for their discussions, but accounted for the scarcity of papers by the limited time at the command of gentlemen who followed their branch of the profession.

The resolution was adopted.

Dr. **Lombe Atthill** briefly acknowledged the compliment, and said he would yield to no man in his anxiety for the well-being of the Society.

Dr. G. H. **Kidd** moved, "That this Society desires to record a deep sense of the loss it has sustained by the death of Dr. Ringland, one of the earliest members of the Society, President during the session 1868-1869, and always a highly-valued and esteemed colleague, and they wish to express their sincere sympathy with his family in their bereavement." Dr. Kidd spoke in feeling terms of the many estimable qualities of the late Dr. Ringland; his anxiety for the welfare of the Coombe Hospital (in which institution he, Dr. Kidd, had been associated with him for upwards of thirty years); his solicitude for the sick poor, and his kindly, upright, honourable, and benevolent disposition, and his consideration for those who were entering the profession.

Dr. **Johnson** seconded the motion, and said that no praise could be too high for the memory of Dr. Ringland.

The resolution was passed by acclamation.

Dr. **Denham** said, that when he looked upon that meeting and remembered the immense advance this branch of science had made, he thought they had reason to be proud, and notwithstanding the fact that some high-minded females saw fit to leave the path of duty assigned to them to go forth to civilise the medical profession, he saw nothing to fear as to the result. The pleasant task had been accorded to him of moving, "That the thanks of the Society be given to the Lord Mayor, to the President of the College of Physicians, to the Governor of the Apothecaries' Hall, and to our other distinguished visitors who have honoured the Society by their presence."

Dr. T. **More-Madden** seconded the motion. In acccording the Presidents of the Colleges of Physicians and Surgeons their thanks, they were expressing their sense of the many obligations which their branch of the profession owed both to medicine and surgery, requiring as it did the accomplished tact of the physician combined with the operative dexterity and skill of the surgeon. Therefore, he thought they were under special obligations to the representatives of those two great corporations that fostered medicine and surgery in this country for honouring the Society with their presence, and for countenancing a branch of the profession which, although comparatively modern in its development to its present status, had achieved great things, and which, with the assistance and knowledge which it derived from medicine and surgery, might hope to do much more for the cause of suffering humanity.

The motion was carried.

The **Lord Mayor**, as an old member of the Society, expressed the pleasure which it afforded him to be present.

Dr. **Kidd** (President of the College of Surgeons) said, he was very proud of being there as the President of the College of Surgeons, being, as he was, an humble working member of the Society. It was not the rule to treat practitioners in midwifery with the respect they were treated with in Ireland, and it was not new to Ireland to do so. Dr. M'Clintock had put it on record that nearly a century ago the Irish College of Surgeons elected Dr. (afterwards Sir Henry) Jebb—who was then professor of midwifery—as their president. At that time the College of Physicians did not treat midwifery with so much respect. They thought a professor of midwifery was unworthy of admission to the license of the College, and a great falling out—if he might use the expression—occurred, a great strife took place between the College of Physicians and the University of Dublin on that account. Mr. (afterwards Sir) Fielding Ould presented himself at the College of Physicians to be admitted to the examination for licentiate, but the College thought he was unworthy of it as being a midwifery practitioner, whereupon the authorities of Trinity College examined him themselves and admitted him to the degree. The College of Physicians were so indignant at that that they broke the compact existing between them and Trinity College, and determined forthwith to have no communication with it, at all events, refused to examine any one sent from that college. But a change had taken place since then, and now they not only admitted practitioners in midwifery to be licentiates but made them Fellows and even presidents.

Dr. **O'Flaherty**, on behalf of the Apothecaries' Hall, and Dr. Croker King, P.L.I., on the part of "the Visitors," also responded.

The Society then adjourned.

In view of the expected epidemic of small-pox in London, a special meeting of the Marylebone Vestry is to be called to take into consideration the provision which at present exists for the isolation and treatment of the disease.

Another victim to a "quietner" died last Thursday, at Blackburn, in the person of Mary Hartley, wife of John Hartley. The deceased bought some cough medicine from an herbalist, took a dose and died immediately afterwards. A *post-mortem* examination has been ordered.

WEDNESDAY, NOVEMBER 29, 1876.

THE SANITARY EDUCATION OF THE PEOPLE.

Undoubtedly one of the brightest features in the civilisation of the nineteenth century is the large share of attention that is given to the improvement of the public health. There have been times when nations which have become politically great, and which have been distinguished for their success in arms abroad, or in their cultivation of the arts of peace, have been nevertheless in a most deplorable condition as respects the social and sanitary condition of their people. But the change which has taken place in the manners, in the habits, in the diet, in the dwellings, in the household comforts, and in the health of the most civilised communities of the present day, forms one of the most remarkable pages in their history. And the contrast between the present and past social condition and health of different societies is the greater the further we go back in their respective annals. Erasmus, when on a visit to England in the time of Henry VIII., ascribed the sweating sickness and the plague by which London was continually ravaged to the poor and wretched state of the houses, the filthy condition of the streets, and the "almost inconceivable sluttishness that prevailed within doors." Dr. Heberden, also in his work on the "Increase and Decrease of Diseases," written about the middle of the eighteenth century, ascribed the great plague of 1665 to similar causes as well as to the want of water and ventilation, while he attributed the extraordinary increase of health which had taken place since that period to the improved sanitary condition of the population, to their greater love of cleanliness and ventilation, and the various improvements which had been made in their dress and diet. But perhaps the change which has taken place in the health of the community within the last fifty years is tenfold as great as that which took place in the two centuries which elapsed between the age of Erasmus and that of Heberden, and perhaps the next century may witness a population whose health is as great an improvement upon what we now enjoy as the latter is upon that which prevailed a hundred years ago.

If, however, we do fail in reaching that millennium of health to which many sanitarians are looking forward, it will not be for want of perseverance, or because they neglect any means by which their object may be attained. Another instance of the impetus that is being given to public sanitation is the commencement of a popular series of lectures on the laws of health, of which we gave a brief notice in our last issue. The lectures were initiated by the Trades' Guild of Learning, in conjunction with the National Health Society, and they were inaugurated with a certain amount of *éclat* that was, perhaps, out of proportion to the results which may be reasonably expected from them. On the delivery of the introductory lecture, the large hall of the Society of Arts was so full that many could not find seats. Dr. Corfield, the able professor of hygiene and public health at University College, was the lecturer; while the chair was occupied by Professor Huxley, a gentleman who is always ready to assist in any work in which his favourite science is laid under contribution.

As we observed last week, these lectures will leave a good impression upon the minds of those who have attended them, but the question of popular sanitary teaching is of so much importance, and the object in view is unquestionably so commendable, that we are apt to overrate the influence which such a series of lectures would have upon the sanitary condition of the people. The object of these lectures is, as Professor Huxley said, to demonstrate in popular language the laws of health, and to "drive a sense of their value home to the minds of all persons, and especially the working classes of this country." The course is to consist of twenty lectures, half to be devoted to anatomy and physiology, half to hygiene proper.

No one will deny that it is highly desirable to spread among a people an elementary knowledge of the laws of health. The legislature, in conjunction with the profession, has done much, from a public point of view, to improve the sanitary condition of our large cities, and of the people generally; but as regards the individual maintenance of health, much must be left to people themselves. There is personal hygiene as well as public hygiene; and how a knowledge, as well as how the importance of the former can be best brought home to the masses is certainly a problem well worthy of our consideration. That there is ample need for such instruction, is only too palpable to all who have visited our poorest and most crowded districts. For notwithstanding the great change that has taken place in the drainage and water supply of towns, the filth, the overcrowding, the intemperance, and the "almost inconceivable sluttishness," that are still to be found in whole districts of our large cities, is quite as great, if not greater, as that which prevailed in the time of Erasmus. But when we consider that the people in whom it is desirable to initiate a sanitary reformation consist of large communities, to be numbered by hundreds of thousands, we at once see how very limited must be the effects of lectures that are given to a mere roomful of people, consisting for the most part of the more respectable and orderly members of the labouring classes, to whom the scientific part of the course and the eminence of the lecturer, are probably the chief attractions.

What we want to do is to reach the very core of that festering portion of society which is such a hideous feature in our social system; and to attain this object, popular lectures on hygiene must be only one, and that a comparatively insignificant, means to be resorted to. The general education of the masses, the prevention of overcrowding and of a surplus population by emigration and other legitimate means, the improvement of pauper and artisans' buildings, and, above all, the education of the rising generation in habits of thrift and cleanliness—these are among the most widely influential means by which we may hope to impress upon the working classes the importance of attending to the laws of public and personal health.

One great drawback to a *course* of lectures which is intended for the working classes, is that the lecture room is naturally filled with the same audience every night, and consequently after the completion of the course only an infinitesimal portion of the classes for whose especial benefit they are given derive any advantage from them. Whereas, if one good lecture were frequently delivered in those districts where such lectures are most wanted, a fresh audience would be obtained on each occasion, and thus the great facts dealt with by the lecturer would, after the lecture had been repeated twenty or thirty times, become directly or indirectly familiar to a large portion of the district in which it was delivered. It is also worthy of consideration whether such lectures might not be supplemented by other measures; whether, for instance, a hint might not be taken from the Religious Tract Society, and a series of "Tracts on the Laws of Health," printed and disseminated among the people. A tract headed "Cleanliness next to Godliness," or "The Advantages of Soap and Water," might vie in its beneficial results with those, the headings which are of a far more awful significance.

As we have already mentioned, fully one-half of these lectures are to be of a purely scientific nature, but we confess to a doubt in the propriety of that principle on which a working man is not expected to obtain an elementary knowledge of the laws of health, unless he has previously attended a series of lectures on anatomy and physiology. The causes of half the mortality in this country are very few in number, as may be seen from the last Annual Report of the Registrar-General, and from those special reports on the spread of epidemics which have been published on the authority of her Majesty's Privy Council. Filth, in all its forms and manifestations; exposure to cold and wet; overcrowding, and the breathing of impure air; insufficient, improper, or badly cooked food; sedentary and other unhealthy occupations; and, lastly, the great and destructive vice of intemperance—these are the source of nearly all the diseases which now afflict the human race. As a contemporary writer has well observed, the chief foes of health and of human life are not so much subtle and mysterious poisons, which defy the curiosity of science, but open enemies, against whom all but the poorest can take easy measures of precaution.

The great requirement of the age, therefore, in a hygienic point of view, is to battle with the large amount of preventible disease which still causes so much havoc among all classes of the community; and to do this, not so much by giving to a select audience a few scientific lectures, but by bringing home to the masses, through such channels as we have pointed out, a knowledge of the chief preventible causes of disease, and how to avoid them. A thorough acquaintance with the laws of health, based upon a knowledge of anatomy and physiology, must be necessarily confined to a very small portion of the poorer classes of this country. To reach the great bulk of the people other measures must be adopted, and to this end, perhaps, a short catechism on the laws of health for the use of our pauper schools, or short tracts distributed broadcast among the inhabitants of our more thickly-populated districts, would be of more service to the cause of public health than the most elaborate lectures.

◆

THE IRISH COLLEGE OF SURGEONS AND THE ARMY MEDICAL DEPARTMENT.

The Council of the College have at their meeting last week given utterance to a very important protest against the existing system of administration of the Army Medical Department. They have resolved with unanimity

"That the President and Council of the Royal College of Surgeons in Ireland feel it incumbent on them to call the earnest attention of her Majesty's Government to the low estimation into which the Medical Department of the Army has fallen in the opinion of the Irish student, and to express the conviction of the President and Council that, under the present system and existing regulations, able and efficient men are deterred from entering the Army Medical Department."

This expression of opinion should be received with all the more respect when it is remembered that it emanates from the executive of that College which has hitherto contributed more largely than any other to the ranks of the Army Medical Service, and has up to the present refrained from interfering in the free choice by the student of his destination in professional life.

That the Council has now spoken out with so much force may be taken as a proof that the *status quo* has become so objectionable—so unfair to the individual—so injurious to the public service, and so unjust to the medical profession, that the College feels itself called upon to sacrifice its own money interest to the public advantage.

Day by day the Army Medical Administration becomes more and more intolerable—the service more unattractive—its personel lower in grade, and more discontented—its numbers scantier—its popularity with the soldier less and less—and with the clang of the war trumpet ringing in our ears the most important non-combatant service of the country is found to be disorganized and inefficient to the last degree.

Should Parliament be obliged to take the matter out of the hands of Mr. Hardy and Sir William Muir, it can hardly hope for a reform of the system, without placing some officer more efficient and less subservient in the place occupied by the Director-General. Under his regime the progress of the military medical service has been steadily, continuously, and rapidly downward.

For much of its decadence, Ministers or Horse Guards may be mainly responsible, but for the whole of it the Director-General is partially blamable, for he has sacrificed the efficiency of his department and the just rights of his officers to his anxiety to "keep square" with the great people of the army service. At no epoch of its history has the Queen's medical service been so unpopular with students as at the present moment. No one in Dublin talks of the "competitive" (?) but a few of the under stratum of students, who cannot muster even the influence necessary to achieve a country dispensary at £100 a-year, and if the popularity of the A.M.D. should wane with its present speed, we predict that the examiners at the February competitive will have light work to do.

◆

Notes on Current Topics.

Cæsarean Section.

On Monday last (Nov. 27), before the Medical Society of London, Dr. James Edmunds read a paper, entitled "A Second Case of Cæsarean Section in which the mother and child survived." The operation was performed at the London Temperance Hospital, on Oct. 8, 1876, and the patient with her child left the hospital on the twenty-third day. No alcohol was administered. Dr. Edmunds's former case is recorded in the Medical Circular for Jan. 9, 1861. In performing the operation, Dr. Edmunds was assisted by Mr. S. W. Sibley, Dr. Routh, Mr. M. A. Lamb (the patient's medical attendant), and Dr. S. L. Smith. The discussion was upon the treatment of the uterus and other practical points. The subject is one of much importance.

Medical Society of the College of Physicians of Ireland.

The Council of the Society has added to its bye-laws a rule which opens the membership of the society to all medical diplomates of universities or colleges of physicians or surgeons. Practitioners who keep open shop for the sale of medicine are not eligible. The College of Physicians has endorsed the admission of licentiates of other bodies to the Faculty by throwing open the College reading room to its members.

The Royal Society Medals.

The "Copley Medal" of the Royal Society has been this year awarded by the Council to Professor Claude Bernard, for his contributions to the science of physiology. The "Rumford Medal" has been awarded to M. Janssen, for his researches respecting the radiation and absorption of light, chiefly carried on by means of the spectroscope. Also a "Royal Medal" has been awarded to Sir C. Wyville Thomson, for his successful direction of the scientific investigations carried on in connection with the cruise of the *Challenger*. The medals will be presented at the Annual Meeting of the Royal Society on the 30th inst.

Spurious Tea.

In compliance with an application made at the Mansion House, by the Solicitor to the City Commissioners of Sewers, Sir Robert Carden made an order for a large quantity of bonded "tea," estimated to amount to 40,000 lbs., to be destroyed by fire. The evidence showed that it had been in bond for about nine years, and Dr. Saunders, the Food Analyst for the City of London, certified as to its unfitness for food, some of it being putrid, some partially exhausted, some mixed with sand, and some with 20 per cent. of dried olive leaves.

Army Medical Duties in Dublin.

We see by a contemporary that a new scheme for the re-distribution of medical duties has emanated from the Horse Guards. The vaccination of the men will be performed at the station hospitals. The medical officer in charge of the Female Hospital and his assistant are allowed extra forage for the purpose of affording medical aid to the staff, and women and children of the garrison as at other large stations, where the system is stated to work without difficulty. From the scheme noticed by our contemporary it has become evident that the barrack and hospital will be the units of medical relief, by which means frequent removes of medical officers will be obviated, and considerable expense saved to the public. The smaller stations will be in charge of civilians.

Intoxication by Subcutaneous Injection.

At Southsea, recently, an inquest was held upon the body of Mrs. Frampton, wife of a lieutenant and adjutant in the Royal Marine Light Infantry.

Deceased's husband deposed that his wife was 25 years old, and that in 1871, previous to giving birth to a child, she suffered greatly from sickness. A surgeon, to alleviate this, used morphia by the hypodermic method, always injecting the solution himself. Sometime since, deceased assured him she had entirely given up the use of morphia. On the previous Thursday he found the deceased suffering from convulsions. She grew worse and died the following morning. Since her death several bottles had been found in her wardrobe tied up in a parcel and secreted, together with five or six small cases each containing a hypodermic syringe.

Mr. Cruise, pharmaceutical chemist, said that at first he refused to serve the solution, but on reference to his junior assistant he was informed that Mrs. Frampton had been frequently supplied with the solution. In August, September, and October, he supplied nine bottles each month, the last being on the 30th ult.

Dr. Norman described the state he found deceased in, and stated that when Mr. Norman and Dr. Jackson were called in they discovered on the upper part of both arms, a large number of old scars, which they were informed were the result of hypodermic injections five years ago. There were no recent marks about the arms, but upon both thighs there were a large number of similar marks, and also several marks of recent punctures. Around some of these latter there was a redness of the skin in different stages, and one particularly had the appearance of having been made within twenty-four hours. He was of opinion that Mrs. Frampton died from tetanus, caused by the punctures made in the thighs for the purpose of injecting solution of morphia. He had been shown three syringes, of which were in a dirty condition, apparently not having been wiped dry after using. The steel needles were in a very rusty state, which would be likely to set up inflammation.

The jury returned a verdict to the effect, "That the deceased died from tetanus, or lock jaw, caused by inflammation arising from punctures made by the deceased herself, for the purpose of subcutaneous injection of solution of morphia."

Pseudo-Specialists.

Specialism, says the *New York Record*, in the mind of the medical student, is always associated with pecuniary success. Naturally he is inclined to tack his capabilities to some particular organ of the body as soon as he possibly can. Consequently, when he graduates in medicine he commences the special study at once. In order, however, that there may be some tangible reason why he should be entitled to take his new departure, why he should seem to have more than the usual opportunities for fitting himself for his specialty, he seizes the convenient pretext of "brushing-up" abroad, and being an attaché to some foreign clinic. In the course of a few months, during which an occasional article from his pen appears in the medical journals, he comes home laden with all the glittering armoury of his assumed rank. Next, if he has friends, he is appointed as summer lecturer to some of the medical colleges, and at once appears as an authority in his chosen branch; is careful to speak in "open meeting" at every opportunity, and advertise himself as a specialist on the slightest provocation. No discussion bearing even remotely on his branch is considered complete without his opinion or his suggestion, and it becomes generally known that he must carry his pack wherever he goes. These are what may be called pseudo-specialists, and we are sorry to say that they are becoming quite numerous.

To rightly appreciate how ridiculous are the pretensions of the pseudo-specialists, to whom the *New York Record* refers, it is necessary to recollect in what the process of "Brushing-up" abroad consists. As long as the competitor for a special reputation—who may probably have thereby scraped through his examination in general education a few months before he sets off on his travels—confines his experiences to London, Edinboro', or Dublin, he does well, and if he keeps his eyes and ears open, will in time acquire some right to a character for special knowledge. But experience or teaching at home is not what the public believes in, and, therefore, not what the pseudo-specialist wants, and having little money to spend, and much need to be earning fees as soon as he can—he gets through the home hospitals and schools at a double quick trot, and flies off to Paris, Vienna, Leipzig, Utrecht, and Berlin. In nine cases out of ten he possesses the barest smattering of French, and no German at all, and the rapid colloquial lectures of the surgeon at the bedside are utter blank-darkness to him. He sees as much of the methods of continental teaching as will enable him to talk wisely when he gets home. He gets a glimpse of the patients over the shoulders of a crowd, and knows the appearance of the Gamaliel, to sit at whose feet he has crossed the seas, but as to the vernacular spoken by his teacher, or the views which he utters, not a syllable is comprehended. A week in France, three days in Holland, ten in Germany, and a fortnight in Vienna, and our specialist is marked with the indispensable brand of a continentally educated new light of the profession, and is in a position to sit down quietly and begin the study of his specialty at the neighbouring hospital, and upon the vile bodies of pauper patients. If he be discreet, success is assured, but if he allows the public to forget that he has made the grand tour, his opportunity is hopelessly lost. He must, therefore, take care never to treat or operate by an old method—never to call anything by a common English name, and, above all, never under any consideration, quote an old author or one of his own countrymen. A little clipping from a foreign journal, abundantly garnished by German synonyms, and with copious foot references to continental books and periodicals (which he never saw, and could not read if he did), will catch customers much more surely than any experience or views of his own, and if he only can let it be undersood that he differs in opinion from every other of his specialist competitors, dresses himself *à la* Leipzig, and is fortunate enough to have a queer sounding name, fortune is at his feet—*Populus vult decepi et decipiatur.*

The Fourpenny System.

The kind sympathy evinced by the profession in our defence *re Betts* is, we are glad to observe, shared by at least one of our medical contemporaries, *The Examiner*, the editor of which came boldly forward in its last issue to express his opinion of the righteousness of our cause, and his sympathy with our loss. We reproduce his own words, at the same time tendering our thanks that journalistic jealousy has not been allowed to stand in the way of expressing an honest conviction.

"Dr. Jacob, the writer of the article, appeared in court, and testified that he had no personal knowledge of the plaintiff, and wrote solely out of consideration for the good of the profession and the public. He testified, too, to his honest belief that valuable medicines could not be retailed at a commercial profit on such terms, and spoke of hospitals where he knew the drugs to be a heavier item of the expense. Other evidence was also tendered to show that hospitals expended more than fourpence per case on drugs. But in spite of this, and of the eloquence of the counsel, the jury decided against our contemporary, and so, we presume, it may be considered dangerous to declare that no one can profitably practise medicine at rates which nearly all medical men find to be impossible. We confess to some surprise that Mr. Betts finds the fourpenny rate remunerative; we are still more astonished that he was able to bring forward witnesses to testify to the same effect. We could not ourselves take an oath that we have learned to practice so economically, and we believe thousands of our brethren are equally ignorant. Considering the great discovery Mr. Betts has found, it would have been more generous on his part to refrain from fining our contemporary for hesitating to credit his financial ability, and too strongly expressing its doubts. Further, considering the poverty of the profession, it would be a charity if some of those in the secret would make known the exact mode of making money out of fourpenny practice. When we look at all the expenses of education and establishment in practice, at the rents, rates, and taxes, and other demands that attend civilised life, and the cost of keeping up the position of a professional man, we confess we regard the more usual ideas of professional remuneration as by no means exaggerated. Still, the British juryman has shrewd ideas on matters of trade, and it may be that one mind is warped by the prejudices of professional education. A British jury differs in opinion from us, and we are not prepared to abandon our faith in our national institution. The jury has not told us how it is to be done, and pending that important item of the information, we should advise our readers to refrain from the rash experiment of reducing their own fees to fourpence, or endeavouring to fathom the final mysteries of getting a living on such terms."

The Prince of Wales and Hospitals.

His Royal Highness is eminently practical; he has always been ready to take the chair at meetings, and to speak earnest words, in behalf of hospitals. But he has done more—he has given large sums towards the maintenance of existing institutions or the building of new ones. Last week we again find him coming forward with word and work, enlisting also the sympathy and practical assistance of others.

The Norfolk and Norwich Hospital is found to be too small for the claims upon it; and upon this fact becoming known to His Royal Highness, he attended a county meeting at Norwich for the purpose of raising the sum of money required for the enlargement and improvement of the Institution referred to; giving at the same time a donation of £240. This was backed by Lord Leicester (the Lord-Lieutenant) with £5,000, the Duke of Norfolk £1,000, Messrs. Gurney, Birbank, Barclay, and Buxton, £5,000, Mrs. R. P. Clark £1,000, Messrs. J. and J. Colman £1,000, Mrs. Dashwood £1,000, the Rev. Sir E. Jodrell £1,000; in all £15,210, in eight sums only. In addition to the above, the Lord-Lieutenant of the county has promised to invest £13,000 for the support of the hospital, provided a further sum of £23,000 is promised from other sources.

The Conjoint Examination Scheme for Ireland.

We last week noted the fact that the Conference Committee of the University of Dublin and the two Colleges had decided upon a scheme of conjoint examination for Ireland. The following is the text of the propositions agreed upon:—

SCHEME FOR A CONJOINT EXAMINATION

Proposed by a Joint Committee appointed by the Provost and Senior Fellows of Trinity College, Dublin, the President and Fellows of the King and Queen's College of Physicians in Ireland, and the Council of the Royal College of Surgeons in Ireland.

Resolutions.

1.—That it is expedient to form a Board for Conjoint Examination in medicine, surgery, and midwifery, which shall be constituted of examiners appointed by Trinity College, the College of Physicians, and College of Surgeons.

2.—That it is expedient that none of the corporations cooperating in this Scheme should confer any of their qualifications upon any candidate who has not previously passed the examinations of the Conjoint Board, unless such candidate shall be already on the Medical Register.

3.—That it is expedient that a committee of reference be constituted, consisting of two members appointed by each of the three corporations, and that it should be the duty of committee of reference—

(*a*) To determine the number of examiners to be assigned to each subject at each examination.

(*b*) To arrange and superintend all matters relating to the examination, in accordance with regulations approved by the three corporations.

(*c*) To consider such questions in relation to the examinations as they may think fit, or such as shall be referred to them by any of the three corporations, and to report their proceedings to all the said corporations.

(*d*) To bring under the notice of the three corporations any dereliction of duty on the part of any examiner.

4.—That it is expedient that all medical students availing themselves of the Conjoint Examining Board should pass the same preliminary examination in arts previous to presenting themselves at any of the professional examinations of the Conjoint Examining Board.

5.—That the examination should consist of English, Greek, Latin, arithmetic, algebra, and geometry.

6.—That the examiners in each court should be appointed in equal numbers by each of the three corporations.

7.—That no student should be admitted to any of the professional examinations of the Conjoint Board until he has completed a curriculum of study to be agreed upon by the three corporations.

8.—That the previous medical examination should consist of four parts, viz.:—

a. Botany and materia medica.
b. Physics and chemistry.
c. Anatomy.
d. Physiology (including histology):

and that students should be required to pass in each of the parts separately.

9.—That a student should not be allowed to attend either of the first two parts of the previous medical examination earlier than the close of his first year of study; and that he should not be allowed to attend either of the last two parts of the previous medical examination earlier than the close of his third year of study.

10.—That the subjects for the final professional examination should include—

a. Medicine, clinical medicine, medical pathology, and therapeutics.
b. Surgery, clinical surgery, surgical pathology, and therapeutics.
c. Midwifery and diseases of women and children.
d. Forensic medicine and hygiene.

11.—That a student should not be allowed to attend the final professional examination earlier than the close of his fourth year of study.

12.—That the courts of examiners should consist of three examiners in each of the following subjects, viz.:—

a. Arts.
b. Botany and materia medica.
c. Physics and chemistry.
d. Anatomy.
e. Physiology.
f. Medicine.
g. Surgery.
h. Midwifery.
i. Forensic medicine.

13.—That each examiner should hold office not longer than three years in succession; and that the examiners should go out of office in succession, one in each year, and not simultaneously.

14.—That no member of the committee of reference should act as examiner under the Conjoint Scheme.

15.—That professors and lecturers in the universities and medical schools should be eligible for the post of examiners under the Conjoint Scheme; but that no person engaged in private tuition should be eligible for any such office.

16.—That the fee to be charged for the preliminary examination in arts should be one guinea.

17.—That the fees to be charged for each part of the previous medical examination shall be four guineas.

18.—That the fees to be charged for the final examination should be fourteen guineas; and that after payment of the expenses of the professional examinations, the surplus remaining should be divided between the Colleges of Physicians and Surgeons in the following proportions, viz.:—*Three-eighths* to the College of Physicians, *Five-eighths* to the College of Surgeons.

19.—That candidates who have paid the above-named fees, amounting in all to thirty guineas, and have passed the examinations of the Conjoint Board, should be entitled, without additional payment, to the license of the King and Queen's College of Physicians, and to the license of the Royal College of Surgeons in Ireland, provided that the candidates shall have complied with the regulations of the respective bodies.

20.—That inasmuch as Trinity College does not share in the distribution of the surplus left, after deducting the expenses of the examinations; that her graduates and undergraduates in arts should be admitted to the professional examinations, on payment of fees, sufficient to cover the expenses of the examinations, viz.:—to the previous medical examination on payment of one guinea for each subject, or four guineas in all; and to the final examination on payment of five guineas, such graduates and undergraduates not being entitled to the licenses of the Colleges of Physicians and Surgeons without an additional payment of twenty-one guineas.

21.—That the following curriculum of study should be required of candidates desirous of obtaining license to practise medicine and surgery through the Conjoint Examination.

Candidates shall be required to produce documentary evidence—

(1.) Of having studied at any recognised medical school or schools, the following subjects for the periods specified, viz.:

Practical anatomy, with demonstrations and dissections: for three winter sessions.

Anatomy and physiology: for two winter sessions; or anatomy and physiology: for one session; and institutes of medicine, including a practical course, for one session.

Botany: for three months.

Chemistry: for one winter session.

Practical chemistry, with instruction in the laboratory: for three months.

Materia medica: for three months.

Principles and practice of medicine: for one winter session.

Principles and practice of surgery: for two winter sessions.

Midwifery: a course of not less than fifty lectures.

Medical jurisprudence: for three months.

(2.) Of having attended a recognised clinical hospital for twenty-seven months, during which regular courses of clinical instruction are delivered.

(3.) Of having attended practical midwifery at a recognised lying-in hospital, or maternity, for six months, and conducted ten cases of labour.

22.—That inasmuch as the foregoing scheme, if carried out, without an alteration of fees, would involve a diminution in the emoluments of the teachers of anatomy and surgery, the committee are of opinion that this result should be guarded against, by fixing the fees in anatomy and physiology, and in surgery, at five guineas for the first course, and four guineas for the second course.

It will be observed that the university has made very liberal concessions in order to make the scheme applicable to the colleges and to the views of the profession. It has consented that all candidates for its degrees shall be submitted to the conjoint examination, that the preliminary examination which under the former proposal was entrusted solely to Trinity College, shall now be relegated to a joint court appointed in equal proportions by each of the co-operating bodies, and lastly, that the diploma fees shall be divided solely between the colleges, the university taking no share.

Hospital Sunday.

ALTHOUGH the Hospital Sunday movement has been steadily gaining ground throughout the country, the success which has attended it is by no means so great as was expected, or at all commensurate with the wants of those institutions for whose benefit it was started. There can be no greater proof of the instability of the fund, and of the great falling off that has taken place, and may be expected to take place, in the receipts at different places, than the very unsatisfactory results of the collection in one of the largest and most wealthy towns of England, in which, seventeen years ago, the movement first originated.

In the year 1859, observes the *Birmingham Evening Mail*, which witnessed the starting of Hospital Sunday, something approaching a feeling of excitement was experienced in Birmingham at the birth of that which has now become a national movement, and the result was that the first collection realised an amount which was not equalled for fourteen years afterwards, the average yield of the early years being about £4,000. "Seventeen years have passed; Birmingham of to-day has doubled in importance; it is no longer an unwieldy mass of houses and factories; its main streets are no longer mean thoroughfares, nor are its suburbs contracted or disjointed. Its artisans are now well-to-do citizens, its middleclass has within reach luxuries which but the few formerly enjoyed. House rents and the cost of living have almost doubled, and numberless carriages a now crowd our streets where once a well-appointed 'turn-out' gained recognition. But with all this advance, we fail to note a corresponding improvement in Hospital Sunday." Our contemporary goes on to say that so far from the Birmingham Sunday hospital returns being a source of satisfaction, there is relatively a great falling off in support. "We are quite aware that times are bad,' and that 'trade is quiet,' but when amateur shopkeepers can extricate with ease a couple of thousand pounds from bazaar frequenters for articles of a *bizarre* description, we venture to think that this same cloak is being donned somewhat too frequently. . . . . . . Briefly, Birmingham does not fairly fulfil the duties of sponsor to the child of its adoption."

It is to be feared that Birmingham will not be the only town which will have cause to complain of a falling off in that charitable zeal which characterised the inauguration of this fund. That the success of the movement in this metropolis is by no means in proportion to its great wealth, is generally acknowledged, and there can be no doubt that unless they continue to be largely supplemented by the subscriptions and donations of the governors and subscriers of our different hospitals the returns will add very little to the resources of these institutions.

"Vaccination and Revaccination."

"Such is the cry," observes the *Lyon Médicale*, "raised by all the eminent physicians who are desirous of putting an end to the ravages of small-pox. It is easy to cite thousands of cases where persons who were attacked with the plague were precisely those who had never been vaccinated, or also vaccinated at a very early age, and neglected revaccination. It will be sufficient to draw attention to a remarkable fact related by Dr. Cuignet at one of the last meetings of the Central Society of Medicine in the northern department. "With regard," he says, "to the influence of revaccination as a means of preventing small-pox, I will point out to you the peculiar situation in which the soldiers of the Parisian Guard were placed, as it is only among them that revaccination is frequently and carefully practised. For the last seventy years we have not met with a single case of small-pox, in spite of the epidemics which have on various occasions decimated the most populous districts of Paris. In Algeria, on the other hand, where vaccination—and especially revaccination—is rarely practised, the ravages from small-pox are very considerable."

The Artisans' Dwellings Act.

Mr. Cross appears to be indefatigable in urging upon the local authorities of large towns the necessity of their giving all the attention in their power to sanitary improvement. A few days ago, in the course of an address which he delivered at Birmingham, he again referred to the above Act, and to the measures that had been recently adopted to improve the sanitary condition of the poor. Nor could a better place have been chosen for directing attention to the provisions of that Act. We have in another part of this journal incidentally alluded to the great change which has taken place within the last twenty years in the social and sanitary condition of that great manufacturing town, and we are glad to see that its Town Council has lost no time in taking advantage of the Act. Most of their meanest thoroughfares and fever dens have been swept away, and replaced by commodious and well-drained residences. They have, in fact, set an example that might well be followed by our own metropolitan authorities, especially when we consider the deplorable condition of the drainage of some districts in London.

We must not, however, expect too much at once, particularly from Town Councils and district Boards. As Mr. Cross said, sanitary legislation must necessarily advance, and with it the gradual abolition of all those conditions which are at the foundation of half the preventible diseases.

"Who's to Blame?"

We have been prevented noticing until now this useful little pamphlet. It is published by the Society for promoting Legislation for the Control and Cure of Habitual Drunkards, and it tells a tale which brings out in a striking manner some of the points introduced in the "Dipsomania" question. A story is told of a man whose career of habitual drunkenness at last terminated in murder, for which he underwent the extreme penalty of the law, and it shows how this man, who is no imaginary character, might have been reformed at one period of his life, and made a useful member of society, had there been some reformatory in which he could have been legally detained for a sufficient length of time to admit of his insane propensity to drink being conquered. There can be no doubt that short terms of imprisonment have, in these cases, proved a great failure, and we wish the society every success in its endeavours to bring about some alteration in the law by which the habitual drunkard is, after a few days' incarceration, turned out into the streets to renew his old habits, and gradually become a hopeless and incorrigible drunkard.

The Irish Vaccine Institution.

We understand that the abolition of the Dublin Cowpock Institution, which we announced last week had been decided upon, will take place from the conclusion of the financial year in March next. The grant of £400 a year hitherto made through the Dublin Hospital Board, will be vested in the Local Government Board for Ireland, and will be increased to whatever sum the Board finds necessary. The house in Sackville Street, which has hitherto been the head-quarters of the Cowpock Institution, will continue to be occupied for the same purpose, and Dr. Sinclair, the present secretary, will have the chief administrative position in the supply of lymph.

Now that the Cowpock Institution may be said to be deceased, we need have no hesitation in saying that the public and profession will gain much by the new arrangement. The Institution has been somewhat starved by the Treasury, and the small grant which it received was not made the best use of. The superior management of the Institution has always been antediluvian and somewhat obstructive, and it has consequently for many years been altogether behind the requirements of the country.

Apropos of the disestablishment of the Institution, we venture to point out that the present vaccination law, though fairly effective on the whole, greatly needs codification and improvement in detail not only to make it more efficient in its public use, but more practicable and fair for the public vaccinators. We understand that the Irish Medical Association has been in communication with Mr. Meldon, M.P., who identified himself with the subject in the last Parliamentary session, and is preparing a bill which will have for its object to introduce into the Irish vaccination system those parts of the English Bill which seem suitable to the requirements of the country, and those amendments which experience has shown to be necessary. We hope to be able to lay the draft-bill before our readers.

Micrography in Hospitals.

Last year the "Assistance Publique," of Paris, in conformity with the request of the professors of the various hospitals, established at La Charité a micrographic laboratory where special apparatus is provided for the study of the constituent elements of morbid tissues. The *Journal de Connaisances Medicale* learns that, on the memorial of Dr. Besnier, of the Hôpital St. Louis, a complete laboratory is about to be established in that hospital for micrography. The laboratory, which will be placed in the courtyard close to the large amphitheatre, will be brilliantly lit and well ventilated, and will be furnished with the most approved apparatus for the microscopic study of skin affections. The plans and estimates have already been passed by the superintending committee, and will be shortly submitted to the municipal council.

The Next Vice-Presidency of the Irish College of Surgeons.

There has been considerable interest manifested as to the next election to the Vice-chair of the College, in consequence of the circumstance that the Fellow who may be elected will be called upon to entertain, as President of the College, the British Association for the Advancement of Science upon its visit to Dublin in 1878. Mr. Smyly has announced that he will seek the honour, and we are authorised to state that Dr. Mapother, who is now one of the senior members of the Council who have not yet occupied the Chair, will not present himself for the vice-presidency until the election of June, 1878.

Her Imperial Highness the Duchess of Edinburgh was delivered of a daughter on Saturday last. Dr. Playfair telegraphs from Malta that the Royal patient and child are doing well.

On Sunday night a man, named Wagstaff, of St. Neots, Hunts, amused himself by cutting out the tongue of a horse which was found at the bottom of the stable on the following day, the mutilated organ having no less than five separate incisions, showing the number of attempts which had to be made before the revolting deed could be carried out. A warrant for the apprehension of the savage is out against him.

The next meeting of the Pharmaceutical Society of Great Britain will be held on Wednesday evening, December 6th, 1876, at half-past eight precisely. The following paper will be read: "A new mode of making Grey Powder." By Mr. A Bottle, of Dover.

A sad case of accidental poisoning is reported in Leeds. It appears that Margaret Conway, the wife of a fishmonger, went to Mr. Manfield, chemist, Kirkgate, Leeds. The assistant told her to call again in a quarter of an hour, and on returning he handed her a bottle of tincture of strychnine, made up for Dr. Birchall, instead of the mixture he had made up for her. The woman took a dose, and died in about two hours in great agony.

The examination of candidates for commissions in the Army Medical Department will be held in London on 12th February, 1877, and following days. The advertisement contains the announcement that those gentlemen who may be selected for appointment will receive £250 per annum and allowances in addition, after passing the examination at the Army Medical School at Netley, and that the tenure of appointment will be limited to ten years, and on the completion of that period of commissioned service surgeons, unless they be specially selected for further employment in the department, will be entitled to receive, in lieu of all pension on retirement (pension for wounds excepted), the sum of £1,000. There will be fifty appointments offered for competition. For the Indian Medical Service there will be twenty-seven appointments.

We hear, on good authority and with surprise and regret, that the honour of knighthood will be conferred at the undress levee of his Grace the Lord Lieutenant of Ireland on the mayors of Cork and Belfast, the Lord Mayor of Dublin, Dr. Owens, being unaccountably and, in our opinion, unjustifiably passed over. Whatever may be the social or public claims of the gentlemen whom the Viceroy contemplates distinguishing, we venture to say that they are, in no respect, superior to those of Dr. Owens, who not only is a member of a gentleman's profession and of untainted reputation, but has discharged his duties as chief magistrate with perfect success and efficiency. Whatever reasons may actuate the dispensers of vice-regal honour, the public will be of unanimous opinion that the Lord Mayor of Dublin is subjected to a slight which he has in no respect deserved.

The Mortality of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were:—In Calcutta 24, Bombay 25, Madras 32, Paris 31, Brussels 27, Amsterdam 25, Rotterdam 23, The Hague 29, Copenhagen 21, Stockholm 23, Christiania 21, Berlin 26, Hamburg 24, Breslau 24, Munich 33, Vienna 24, Buda-Pesth 34, Rome 24, Naples 24, Turin 20, Alexandria 47, Brooklyn 17, Philadelphia 20, and Boston 18. The fatal cases of typhoid fever in Paris were 150, against 59 and 171 in the two preceding weeks.

BETTS *v.* "THE MEDICAL PRESS AND CIRCULAR."

THE "MEDICAL PRESS" DEFENCE FUND.

We experience much gratification in the knowledge that we are considered to have deserved the sympathy of the profession by the course we have adopted in this matter. We have received many communications, verbal and epistolary, from gentlemen of influence in the profession, expressive of their approval, and tendering us their help in the circumstances in which we are placed. We transfer but four of these letters to our columns, and take the occasion to say that we value the support of our medical brethren as highly as we do because we are well aware that their sympathy would not be given to us if we had placed ourselves in the position by an intemperate or personal attack on any individual, and we recognise in their expressions of approval their feeling that we have done our duty, and vindicated the profession against the practices condemned.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The action of Betts against the Medical Press and Circular is a matter which deeply concerns every one engaged in the practice of medicine. Indeed, it is as much a public as a professional duty to come forward on the present occasion in your support. Permit me to say, therefore, that I entirely concur in the opinion expressed by Dr. Greene in your last week's issue. An effort should at once be made to defray every farthing of the costs you have been put to in your praiseworthy attempt to uphold the dignity of the profession. From a long personal knowledge of hospital work, I most conscientiously believe with you that it is an utter impossibility "*to furnish a patient with a mixture* (containing the minimum dose of the drug) *lasting two days for 4d. and make a profit*," which shall enable any man to live and pay rent and taxes. Be this as it may, we must all sympathise with you in the unflinching performance of a duty to the profession and the public.

You will permit me to offer my guinea towards the contemplated fund, which I have no doubt will be cheerfully raised in so good a cause. I would take the liberty of suggesting the formation of a small committee for taking whatever steps may be necessary to attain the object.

I remain, Sir, yours faithfully,

Bedford Square, London, Jabez Hogg.
Nov. 24th, 1876.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have just seen with much regret that in the recent law proceedings against The Medical Press and Circular an adverse verdict has been pronounced, thereby entailing on you a heavy pecuniary loss.

I hope all my professional brethren, in unison with myself, feel that in your having thus rendered yourself liable for the payment of a large sum of money, you were merely acting in that full and fearless independence with which your journal has, through a long series of years, manfully defended the rights of our profession, and for our common good strenuously endeavoured to redress the wrongs thereof.

To Poor-law medical officers I would simply say you now have an opportunity—a thoroughly deserving one—of giving practical expression to your appreciation of the many services rendered to you by The Medical Press and Circular, and whilst I thus address these sentiments to the poor-law medical department as well as the profession in general, I will ask you, Sir, to accept the enclosed one guinea towards the object herein expressed.

Your faithful servant,

Frank J. Davys, B.A.,
Lic. and Fellow Royal Coll. Surg., &c., &c.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Never in my lifetime have I paid a sovereign with more *bongré* than at present, when I send you one towards your law expenses in the Betts *libel* case, and I hope the entire "profession" will look upon the case as their own. A country practitioner, living "remote from towns," I still, unfortunately, know a good deal about "cheap doctors," and their system, and what I do know enables me to state that the system is most injurious to patients and doctors alike.

With the doctors the first consideration is to catch as many three-pences as possible, and if these come in regularly their mission seems to be fulfilled. But of the general results of such practice, as far as the treatment of disease is concerned, the Registrar-General would be the best qualified to speak.

Among the majority of the working classes any man who calls himself a doctor is taken upon his own *ipse dixit*, and anything in the name of "physic" is deemed good enough, especially when put into bottles and duly *labelled and shaken*. In my district (a large mining one in the north of England) I am almost entirely surrounded by *doctors* who attend and "physic" whole families at the remuneration of sixpence a fortnight. I do not do so, but, on the contrary, I charge from three-and-sixpence to a guinea for visits, according to the distance travelled, and the social condition of the patient, and my lowest fee for midwifery is a guinea. This being so, a stranger might think my services would not be in much demand, but on the contrary, my neighbours benefit me.

From my own drug accounts I may most reasonably conclude that these cheap doctors *neither do nor can* give their patients medicines suitable to their complaints, and thus the evil of the system reacts in time upon themselves.

I am, truly yours,

A General Practitioner.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—I regret to see in your issue of the 22nd that the trial of this case has resulted in a verdict for nominal damages, but involves, no doubt, considerable law costs, and having read the publications which gave rise to the action, I fully concur with Dr. Greene's suggestion, that your spirited attempt to uphold the dignity of the profession and the welfare of the public should be recognised. I am aware that there are many who sympathise with you who would gladly subscribe towards defraying the expenses of the trial, and that such a movement only requires to be set a-going to be supported. To those who feel as I do in the matter, and desire to co-operate in raising a fund for such a purpose, I venture to offer my services, and to say I shall be happy to receive the names and contributions of subscribers in Ireland, and form a Committee to carry out this object

I am, dear Sir, yours faithfully,

John H. Chapman, L.K.Q.C.P., L.R.C.S., &c.

60 Pembroke Road, Dublin.

We have already received several contributions to the Defence Fund, of which, with those received subsequently we shall give a list in our next issue.

Correspondence.

DIPLOMAS IN STATE MEDICINE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—It is now near time that the Irish Colleges of Physicians and Surgeons bestirred themselves in reference to the supplying of the want deeply felt, namely, a diploma in state medicine. A large number of sanitary officers anxiously desire such an evidence of ability and learning to be granted in Ireland. There are about one thousand medical men in this part of the kingdom entrusted with the due carrying into effect of the provisions of the Public Health Act of 1874, and of this large staff, we would venture to assert, that not a dozen could display diplomas to prove the fact that they had either been educated or examined in sanitary matters. No doubt in many instances, it is not the fault of the sanitary officers, as the majority are licentiates of one or both the above colleges, and under existing regulations have no opportunity of qualifying in sanitary science; unless graduates of Trinity College none else in Ireland can obtain such, and the senate of Trinity will not open its doors to any except graduates, although a noble example of liberality in this respect has been set by the University of Cambridge.

This being the state of sanitary affairs here, is it one bit surprising that sanitary boards so persistently and deliberately, all over the country, ignore the recommendations of their respective sanitary officers. Indeed, we are only surprised that any respect is paid to suggestions on sanitary matters, as although the general public do not know the relative values of degrees, diplomas, or licenses, yet they readily enough conclude that a man without a diploma does not deserve the same respect and attention to be paid to his recommendations as to one who holds such, and this is especially the case in Ireland. Again, as the sanitary boards have only the recommendations of the medical officer to guide them, as to the order they should make regarding the abatement of nuisances, the construction of structural works, &c., in cases of these kinds, where a heavy outlay would be entailed either on themselves or on their constituents, we think that the Board would in such a case be only too willing to shelve the report, and get out of the difficulty by saying—as has happened over and over again—that the sanitary officer would make them bankrupt before long, and that he does not know a great deal about what he suggests. The consulting officer is in a worse plight, as rarely does the Board consult him on sanitary matters, and for the very same reason.

The possession of a diploma would at any rate give its possessor a *status*, and in a measure compel the sanitary authorities to accord a fair amount of respect to the opinion or recommendation of their sanitary officer, and for these reasons, if for no other, we are greatly astonished the authorities of the colleges have not long since endeavoured to meet so palpable a want, and maintain the dignity and position of their licentiates.

If we are correctly informed, the only objection raised against granting this diploma rests on the fact that it could not be registered. If this be so, it is a lame excuse, and one that Trinity College might have put forward when first it granted a qualification in state medicine, besides the Medical Council mulct the profession of quite enough without such a charge being added to swell their income; and the mere fact of its being registerable would not enhance its value one iota in public estimation.

English and Scotch *sanitary officials* are amply provided by their respective colleges in this respect, and we cannot understand why the profession in Ireland should be left out in the cold, unless indeed our college counsellors are so deeply imbued with the principles of the one portal system, and despise the filthy lucre, and so prefer driving those who are anxious to possess a diploma in this subject over to either Cambridge or Edinburgh.

I have anxiously watched for some move being made in this direction, ever since the Health Act came into force, and, we are sorry to say, watched only to be disappointed.

We trust, however, now that attention has been called to the want, that one or other, *or conjointly*, the colleges will at an early date provide the means of conferring a diploma, even although it cannot be registered at present. Probably, if they did so, in a few years the privilege they seem to desire could also be obtained. The diploma in state medicine of Trinity could not at the beginning be registered, until Government passed a bill during the late session of Parliament, empowering the Medical Council to register it as an additional qualification.

I am, Sir, yours, &c.,

An Irish Sanitary Officer.

ALCOHOLICS AT THE INTERNATIONAL MEDICAL CONGRESS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In an interesting summary of the work of the late Medical Congress at Philadelphia in the Medical Press of November 8, I note the following passage:—"As one of the signs of the times we may notice that a communication was received from the National Temperance Society, inviting a declaration to the effect that alcohol should be classed with powerful drugs, that it is in no sense a food to the system, and that total abstinence be recommended to the several nationalities represented! We need scarcely say that this very ingenious invitation was politely declined. The Congress committed itself to no such declaration. The communication was simply tabled."

On the other hand, I find in the *Temperance Record* of October 12, 1876, the following statement:—

"From the other side of the Atlantic we learn that the medical uses of alcohol were considered at the International Medical Congress which recently assembled at Philadelphia. The subject was brought before the Congress at the request of the National Temperance Society, whose president, the Hon. W. E. Dodge, received the following official reply:—

"'Philadelphia, Sept. 9, 1876.

"'Dear Sir,—I am instructed by the section on Medicine, International Medical Congress of 1876, to transmit to you as the action of the section the following conclusions adopted by it with regard to the use of alcohol in medicine, the same being in reply to the communication sent by the National Temperance Society:—1. Alcohol is not shown to have a definite food value by any of the usual methods of chemical analysis or physiological investigation. 2. Its use as a medicine is chiefly that of a cardiac stimulant, and often admits of substitution. 3. As a medicine it is not well fitted for self-prescription by the laity, and the medical profession is not accountable for such administration or for the enormous evils arising therefrom. 4. The purity of alcoholic liquors is in general not as well assured as that of articles used for medicine should be. The various mixtures when used as medicine should have definite and known composition, and should not be interchanged promiscuously.

"'Very respectfully, your obedient servant,
"'J. Ewing Mears, M.D.,
"'Secretary of Section on Medicine, International Medical Congress.'"

"The important propositions embraced in this communication were embodied in a paper by Dr. Hunt, which was formally approved by the whole congress, and not merely by the section in which it was read."

Knowing that you are anxious to keep your readers accurately informed as to medical affairs, and as your columns are largely read in the United States, I ask you to give publicity to this letter, in order that we may see which of the statements is untrue.

Yours faithfully,
James Edmunds, M.D., M.R.C.P.

5 Savile Row, W., London, Nov., 1876.

[The statement to which Dr. Mears refers was taken from one of the reports on which our article was based, We thank Dr. Mears for his communication, and are glad to hear that the Congress did reply to the invitation of the National Temperance Society, but that in doing so they did not recommend total abstinence to the several nationalities represented.—Ed. M. P. & C.]

◆

ROYAL BOUNTY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—With your permission, I purpose inviting attention to an item in connection with a triple birth case which I recently attended, and which may not be altogether out of place.

I need hardly mention that I am fully aware of the humanity, benevolence, and kindness of the entire medical profession in all cases where suffering and poverty are concerned. But yet certain opportunities of doing good may pass unnoticed by the young practitioner, which, if embraced, might be the means almost of establishing his reputation.

Now, in the case I have just referred to, one of the children lived only a few seconds after birth, and therefore the thought of obtaining the royal bounty for the mother, Mary Ann Rainey, could not be entertained.

Rainey's house and family presented all the appearance of real poverty, *et propter hoc.* I thought it my duty to make the circumstances of the case known to her Majesty the Queen, whose generosity at all times claims our most marked approval. It was evident that one pound to this poor woman would prove as valuable as fifty to any one occupying a professional position. Consequently, *jacta et alea*, I wrote to Major-General Henry Frederick Ponsonby, the Queen's private secretary, on behalf of the mother, and on the 11th inst. I was gratified at receiving a post-office order from the Queen for the sum of two pounds. It can be well imagined how agreeably surprised Mrs. Rainey was when I announced to her the tidings, and put into her hand a gift from the highest personage in the world.

My only apology for thus trespassing upon your valuable space is that I believe the above, notwithstanding its insignificance *per se*, is worthy of imitation, for the medical man will find numerous opportunities in the various departments of his profession of showing to the public his anxiety for those placed under his care, and by this means he will consolidate confidence and heighten esteem.

Yours, &c.,

H. McHarry, L.R.C.S.

Belfast, November 17.

◆

INDIAN ARMY MEDICAL PAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—As a difference of opinion exists on the subject, perhaps you may be able to inform me will those medical officers who have joined the British army *subsequent to the issuing of the late Warrant*, be entitled to Indian pay if sent out to India ?

Yours, &c., M.D., &c.

[Medical officers who have joined the British army subsequent to the issuing of the late Warrant, are entitled during their first term of service in India to the scale of pay granted by the Warrant, and the allowance of a lieutenant. This sum in the aggregate is somewhat less than what they would receive if employed at home during the same period. If the officers ranked as captain instead of lieutenant, they would have a higher rate of pay while serving in India.—Ed. M. P. & C.]

◆

ANTI-VIVISECTION FOLLY.

The Dublin Anti-Vivisection fanatics outstrip their prototypes of England in want of principle and wicked folly. With persons who cannot be reached by argument and remonstrance, plain speaking is necessary. They have been guilty of deliberate misrepresentation and falsehood in stating by public placards that vivisection is practised in Dublin hospitals, and this with the object of checking the flow of public charity towards the Hospital Sunday Fund—a crime which disentitles them to be treated with the consideration due to ladies and gentlemen. Following up this proceeding, they have addressed the following letter to all hospital surgeons :—

"Sir,—I am desired by the committee of the Irish Society for the Abolition of Vivisection to request you will favour me with your views on that subject, and whether you approve of or oppose the practice ? I would candidly say the information is sought with a view to publishing (as is being done in England) the names of non-vivisecting doctors. The favour of an early reply is earnestly requested, and the non-receipt of one will be considered as in favour of vivisection.—(Signed by order).—Faithfully yours, Alice M. Swifte, Hon. Sec. Irish S.A.V.

"Whitechurch Lodge, Rathfarnham, Nov. 1876."

This is a piece of impertinence which no surgeon who respects himself would condescend to notice, and we hardly think that there is one who will purchase the patronage of the anti-vivisectionists by submitting to such an inquisition. We can hardly feel annoyance at such proceedings when we recollect that these fanatics are playing the game of the most rabid vivisectionists much more effectively than all the medical journals together could do. They are making their sentiments, which, though foolish in practice, are humane in principle—odious in the sight of even the most moderate thinker, and one thus educating the public up to close its ears against their frantic howling.

Dr. Brown-Sequard delivered, at the Irish College of Physicians, since our last issue, a series of those interesting and erudite lectures on Anæsthesia, Amaurosis, and Aphasia—the last being delivered on Monday last. The learned lecturer visited Dublin on the invitation of the Medical Society, and the large hall of the College was crowded by the leading members of the profession in Dublin. Dr. Brown-Séquard devoted these addresses to the disproof of the theory of the localization of special functions in special parts of the brain, and combated the received idea that the nerve fibres are simply conductive elements. He formally recanted the opinions on this subject to which he had given expression a year ago. In his lecture on amaurosis, he referred to Woollaston's theory, and pointed out that the observed effects in cases of hemiopia, from lesion of the optic tract or commissure, did not confirm that theory, but disproved it. The lectures were listened to with much interest and attention.

◆

Medical News.

Vital Statistics.—From the Registrar-General's returns we learn that during last week 5,786 births and 4,291 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 1,495. The mortality from all causes was at the average rate of 28 deaths annually in every 1,000 persons living. The annual death-rate was 23 per 1,000 in Edinburgh, 28 in London, 28 in Glasgow, and 30 in Dublin. In the other large towns the rates were—Brighton 18 Portsmouth 23, Hull 23, Bristol 24, Newcastle-upon-Tyne 24, Nottingham 24, Birmingham 24, Norwich 24, Leeds 25, Plymouth 25, Sunderland 26, Liverpool 28, Leicester 30, Bradford 31, Sheffield 31, Manchester 33, Wolverhampton 33, Oldham 37, and Salford 37. The annual death-rate from the principal zymotic diseases in these averaged 3·5 per 1,000, and ranged from 1·1 and 1·5 in Nottingham and Plymouth, to 9·2 and 10·9 in Sunderland and Salford. Scarlet fever caused 10 more deaths in Portsmouth. Eighty-one deaths were referred to small-pox, against 46 and 61 in the two preceding weeks ; 52 occurred in London, 14 in Manchester and Salford, 18 in Liverpool.

A New Hospital for Wakefield.—On Saturday last Colonel Charlesworth laid the foundation stone of a new hospital, the cost of which is estimated to reach about £20,000. The ceremony was made one of popular rejoicing ; representatives of all the religious bodies, trade guilds and societies, took part therein, and the affair was a great success. A good start in the funds was made by the announcement that Mr. Tew, a local banker, recently deceased, had bequeathed £4,000 towards the building.

University of Cambridge.—At a Congregation holden on Thursday last, November 23, the degree of M.D. was conferred on Herbert Watney, of St. John's College. At the same Court the M.B. degree was conferred on Herbert Howard Murphy, St. John's College, and Arthur Martin Phelps, of Sidney College.

CANABIS INDICUS IN POST-PARTEM HÆMORRHAGE.

The following notes, are taken from *L'Union Médicale*, Jan. 27th 1876, p. 1027, the extracts being quotations from other journals :—

DR. DUNCAN (*Rev. des S. C. Méd. et Journ. des sages Femmes*) reports favourably of the above remedy as a hæmostatic, in post-partem hæmorrhage. He recommends, as the dose, about 15 to 20 minims of the tincture, and claims for it a rapid and satisfactory action. He has found it useful in cases in which the use of ergot had failed. Dr. Duncan states, that this special use of Indian hemp has been known and practised for a very long time.

Editor's note.—Pereira, Ringer, Squire, and other authorities fail to make mention of its employment for this special purpose.

Ringer recommends its use in cases in which stranguary, or blood in the urine, exists. Churchill advises its administration to patients suffering from menorrhagia. Amongst the other properties claimed for this drug from a therapeutical point of view, may be mentioned its use as :

1. *Hypnotic* in the case of spirit-drinkers, patients affected with hysteria, and in cases of chorea, pulmonary affections, and low fever.
2. An *anodyne*, inferior in its action to opium. Useful at times in cases of neuralgia, acute, and sub-acute gout, and rheumatism.
3. An *antispasmodic* in tetanus, hydrophobia, malignant cholera, chorea, and infantile convulsions.
4. A *phrenic* or medicinal agent affecting the mental functions ; some having found it useful as a nervous stimulant. Pereira.—It is not a very reliable medicine, the experience of different observers varying very much. Its use as a means to arrest post-partem hæmorrhage must be a matter for further experience, but as an additional remedy, is worthy of being born in mind.

◆

NOTICES TO CORRESPONDENTS.

☞ **CORRESPONDENTS** requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

LETTERS are in type from Mr. J. M. Elliott and a Dublin Hospital Surgeon.

DR. BOYD MUSHETT will please receive our best thanks.

THE "MEDICAL PRESS" DEFENCE FUND.—We have received so many letters of sympathy and promises of support to this Fund that we are unable to reply individually as we should desire. But our correspondents will, we are sure, accept our thanks collectively, which we now tender them in all sincerity. In our next we intend publishing a list of those gentlemen who have contributed to the Fund kindly suggested by Dr. Greene and others.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Billing, London. Dr. Leared, London. Mr. Lawson Tait, Birmingham. Dr. Bourns, Oxted. Dr. Williams, Colchester. Dr. Greene, London. Dr. Owen, London. Mr. R. Hanslip Sers, Southwell, Nottingham. Dr. Thomas, Glasgow. Dr. Lander Brunton, London. Dr. Castle, New York. Dr. Atthill, Dublin. Dr. Hamblin, Keokuk, Iowa. HOOPER.—On Oct. 4, at the residence of his son, View Point, Ararat, Australia, John Hooper, M.D., late of Aylesbury, Hoddesdon, and Buntingford, aged 77.

HUNTER.—On Nov. 7, at Glasgow, Matthew Hunter, M.D., aged 33.

MILLER.—On Nov. 16, at Sutherland Crescent, Helensburgh, John Miller, M.D., J.P., late of Rothesay, and formerly of Madeira, aged 70.

ROBINSON.—On Nov. 16, at Ballymagrorty, Balintra, co. Donegal, John Musgrave Robinson, M.D., aged 36.

STEEL.—On Nov. 11, at Blaenavon, Richard J. P. Steel, M.D., aged 65.

TURNBULL.—On Nov. 9, at Cambuslang, Lanarkshire, John Turnbull, L.F.P.S.G., aged 72.

RESIDENT MEDICAL PUPIL (DUBLIN).—An M.D. Dub. Univ., and F.R.C.S.I., who is intimately acquainted with the method of medical education in Ireland, will receive a young gentleman to reside in his house, for whose education he will, if desired, make all arrangements. Apply by letter to SOCIUS, 23 Ely Place, Dublin.

IRISH POOR-LAW INTELLIGENCE.

BALLINA DISPENSARY.

A SPECIAL meeting of the committee was held on Saturday week to consider the following letter from the Local Government Board on the subject of the late inquiry into the charge preferred by Thomas Mullen against Dr. Scott, lately investigated :—

Dublin, 3rd November, 1876.

Sir,—Adverting to their letter of the 11th ult. relating to the complaint preferred against Dr. Scott, medical officer of the Ballina Dispensary District, by a man named Thomas Mullen, of neglect of duty in the case of his (Mullen's) late wife, the Local Government Board for Ireland now forward for the information of the committee of management the minutes of evidence taken by their inspector, Mr. Armstrong, at the inquiry made by him on the 17th ult. into the matter.

From the evidence of Mullen it appears that on Sunday the 4th June last, he presented a red ticket to Dr. Scott, who at once proceeded to the house and saw the poor woman, that the medical officer paid no subsequent visit to the case, and on the 6th June Dr. Nolan was sent for and attended the patient on the following day. The woman died on the ninth day after Dr. Scott's visit.

Bridget Coleman, midwife, deposes as follows : "I was in attendance on Mrs. Mullen when she was delivered ; I was there when Dr. Scott called ; when he came in he took off his top coat ; he bared his arm ; I saw him do nothing to the woman except to take a drop of blood from her ; he threw the drop of blood on the floor and said she would be well in a few days, and what was wrong with her would come off in a few days."

With regard to this witness, Mr. Armstrong informs the Board that he has no confidence in her evidence, as she swore in the first instance that she could not speak English, and was accordingly examined through an interpreter, but that she subsequently spoke it fluently.

Dr. Nolan deposed that when Mullen came to him he informed him that his wife had been confined two days previously, and that the after-birth did not up to that time come away ; that he gave Mullen a draught and visited the woman on the following day, when he found her suffering from puerperal fever, of which she died a few days afterwards. He states that he received £1 from Mullen, and that he prescribed for the woman up to the time of her death. He adds : "I cannot say that she was neglected in the first instance ; I could not say whether the after-birth was removed or not ; I do not remember stating that the non-removal of the after-birth was the cause of death."

Dr. Scott states that on visiting the late Mrs. Mullen he found on examination that she had been improperly treated in delivering the child, and that part of the after-birth and the funis had been pulled away ; that he introduced his hand and removed the remaining portion of the after-birth with some clots of blood, and that he waited for a short time to see if there was any hæmorrhage, but there was none. He also states that the case seemed to be going on favourably, and that he considered the woman would be well in a few days. He adds : "I think I was in the house twenty minutes or half an hour, and I consider I had done all in my power, or what any medical man would have done."

Dr. Scott admits that he did not visit the case again, hearing that a private practitioner was in attendance.

The evidence of Dr. Mahon and Mr. Matthew Scott, who were waiting for Dr. Scott outside, is to the effect that the latter remained with the patient about half an hour.

With regard to the special treatment of the patient by Dr. Scott, the Local Government Board have to observe that the evidence is very conflicting ; but even accepting the statement of the medical officer as correct, his explanation is by no means satisfactory. The fact of another practitioner having been called in five days after his visit is no reasonable excuse for his neglect in not having visited his patient at an early period, especially having regard to the fact of it being a case of child-birth requiring operative interfetence. Under all the circumstances of the case the Local Government Board are of opinion that the Committse of Management should call upon Dr. Scott to resign.—By order of the Board,

B. BANKS, Secretary.

The Chairman said he had previous to the meeting of the committee read over the evidence carefully, and the letter of the Local Government Board, He was struck by the abrupt way in which the letter closed, as he rather expected the Local Government Board would have added further remarks after having reviewed the evidence at such length. But he inferred that the subject was left open to them to express an opinion upon it, and place views their views before the Board, as otherwise the Board would have written in more direct terms. Giving his own opinion on the case, he so far concurred with the Local Government Board, that he considered Dr. Scott was not altogether clear of blame—in fact, that in such a serious case he should have taken measures himself personally to ascertain how the woman was getting on, and not act upon hearsay. At the same time he fully credited Dr. Scott's evidence—namely, that he performed an operation which he believed was all that was required ; that he expected an account would have been sent to him if any unfavourable symptoms appeared, and that, hearing Dr. Nolan was called in, he considered himself discharged from further attendance, it not being usual with medical practitioners to interfere with each other. Under all the circumstances he considered the committee justified in recommending a less severe punishment.

Mr. Thompson—Dr. Scott is not the man to neglect a case of the kind, as he has frequently sat up at the bedside in a midwifery case all night.

Mr. Egan—Is it customary to be sent for in such cases?

M. Mostyn—It is.

Mr. Crean said it would not be safe to leave it to the judgment of the country people to determine whether or not a second visit from the doctor was or was not necessary. The doctor should use his own judgment.

Dr. Macaulay said, as the only medical man on the board, that the only point against Dr. Scott was that he did not follow up his attendance upon the woman ; but he would not have been justified in continuing his attendance once he became aware that a second medical man had been called in, as the rules of the profession in such cases were very strict. If Dr. Scott had gone back, and found another doctor in charge, the probabilily is the people would have insulted him.

Mr. Thompson—It seems to me to be the feeling of the committee that Dr. Scott should not be asked to resign, but be admonished.

Mr. Dillon—That is the feeling of the entire board, but at the same time a mistake was made in not repeating the visit.

Mr. Joynt—Mr. Macaulay says that it was unnecessary.

Chairman—We are all liable to make mistakes, and this was a mere error of judgment on the part of Dr. Scott, not culpable negligence. We must temper justice with mercy, as it would be a very severe blow to Dr. Scott if he were dismissed.

Mr. Coen—It would be unjust.

Dr. Macaulay—As far as the operation went I believe it was quite successful. The only thing Dr. Scott had to apprehend in the case was hæmorrhage, and this not occurring, it was not necessary for him to remain with the woman more than five minutes, or to visit her again unless required so to do.

The Chairman drew up the following resolution, which was unanimously adopted :—

"The Committee being fully aware of the gravity of the case, and having most carefully read over and considered the whole of the evidence, together with the notes thereon by the Local Government Board, concur with the opinion therein expressed, to the extent that blame attaches to Dr. Scott in not having personally made himself acquainted with the condition of his patient within the next two or three days subsequent to his visit. 1. They however attach weight to what has been pleaded in extenuation that Dr. Scott believed the operation to have been fully successful and final, and consequently that a second visit was not requisite, and in this opinion he is borne out by Dr. Mahon and another medical man, a member of this committee. 2. That it is contrary to the custom and general usage of medical men for one to continue his treatment of a patient if once the case has, by wish of the patient or friends, been assumed by another skilled person, and in fact, any other course (unless a case of consultation by consent of both doctors) would obviously be likely to end in inquiry to the case. Under these circumstances the committee consider Dr. Scott's error to be one more of judgment than of culpable neglect; and coupling this with the fact that, with the present exception, Dr. Scott's onerous duties have been discharged to the entire satisfaction of the committee and public, the committee, with all respect, submit that Dr. Scott should be reprimanded, as in this instance the committee do not think the case calls for a course tantamount to dismissal, which would not only entail the loss of his present appointment, but would prove a serious blow to his future career and reputation as a medical man."

◆

THE CASTLEBAR LUNATIC ASYLUM.

The Inspector of Lunatic Asylums, assisted by a number of the Governors, were engaged, on Saturday, investigating charges and counter-charges by Dr. Carre, medical superintendent, and Mr. John Gilham, clerk and storekeeper, of the above institution. The evidence has not yet been published by the local press, but the *Examiner* has been able to give the decision arrived at by the Inspector and Governors, as follows :—

"Mr. Gilham having admitted that all the charges he brought against the Resident Medical Superintendent are made solely as recriminations in consequence of Dr. Carre's complaints of his misconduct, all his statements must be considered as influenced by this animus. The Board consider the first accusation as to Dr. Carre's using stirabout unfounded. That, as regards the second accusation, a minute of the former Board was shown by the Resident Medical Superintendent authorising him to have a pig of his own kept with the pigs of the asylum. With regard to the number of poultry kept, the Resident Medical Superintendent admitting the number of poultry to be very large, did not satisfy the Board that these poultry were kept at his own expense. The Board consider that the Resident Medical Superintendent acted very imprudently in keeping so many poultry, and direct that no more than fifty head of poultry be kept in the asylum, offices, or grounds at any one time. Touching the third accusation, the Resident Medical Superintendent states that some part of the time of patients and attendants is occupied in making different articles for officers and servants of the asylum, the Board considering that the system is open to grave objections, forbids its continuance. Though the investigation has led the Board to the conclusion that some irregularities exist in the house, yet there is no excuse for the accusation brought against the medical superintendent by the clerk. Under these circumstances, the Board have come to the unanimous conclusion that Mr. Gilham's continuance here as clerk and storekeeper is highly inadvisable, and they hereby call on him for his resignation.—(Signed) J. T. Browne."—*Ballnia Herald.*

◆

CASTLEBAR GUARDIANS.

APPOINTMENT OF MIDWIFE.

There was only one application before the Board.

Mr. Daly said it was very easy to create new offices, but very hard to get rid of any old ones. They heard a great deal about creating sanitary officers, from the consulting to the sub-sanitary officers; there was a good deal also about fixing their salaries; but, from once appointed, all we hear or see of them is their names when signing their cheques for payment.

Mr. Cannon asked where was the midwife to be found when looked for by the public ?

Mr. O'Malley said in this enlightened age it was necessary to have such an officer appointed.

Mr. A. Walsh thought that such an appointment should not be made.

Mr. Daly said that, after hearing the strong expression of opinion by gentlemen of so much experience as those in favour of the appointment, he would withdraw his opposition.

The applicant was then appointed.

◆

TRALEE GUARDIANS.

A DOCTORS LEAVE OF ABSENCE.

The Clerk read minutes of an extraordinary meeting of the Dispensary Committee. The following resolution was unanimously adopted :—

"Resolved unanimously that Dr. Harrold's application for fourteen days' leave of absence be granted, and that Dr. Nolan do discharge his duties meanwhile at £3 3s. a week, Dr. Harrold's leave to commence on the 20th of the month."

Mr. Leahy: I think the usual course is, where a doctor applies for leave of absence, that his substitute should be paid by the Board.

Mr. Loughnane: I think he should not be paid by the Board. Let Dr. Harrold himself pay it, when he is going on his own business.

Mr. Leahy: Dr. Harrold is required to appear in Dublin by a subpœna under a penalty of £100. Besides, Dr. Harrold is one of the oldest officers of this Board; he very seldom makes a requirement of this kind, and I think this application should be granted to him this time.

Mr. Loughnane: Going to Dublin on his own business, for he wants to come by a property of £600 a year. I move that it will not be taken into consideration at all. It was only a hole-and-corner meeting, when all the members were not noticed to attend.

The Chairman said he had prepared the following resolution :—

"Resolved, that the Board of Guardians grant permission to Dr. Harrold to absent himself from his duties for a fortnight on his procuring a substitute, and the consideration of paying his substitute must be considered at the meeting of the Dispensary Committee and Board of Guardians."

The resolution was agreed to.

CARRICK-ON-SUIR UNION.

CERTIFYING LUNATICS.

The Local Government Board, in answer to a communication from the guardians, as to whether it was compulsory on them to pay a fee of two guineas on an order of the justices at petty sessions for the medical examination of a lunatic, wrote, stating their opinion. They further referred the board to their circular, dated 18th September, 1875, and to Acts 38 & 39 Vic., 14th sec., cap. 67. Mr. Lalor: It is perfectly useless for us to ask the opinion of the Local Government Board, for they invariably decline to give us any. Lord Bessborough: I think it is evident we are compelled to pay the money when so ordered. Mr. Wilson said he coincided in that view of the matter. Mr. Lalor: Are we obliged to pay £1 whenever the doctor is brought a hundred yards? I think we are not. Clerk: It is generally in cases where there is trouble and expense that such payments are ordered. Mr. Richardson: Perhaps the doctor will not ask it now, when he hears of its being objected to (laughter). Lord Bessborough said he took it to be optional with the justices to make the order; but believed their order was, when made, compulsory on the board.

WATERFORD UNION.

A short time ago Dr. S. Brown, Waterford dispensary doctor, certified a man named Curran, from Tramore, as a dangerous lunatic, on which certificate he was sent into the asylum. The magistrates made an order for a fee of a guinea to Dr. Brown, which order Dr. Browne sent to the board for payment. The guardians were in doubt—at least some were—as to their liability, and sent up for the opinion of the Local Government Board. To-day the following letter was received on the subject:—

"Local Government Board, November 14, 1876.

"Sir—The Local Government Board acknowledge receipt of minutes of 8th instant, containing a resolution in which the guardians inquire whether they are bound to pay a fee of one guinea to Dr. Brown, medical officer of the Waterford dispensary district, for examining and certifying in the case of a dangerous lunatic, and in reply the board desire to state that the guardians are bound to comply with the order of the justices made under the provisions of section 14 of 38 & 39 Victoria, cap. 67.—By order, "B. Banks.

"Clerk, Waterford Union."

An order was made for payment.

◆

NAAS UNION.

THE CONVEYANCE OF A FEVER PATIENT.

The following letter was read from Dr. Kehoe:—

"Kildare, 21st November, 1876.

"Dear Sir—With reference to the case of Martin Dunne, I am surprised to find that some of the guardians have failed to appreciate the fact that the unusual circumstances obliged me to adopt an unusual course. The point is, why did I not send for the van? and why did I send him by train? Simply and shortly, to prevent his being exposed in the streets of Kildare for two-and-a-half or three hours till the van arrived. That he would have to remain in the street was inevitable, because neither lodging- or public-house would receive a man in fever, and without money. Stress has been laid on the fact that this man was a focus for contagion, and therefore should not have been sent by train. I have shown that his being sent by train was unavoidable. By being sent by train he was a focus of contagion for half an hour; by waiting for the van he would have been a focus of contagion for three hours. When it became a matter for consideration whether this man's life should incur increased risk by waiting three hours for the van, or whether other persons should be exposed to contagion by his travelling in a train, I had no difficulty in arriving at the conclusion that the first object to attain was the lessening of risk to the patient's life. The life was the approximate consideration, the risk on contagion a remote and problematical contingency. I would rather expose a thousand persons to contagion than one individual to the loss of his life. That the unfortunate Martin Dunne lost his life was certainly not due to the immediate and rapid steps I adopted to have him conveyed to hospital. It may be as well to remind the board that Martin Dunne was not a dispensary patient; he had no dispensary ticket. I was not responsible for him; therefore my conduct in the affair was, so to speak, gratuitous. I was not acting as medical officer. I acted as a volunteer relieving officer. The case being urgent, I considered that my character was assailed and impeached by the very crude and unconsidered remarks of some probably inexperienced guardians at last day's board. Therefore, as a matter of justice, I hope this second letter of explanation may be placed on the minutes, and that a copy may be sent to the Local Government Board, and that it be published in the *Leinster Express* as an answer to the remarks that were published in that paper of last week.—I am, dear sir, yours truly, "T. Bennett Kehoe."

The Board ordered that a copy of the letter should be forwarded to the Local Government Board.

PAYMENT OF CIVIL PRACTITIONERS FOR MILITARY SERVICE

The Council of the Irish Medical Association, it will be recollected, recently addressd to the Director-General of the Army Medical Department a remonstrance against the small remuneration offered to medical men for their care of small depôts of troops throughout Ireland, the maximum pay being 2d. per man per week, instead of 2s. a month—the fee paid by the Royal Irish Constabulary. To the memorial of the Council the following has been received:—

Army Medical Department, War Office,
8th November, 1876.

Sir,—I am desired by the Director-General to acknowledge the receipt of your letter of 1st inst. relative to the prevalent dissatisfaction amongst civil medical practitioners in consequence of the alleged inadequacy of the emoluments offered to them when engaged in the service of the army, and, in reply I am to acquaint you, for the information of the Council of the Irish Medical Association, that the matter treated of has been brought to the notice of the Secretary of State for War, but that up to the present time no revised scale of remuneration has been framed.

I have the honour to be sir, your obedient servant,
Wm. Munro,
Medical Branch.

The Hon. Sec. Irish Medical Association,
Royal College of Surgeons, Dublin.

This answer is evidently only a "put off." It, however, admits the existence of prevalent dissatisfaction, and we hope that the Association will not cease to agitate the question when a suitable occasion offers itself.

◆

PAYMENT OF MEDICAL WITNESSES IN PETTY COURTS OF LAW IN IRELAND.

This question, which was brought under our notice by a correspondent last week, has been under the consideration of the Committee of Council of the Irish Medical Association, and it was decided to form a deputation to wait upon the Attorney-General on the subject. The rule to which the Council takes exception is as follows:—

Copy Rule 19 *of the Attorney-General's Rules for Crown Solicitors and Sessional Crown Solicitors.*—1868.—When a medical witness is summoned to attend at Sessions in the town in which he resides, the usual fee of one guinea only is to be paid; but, when he is summoned to attend in any other town, he is to be paid one guinea for every day he is necessarily absent from home, besides his actual travelling expenses and hotel charges, such hotel charges not to exceed fifteen shillings per day.

◆

THE ABUSE OF RED TICKETS.

Woods *v.* Crumley.

The case of Dr. Woods *versus* Mr. W. Crumley, tried at Monaghan last week, for that the latter did issue a "red ticket," instructing the former to furnish medicine, advice, and attendance to the wife of a National School teacher, who was not, within the meaning of the Act, a "poor person," has been decided against the plaintiff. We commented on this case in our Saturday's issue, and therefore need not go back on it. Briefly, Dr. Woods sued Mr. Crumley, an ex-member of the Monaghan Dispensary Committee, for "fraud," in that he issued a "red ticket" on behalf of a person who was able to pay the usual medical fee. We said, on Saturday, that the Chairman deferred giving judgment, but that he was against the defendant, and so he was. "I am for the plaintiff on all points of the case," said his Worship, "save one that was raised by Mr. M'Loughlin, barrister-at-law—namely, that the action should have been brought within three months after the alleged fraud was committed. On that point I feel called upon to dismiss the case." Dr. Woods, then, was defeated by a mere technicality—a mere accident. Dispensary doctors will take note of the fact as a protection against imposition, and members of Dispensary Committees would do well to exercise, henceforth, a proper discrimination before issuing a "ticket" which may form the basis of an action for "fraud." To avoid such an unpleasant ingredient in their life's experience, they have only to rigidly carry out the homely old maxim—namely, "to be just before they are generous"——at other people's expense.—*The Newry Reporter.*

MICROSCOPY.

When Dr. Klein announced the discovery of an organism which was the cause of sheep-pox, many believed at once that the pathology of variola was about to become clearly understood. Dr. Creighton has since proved that the so-called mycelial growths which Dr. Klein had found were only artificially-produced coagula of albuminous matter.

When experienced microscopists like Dr. Klein are thus deceived, it behoves us to be exceedingly cautious how we accept astonishing statements from even skilled observers. The difficulties surrounding microscopic research are numerous.

ON THE VALUE OF JABORANDI AND GELSEMINIUM SEMPERVIRENS AS THERAPEUTIC AGENTS. (a)

By Thomas Stretch Dowse, M.D., F.R.C.P.E.,

Physician Superintendent Central London Sick Asylum, Highgate.

(*Continued from page 437.*)

Gelseminum Sempervirens.—This plant is not common in this country, and until recently was absent from the Botanical Gardens of London and Dublin. It goes by the popular name of jessamine in America, which is, however, an incorrect term, for it belongs to the natural order Loganiaceæ. It contains two active ingredients—one which is said to have a tetanising influence, and the other paralysing. In using the liquid extract where the paralysing agent is in excess of the tetanising ingredient, small doses paralyse more completely than the corresponding quantity of the alkaloid solution, whilst larger doses of the liquid extract produces paralysis so profound that its tetanising ingredient fails to produce its characteristic effect. It is of interest to note the difference between the tetanising effect of gelseminum and strychnine. After the administration of strychnine we find—1st. That tetanus supervenes without previous loss of voluntary or reflex power. 2nd. Respiration continues unimpaired during the paroxyms. 3rd. Every part of the body is affected—the anterior extremities as well as the posterior. 4th. Reflex action can be excited for hours, or even days, after its administration. In gelseminum, on the other hand, we find that the tetanic condition is always preceded by considerable loss of voluntary and reflex power. 2nd. Respiration ceases before the onset of the convulsions. 3rd. The posterior extremities are most affected. 4th. Irritation fails to excite another paroxysm till the lapse of some seconds, as if the exhausted cord required time to renew its energy. 5th. It lasts only a short time, sometimes only half-an-hour, rarely more than three hours. These are the results of the experiments of Dr. Ringer and Dr. Burdon Sanderson, which I will follow a little more closely, So far we have seen that gelseminum has the power, by its action upon the cord, to produce tetanoid convulsions like strychnine, yet that it possesses a property which has in addition a paralysing agency, which modifies to a great extent its motor action, so much is this the case, that gelseminum can be given as an antidote in cases of poisoning by strychnine, so that the paralysing effects of gelseminum are, in fact, far in advance of the tetanising which cannot be induced unless the drug is given in really poisonous doses. Dr. Ringer's experiments do not seem to have led him to a definite conclusion as to the way in which the paralysing agency is produced. He says that it is not due to the effect of the drug on the muscles and motor nerves, and it is obvious that the loss of voluntary power cannot be produced by paralysis of the sensory nerves. It must, therefore, be due to its action either on the brain or motor tract of the spinal cord. We have no experiments to decide the question, but we offer the following reasons in fovour of the view that it acts through its influence on the cord—1st. The loss of voluntary and reflex power proceed *pari passu.* 2nd. The abolition of reflex power being due to the effect on the cord renders it to some extent probable that the loss of voluntary power also depends on the cord. 3rd. In cases of accidental poisoning, where the loss of voluntary power was so complete that the patients could not move a muscle, could not even raise their eyelids, it is recorded that on recovery they asserted that their consciousness was not at all affected. The foregoing experiments prove that gelseminum abolishes reflex movement, and probably voluntary movement by its influence on the spinal cord.

Yet, more than this, we find that the drug in animals has an especial action upon the respiratory centre, and it reduces the frequency of the respiratory act before it exerts any especial influence upon either sensation or motion, so that when death occurs it is by asphyxia, and it is interesting to note that if artificial respiration be maintained until the drug can be eliminated recovery will take place. This has led Dr. Sanderson to the conclusion that the action of gelseminum differs from that of curare by its especial action upon the medulla and those parts which preside over the rythmical respiratory movements, rather than, as before stated, to its suspension of the functions of the motor nerves of the respiratory muscles. He has conducted some extremely interesting physiological experiments, the results of which appeared in some papers of his contributed to the *Lancet*, wherein he shows and explains pretty conclusively that the drug acts on the respiratory function by paralysing the automatic respiratory centre, but that the process of extinction of the respiratory act which might otherwise be expected to be gradual and progressive, is prevented from being so by the intervention of disturbance, of which the explanation is to be found in the perfect arterialisation of the blood.

(a) Read before the Harveian Society.

I believe that Dr. Ringer's experiments do not quite coincide with those of Dr. Sanderson, but in the light of original physiological investigation explanatory of the mechanism of respiration, voluntary, reflex, and automatic, Dr. Sanderson's researches are of the utmost value.

Although the effects of gelseminum upon animals in poisonous doses are constant, and can be determined with accuracy, still I have found that its action upon man is different and not so marked. I have pushed the dose to such an extent that the patient has been what might be termed automatised, where voluntary power has been held almost completely in abeyance, yet neither respiration, circulation, or temperature has been interfered with. Some persons are more prone to its action than others. It usually first affects the eyes, the brows, and the upper lids in some cases. I have found the sixth nerve to be paralysed, in others the third; but in my practice it has produced no decided effect upon the pupil. Of the two it is rather contracted than dilated. The patient, when under the influence of the drug, has a decided sleepy look; there may be dimness of sight or double vision; the mouth may feel dry although the tongue is moist; there is want of voluntary power which begins in the arms, and patients will say that their arms are so heavy (like lead) that they are unable to raise the hand to the mouth; the legs then become affected in a similar manner; and, lastly, the intercostal muscles. The intellect is not involved to any marked degree, still I cannot quite coincide with those observers who have decided that the cerebro-spinal sensori-motor centres are alone involved. It has often occurred to me that persons under the action of gelseminum are to be likened to these under the influence of some forms of uræmic poisoning, where the blood is not sufficiently loaded with nitrogenous material as to influence the mind by its action upon the mass of the cerebral hemispheres, yet we find the more vascular grey matter of the convolutions, and also the cerebro-spinal ganglia to come under its toxic agency. However much gelseminum might act upon the respiratory centre in animals, it is quite clear that in man it seems to possess some specific action upon the trigeminal nerve. I have had patients who, when taking this drug, complained that it was impossible for them to masticate their food on account of the lower jaw feeling so heavy that they were unable to move it. In cases of neuralgia and myalgia, particularly where the fifth nerve is involved, it will be found to be of good service, but the dose must be full, say ʒj. of the tincture, and repeated every two hours. I have found it to act more speedily when in mixture with bromide of potassium. It has not in my hands given evidence of a power to relieve pain in the same manner that bromide of potassium does, neither do I think that it will ever replace it for this object. There are, however, some cases of reflex excito-motor-irritability, where its sedative action becomes manifest and striking, and perhaps this cannot be better exemplified than where such a condition exists in the muco-respiratory tract, where the bronchial secretion is scanty, and the cough is persistent, harsh, and dry. I have found it of great service in several forms of phthisis, but more especially where the tubercle is disseminated, and where no active disintegration of lung tissue is going on, where, in fact, the respiratory centre is in a constant state of oscillation or reflex excitability, the breathing quick and hurried, the face cyanosed, and the expectoration muco-purulent and frothy. The following cases demonstrates my meaning:—

S. S——, æt. 30, says her health was good until three winters ago when she first suffered from cough, but not until this winter, 1875-76, has the breathing been continuously hurried. The physical examination of the chest, which was fairly well-developed, gave a wooden dulness upon percussion, but equally more marked at the apices. At each apex and over the scapula spines there was prolonged expiratory murmur with sonorous rhonchus. At the bases behind the breathing was puerile, with a peculiar singing bronchophony and crepitant rhonchus at the end of inspiration. The heart was dilated, especially the right auricle and ventricle, but gave no evidence of valvular disease, except an occasional soft tricuspid regurgitant murmur, but the lividity of the features, the hurried breathing, and at times rapid pulse, were the interesting features. Before giving her the gelseminum, the pulse (I here take two weeks by way of example) and respirations were as follows:—

Pulse,	132;	resp.,	48	Pulse,	88;	resp.,	40
„	120;	„	52	„	81;	„	36
„	105;	„	42	„	120;	„	44
„	98;	„	40	„	116;	„	44
„	96;	„	36	„	76;	„	34
„	110;	„	44	„	104;	„	47
„	100;	„	40	„	100;	„	52

At this time the temperature ranged from 99° to 102°. The patient was placed upon the tincture of gelseminum. in doses of one drachm every four hours, which was continued for five or six days, with good effect in checking the cough, but the respiration was in no way lessened.

I have given it in similar cases with equally good results, but never have I found the respirations decreased by it. I tried it persistently in the following case to see how far it would affect the circulation,

Jane Kirby, æt. 36, a stout, strong-built woman, not of nervous temperament but of rheumatic diathesis, was admitted under my care complaining of palpitation of the heart. There was no valvular disease, but some hypertrophy of the left side. The heart's action was persistent, quick, and hurried, and at times almost fluttering; the pulse was never under 140, and at times it ran up to 160 and 180. The usual remedies were tried—namely, digitalis and antispasmodics without effect. I then gave her the tincture of gelseminum in doses of one drachm three times a day, but without any good result. I have also tried it under similar circumstances in other cases, and also to reduce arterial tension, but in these I have been disappointed, so that I think we may fairly say that gelseminum as a therapeutic agent exercises little or no power over either the circulation or respiration, whilst, as a nerve sedative, it seems to be of some value.

◆

ASPIRATION IN THE TREATMENT OF HERNIA.

By P. L. O'Neill,
Medical Officer Athy Workhouse.

The following case is illustrative of the success which Dr. Dieulafoy claims for the aspirator as an aid to the taxis in the reduction of hernia, and likewise of the complete harmlessness of one or more punctures in the intestines even of patients having a peculiar liability to serous inflammations:—

On Sunday, the 19th inst., a patient far advanced in Bright's disease of kidney, and who had for some years a small hernial protrusion, for which he usually wore a truss, was admitted to the Infirmary under the following circumstances, viz.: Immediately before his admission, whilst lifting a weight in the absence of the truss, the hernia, which had hitherto confined itself to the region of the external abdominal ring, and was not at any time larger than a pigeon's egg, fell into the scrotum, and in a few moments became as large as a foot-ball, assuming the most exquisite tenderness. I saw him a few hours after the occurrence, but he could not permit me to touch the tumour. To allay the pain, I injected a quarter of a grain of acet. morphia subcutaneously, and had warm fomentations and a stimulating enema administered.

One hour afterwards I revisited patient, and found pain and tenderness abated, but manifestly symptoms of strangulation, without any diminution in the size of the tumour. I applied the taxis for ten minutes without success; then had patient placed in a warm bath, and repeated the taxis with no better result. I next resolved on giving Dieulafoy's method a fair trial, and accordingly aspirated the hernia with a hot needle, with very unsatisfactory results. I then replaced it with a No. 2, which brought away some reddish fluid, fæcal contents, and flatus; the needle, however, becoming clogged, I withdrew, cleaned, and reinserted it in another part of the tumour, with the most satisfactory results. Large quantities of flatus were extracted, the hernia reduced to less than half the size it had been a few moments before, and the merest effort at the taxis placed the bowel within the abdomen. From that time to this (Saturday, 25th Nov.) patient has had a stool daily, and not the smallest inconvenience in the abdomen.

The features in the case most worthy of remark are:—1st. That morphia subcutaneously injected was preferred to the administration of chloroform, which I would have considered dangerous, owing to the renal affection and cardiac weakness. 2nd. That patient escaped peritonitis notwithstanding the peculiar liability such persons have to inflammations. 3rd. The facility with which the tumour was reduced after aspiration.

◆

THE CONTAGIOUS DISEASES OF ANIMALS.

By George Fleming, F.R.G.S.

Having had the pleasure of hearing Lord Alfred Churchill deliver a most instructive address, at the commencement of the present session of the Society of Arts, I was particularly struck with the reference made to the increasing demand for animal food, and the means which were being devised to import the flesh of animals from distant countries, where cattle and other food-producing creatures are abundant and cheap. But while much interested in the attempts that were made to accomplish this most important object, I could not help thinking, at the same time, that we were far too little concerned about home produce, and that we were not exerting ourselves as we ought to increase, and consequently to cheapen, our own food-productions. Neither do we appear to be at all alive to the terrible loss annually sustained in this country from the ravages of transmissible or "contagious," but preventible, diseases among animals which furnish us with food, or yield us essential services as beasts of burden. And neither do we seem anxious to consider, as we should, the heavy embarrassment to cattle traffic, nor the danger to health, which some of these "catching" maladies inflict upon us—losses, embarrassments, and dangers which are yearly on the increase, and to which we calmly submit as if we were fatalists, or lived in the dark ages when medical or sanitary science did not exist. And again, when looking to other regions for increased supplies—regions which can now furnish them, because their human population is as yet too sparse to require them for their own sustenance—we are apt to overlook the fact that some day this source may fail us, either because the supplies may be required on the spot where they are created, or the very diseases which now diminish our own contribution may abolish this source when they are introduced into these (as yet) uncontaminated countries.

The daily increasing value of many of the domesticated animals, due to the greater demand for them as nations increase in numbers and civilisation, and the greater necessity for perfecting and preserving them, have been apparent for many years. Animal food has become more and more requisite for the busy physical or mental toiler, and animals have become more and more necessary as motor machines, notwithstanding the large number of non-vital machines invented by man to supplement or supplant them. Anything, therefore, which diminishes our flesh supply, or hampers it, or reduces the services we require from these animals, is a matter of great moment in the conditions under which we now live. And when, besides this, we are at the same time exposed to serious—it may be fatal—maladies, through consuming their flesh or products, or coming in contact with them, then is the question greatly increased in importance.

I need not dwell at any length on the medical aspect of the subject, though I hail with delight a growing desire on the part of the masses to learn more pertaining to vitality—to life, health, and disease. It may, therefore, be sufficient if, in relation to what I am about to say, it is stated that transmissible maladies may only be so in respect to the same species, that is, from horse to horse, cow to cow, &c., or to one or two allied species; or from one to every or nearly every species. We have well-marked instances of these. Again, a "catching" disease may be so intensely virulent, that the slightest contact of a healthy with a sick animal, or even a few minutes' stay some distance from it, or near anything which has touched it or has been in its vicinity, will produce infection in almost every animal so exposed; or it may be so slightly transmissible that prolonged contact, or even inoculation with some of the fluids containing the virus, is necessary to produce the disease in only a certain number. In this respect every contagious disease has its special characters, its own individual potency and diffusibility. Some of these communicable disorders, again, are extremely fatal, and kill almost every creature they attack; while others only produce a slight and transient derangement of health. In this respect, however, they vary—malignant diseases being sometimes less deadly, and benignant ones occasionally very destructive.

The "catching" quality of a disease depends upon the presence of certain exceedingly minute living particles or germs—at least, for convenience sake, we will suppose it does. These are possessed of immense reproductive power, and more or less tenacity of life. Some of these specific germs possess the faculty of reproduction to such a degree, that a very few of them introduced into an animal body adapted for their reception will, in a short time, have become so multiplied, that the whole of the tissues and fluids—it may be of an elephant—are impregnated with them. We have also diseases due to animals more or less minute, which take up their abode in different parts of the body, and give rise to particular disorders; and which again, if they obtain access to another animal, when this eats the flesh or any of the products of the one they infested, may give rise to great inconvenience or a more serious form of disease. We have, likewise, transmissible diseases due to vegetable growths in the interior or on the surface of the body. Some of these contagious diseases may affect the entire mass of an animal, and the poison exist in the flesh, secretions, breath, &c., or only certain organs, tissues, or fluids may be involved.

The poison, germs, parasites, or whatever the agents may be upon which the disease depends for its maintenance or multiplication, may gain access to a healthy body through the breathing apparatus, stomach, skin, a wound, &c.; and before its effects are manifest, a certain period—in some diseases pretty well defined, in others not so—generally elapses. The disease may, or may not, be communicable during this latent period.

Some of these diseases are, in the present state of our knowledge, incurable; all are more or less prejudicial to the animals they affect, either by killing them outright, or, when curable, depreciating them in value, permanently or temporarily: diminishing more or less their products or their services, or rendering their flesh or products of less value, or even dangerous, as food for man or other creatures.

Though certain diseases are transmissible from man to animals, yet a far greater number are communicable from these to man, and some of them are extremely fatal when so transmitted.

Some of these diseases of animals are indigenous to the country, and may be developed "spontaneously," through unsanitary or other influences; while other of these maladies are "exotic," or foreign to our soil, and are, or have been introduced from countries where they are more or less prevalent. These exotic diseases are by far the most serious, and have proved a most terrible scourge to this country; they cannot be developed here by any combination of circumstances or conditions, but depend solely for their maintenance on their contagious properties.

A knowledge of this undeniable fact is of great moment, in connection with their suppression; for badly-informed people, who fancy these can be "generated" in different ways in this country, would also have us believe that it is useless trying to suppress them like other contagious diseases. This was the painfully-erroneous notion which also prevailed when the cattle-plague was introduced twelve years ago, and the injury the silly idea wrought we can all remember; we can also recollect how it was proved to be utterly destitute of a shadow of probability by the manner in which the plague was eventually stamped out. The same ignorance yet prevails with regard to the exotic diseases from which we now suffer, and the baseless notions are working as much harm every year as they then did. The people who entertain such fancies, when they are not moved by interested motives, cannot know anything of the history or the nature of such maladies.

It is only quite recently that these foreign contagions have been introduced among our more valuable animals. On the Continent of Europe, the events of war, but more especially the greatly-extended intercourse brought about by railways and steamboats, have been carrying these diseases from their birthplace, and gradually diffusing them all over the world. For the most serious of them have a wonderful power of adaptation, and they can maintain themselves in a great range of climate, and under extremely variable and adverse circumstances.

To be continued.

Clinical Records.

METROPOLITAN FREE HOSPITAL.

Cases of Progressive Muscular Atrophy.

Observed by DR. CHARLES R. DRYSDALE,
Senior Physician to the Hospital.

AMONG the vast population of out-patients of this hospital, a certain number of cases of this important and fatal disease come annually before the notice of the physicians. It is rare that such cases are taken into hospital in their early stages, on account of the small prospect of affording relief to their unfortunate condition.

Recently an elderly woman, æt 52, was admitted to the wards under the care of Dr. Drysdale, whose case commenced in the usual way by wasting of the muscles of the thenar and hypothenar eminence of the hand. This woman, an Irishwoman, sold fruit in Bishopsgate; and, according to her account, had been latterly exposed to very wet weather, having several times during the winter gone home quite soaked to the skin. Gradually she perceived that the power of her right hand and arm was becoming much lessened, and that she could not carry her basket as before. On inspection, it was noticed that the muscles of the forearm were extensively atrophied, and that on both sides the hands resembled claws rather than human hands. The prognosis in this case was very bad. In another case, recently observed by Dr. Drysdale, the prognosis was quite as unpromising. It is as follows:—

A man, æt 37, seen October, 1876, had been ill about four years. Of a healthy family, there was no one of his relations who had suffered from any similar disease. He had never been a drinker to excess, and had *no marks of syphilitic disease.* His occupation was that of a polisher of marble. Four years ago he was taken with feebleness in his left hand, and this weakness increased, finally causing it to be impossible for him to hold the marble he was was forced to polish. The muscles of the thumb began to diminish in size, and then those of the hypothenar eminence, and the hand assumed the appearance of a claw, the first metacarpal bone being drawn backwards, so as to place it in a line with the others. The inter-ossei then disappeared and the muscles of the forearm. This condition lasted two years, when the other arm became affected in an analogous way.

At the end of two years the muscles of the trunk became affected, at first on the left side, then on the right. This was painlessly accomplished. At the same time the patient remarked that a good number of his muscles, whether attacked or not by atrophy, were affected with fibrillary contractions.

These were at first limited to the right upper limb, but in a few months they appeared in the left shoulder. On the left side, also, the movements of the leg were not long in presenting a notable modification; the patient perceived that he could not lift the point of his foot, so that the latter was always trembling, and gave to his walk a peculiar character. This was due to atrophy of the tibialis anticus, and the extensors of the toes. This state continued for four years, and the poor patient went from one hospital to another, undergoing various treatments, without any sensible amelioration.

On being seen, patient exhibited no fever, nor loss of appetite. The emaciation of the upper extremities was very striking, the hand being flattened, the forearm also flattened, from the wasting of all the muscles, save that of the supinator longus. The atrophy had also attacked the coraco-brachialis, the biceps, the deltoid, and brachialis anticus. The pectoralis major was greatly wasted. The trunk showed no apparent deformity, and the shoulder blades were not winged. The patient walked on the point of his feet, which he threw forward, and which fell down as soon as they were raised. The fibres of the pectoralis major and trapezius and sterno-mastoid were the seat of slight spasmodic movements. These contractions took place both in the atrophied muscles and in those which were not yet attacked. The electric contractility of these muscles was sensibly diminished.

There was no loss of sensation in this patient. The intelligence was perfectly clear, and also the deglutition. The muscles of the tongue were wasted. Micturition and defecation normally executed, and the muscles of the abdomen were apparently intact. The hand was in a state of permanent flexion.

Remarks.—This disease has been lately designated *protopathic amyotrophy*, or progressive muscular atrophy, as it was named by Cruvelhier, its disoverer, and by English writers. The atrophy commences indifferently, either in the extremities or in the trunk. If the muscles of the trunk are first affected, however, it may be long before the patient notices the nature of his case. On the contrary, if the muscles of the arm or leg are affected, the loss of power becomes at once evident to the patient. The disease generally commences by the upper extremity, and generally the muscles of the thenar and hypothenar eminences are affected first of all. At other times the muscles of the forearm are first affected, especially those of the extensors. At other times again the deltoid is the first muscle to be affected, or the rhomboid, l. anguli scapulæ, trapezius, and serratus magnus. Sometimes the supinator longus is the first muscle attacked. The disease rarely extends to all the muscles of the lower extremities, and the face is generally spared. When the muscles of the tongue are affected, as in this patient, there may be bulbar disease, and a glosso-labio laryngeal paralysis may ensue.

The changes which characterise this disease are generally simple. They consist in atropic lesions, which, above all, affect the large motor and trophic cells of the anterior cornua of the cord, and their prolongations. The muscular atrophy is of two kinds—pigmentary and simple. In the first form of atrophy the cell is infiltrated with a great quantity of pigmentary granulations, yellow or brown in colour. This pigment distends the cell or is accumulated only at one point; the cell becomes globular, and its prolongations become very fragile and are destroyed. After remaining for a pretty long time voluminous, the cell atrophies, its contents become altered, and neither protoplasm nor nucleus is observable, and finally it becomes transformed gradually into a little granular and irregular mass.

In the second form, styled simple atrophy, the cell is reduced in all its dimensions, but maintains its stellate form, still possesess its nucleus and nucleolus, but becomes six or seven times smaller than in its normal condition, whilst at the same time its prolongations become shortened and atrophied.

Now, if it be remembered that each of the cells has the nutrition of a muscle attached to it, in whole or in part, we shall easily understand how a disseminated and progressive muscular atrophy corresponds of necessity to an atrophy of the spinal cells, progressive and disseminated also. It would, moreover, appear that the neurilemma of the grey subatance is also sometimes affected. The walls of the vessels become thickened; the lesions of the nerves are chiefly traceable in the anterior roots of the nerves, which are diminished in volume. The fibres of the muscles diminish simply in number and volume, whilst preserving their normal characters and striation. All this is well seen by using osmic acid to the nerves which are wasted.

Causes.—Hereditary transmission is one of the antecedents of progressive muscular atrophy. Charcot speaks of the disease having existed in several generations of a family. Duchenne (de Boulogne) mentions cases where there existed in the father and mother of the individual affected atrophy of the pectoralis and the trapezius, the existence of which was unknown to the patient.

Excessive exercise is one predisposing cause. The disease is more frequently seen in males from the age of 18 to 40. It is, however, occasionally seen in children although in them it is often taken for infantile paralysis. The muscles of the mouth and chin are often first affected in such cases, and it appears that there is always hereditary transmission when the disease appears in young children.

Other causes for the disease have been given, as, for instance, excessive connection, masturbation, &c., but they do not appear to have a great influence after all. Cold and wet seem to us to be far more frequent and efficient causes; syphilis is probably a cause, and it is a frequent cause of locomotor ataxy.

Diagnosis.—There are some diseased conditions which more or less resemble progressive muscular atrophy. First of all, there is the disease named general spinal anterior acute atrophy. This disease has for its principal symptoms a paralysis which, first of all limited to the whole of one limb, then extends to the greater part of the body. Atrophy soon follows, and then diminution of the dimensions of the limbs. Here the commencement is rapid, the paralysis soon diminishes, and the atrophy caused by it.

Infantile paralysis, when spinal in character, may be confounded with this disease. In ordinary cases of the disease the diagnosis is not difficult, for it commences suddenly and is generally accompanied by febrile symptoms, after which we notice complete palsy, which occurs a certain time before the production of the muscular atrophy. Again, in this disease the lower extremities are the ones first affected.

After rheumatism, atrophy sometimes attacks the deltoid, but this has usually been preceded for a long time by intolerable pains. It has also been alleged that in certain cases of lead poisoning muscular atrophy may become generalised. But in these cases the diagnosis is easy, since these lesions have been preceded by all those which characterise poisoning by lead. Very frequently, again, it appears only after limited paralysis, and there is complete abolition of the electric contractility without any relation to the degrees of the atrophy.

Prognosis.—In the most rapid cases of this disease death has never supervened in less than two years. Sometimes the patients live a very long time indeed, and cases have been cited where the length of life has been thirty or even forty years after the commencement of the atrophy. These cases, however, are quite exceptional, and in general the evolutions of the disease require only six, seven, eight, up to ten or fifteen years. In numerous cases the disease remains stationary — sometimes indefinitely, sometimes during a very long time, for seven or eight years for instance—after which it resumes its invading progress, and finally causes death. This takes place sometimes from the atrophy of the muscles of mastication or deglutition, sometimes by extension to those which are concerned in the act of respiration. Sometimes it results from atrophy of the muscles of the tongue, constrictors of the pharynx, and velum palati. When the diaphragm and respiratory muscles are affected, the patient may die of asphyxia.

At other times the atrophy of the motor cells of the anterior cornua may by proximity extend and attack the nuclei which give origin to the bulbar nerves. We then see the phenomena of labio-glosso laryngeal palsy appear. Perhaps this palsy is only a form of the disease we are discussing.

The cases when the atrophy is arrested are those where it is due to excessive work. The most unfavourable cases are those where there is hereditary transmission of the disease. Syphilitic cases may have a better prognosis.

Treatment.—Faradisation of the atrophied member has been recommended, and should be tried; not with the view of curing the disease, but by the passage of intermittent currents it may be hoped that the muscles may retain a little of their contractility, and thus a little of their movements may be restored to them. Very weak currents should be used every second day at nearest, and not for longer than a quarter of an hour at a time. The rheophores should be kept close to each other in the centre of the muscle. Arsenic and strychnine, although of doubtful utility, have been recommended.

◆

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

At the last meeting of this society, Mr. J. W. **Hulke** read a paper on "A Case of Complete Absence of both the Upper Limbs, and of Faulty Development of the Right Lower Limb." The child was 4½ years of age, and was, with the exception of her deformity, a healthy and good-looking child. Her father and mother were also healthy. There is no external mark, except a small congenital scar and a little dimple below the outer end of the right collar bone. The clavicles and scapulæ are well-formed, and the muscles attached to them act well. The right leg is shorter than the left, and the foot has slight talipes varus, and the femur is short; but there is great and unusual mobility both of the hip and knee-joints. The left leg is natural, and dexterously performs offices generally devolving upon the hands. The author thought that the case supported the theory of absence, arrest, or misdirection of development rather than amputation of the limbs by constriction—a hypothesis which was disproved in this case by the total absence of scar from the child's left shoulder.—Mr. Lowne said that he had dissected several examples of these malformations, and had found in them every variety of atrophy, generally of the distal portions of the limb. He thought that in every instance a small papilla or dimple occurs on the stump, indicating the position of the limb, and showing that the limb buds are developed. He did not believe in maternal impressions, and referred to two instances in which such impressions had been followed by no evil result.—Mr. John Wood suggested the theory that these malformations might be owing to pathological changes in the ovum; and in support of this theory adduced Mr. Buckland's experiments in salmon ova, in which it was found that the development of the head or tail could be arrested by placing a small particle of dust on either of those parts of the embryo.—Mr. T. Smith said that undoubtedly some cases of intra-uterine amputation did occur, however produced; for he had seen limbs marked with deep constrictions through the soft parts, which could only have been produced by a ligature. With regard to parental impressions, he thought something depended upon the age of the mother when submitted to the shock, and he cited a case of congenital hare-lip and cleft palate which had apparently originated in such impressions.—The President (Sir James Paget) said it was impossible to doubt the occurrence of intra-uterine amputations after the number of facts that had been collected by Sir James Simpson, and especially as cases had been observed in which amputation had all but taken place. Sir James Simpson did not attribute this accident to the umbilical cord, but to bands of lymph due to inflammatory changes, and causing constriction of the limbs. Therefore, although some of these cases are owing to arrest of development, others must be attributed to amputation in utero.

Mr. Hulke also read a paper "On a Case of Lodgment of a Tracheotomy Tube in the Right Bronchus, and its Extraction." Tracheotomy had been performed on a woman, æt 37, suffering from acute laryngitis. The operation was attended by immediate relief, but a week afterward the outer tube slipped by accident down the trachea, and the patient felt it slide deeply into her chest. Ineffectual attempts were made to seize it with slender, long forceps, and in the course of two or three days pain was complained of at the right of the lower part of the sternum, along with cough, quick pulse, high temperature, and dyspnœa, so that its immediate removal seemed imperatively necessary. Chloroform was given, and a long piece of German silver wire (one end of which was bent into a blunt hook, with another bend in the wire, one inch and a-half above this, so as to correspond with the angle formed by the trachea and right bronchus) was passed through the wound down the trachea. The other end of the wire was bent into a large loop, the plane of which coincided with the blunt hook, so as to admit of the latter being guided into the right bronchus. By this means the tube was distinctly felt, and by pushing the hook onwards to the distal end of the tube, the latter was caught and moved upwards until within a short distance of the tracheal wound, when it was seized with a forceps and taken out. The patient eventually got quite well, and was discharged about six weeks after her admission. Mr. Hulke made some remarks on the cause of the screw in Durham's tube becoming loosened, and on the defect of the outer tube, in having no flange to prevent its slipping through the collar and being drawn into the trachea. He also dwelt upon the necessity of forceps for extracting foreign bodies from the air-passages being light enough to serve as a sound, and sufficiently flexible to bend in any desired curve.

The discussion which followed turned upon the respective merits of different tracheotomy tubes, and, as usual on such occasions, each inventor was prejudiced in favour of his own peculiar instrument. We must, first, however, remark that Mr. Morrant Baker had, in the course of the evening, read a paper "On the Use of Flexible Tracheotomy Tubes," in which he referred to the evils resulting from the use of silver or other rigid tubes, especially the pain and difficulty in their introduction and withdrawal, and the liability of the trachea becoming ulcerated from pressure. His flexible tubes were constructed of vulcanised red indiarubber, and in shape and size resembling ordinary tubes. Only one tube is used at a time, as it can be introduced and withdrawn with ease, but it should not be as a rule introduced until about three days after the operation. These tubes do not, as might be expected, yield to the pressure of the edges of the wound in the trachea, they are very durable, and are less liable to be clogged with mucus than the silver ones. It would be as well, however, to have always at hand a silver tube, in case of any temporary difficulty in replacing it.

During the remarks that were made on Mr. Hulke's paper, Mr. Durham defended his instrument from Mr. Hulke's strictures, and said that they were only applicable to instruments of bad construction. Mr. Marsh said that Mr. Baker's flexible tube had, according to his experience proved to be an unqualified success. He made several objections to Mr. Durham's instrument, and while recommending Fuller's tube in preference for the first day or two, thought that Baker's instrument should be substituted for it within two days after the operation. In reply to the observations that had been made, Mr. Hulke thought that Mr. Baker's tubes bid fair to obviate many of the objections which had been raised against the use of rigid tubes; and with regard to his criticisms on Mr. Durham's instrument, they had been based upon an examination of many examples of it, and upon the information of several instrument makers.

The Society then adjourned.

◆

DUBLIN OBSTETRICAL SOCIETY.

The first meeting of the Session was held on Wednesday, November 1st, 1876. Dr. Gordon, President, in the Chair. The minutes of the previous meeting having been read the report of the Council was taken as read.

The President said that he was sorry to say that that the report of the Council was almost entirely taken up with regrets. There was, however, one object of congratulation, and that was that the College of Physicians continued to entertain the same high feeling for the Society that it had done in the past, and had endeavoured to assist the Society in the arrangement of new rules, and in having them carried out with their sanction and co-operation. The subjects of regret were first of all that the meetings of the Society had not been so well attended as in former years. The average attendance during the last year had been only about twenty-one on each occasion, and following on that was the natural regret that there had not been more communications from members of the Society. Another subject of regret was that they had lost during the past year two members of the Society, who were members of the Society for a very long period, Dr. Ringland and Dr. Sibthorpe. They both were very constant attendants at the meetings of the Society, and assisted frequently in discussions on subjects connected with their own branch of the profession. They belonged, however, properly to the kindred Society which met in that building—the Obstetrical Society—and the regret would be more fully he was sure felt there.

Dr. W. G. Smith made a communication on some new tests for bile-pigment. He said that his object was to invite the attention of the Society to some new tests, which from their simplicity and freedom from fallacy, seemed to answer admirably. More than seven years ago he was struck by a sentence in a short article by Marechal in the *Journal de Pharmacie* for March, 1869, in which he there stated that tincture of iodine was the most sensitive test for bile in urine, giving with it a magnificent emerald green, lasting half-an-hour, and then changing into rose colour, and then changing into yellow. M. Marechal's statements would appear, as far as he (Dr. Smith) could ascertain, to have been overlooked by subsequent writers. Since that time he (Dr. Smith, had tried that test in almost every case of jaundice he had met with, and had repeated and varied the test in the one case. In no single case had he failed to get a distinctive colouring action. The value and delicacy of the nitric acid test were less than was commonly supposed, although it was relied on in physiological investigation, but it was desirable to have some supplementary tests for bile-pigment. The four tests were—tincture of iodine, ferric chloride, peroxide of hydrogen, and peroxide of lead. With a fresh supply of material he hoped to study more closely the action upon the iodine and peroxide of lead tests. The reason he recommended the tincture of iodine as a test was that a single definite was given, a test which fully equalled in delicacy, possibly surpassed the nitric acid test.

Dr. **Emerson Reynolds** believed in the value of the nitric acid tests. Iodine to his mind was a somewhat unsatisfactory mode of affecting oxidation. The iodine solution itself was so strongly coloured, that unless the solution were properly worked, it might lead to error. The phosphoric solution of lead answered well and sharply. The ferric chloride which was tested in a few cases acted exceedingly well, but it was open to the objections that many other substances besides bile might affect the reduction of the ferric solution.

Dr. **Finny** said that from his experience the iodine test answered readily and was a most useful one.

Dr. **Foot** had seen that test worked with very neat results indeed. It occurred to him that the use of these oxidising pigments might be turned to great use in the diagnosis and etiology of jaundice, that was to distinguish between the kinds that originated in the blood, quite independent of those that originated in the liver.

Dr. **Smith** said, in the course of his reply, that he would endeavour to turn Dr. Foot's suggestion into account.

Dr. **M'Swiney** then related the particulars of a case of syphilitic phthisis, occurring in a man, æt. 36 years, who had been a hospital-patient of his. The man had been originally a very healthy subject, and had inherited no tendency to any pulmonary or other disease. He had been married when 18 years old, up to which time he never had had venereal disease. Three healthy children were the fruits of his marriage, when unfortunately he contracted a chancre. Seven children were born after this event, not one of whom lived, but were either still-born or died shortly after birth and presented evident marks of syphilitic contamination. The primary disease was followed in the man, and in a short time by sore throat and other symptoms of secondary poisoning. Then there was a long interval of quiescence from any symptoms. After the lapse of some years—about two years ago—he was attacked with syphilitic ear-ache, followed by purulent discharge and escape of the ossicula or small bones of the ear. At the same time he suffered from syphilitic disease of the nose, nasal discharge, perforation of the septum, and extensive necrosis. Finally, the nose became greatly deformed and fallen in, and he lost the sense of smell. Six months ago he got for the first time, a cough, accompanied by pain in the chest, quick breathing, rapid wasting, and all the symptoms of pulmonary phthisis. He was admitted into hospital in a miserable state of weakness and prostration. Evidence of pulmonary consolidation, together with the formation of cavities was afforded by a physical examination of the chest. His general appearance denoted the syphilitic physiognomy in the most marked manner. He was put upon anti-syphilitic remedies—perchloride of mercury and bark—under which form of treatment his improvement was very remarkable during the month which he remained in hospital. Shortly after he left hospital, however, he relapsed, and in about six weeks died. No *post-mortem* examination was allowed to be made. Dr. M'Swiney next justified his designation of the case as one of syphilitic phthisis, by a considerable amount of reasoning, in the course of which he stated that the conclusion was arrived at upon the following considerations :—1st. The history of the case. 2nd. The absence of any hereditary predisposition to ordinary phthisis. 3rd. The progressive extension of the syphilitic disease from its outset through its various stages to its ultimate full development. The special cachexia by which the symptoms were accompanied, together with the combination of the lung affection with other specific morbid phenomena. 5th. That the stage of the specific disease, namely, the tertiary stage, at which the pulmonary attack set in, that being the stage most frequently by far reported as the one in which syphilitic phthisis had been found to present its first manifestation. Dr. M'Swiney then stated that pathologists now universally recognised the existence of syphilitic affections of the several internal organs of the body, and he cited numerous examples of organs, and various medical authorities in support of this proposition He likewise maintained that there were various forms of morbid state which terminated in a certain form as generally known by the title of consumption, and amongst those forms of consumption he held syphilitic phthisis was at once the most important and least understood. Finally, he remarked that it should be laid down as a rule of practice that when, in any particular instance, it came to be suspected from the history of the symptoms, that syphilis might be the cause of lung disease, the indication was at once to apply the test of specific medication, it having been abundantly demonstrated that tertiary syphilis could produce in the lungs lesions which simulate pulmonary consumption, and many of those lesions being as was now well known quite amenable to specific remedies, their recognition and treatment by anti-syphilitic means, became it was evident, matter of the highest practical importance in clinical medicine.

The **President** said he remembered Dr. Hulton saying of a case under the care of the late Dr. Colles, that it was a case of disease of the lung, but that the primary disease was syphilis. He argued from the success of his treatment the correctness of his theory. He treated that case with mercury persistently, and after a considerable time the success was beyond his expectation. The success of the treatment justified the diagnosis that the disease was essentially syphilitic. He had also heard Dr. Hulton speak of the position of the disease of the lung as differing from the ordinary position of the disease found in thesis. As to the case just read, he (the President) had no hesitation in coming to the conclusion that the symptoms referred to were truly syphilitic.

Dr. **Foot** thought the tendency now-a-days was to the unity of phthisis, and not to the multiplicity of the twelve or fourteen varieties of phthisis; and instead of calling the case just described by Dr. M'Swiney a case of syphilitic phthisis, he would call it a case of phthisis in a syphilitic person. There were no doubt cases of syphilis of the lungs and larynx, which were treated as phthisis. It seemed to him (Dr. Foot) that the syphilitic lesions of the lung quoted by Dr. M'Swiney were not to be regarded as sufficiently constant to be reliable.

Dr. H. **Kennedy** said his remarks would be only a following up of what had fallen from Dr. Foot. He then went on to say: I have got the strongest convictions that, of late years the ideas of the syphilitic poison and its consequences have been carried to an extreme degree ; and the result has been that many cases are now set down to this cause, which in reality are due to another and a very different one, namely, struma. In London this has been strikingly evident, and any one who has looked over the transactions of the Pathological Society of that city, cannot fail to have been struck with the fact that many cases are detailed as syphilitic, which in reality had nothing whatever to say to that poison. They were essentially strumous, and a single word in their history need not be altered to make them so. In time, I hope this grave error will be avoided ; for it is grave in every aspect in which it can be looked at. I am far from saying that the two poisons do not often co-exist. But that is a totally different matter from saying that struma is syphilis.

As to the lung affections which follow syphilis, I think I may say they are rare. They do not certainly occur, and most probably of a specific kind ; but it must not be overlooked that tubercular phthisis may and does arise when the system is broken down from any cause. The treatment, I believe, in all these cases ought essentially to be restorative, and I would specially mention sarsaparilla, given in the form of powder, as being mos valuable. I have on another occasion stated this fact, and it is worth keeping in mind, inasmuch as the drug is always expensive. But by this mode of giving it, the expense is materially lessened.

Dr. **M'Swiney** said he had adduced what he believed to be very cogent reasons for regarding phthisis, or pulmonary consumption, as being frequently due to the presence in the condition of the syphilitic virus. There were a good many causes of pulmonary consumption. The disease resembling decline in all particulars was frequently due to the presence of the syphilitic virus.

The Society then adjourned.

We are glad to report that Mr. Francis Mason has been elected full surgeon at St. Thomas's Hospital, *vice* Mr. Simon, whose term of office has expired. Mr. Mason will still continue to lecture on anatomy.

THE OPINION OF THE PROFESSION UPON PROPRIETARY DISPENSARIES, AND THE ACTION FOR LIBEL AGAINST THE "MEDICAL PRESS."

On Monday last, a large meeting took place at the Rooms of the Medical Society, Chandos Street. Among those present were—

Drs. Quain, Barnes, Stewart, Farquharson, Sturges, Watson, Thorowgood, Routh, Milner Fothergill, Semple, Williams, Edmunds, Arthur Leared, Greene, Winn, and Forbes Winslow. Messrs. MacCormac, Adams, Field, Parker, George Brown, Jabez Hogg, Nunn, Cooke, Browne, Owen, Norton, Royes Bell, Sewill, Copland, Thomas, &c., &c.

Communications were referred to by Mr. Jabez Hogg, who acted as Secretary of the meeting, from many members of the profession who were unavoidably absent, but who approved of the objects of the meeting, among whom were Drs. Sieveking, Murchison, Wilson Fox, Hy. Green, Billing, Brunton, E. Williams, James, and Carey; Messrs. Erichsen, Critchett, Brudenell Carter, and others.

The following letter was read from Mr. Carter, as having an important bearing upon the objects of the meeting:—

69 Wimpole Street, Cavendish Square, W.
December 3rd, 1876.

If I should by any chance be prevented from attending the meeting, I should like my full sympathy with its objects to be expressed. The existing law of libel, as applied to the press, is a shelter to evildoers, and a terror only to honest men. It permits the public to be robbed with impunity by a host of knaves, whose practices are only rendered possible by the fact that a newspaper has to pay for exposing them; and by the further fact that few newspapers are sufficiently public-spirited to incur the risk.

Sincerely yours,
R. Brudenell Carter.

Dr. Quain who was requested to take the chair, referred to the difference between proprietary dispensaries in which it was the object of the owner to make as large a profit as possible out of the patients, and the provident dispensaries which were under the directors of governors, and which were truly charitable institutions. He considered that a proprietary dispensary under the mask of a provident institution was but a prostitution of the name of charity, and nothing could be more defrauding. He had himself met with an instance in which medicines in large quantities were supplied to a poor patient for a sum of money so small, that no profit could have been obtained, and on questioning the individual who was a member of our profession, he candidly confessed that he never supplied medicines except those of the cheapest kind, chiefly quassia and Epsom salts. How could such remedies, how could such forms of treatment benefit the poor? The matter to be brought before the meeting concerned a medical journal which desired to raise its voice against such treatment of the poor, and which had been by the law made to suffer for its honest expression of opinion. He ventured to suggest that the conductors of that journal deserved the support of the profession, for which purpose the meeting had been convened that afternoon.

Mr. Adams, President of the Medical Society of London, then proposed the first resolution:—

> "That the principle of establishing proprietary dispensaries, under the guise of provident institutions, is in the highest degree objectionable, and ought to be discouraged as fraught with danger to the public, and as tending to degrade the status of the profession."

Mr. Adams concurred in the broad principles laid down by the chairman's reference to proprietary dispensaries and provident institutions, condemning the system in which small payments were allowed to find their way into the pockets of the proprietor, and the poor were deluded into the idea that they were receiving the best advice and medicine. He was sure that all present were agreed that the conductors of the journal had the interest of the public and the profession at heart, and although the terms used had doubtless borne the legal interpretation of libel, yet a writer on such a subject might well be excused for overstepping the bounds of words. He was glad to have the opportunity of expressing his sympathy in common with those present with the proprietors of the journal, who he was sure deserved the confidence and support of the profession.

Mr. MacCormac remarked that it gave him great pleasure to second the resolution which had been proposed, and at the same time he wished to enter his protest against that degrading system which pretended to give cheap medicine and advice under the guise of charity.

Mr. George Brown (Hon. Sec. to the Medical Defence Association) said there was nothing more degrading to the dignity of the profession and against the interests of the public, than these so called cheap provident dispensaries. It was his misfortune to come across numbers of patients who had attended them from time to time; poor people who had been deluded into the notion by specious artifices that they were to get proper advice and medicine for the small fee of 4d. or 6d. a visit—medicine, he admitted, they might get such as it was, but as to proper advice it was simply monstrous. From numerous inquiries he found that the most that was ever done for the poor creatures in the way of diagnosis was to look at the tongue or feel the pulse, and there it ended. He had known dozens of cases of chest diseases, in which the chest had not even been sounded, or any attempt made to find out the nature of the complaint. And was this, he asked, proper treatment? Why, it was nothing less than a satire upon medicine, and a delusion of which the public should be made well acquainted. It was true the language used by The Medical Press and Circular was somewhat forcible, but abuses such as this system undoubtedly was, could only be put down by strong words, and he thanked the journal most sincerely for its courageous conduct. As a general practitioner it gave him great pleasure to see such a number of gentlemen of the greatest eminence in the profession coming forward to express their disapprobation of such a degrading system, and to support the conductors of the journal which had striven manfully and fearlessly to expose it.

Mr. Hogg testified that from his connection with two hospitals, and after exercising the most rigid economy, they had found that it was impossible to give proper medicines to a miscellaneous lot of patients at fourpence a head, putting of course advice and profit out of the question; the jury, however, appeared to have been misled by statements on the other side, and hence their verdict.

The resolution was then put, and carried unanimously.

Dr. Barnes said the object of the meeting had his cordial sympathy, and the resolution he was about to propose naturally followed that which they had already unanimously passed. It was an extraordinary system, this advice and medicine at fourpence a-head, it was one of those enigmas "which no fellow could understand." He had read the articles in the Medical Press and Circular, and he was bound to admit that they were written in a manner which reflected the highest credit upon the editors of the journal; they were dignified and to the point, condemning in very proper terms that system which they met there that day to denounce. He had also carefully read the evidence given at the trial, and he was glad to see that the judge spoke so highly, and as he (Dr. Barnes) considered justly, of the honourable, straightforward, and impartial way in which the journal was conducted. He was also delighted to find that the judge commended the honourable and consistent motives of Dr. Jacob, the writer of the articles, to the notice of the jury. But common juries could not always be brought to look at matters in a common sense way. He was astonished that any man could have had the hardihood to bring such an action, he was still more so that a jury should find a verdict for him. There was not the shadow of a reflection upon the character and impartiality of the journal, which he deemed worthy the support and sympathy of the entire profession. Dr. Barnes then proposed the following resolution :—

> "That this meeting desires to express its approval of the policy of the conductors of the MEDICAL PRESS AND CIRCULAR in bringing the influence of their journal to bear against such institutions. It also considers it a matter for regret that a verdict should have been obtained against them in a court of law for a conscientious expression of opinion, and it desires to offer them its entire sympathy and support."

Mr. HAYNES WALTON rose with great pleasure to second the resolution; and in doing so remarked that the journal with which they had met to express their sympathy, was one deserving of every support. It was an old and well-recognised organ of the profession, in which they had every confidence, or they would not have assembled there that day. It was not a personal affair, it was in support of a principle they had met, and as that principle had been so ably carried out by the conductors of the journal in question, all they wished to do was to express their sense of admiration of the manner in which the dignity and honour of the profession had been guarded.

The resolution was then put and carried unanimously.

Dr. EDMUNDS rose to propose that their sympathy should take some practical shape, and moved that a subscription be started to defray a portion of the expenses the journal had been put to in upholding the dignity of the profession in a court of law.

Mr. BROWNE was of the same opinion, and begged to second the motion of Dr. Edmunds.

Dr. BARNES and Mr. HAYNES WALTON thought that this should not be done on the present occasion, as the conductors had not requested it, and they had carried the resolutions which were on the programme; at the same time it was open to and consistent with the object for which they had met to decide afterwards upon the subject mooted by Dr. Edmunds.

The resolutions passed at a similar meeting held in Dublin, at the residence of Professor Mapother, on Saturday last were read from the chair, together with the names of those who had given their support to the objects of the meeting. These names, Dr. Barnes remarked, represented the *élite* of their professional brethren in Ireland, with whom he was proud to be working in so just a cause.

Votes of thanks to Drs. Quain and Barnes for presiding were carried unanimously, and the meeting dissolved.

THE MEETING IN DUBLIN.

A preliminary meeting of the profession in Dublin was held on Saturday last at the residence of Dr. Mapother, Merrion Square, at which it was announced that Dr. Gordon, the president of the College of Physicians, and Dr. Hayden, the vice-president, Dr. Kidd, president of the College of Surgeons, Dr. James Martin, president of the Irish Medical Association, Dr. Owens, Lord Mayor of Dublin, Dr. Atthill, Master of the Rotundo, Dr. McClintock, Dr. Davys, Dr. Mapother, Dr. Minchin, Dr. W. J. Martin, Mr. Croly, Mr. Smyly, Dr. Thornley Stoker, Mr. Henry Wilson, Dr. Banke, of Limerick, Dr. Tagert, of Monkstown, Dr. Chaplin, of Kildare, Dr. Wharton, Dr. Smith, of Donaghmore, Dr. G. F. Duffy, Dr. Morton, of Castleblayney, and many others of the leading members of the profession throughout Ireland had expressed their warm sympathy with the objects of the meeting, and their desire to be placed on the Committee if such should be formed. After some deliberation as to the best means of enlisting the support of the profession throughout Ireland, it was unanimously resolved—

> "That Dr. Chapman, 60 Pembroke Road, Dublin, be appointed Honorary Secretary and Treasurer of the Fund, and be requested to draw up a circular explanatory of its objects, and to forward same to the members of the profession in Ireland at large, inviting their support, co-operation, and subscription."

The following first subscriptions were announced :—

Dr. Gordon, President of the College of Physicians	1	1	0	Dr. Rowles, Rathmines	1	0	0
				Mr. Henry Wilson, Dublin	1	1	0
Dr. Kidd, President of the College of Surgeons	1	1	0	Dr. Atthill, Master of the Rotunda Hospital	1	1	0
Dr. McClintock, Dublin	2	0	0	Dr. Chapman, Dublin	1	1	0
Dr. Wharton, Dublin	1	1	0	Dr. Minchin, Dublin	1	1	0
Dr. W. J. Martin, Dublin	1	0	0	Dr. Tagert, Monkstown	1	1	0
Dr. G. F. Duffey, Dublin	1	1	0	Dr. Edward Taylor, Dundrum	1	1	0
Dr. Thornley Stoker, Dublin	1	1	0	Dr. Usher, Dundrum	1	1	0
				Dr. Chaplin, Kildare	1	1	0
Dr. Mapother, Dublin	1	0	0	Dr. Jacob, Maryboro'	1	1	0
Dr. Godfrey, Dripsy	1	1	0	Dr. Morton, Castleblayney	1	1	0
Dr. Davys, Swords	1	1	0	Dr. Raverty, Bray		10	0

The following offers of subscription, and subscriptions paid, had been received at the London office prior to the meeting at the Medical Society of London on Monday :—

Dr. Greene, Old Kent Road	1	1	0	Mr. George Brown, Hon. Sec. Med. Defence Society	1	1	0
Dr. E Williams, Colchester	1	0	0	Editors of the *Students' Journal*	3	3	0
Dr. Lauder Brunton, London	1	1	0	Dr. L. S. Forbes Winslow, London	5	0	0
Mr. R. Hanslip Sers, Epperstone, Notts	1	1	0	Dr. Prossor James, London	1	1	0
Dr. O'Flanagan, Houghton-le-Spring	1	1	0	Mr. Lennox Browne, London,		10	0
Mr. Jabez Hogg, London	1	1	0	Dr. Billing, London,	1	1	0
Mr. F. B. Courtenay, London	2	2	0	Dr. Carey, Taunton,	1	1	0
Dr. A. Leared, London	1	1	0	Mr. W. Douglas Hemming, Notting Hill,		10	6
Mr. C. T. Brookhouse, Deptford,	1	1	0				

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, DECEMBER 6, 1876.

THE OPINION OF THE PROFESSION ON PROPRIETARY DISPENSARIES.

ONE of the most gratifying features which characterise the different professions and vocations in which men are engaged is that *esprit de corps* in virtue of which the interests of a few become an object of concern to the whole class, by which the unmerited misfortune of even one individual is ameliorated by the kind sympathy and assistance of his professional brethren, and which, moreover, makes each class unanimous in resenting any conduct that is derogatory to its dignity or respectability. Hence, the different Funds, Provident Institutions, and Benefit Societies which have been instituted in London and elsewhere on behalf of various denominations of professional men; and hence also the incentive which should induce everyone to do all in his power to support the honour and integrity of the class to which he belongs. Of course this feeling is more strongly felt and is more influential, the higher we move in the sphere of society and perhaps there is no class more jealous of its good name than that to which we have the honour to belong; and that too, in face of difficulties from which many others are free. If there is any doubt as to the truth of this last remark, it will be at once dispelled by the public meeting which took place on Monday evening, at the rooms of the Medical Society, on behalf of this journal, and in support of the action taken by us against certain practices which are considered to be prejudicial to the dignity of the profession; nor can we appreciate too highly the magnanimity and self-sacrifice of those leading physicians and surgeons who, setting aside all other considerations, have devoted time, which they can ill spare, to justify the action of THE MEDICAL PRESS on a matter of great professional importance, but one in which their own private interests were only indirectly and remotely concerned. And not only does it afford us great satisfaction to be backed up by men of such ability and position as those who represented the profession at the above meeting, but it more than recompenses us for the trouble, anxiety and expense to which we were put in our endeavour to uphold the dignity and respectability of the profession. Such a meeting, moreover, is a guarantee that not merely any particular class of practitioners, but the whole profession, are concerned in the matter, and are of one united opinion as to the propriety of the course we took, and the worthiness of the motives by which we were actuated.

The great proof, however, of the sympathy and support accorded to us are the resolutions which were proposed and unanimously adopted at the meeting. The first resolution, moved by Mr. Wm. Adams, and seconded by Mr. McCormac, was:—

> "That the principle of establishing Proprietary Dispensaries, under the guise of Provident Institutions, is in the highest degree objectionable, and ought to be discouraged, as fraught with danger to the public, and as tending to degrade the status of the profession."

In the second resolution, moved by Dr. Barnes, and seconded by Mr. Haynes Walton:—

> "That this meeting desires to express its approval of the policy of the conductors of THE MEDICAL PRESS AND CIRCULAR, in bringing the influence of their journal to bear against such institutions. It also considers it a matter for regret that a verdict should have been obtained against them in a court of law for a conscientious expression of opinion, and it desires to offer them its entire sympathy and support."

We need scarcely say that such resolutions speak for themselves, and quite exonerate us from any indiscretion that might be charged against us by some of the more timid writers. What we required, and what no money can purchase, has been spontaneously accorded to us—the hearty sympathy and moral support of our professional brethren—and we cannot be too thankful for, or value too highly the readiness with which they met together to regret the course which late events have taken, and to heartily sympathise with the principles by which we were guided.

◆

THE INTERNATIONAL MEDICAL CONGRESS.

WHEN we last commented upon the proceedings of the American Congress (see p.), our attention was chiefly directed to the more interesting addresses that were delivered on that occasion. We shall now notice some of the papers which were read at the different sections, some of which were of peculiar merit.

Typho-malarial fever, diphtheria, phthisis, and the therapeutic relations of alcohol, were the chief subjects taken up under the section on medicine. Dr. J. J. Woodward, Assist. Surg. U.S. Army, drew attention to the fatality of camp fevers during the American civil war, and to the fact that many medical officers believed that these fevers represented a new type of disease. But he submitted that whenever great armies campaign in malarial regions, the prevalent fevers are hybrids, between malarial fever and some forms of typhus, and resulting from the combined influence of the causes of malarial and of enteric fevers. His views received the support of several members present, and the section adopted a resolution in accordance with the above proposition. Moreover, Professor Estlander, of Finland, read an interesting paper on the alternation of malarial and typhoid types of typho-malarial fever in certain regions of his native land.

The reader will naturally be curious to know what our American *confrères* say about the question of Identity or Non-identity of Croup or Diphtheria. Dr. J. Lewis Smith, physician to the New York Infant's Hospital, maintained that croup is a local disease, while diphtheria is but the expression of a general malady, but a difference of opinion was evinced by the members present, so that while the French school is pretty unanimous in favour of the unity of these affections, the opinion of the profession, both in this country and in America, is still divided on the subject. Dr. Hare, of London, who is himself a strong believer in the non-identity of the two diseases, reminded the section that the question was just now engaging the special attention of the Medico-Chirurgical Society of London.

There was a long and interesting discussion on the Influence of High Altitudes on the Progress of Phthisis. The reporter, Dr. Charles Dennison, of Colorado, spoke favourably of this influence, and thought that the remedy of high altitude is too long delayed in the majority of instances. He was also of opinion that too much importance has been attached to equable temperature, as equability of temperature often entailed excessive moisture, and that cool, dry climates are better than warm, moist ones. Dr. Duffy, of North Carolina, spoke of the rarity of phthisis in the high portions of his State, although this circumstance might be due to the out-door life which the people led. He also said that phthisis is rare in Southern California, where but little rain falls. Dr. Baldwin, of Florida, who had paid much attention to the subject, was sceptical as to the supposed beneficial effects of altitude, an opinion in which Dr. Johnson, of Illinois, coincided. However, the latter physician believed that in the earlier stages of the disease patients were benefited by going to the mountains. Dr. Gibbons said that the climate of California was almost absolutely dry; that in the interior of the State there was neither cloud nor fog for six months; that San Francisco was remarkable also for its equable climate, and that he had scarcely found cases of pulmonary consumption developed there. Dr. Harwft, of London, agreed with most of the other speakers in the opinion that high altitudes are suitable when patients can take exercise. Dr. Hare took the opportunity of recommending long sea voyages, as from England to Australia; but we protest against the habit, into which many physicians are falling, of advising this course to be taken, except in the incipient stages or more chronic forms of phthisis. We have known several instances where the fatal termination has been precipitated, the last few months of the patient's existence made miserable, and his return home rendered impossible by the inconsiderate adoption of such measures. But to go back to the influence of high altitudes, we must admit the question is one of very great importance, and it is to be regretted that the Conference did not, by previous arrangements, make it the subject of special inquiry.

In reference to a paper by Dr. Roberts Bartholow, Professor of the Theory and Practice of Medicine at the Medical College of Ohio, an interesting but not very profitable discussion took place on the question—Whether the Conditions of Modern Life favour the development of Nervous Diseases? Dr. Bartholow thought that the supposed increase in the number of nervous diseases is more apparent than real, and was owing to the increased notice that was now taken of them, as well as to the fact that not only had these diseases been more accurately studied within the present century, but that the growth of a higher humanitarian sentiment has led to a more abundant provision for the insane. The discussion which followed showed that there was a difference of opinion on the subject, but most of the speakers agreed that insanity was not to be attributed so much to mental strain and brain-work as to other causes. One member asserted that such diseases are very rarely the result of over-strain; another that intellectual men are generally long-lived, and that the nervous system accommodated itself to the strain upon it. Mr. Davis thought very few brains ever wear out by work. Dr. Green said the idea that a man could hurt himself over books is preposterous; and Dr. Bartholow that men could now-a-days do more intellectual work. In calculating, however, the influence of brain work as a condition of insanity we must not only accept the stern logic of facts, but also take into consideration that all mens brain's are not equally strong, no more than their stomachs or their livers are equally strong, and that, therefore, if mental strain be out of all proportion to cerebral power the result may be some form of insanity. There was also a wide divergence of opinion, as to the weight to be attached to such causes as syphilis and drunkenness. One or two speakers considered syphilis to be a fruitful cause of nerve disease. By one member nervous disorders were attributed to "wickedness," and to such agents as alcohol, tea, coffee, and tobacco; by another to the fast-living and to the excitement and competition incidental to modern civilisation. Altogether, the discussion was by no means satisfactory, and had a stranger been present he would have thought that the etiology of nervous disorders must be in a very unsettled condition. The Section also, while recommending the publication of the paper, expressed no opinion on the question involved.

The Section on Dermatology and Syphilology had under consideration the Treatment of Syphilis. with special reference to the Constitutional Remedies appropriate to its various stages, and the following "positive conclusions" were adopted:—1. That mercury is an antidote to the syphilitic poison, and of service in controlling all its symptoms in all, even the latest, stages of the disease, its power over gummata being least, and not to be relied upon. 2. That mercury in minute doses is a tonic. 3. That iodine cures certain symptoms of syphilis, but does not prevent relapses. 4. That mercury long-continued uninterruptedly, so far as practicable, in small doses, from the commencement of the eruption constitutes the best treatment of syphilis. It would also appear that this Section favoured the dual theory of the syphilitic virus, and, further, it sanctioned the proposition that venereal sores may not only be due to the inoculation of the syphilitic virus, but also to the inoculation of products of simple inflammation.

◆

THE SO-CALLED FUNGUS FOOT-DISEASE OF INDIA.

We learn from our contemporary, *Nature*, that the eminent micologist, the Rev. M. J. Berkeley, has lately seen occasion to change his opinion of the supposed fungus character of the Madura foot-disease of India. It is greatly to the credit of so accomplished an observer and authority on this department of nature to voluntarily confess to an error of judgment in a matter of this importance, and about which many exaggerrated and ill-founded theories have been put forth. We have, on several occasions, when called upon to comment upon the perplexing relations of fungi to different diseases, stated our conviction that in this particular instance of the so-called "fungus foot-disease" the relation of fungi is restricted to subjects already in a depressed state of health, and in which fungi merely find a proper nidus for their growth; and we are extremely gratified to find the Rev. Mr. Berkeley, after a further examination of the evidence brought forward by Drs. Lewis and Cunningham, in their report presented to the Government that he is now of opinion "that it is more reasonable to infer that localised spots in the tissues (of the foot) undergo degenerative change into a substance peculiarly adapted to the development of filamentous growths, the origin of which, in situations where no spores could penetrate, must remain a matter of perplexity." No doubt, in the first instance, the remarkable nature of the black sclerotinoid bodies, "fossilised fungus" of various sizes found in the excavated hollows of the tissues of the foot, or the pink "fish-roe"-like masses mixed with various sanious matters, seemed to lead to a belief in the fungoid origin of a disease which, in India, constitutes one of the most formidable maladies which the medical officer is called upon to treat. Its investigation undoubtedly demands patient observation, and it is only those who have paid great attention to questions of the kind, and possess a special training for such investigations before entering upon their study who can hope to clear up the many difficulties by which it has been surrounded. The real point at issue is whether the sclerotinoid bodies observed in the Madura foot-disease by Dr. Vandyke Carter are really of a fungoid nature at all. Our own observations led to a belief that the fungoid nature of the disease could not be established; we were constrained to take this view not only from careful microscopical examinations of specimens of "fungus foot-disease," but also, in some measure, from a statement of Virchow's, which, as Mr. Berkeley justly observes, is a very important one, and is to the following effect:—"A development of myeline is especially prone to occur where portions of the fatty matter, roe-like masses, &c., freshly removed from an alcoholic preparation, are subjected to the action of liquor potassæ. The multifarious and highly complex forms of tubes, filaments, globules, and cysts which may frequently be observed to become developed, shooting out, and, as it were, growing from the globules and aggregations of fatty matter, are wonderful, and such that they could hardly be believed to owe their origin to any such process or material were not their development distinctly traceable through all its stages." The more thorough examinations of Drs. Lewis and Cunningham enable them to positively state that the roe-like bodies which occur in the pale variety of the disease are fat in various modified forms; the pink particles are pigmented concretions, while the black masses consist of degenerated tissues mixed to a greater or less extent with black pigment and fungoid filaments. They deny the possibility of cultivating these fungoid filaments, for "in no instance could they be coaxed by any treatment into the development of fruit, and their nature, therefore, must still remain doubtful."

PHARMACEUTICAL PURISM.

We cannot refrain from an expression of our great surprise and regret that the English Pharmaceutical Society should descend from its position of dignity as the authorised comptrollers of British pharmacy, and appear publicly as the defenders of drug adulteration. We have formed too high an opinion of the intelligence of the Society's Council, derived from its utterances in debate and its educational policy, to give them the credit (or, we should say, the *dis*credit) of honest concurrence in the statements and arguments which are each week put into their mouths by the Society's journal. We are quite alive to the fact that councillors have a difficult *role* to play. They are called to legislate for purism in the pharmaceutic trade, and are entrusted by the public with a vigilant supervision of druggists and drugs in order that the uninformed consumer may be guaranteed as to the purity, efficacy, and honesty of the medicines which he purchases. But by whom are the councillors called? By the very persons who are openly engaged in the falsification of drugs—to whom the laxity of past years in questions of adulteration is a matter of bread and butter—who have been born and bred in the creed that the public is fair game for any trader who can make money of them, and who look on the desire of the public to get honestly what they want and pay for as a ridiculous modern refinement which it is not the duty of druggists to respect. Chosen by the votes of such a constituency is it any wonder that councillors have not the courage of their position and are tolerant of drug frauds? Perhaps not. But it would seem at least sensible that they should be mute on paper as they are in speech, and not allow the Society to be blazoned as the champion of drug roguery and counter prescribing. That it is so represented by its official journal we observe this week, for we find the place of honour in the editorial columns devoted to an apology for gross "milk of sulphur" frauds, for which three druggists in and near Manchester were deservedly prosecuted and punished. The *proteges* of the English Pharmaceutical Society were clearly proved guilty of selling mixtures which contained from 59 to 61 per cent. of plaster of Paris, and the magistrate, who is a medical man, dwelt with very proper emphasis on the ruin to health and life amongst children, which must result from the administration of such stuff under the impression that it is sulphur, and upon the disgraceful character of the trade to the defence of which the Pharmaceutical Society devotes itself.

We cannot do the journal or the Society the injustice to suppose that they believe in the truth of the following phrase or expect any of their reader's consciences to conform to it. "There is no question that precipitated sulphur should always be supplied to those who desire to have it; but *there are many who do not approve of this preparation, and prefer the old-fashioned 'Milk of Sulphur;' many others, ignorant perhaps of the difference, are at least accustomed to the old preparation, and when they are supplied with it really obtain what they expect.* It is monstrous that persons dealing in this article conformably with old established usage should be liable to prosecution and all the detriment attaching thereto simply because it is the whim of some public analyst to assume that 'Milk of Sulphur' means the precipitated sulphur of the Pharmacopœia."

Such a statement as this is simply met by a categorical denial. There may be many who, being deceived by a false name, prefer plaster of Paris and sulphur on account of its cheapness and convenience of administration, but we deny that there are many, or any, who would prefer it if they were undeceived, or would tolerate the use of a grain of it with their children. Does our contemporary really mean to assert that "when they (the purchasers) are supplied with it they really obtain what they expect?" The hidden places of the editorial breast alone can reply. For ourselves, we believe that if the druggists honestly avowed that the "milk of sulphur" was two-thirds insoluble sulphate of lime they would not sell a shillingsworth in the year. Probably the pharmaceutical constituency thoroughly appreciate that fact, and, hence, the elaborate palliation of such adulteration by the Society's council.

We repeat our surprise and regret that the dictates of the "till" should overwhelm those of conscience in an important and valuable public body such as the English Pharmaceutical Society.

Notes on Current Topics.

Sanitary Reform on Board Ships.

Amongst the best papers read at the recent and fourth annual meeting of the American Public Health Association are those of Dr. Albert Gibson on "The Need of Sanitary Reform in Ship Life," and of Dr. A. N. Bell, of New York, on "Practical Conclusions concerning Marine Hygiene," &c.

The great philanthropic agitation of Mr. Plimsoll with regard to loss of life at sea in unseaworthy ships is well known both on this and on the other side of the Atlantic. It has, however, been more than once pointed out that this loss of life was not entirely due to the bad condition of the ship and the malpractices of shipowners, but that there is such a thing as "unseaworthy sailors." It is also well known that not only does the bad sanitary arrangements on board ship but also the bad health of many of the sailors at the time of their enlistment add very much to the mortality that arises from other causes.

In the first paper above mentioned, an abstract of which will be found in the current number of the *Sanitarian*, Dr. Gibson said that the efficiency of ship life is more impaired by sickness than by original deficiency of complement. He drew particular attention to the lack of cleanliness and ventilation in merchant vessels at the present time; he considered that foul air and dampness were the greatest enemies of the sailors; and he very properly insisted upon the necessity of compulsory legislation respecting the sanitary inspection of every vessel as to space of quarters, ventilation, cleanliness, outfit of clothing and bedding, quality and quantity of food and water, &c.

Dr. Bell's paper was chiefly statistical, and was based upon the "experience of ocean lines of ships in communication with New York." As an illustration of the sacrifice of human life in emigrant vessels, he stated that "out of 98,105 Irish emigrants shipped during the summer of 1847, after the great famine of 1846, there died at sea 5,293 in quarantine, and soon after arrival at Quebec 8,072, and at Montreal 7,000 more, making in all 20,365!" We think, however, a good deal of this mortality should be attributed to the bad health of the emigrants at the time of their embarkation, traceable in many cases to the previous famine. For a period of twenty years ending 1855, there was not probably, says Dr. Bell, a single one of all the emigrant ships from British and Irish ports which embarked with a sufficient quantity of proper food and means of cooking it for all on board, and the mortality generally reached 9 per cent of the emigrants. But after twenty years' progress of sanitary reform, out of 430,441 steerage passengers who, during the ten years ending 1873, arrived in New York by sailing vessels, the death-rate was only 9·14 per 1,000. Dr. Bell also submitted statements from the chief ocean lines now in communication with New York, from which it appears (says the *Sanitarian*) that the care taken in providing qualified medical men, sanitary appliances, rigid discipline, and exaction of penalties under the laws of both England and the United States, have had the effect of placing the hygiene of passenger-vessels at least on an equal footing with the best sanitary conditions in the most enlightened communities.

Suppression of the Municipal Nursing Establishment in Paris.

THE Government has submitted to the Council of State a draft decree having this object in view. The way was paved for this reform by an inspection of the nurse children by the Department of Public Charity. The principle of the measure is to substitute maternal for mercenary nursing, which will, as far as possible, be effected by the grant of allowances to the destitute mothers of the Seine Department to enable them to afford proper care and comfort to their infants. The council general has already made a movement in this direction by including in its votes considerable sums under the title "Grants to prevent Child Desertion." This will, no doubt, prove the death of the foundling hospital system in France, that system having long since ceased to exist in Great Britain.

Noxious Vapours on the Tyne.

THE *Newcastle Courant* of the 29th ult., calls attention to the penalties involved in the manufactories at Newcastle, as evidenced by the accounts of some of the witnesses before the Noxious Vapours Commission. Among these witnesses were landowners, tenant farmers, estate agents, inspectors, &c.; and they all testified to the injury to public health and to property from the gases and smoke emitted by the chemical and other manufactories on the banks of the Tyne. It is generally acknowledged that the atmosphere in this neighbourhood is exceedingly bad. The inhabitants of Newcastle have got quite accustomed to the cloud of smoke which hangs over their heads six days out of the seven. An open window is rarely seen, as the living in close rooms and the breathing of impure air are far more tolerable than the inhalation of the poisonous gases which emanate from the surrounding manufactories. The most remarkable evidence that was given, however, was in reference to the destructive influence of noxious vapours upon vegetation. This will not so much excite the surprise of those who know how very sensitive plant-life is to impure states of the atmosphere, but they cannot help being impressed by the magnitude of the mischief produced when occasioned by conditions which operate on a larger scale. Mr. Ellison, in giving evidence as to the condition of his estates at Hebburn and Dunston, said that down to 1840 thick hawthorn hedges flourished where even the grass is now completely destroyed, and that it is utterly impossible by draining, subsoiling, or ploughing to improve the land for agricultural purposes. The result is, that land which formerly let for 25s. per acre can hardly be let now for 10s., or even 7s., notwithstanding that at one time it produced some of the finest crops on Tyneside. Nor is this poisoned atmosphere less injurious to pasture lands; for, according to Mr. Ellison, cattle dislike the herbage grown on land that is exposed to the destructive influences above-mentioned. Such herbage has no nourishment in it, and the cattle which eat it suffer from diarrhœa. It further appears that the effects of these noxious gases are felt miles away from the tall chimneys from which they are emitted. Thus: so destructive are the fumes arising from the alkali works, that in 1868 Mr. Wallace marked off on the Ravensworth estate 500 trees (each a growth of 60 years), which had either been killed or hopelessly injured by the gases from the works three or six miles away. Many more, and similar, instances of the deleterious effects of these gases might be cited; how the value of one estate had been reduced from 35 to 27 years' purchase; how one farmer had to give up his farm at a great sacrifice, in consequence of the damage done by the poisonous vapours; and how another farmer's cows, which had become ill from the same causes, had been ordered to be killed by the veterinary surgeon.

The best hope, however, that something will soon be done to remedy the evils complained of, lies in the fact that the unsanitary conditions which we have but briefly noticed have become so intolerable, and that the very publicity which has been recently given to the extensive depredations of noxious gases, not only in Newcastle but other manufacturing towns, gives promise that before long some means may be found to make manufacturing towns almost as healthy, and the adjoining land as productive, as any rural district in the country.

On Chewing Gum.

THIS peculiar habit seems on the increase in America. Many thousands of pounds are consumed annually. The tree is found in many parts of the south-west of the State. The gum exudes through cracks in the bark at all seasons of the year, and hardens on exposure. It is soluble in alcohol, and makes a smooth, pleasant syrup. It is collected and sent to the "chewing-gum manufactories," which put it up in convenient packages and send it to the retailers.

Singular Injury of the Abdominal Walls.

DR. D. W. FOSTER reports in the *Philadelphia Reporter* the following curious case:—

> "Madame José Frujé, now aged about fifty, and the picture of good health; has thirteen living children; has lost several, and has been *enceinte* twenty-four times. When a young girl she was struck by the end of a buggy shaft, over the region of the stomach, so forcibly as to rupture the abdominal muscles, but left the skin unbroken. Through that at first small orifice a protuberance the size of a very small egg appeared; it remained about the same until she married and became pregnant when during each gestation the opening became enlarged, until now the stomach and all the small intestines, and maybe more, hang outside of the abdominal cavity, in a sack of the skin, about eighteen inches long and twenty-four inches in circumference. She wears a belt to suspend her bowels around her neck; is active and cheerful as a girl; laughs at the idea of packing her bowels about her. She says when she drinks a glass of cold water and lays her hand over the stomach she can feel the temperature of the water very sensibly."

Therapeutical Vagaries.

IF ever a work were to be written on the "Curiosities of Physic," several pages might be devoted to the queer prescriptions and the countless and extraordinary methods of treatment that have been, over and over again, recommended for every disease under the sun. *Le Progres Médical* informs us that Joh. Schnitzler, of Vienna, encouraged by the experience of Trotz in cases of diphtheria, has tried the effects of subcutaneous injections of diluted carbolic acid in various febrile maladies. He has employed these injections in cases of remittent and intermittent fevers, and in one hundred cases of phthisis. The immediate result of the injection consisted in a fall of the fever, or reduction of the temperature, and an improvement in the strength of the pulse, with a general abatement of all the other symptoms—such as dyspnœa, lassitude, and pains in the limbs. Continued for two or three months, these injections were found to be less painful than those of morphia, and they never produced abscesses. M. Schnitzler's experience has not been sufficient to show that they have any influence upon the course of the disease, but he promises to publish the results of his future investigations.

We can scarcely conceive that a weak solution of carbolic acid could be injected subcutaneously without having some effect upon the temperature and circulation of the body; but when we hear that such a practice has been proved to arrest the progress or ameliorate the symytoms of phthisis, we shall no longer doubt the probability of one day finding a remedy for every disease.

Equally questionable is the employment of the same means in the treatment of articular rheumatism. Senator (*Berlin Klin. Wochenschrift*, 1876. No. 6), has injected, in accordance with the suggestions of Kunvre, a dilute solution of carbolic acid at the most painful points about the affected joints, and it is seriously stated that excellent local effects resulted from this treatment.

Certifying Factory Surgeons.

WE understand that the question of the position and emoluments of the certifying factory surgeons has been under the consideration of the Council of the Irish Medical Association, who, however, for the present, abstain from making any recommendations until full information is laid before it relative to the advisability of protesting against some of the recommendations made in the report of the Factory Commission, and at the same time endeavour to extend the usefulness in a sanitary point of view of these officers. In order to obtain the necessary information, we are informed that the secretary of the Irish Medical Association is in correspondence with the secretary of the Ulster Association of Certifying Factory Surgeons.

Medical Witnesses in Crown Cases in Ireland.

THE Council of the Irish Medical Association will appear by deputation before the Attorney-General for Ireland on Saturday next to represent to him the injustice of the existing rule with reference to the payment of medical witnesses in Ireland.

The following is a copy of the Attorney-General's rules of 1868, still in force, viz.:—

> RULE 19.—"When a medical witness is summoned to attend at sessions in the town in which he resides, the usual fee of one guinea only is to be paid; but when he is summoned to attend in any other town he is to be paid one guinea for every day he is necessarily kept from home, besides his actual travelling expenses and hotel charges, such hotel charges not to exceed 15s. per day."

It will be of great importance that the inadequacy of the fee thus provided for shall be distinctly shown, and that the different treatment of other professional witnesses giving evidence of a similar character under similar circumstances should be illustrated. We therefore request that those members of the profession throughout Ireland who have experience of the working of the existing rule, or any other information on the subject, will *at once* communicate with us.

Exclusion of the Press from Poor-law Inquiries.

A SWORN inquiry into certain charges preferred by a contractor against the Clerk of Works to the Mountmellick Guardians was opened last week by Dr. Burke, Local Government Board Inspector.

Before the proceedings commenced, the representative of the *Leinster Express* asked if the inquiry would be open to the Press.

Dr. Burke replied that it would not; that he had as much reverence for the press as any other man; but that many things might transpire in evidence which it would not be right to publish until the evidence went before the Local Government Board.

The representative of the *Leinster Express* reminded Dr. Burke that both the parties to the inquiry were anxious that a full report of the evidence should be given in the papers.

Dr. Burke said he did not care, and that he would not admit the press. He had already formed his decision, and would not alter it. How, he asked, could the inquiry be said to be private when Mr. Cullen and the Messrs. Cobbe were present?

Mr. Cobbe then drew Dr. Burke's attention to the resolution unanimously passed by the guardians requesting that the press should be present.

Dr. Burke said *he did not care what resolutions the guardians passed. They did not affect him. He had the discretionary power of either admitting or refusing to admit the press, and he should not let them be present.*

In our opinion, the inspector's action is as unwise as it is unconstitutional. Public departments may have a legal but they have no moral right to envelop their official inquiry in darkness, and those inquiriers will cease to have any force, whenever the inevitable impression becomes fixed in the public mind that they may be cooked by a process of investigation which cannot bear the light. Any attempt at secrecy in such cases is stupid—firstly, because it never succeeds to any great extent; and, secondly, because the opportunity is afforded to the party who is worsted in the contest to say that he did not get fair play, which, indeed, he does not under such circumstances.

Salicylic Soap.

We have received specimens of this soap, and from an examination we have made of it, both as to its composition and its detergent properties, we can testify to its being one of the most useful soaps that have attracted the notice of the public. It contains a considerable proportion of salicylic acid, and consequently possesses much of the antiseptic properties belonging to that agent. From personal experience we find that it makes a good lather even in hard water, that it has a very pleasant and softening effect upon the skin, and that, unlike many other soaps, it has neither disagreeable odour, nor is it too highly "scented." Unless we are much mistaken, it will be found very useful in offensive perspirations, or in irritability, roughness, and other affections of the skin.

Lactopeptine.

Messrs. Carnrick, Kidder, and Co., pharmacists, of New York, have succeeded in preparing a pepsin compound which promises to be very useful in the treatment of some forms of dyspepsia. It contains sugar of milk, pepsin, and pancreatine, in the proportion of four, eight, and six ounces respectively, along with four drachms of ptyalin or diastase, five of lactic acid, and five of hydrochloric acid. From this list of ingredients it will be seen that, provided we can ensure the genuineness of the compound and avoid all spurious imitations, we shall have a valuable addition to our stomachic remedies. In fact, such a formula is a desideratum, considering that the preparations of pepsin now in use have disappointed the expectations of many practitioners.

Metropolitan Hospital Sunday Fund.

A meeting of the Council of the Hospital Sunday Fund took place at the Mansion House on Friday last, the Lord Mayor (Sir Thomas White) taking his place for the first time as president of the fund. Mr. Custance, the secretary, read the reports of the General Purposes and Distribution Committees, which were unanimously adopted. The collection for this year amounted to £27,042 11s. 4d., being rather less than that of the first year, which was £27,700 8s. 1d., whilst that for 1874 was £29,936, 17s. 10d., and that for 1875, £26,396 2s. On the whole the fund has not been quite so successful as it was expected it would be, but, as the Committee remark, considering the very serious commercial and monetary depression experienced this year, the result has not been so very unsatisfactory. The working expenses of the fund, including all charges for printing, advertising, &c., amount to 3½ per cent. on the gross receipts. In compliance with a resolution of the 7th of May last year, the representatives of every hospital and dispensary were invited to confer with them in every case in which their Committee had proposed to fix the award below the arithmetical basis, and in reply to that invitation some of these institutions intimated their wish to leave the decision entirely with the Committee, while a few availed themselves of the opportunity of a conference thus afforded them. The only award the Council refused to ratify was that recommended in the case of the tank accident at St. George's Hospital. This was thought to be objectionable, as establishing a precedent which might hereafter prove disagreeable.

The meeting was well attended, and among those present, and who take a never-failing interest in the fund, we noticed the Right Rev. Bishop Claughton, the Archimandrite of the Greek Church, Professor Marks, the Rev. T. J. Rowsell, Rev. J. F Kitto, Rev. Dr. Adler, Rev. H. Fisher, Rev. Dr. Finch. Rev. R. J. Simpson, Sir F. Lycett, Sir Edmund Currie, Mr. Turner, Dr. Risdon Bennett, Mr. Jabez Hogg, Dr. Sedgwick Saunders, Mr. Thomas Christy, Dr. Kennedy, &c. A cordial vote of thanks to the Lord Mayor brought the proceedings to a close.

Medical Journals.

From an interesting article by Dr. J. S. Billings, in a recent number of the *American Journal of the Medical Sciences*, we (*Med. Examiner*) learn that at the beginning of 1876 there were in course of publication throughout the world about 280 regular medical journals. Of this number Germany and Austria had 57, France 52, Great Britain, not including her colonies, 29, the United States 46, Italy 31, Belgium 8, Mexico 8, Canada 7, Holland 6, Spain 6. As to the form of publication, the United States has the largest proportion of monthlies, and France and Germany of weeklies and bi-weeklies.

St. Andrew's University M.D. Degree.

It is intended to apply to the Scotch University Commission, at present sitting, through the St. Andrew's representatives, Drs. B. W. Richardson, F.R.S., and Dr. Sedgwick, of London, to have the M.D. degree made more open in competition, the University having only power at present to grant ten degrees in the year. This cause is necessitated by the Durham University having opened its portals to registered practitioners.

Precautions against Epidemic Small-Pox in London.

The managers of the Metropolitan Asylums Board held a meeting on Saturday last, Dr. Brewer presiding, at which the subject of providing increased accommodation for small-pox patients, in anticipation of the expected epidemic, was introduced. Letters were read from the Local Government Board, approving of the appropriation of the Hampstead Hospital for small-pox cases, and increasing the accommodation at Stockwell and Homerton respectively to 140 beds. Since the last meeting of the managers, the president of the Local Government Board had written to the chairman, stating that he thought further accommodation would be urgently required at an early day, and that it would be wise to put up administrative blocks quickly. The committee recommended the erection on the Fulham site of two blocks, and four temporary wards to cost £17,500. They further recommended that at Deptford six temporary wards should be put up as soon as possible, at a cost of £1,750, and a receiving ward for £350, the total amount to be spent ultimately at Deptford being £14,000. If the proposals of the committee were adopted by the managers, accommodation would be provided at Deptford for 144 cases, giving to each patient 2,000 cubic feet, but if including a proportion of convalescent cases, 180 patients. At Fulham the accommodation would be for 168 acute cases, and they proposed to put up the buildings in a lasting manner. The report was agreed to, and a tender was accepted for the proposed buildings at Deptford. As a further precaution the committee recommended that application be made to the Local Government Board to know if it would be possible to place at the immediate disposal of the managers some existing workhouse or other large building, suitable for the instant reception of persons suffering from small-pox.

Surgical Society of Ireland.

The next meeting of this society will be held on Friday evening (Dec. 8), at the Royal College of Surgeons in Ireland, when the following communications will be read :—

Dr. H. R. Swanzy, on Amblyopia.
Mr. H. Tyrrell, on Excision of the Elbow.
Dr. Richardson, to exhibit sections of epithelioma.

Small-pox is happily declining in London.

The deaths from typhoid in Paris have diminished 50 per cent. during the past two weeks.

Mr. Francis Mason succeeds Mr. Simon as surgeon to St. Thomas's Hospital.

The last Sunday in this year has been selected as Hospital Sunday in Belfast.

The Royal Hants Infirmary, Southampton, has received a legacy of £1,000 under the will of the late Captain Bold, R.N.

The Chichester Infirmary acknowledges the receipt of £1,000, under the will of Mr. A. H. Hall, late of that city.

In addition to the sums mentioned in our last, Mr. J. J. Colman, M.P., of the eminent firm of mustard manufacturers of London and Norwich, has given £1,000 to the Enlargement Fund of the Norfolk Hospital.

The magisterial decision *re* the quack "Dr. Hamilton," of Oxford Street, will be given at the Marlborough Street Police Court on the 13th inst., the case having been adjourned for inquiries in America.

A testimonial, consisting of a handsome marble timepiece, was presented last week to Mr. T. B. Rake, M.R.C.S., of Fordingbridge, Hants, by the New Forest Lodge of Odd Fellows, of which he has been medical officer for the last twenty-two years.

The ratepayers of Leeds have consented, by a large majority, to the promotion by the Town Council of a Bill in the next session of Parliament for certain sanitary and other improvements in the city. The estimated cost of these proposed works is upwards of £800,000.

The *Pharmaceutical Journal* says that the subject of the inconveniences resulting from the absence of any authoritative regulations respecting the construction and verification of instruments used in testing the alcoholic strength of liquids has recently been brought before the French Chamber of Deputies. One illustration quoted is, that although exporters of eau-de-vie are compelled by law to declare its strength within a margin of one per cent. under a penalty of from 500 to 5,000 francs, it is not rare to see two instruments applied successively to the same eau-de-vie give indications differing by as much as five per cent. To remedy this state of things, a *projet de loi* has been drawn up, and has been reported upon favourably. It provides that in all transactions, either public or private, after the 1st of January, 1877, Gay-Lussac's centesimal alcohometer shall be used, and that these instruments shall be first officially verified as being correct.

The Council of the Dublin Pathological Society selected as the subject for competition for the Society's Gold Medal, to be presented at the end of the session, "The Pathology of the Œsophagus." The following officers of the Society for the session were elected :—*President:* Thomas Haydon. *Vice-Presidents:* Samuel Gordon, M.B. ; Robert McDonnell, M.D. ; Sir Dominic J. Corrigan, Bart., M.D. ; George H. Kidd, M.D. ; John T. Banks, M.D. ; Edward Hamilton, M.D. ; *Council:* A. H. Corley, M.D. ; Alfred H. McClintock, M.D. ; James Little, M.D. ; Thomas Evelyn Little, M.D. ; Arthur Wynne Foot, M.D. ; Benjamin G. MacDowel, M.D. ;

John Mallet Purser, M.D.; William Stokes, jun., M.D.; Henry G. Croly; James H. Wharton, M.B.; Henry Kennedy, M.B.; George F. Duffey, M.D. *Honorary Secretary:* William Stokes, M.D. *Secretary and Treasurer:* Edward H. Bennett, M.D. *Secretary for Foreign Correspondence:* Robert D. Lyons, M.D.

The next meeting of the Pharmaceutical Society of Great Britain will be held this evening (December 6) at half-past eight. The following papers will be read:—

"A New Mode of making Grey Powder." By Mr. A. Bottle.

"The Composition and Uses of a New Preparation of Bismuth." By Mr. S. C. Betty.

"Note on certain Reactions of the Glycerole of Nitrate of Bismuth." By the President.

"Note on Crystallized Hyoscyamine." By Mr. W. Martindale.

"Note on Impure Glycerine," and "Note on a Crystalline Deposit from Tincture of Galls. By Mr. A. W. Gerrard.

"Note on the Formula of Capsaicin." By Mr. J. C. Thresh.

THE ENGLISH TRADE IN ADULTERATIONS.

Milk of Sulphur.

At the Hyde Petty Sessions, Mr. Harrison, druggist, was summoned by Captain Arrowsmith, chief constable, for selling two ounces of milk of sulphur. The sulphur, on being tested by the county analyst, was found to contain 61 per cent. of hydrated sulphate of lime and only 39 per cent. of milk of sulphur.

The chairman (Dr. Newton) said Captain Arrowsmith deserved credit for bringing this case before the Bench, as mothers gave the drug to their children for skin diseases, and if a drachm of this mixture were given to a child the results in all probability would be that the ingredients would become hard, cause congestion and inflammation of the bowels, and even death. He had no doubt the mortality among children was largely owing to the introduction of mysterious substances into their little bodies. In this case the Bench might have imposed a penalty of £20, but believing the defendant had no guilty knowledge of what he was selling, they only inflicted the nominal penalty of 5s. and costs.

At Dukinfield Sessions Michael Coffey, provision dealer, was also summoned for the same offence.

The milk of sulphur obtained from the defendant's shop contained 59 per cent. of hydrated sulphate of lime. In these cases of adulteration Captain Arrowsmith said he would like to reach the manufacturers of such rubbish, because in populous districts such adulterated drugs destroyed more human lives, and especially of infants, than half-a-dozen plagues.

Defendant, in explanation, said, twenty years ago he became tenant of the shop, and at that time there was a large quantity of milk of sulphur in stock. He had never bought any since, and he believed he was selling the article pure and unadulterated.

Mr. Aspland said the magistrates were of opinion that defendant was guiltless of any intention to defraud. They thought he sold the article in good faith, but at the same time it ought to be known that this stuff with which the drug was mixed was poison, and might produce an injurious effect upon the health of children. It was the duty of every tradesman to know that his goods were pure articles, and he ought either to get a warrant to that effect or have the goods analysed. The magistrates thought it best to impose a small fine in the case, and a nominal fine of 1s. and costs would be inflicted; but if any more such cases were brought before them, the fines would be more substantial.

The next case was one in which Jonathan Radcliffe, shopkeeper, was charged with a similar offence. Defendant said he sold milk of sulphur, but he was not aware that he sold an article contrary to milk of sulphur.

The certificate showed that there was 61 per cent. of hydrated sulphate of lime or elements of plaster of Paris in the drug as sold.

Defendent said he did not sell the article as precipitated sulphur.

Captain Arrowsmith replied that it was known throughout the trade as precipitated sulphur.

The Chairman said the two terms meant the same thing. In point of law the customer asked for precipitated sulphur, and defendant gave him a poisonous drug.

Defendant: I sold the article as pure for ought I knew; I never altered it, and it is so long since I bought any that I forget where I bought my present stock.

The Chairman: You are selling an article with only 39 per cent. of precipitated sulphur, and 61 per cent. of a poisonous article. If you had gone to a respectable druggist you could have got the pure article. You may have poisoned people by selling this stuff. You know very well that if you buy drugs that are not pure you may get protection against the person who sells them, and then you will be safe. If you choose to go and buy cheap drugs which are poisonous you will render yourself liable to all the penalties. As this is the first time, you will only be fined 10s. 6d. and costs, the cost of the analysis, and the police costs. If you come up again you will probably have the full penalty.

Mustard Compounds.

Mr. William Whitworth, grocer, Hurst, was summoned on a charge of having sold two ounces of adulterated mustard. The defendant pleaded guilty.

The Clerk: The question is, did you know that this was not real mustard?

Defendant: It is Colman's mustard, and it said "mixture" on the tin.

Prosecutor said he did not see the label on the tin, but if it had been labelled, as alleged, it was illegal to sell a portion of it unless every such portion was labelled. The article bought contained 25 per cent. of farina, which was put into it for the purpose of diminishing the strength and improving the appearance. It was not sufficient that the tin should be labelled "mixture" unless it was sold whole. If a milkseller labelled his cans "milk and water," he must as well attach a label to every quantity he sold if he wanted to escape the law.

The Clerk: To every gill.

Mr. Buckley: If you had sold the whole tin of mustard you would not have been liable.

The Chairman (to defendant): We consider this a very serious case, but as it is the first one of the kind in the division, we shall not fine you heavily.

The defendant was then fined 1s. and costs.

Arrowroot.

Mrs. Everett, grocer, of Shepton Mallet, was charged with selling adulterated arrowroot. The constable stated that he asked for an ounce of arrowroot. The assistant brought into the shop a tin box of arrowroot that had not previously been opened and opened it in the presence of witness, and supplied him with arrowroot therefrom. The box was labelled "warranted genuine," and the assistant wrote similar words on the packet he produced. The arrowroot in question contained 50 per cent. of cassava starch. Mr. Wontner, who appeared for the firm of Keen, Robinson, Bellville and Co., of London, who had sold the arrowroot to Mrs. Everett, submitted that defendant had sold the arrowroot in the same condition that she bought it, and had given notice to that effect when she sold it to the constable. She was therefore protected by the 25th section of the Act. The bench agreed with this opinion, and dismissed the case.

Mr. William John Bellville was next charged with selling fourteen pounds of adulterated arrowroot. Mr. Wontner said the facts were admitted by the firm, who claimed the same protection under the Act as Mrs. Everett, and would prove that they had sold the arrowroot in precisely the same condition as they had bought it, and as it was imported. It was the custom of the firm he represented to submit samples of all goods purchased by them to Mr. Piesse, the public analyst, for analysis, before warranting them to their customers; but during last summer Mr. Bellville was out of town, Mr. Swinbourne, their spice buyer and salesman, was laid up for six weeks by an accident, and when he returned to business he found a great demand for Natal arrowroot, and he went into the market and bought six cases under warranty from sworn brokers, and being anxious to supply the customers of the firm he did not wait to have it analysed. Since these proceedings had been taken they had sent samples to Mr. Piesse, who found the arrowroot was not genuine, and they had accordingly withdrawn all that they had sold from that lot. It contained a mixture of starch of cassava, which was a wild arrowroot. He also thought that as this description of goods was imported and passed through the Custom House its purity should be guaranteed, as in the case of tea.

The Chairman of the bench said the only difference they could see in the two cases was, that the retailer had given notice that she sold the arrowroot in the same condition that she bought it, and the defendants had not; they would therefore have to pay the costs, and the case would be dismissed.

◆

DISCUSSION AT THE LEARNED SOCIETIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

PARAPSYCHOSIS.

I HAD had an arduous day, and was much concerned respecting an obscure case of nervous (? hysteric) disease, on the diagnosis of which I intently pondered. Having drawn my chair towards the fire, as a calmative I took up the "PRESS." In a listless mood, I turned over its pages, and, glancing at the "Report of Meetings of Societies," imperceptibly drifted into reverie. Ultimately, I became absorbed by

PSYCHO-BIOLOGICAL SOCIETY OF LONDON.

Dr. NEPHELE, F.R.S., Vice-President, in the chair.

A paper was read by Dr. Micracloths Thaumaterges, of the University of Gottingen, on "Functional Disorder of the Extra-ventricular Portion of the Corpus Striatum." The author commenced by remarking that little apology was demanded in bringing this important, though hitherto unrecognised, affection before the Society. Notwithstanding that the labours of Glabella, Lambdoides, and Sinciput in Italy, Germany, and France, had thrown considerable light on disorders of the hemispherical ganglia, yet the functional lesions and their causation of the segment of the striate body in question had been altogether overlooked or unnoticed. As the malady was seldom fatal when uncomplicated, more insight might be expected and obtained from clinical experience than from cadaveric revelations.

He adverted to the researches of Rolando, Van der Kolk, Brown-Séquard, and other physiologists, in proof of the existence of a special set of emotional nerve-fibres. He had succeeded in tracing these upwards, chiefly in connection with the cutaneous, ophthalmic, and auditory nervous trunks, to their ultimate distribution in the extra-ventricular portion of the corpus striatum, together with certain filaments which were distributed to the corpora quadrigemina, the floor of the iter a tertio ad quartum ventriculum, and finally, to a deposit of grey matter in the calamus scriptorius. The complexity of these neurological relations must be estimated in endeavouring to account for the variety manifested in the phenomena, according as a few branches or the entire nervous structures enumerated became involved.

Having adduced a number of uncomplicated cases with which, on the present occasion, he was more particularly connected, he drew a series of conclusions of a very elaborate and recondite character—of which it is impossible to offer more than a most condensed and imperfect abstract—tending to prove that the cortico-striate fibres constitute a "true central apparatus engendering and distributing its influence by a special conductive system to an apparatus of peripheral reception."

The *diagnosis* might be readily formed from the objective symptoms and the emotional exaltation. Influence on the reflex motor tract, through the vagus and sympathetic, eventuated in simpering, winking, ogling, and allied psychical actions, as palpitatio cordis, suspiration, psellismus, and in women globus, choraic and catalytic seizures, and ecstatic disorder, coupled with inordinate and irresistible inosculatory efforts. In men, babuzicarius and oneirogonos at times occurred. In some instances, especially in the uneducated, who are less restrained by the controlling power of the higher centres—the cineritious cortex being more gross and passive—the phenomena occasionally observed were cachinnation, jactitation, ululation, ejulation, and sometimes perfremation; and, in extreme examples, titubation and other ataxic disorders.

Enumeration and appreciation of the foregoing train of symptoms had not hitherto been philosophically regarded by systematic neuro-phybiologists. Neither had they adequately insisted on or explained the sensorio-emotional operations, which led to paralysis of the vaso-motor nervules. Such paralysis, by inducing cutaneous capillary hyperæmia and consequent facial erubescence, resulted in modification of physiognomical expression from the delicately acute impressions propagated along the peripheric motor fibres, supplying the levator labii superioris alæque nasi, the orbicularis palpebrarum, occipito-frontalis, levator et depressor anguli oris, depressor labii inferioris, orbicularis oris, platysma myoides, and the recti et obliqui oculorium.

Etiologically, the disorder was more frequent in females, dependent for the most part on erotic excitement, occurring at puberty or later, in highly impassioned and romantic temperaments, though the male sex undoubtedly often exhibited analogous phenomena. Acceptance of, and belief in, spiritual manifestations, and proclivity and amenability to mesmeric influences if not to be confidently affirmed as causative, were at least commonly associated with disordered balance of the tract under consideration. Concerning the *pathology* of the affection, which he approached with diffidence, regretting the deficiency of anatomical proof, he ventured to ascribe it primarily to embolic obstruction of the alterioles of the external portion of the anterior cerebral ganglion, which resulted in abnormal involuntary discharges. By extension to the hemispheres, modifications of intellection and volition ensued, and, in persistent cases, cortical atrophy.

Therapeutics were to be conducted on rational principles. The bromides, cannabis, belladonna, strychnia, veratrum, zinc, iron, manganese, silver, arsenic, chloral, shower-baths, and, in obstinate attacks, Faradisation and general moral supervision.

Dr. NECROPHILUS, who rose first, felt compelled to express his high sense of the erudition displayed by the author of the paper. He must, however, affirm that extended experience at a large hospital had convinced him how cautiously clinical phenomena were to be regarded, unless supplemented by autoptical corroboration. He conceived the cases reported were referrible to hysteria, malingering or quasi-epileptiform disturbance.

Dr. MELANOPSIS, who was indistinctly audible, was understood to allude to the speculative views ennunciated by the imaginative professor, who, he feared, was also subject to eccentric cerebration. Amidst cries of "order," he advanced an opinion that pathological forgeries were frequently committed on ideal patients, an assertion vehemently dissented from and condemned by the majority of the Fellows.

Dr. PSEUDOGLOSSUS, who observed that he had entered late and had heard the discussion only, accorded great praise to the author for his philosophical paper. He must, nevertheless, in justice to himself, aver that he had many years since anticipated the views and conclusions arrived at in his work on "Diseases of the Brain," under the articles "Perverted Motility and Ideation."

Dr. AMPHIBOLUS remarked, that it was a fact in biology that the manifestations noticed were not exhibited in creatures destitute of a corpus striatum. In such animals suppression of this ganglionic centre went parallel with non-evolution of the emotional operations, and with absence of the gyral absurdities, which arise from excessive conductivity of the commissural tract.

Dr. Pyrophobus inquired whether any thermometric register had been employed in the cases mentioned, and, if so, was desirous of ascertaining its significance.

Dr. Pantodosis deemed the chief concern to be the therapeutical considerations. In the cases detailed, he would give bromide of potassium in drachm or two drachm doses every few hours, until physiologically admonished by the supervention of fatuity.

In reply, Dr. Thaumaterges, after tendering his thanks and acknowledgments to the Society for its logical criticisms, expressed a hope that he might be permitted on another occasion to bring forward his researches on subtle, mesmeric, or reciprocal nervous currents which undoubtedly exist in certain neurotic individuals. As nervous energy is transmitted at the rate of more than a hundred feet in a second, there is practically a physiological instantaneity in the *consensus* between any two parts or persons thus affected, and although he spoke as yet vaguely, being on the threshold of the investigation, he believed further observations would reveal the laws presiding over the lately discovered "psychic energy," so ably advocated by Mr. Crookes and others, and lead to discoveries pregnant with supreme interest.

The Society then adjourned.

At the closure of the meeting I attempted to rise from my chair. Stumbling over an obstruction and startled by a piercing yell, my confused faculties regained perception, and I observed my favourite skye-terrier excitedly circling round the table—his vertebral prolongation having sustained severe metatarsal compression—whilst I realised (δυλε ῞Ονειρε !) that my convolutions had been held captive by the counterfeit presentiments of—a dream.

W. Boyd Mushet.

THE ARMY MEDICAL DEPARTMENT.

There is in the exercise of continued perseverance, a point at which that estimable quality degenerates into senseless obstinacy, and without doubt that point has been fully reached by those whose business it is to attract candidates to the Army Medical Department.

Never was a more unmistakeable verdict expressed upon a novel proposal than that embodied in the determined rejection of fifty vacancies under the new short-service rules in August last, by all the students of the three countries, with the exception of thirty-three competitors whose quality was such, that some were admitted on the lowest marks ever given.

For a second time with a strange pertinacity, fifty vacancies are again offered on the same terms.

We do not propose to repeat the various reasons why this service is unworthy of the acceptance of any man of average education or ability. We have already put them forward, and they have been echoed through the principal medical schools of the kingdom, by the givers of introductory lectures and others.

We would now but offer a word of warning, seeing as we do that a coming attempt is being made by taking advantage of the chivalrous feeling and love of adventure of young men, to seduce them into the acceptance of appointments when war is not impossible, which they have unhesitatingly rejected in time of peace.

Should war occur, the medical duties of the campaign must, owing to the extreme reduction of the Army Medical Department, be discharged for the most part by civilians, and the remuneration offered to these civilians will be far in excess of the pay given to the existing medical officers; while, at the conclusion of the campaign, it will be optional for as many as are not wearied with the connection to accept commissions, and count the previous term of service towards the completion of the required ten years.

Could anything, then, be more short-sighted than for a young medical man to tie himself, on a lower scale of pay, to a department of which he can make an experiment on a higher?

We trust that this timely warning may be the means of arresting any who were about to take the fatal step, which those who have gone before seem so bitterly to regret.

◆

SIR GEORGE B. OWENS, M.D.

We are gratified to state the inaccuracy of the rumour which we inserted last week to the effect that Dr. Owens, the Lord Mayor of Dublin, would be passed over in the distribution of the distinctions which the out-going Viceroy—the Duke of Abercorn—had intimated his intention to confer upon the municipal representatives of the capitals of Irish provinces. The announcement of His Grace's intention to honour the Lord Mayor of Dublin was a little tardy, and hence the incorrect report. At His Grace's undress levee the distinction of Knighthood was conferred upon Dr. Owens, and we can truthfully say that no civic dignitary, or member of our profession, is better deserving of the honour. Both during his term of office as Lord Mayor, and at all times previously, Sir George Owens has been uniformly suave in manner and independent in action, and we heartily congratulate the newly-dubbed knight on the well-merited compliment which the Viceroy has paid him.

The Dublin Obstetrical Society will meet on Saturday next, at 8 p.m., at the College of Physicians, when the following communications are set down for reading:—Dr. H. Kennedy on "Notes on Diphtheria;" Dr. Purefoy on "A Case of Extra-Uterine Fœtation, Escape of Fœtal Bones per Vaginam—Recovery."

The Medical Society of the King and Queen's College of Physicians, Ireland, will meet this evening, at 8 p.m., at the College Hall, when the following communications are set down for reading:—Dr. J. W. Moore on "Salicylic Acid in Acute Rhematism;" Dr. J. Magee Finny on "Cases of Chorea;" Surgeon-Major Gore on "The Cold Bath in Typhus Abdominalis."

Medical News.

Vital Statistics.—From the Registrar-General's returns we learn that during last week 5,581 births and 3,537 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,044. The mortality from all causes was at the average rate of 23 deaths annually in every 1,000 persons living. The annual death-rate was 16 per 1,000 in Edinburgh, 22 in London, 23 in Glasgow, and 24 in Dublin. In the other large towns the rates were—Brighton 11 Portsmouth 23, Hull 26, Bristol 20, Newcastle-upon-Tyne 19, Nottingham 20, Birmingham 21, Norwich 21, Leeds 21, Plymouth 27, Sunderland 22, Liverpool 25, Leicester 21, Bradford 26, Sheffield 26, Manchester 24, Wolverhampton 30, Oldham 35, and Salford 40. The annual death-rate from the principal zymotic diseases in these averaged 3·1 per 1,000, and ranged from 0·7 and 1·3 in Plymouth and Bristol, to 7·7 and 12·8 in Sunderland and Salford. Scarlet fever caused 11 more deaths in Portsmouth.

In these towns 65 deaths were referred to small-pox, against 61 and 81 in the two preceding weeks; 43 occurred in London, 13 in Salford, 9 in Liverpool, and not one in any of the seventeen other towns.

University of London.—The following gentlemen passed the recent Second M.B. examination for Honours:—

MEDICINE.

FIRST CLASS.
Pepper, Augusts. J. (Scholarship and Gold Medal), Univ. Coll.
Hunt, Joseph W. (Gold Medal), University College.
Pinnell, Thomas M., Univ. Coll.
Hellier, J. B., Leeds, & Univ. Coll.
Ferrier, John C., Guy's Hospital.

SECOND CLASS.
Rogers, Thomas K., Univ. Coll.
Burton, Samuel H., Univ. Coll.
Jones, Arthur H., Guy's Hospital.
Kidd, Walter A., Guy's Hospital.
Parry, Thomas S., University Coll.

OBSTETRIC MEDICINE.

FIRST CLASS.
Hellier, John B. (Scholarship and Gold Medal), Leeds,&Univ. Coll.
Pepper, Augustus J. (Gold Medal), University College.
Ferrier, John C., Guy's Hospital.
Pughe, Rhinallt N., L'pool Infirm.
Jones Arthur H., Guy's Hospital.

SECOND CLASS.
Burton, Samuel H., Univ. Coll.
Rossiter, Geo. F., St. Tnomas's.
Edwardes, Edward J., St. Mary's.
Rogers, Thomas K., Univ. Coll.
Kidd, Walter A., Guy's Hospital.

THIRD CLASS.
Duke, Herbert, Guy's Hospital.
Langley, John G., University Coll.
Lamb, William H., Guy's Hospital.

FORENSIC MEDICINE.

FIRST CLASS.
Pepper, Augustus J. (Scholarship and Gold Medal), Univ. Coll.
Kidd, Walter A., (Gold Medal, Guy's Hospital.
Jones, Arthur H., Guy's Hospital.

SECOND CLASS.
Langley, John G., Univ. Coll.
Harrison, Charles E., St. Bartholomew's Hospital.
Parry, Thomas S., Univ. Coll.
Rogers, Thomas K., Univ. Coll.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

THE LECTERES ON THE LAWS OF HEALTH.—We have received from Prof. W. H. Corfield a syllabus of the course of lectures which he is now delivering on the Laws of Health, and to which we referred in one of our last leaders. From this syllabus we see that we were mistaken in saying that half of the course is to be devoted to anatomy and physiology, as only six are to be given on these subjects, and fourteen on hygiene. We may also observe that, although we see no reason to change the opinions we expressed in the article above-referred to, we must admit that the lectures are very comprehensive and their object a very desirable one.

"ON SOME UNSUSPECCED SOURCES OF INFECTIOUS DISEASES."—We are requested to correct a mistake which appeared in our "Note" on the 1st November with reference to the title of the paper contributed by Mrs. Baines to the Social Science Meeting at Liverpool. The paper then noticed by us is, "On the Urgent Need of some Compulsory Sanitary Enactments." The paper which was read at Brighton last year (and since published by Mr. Lewis, of Gower Street) is entitled, "Some Unsuspected Sources of Infectious Diseases."

MEETINGS OF THE LONDON SOCIETIES.

OBSTETRICAL SOCIETY.—Wednesday, Dec. 6th, 8 p.m., Dr. Langdon Down, "On the Obstetrical Aspects of Idiocy."—Dr. Budin (of Paris), "On a Diagnostic Sign of Vaginal Hæmorrhage during Parturition."—And other communications.

HARVEIAN SOCIETY.—Thursday, Dec. 7th, 8 p.m., First Harveian Lecture: Mr. James Lane, "On Syphilis."

CLINICAL SOCIETY.—Friday, Dec. 8th, 8½ p.m., Discussion on "Leukæmia."—Dr. Hermann Weber: "Cases illustrating the Treatment of Rheumatic Fever and other Febrile Diseases by Salicin and its Congeners."—Mr. Brodhurst: "Cases of Subcutaneous Section of the Neck of the Thigh-bone."

VACANCIES.

Hospital for Sick Children, Pendlebury, Manchester.—Assistant Physician. Salary, £300 per annum. Applications, with testimonials, should be sent to the Chairman of the Medical Staff, Gartside, Manchester. (See Advt.)

Central London Sick Asylum.—Assistant Medical Officer. Salary, £100, with board and residence. Printed forms will be provided on application to the Clerk. Cleveland Street, W.

Bristol Hospital for Sick Children.—House Surgeon. Salary, £100. Address the Committee, St. Michael's Hill, Bristol.

Chester Infirmary.—House Surgeon. Salary, £80, with board. Address the Chairman of the Board.

Bournemouth General Dispensary.—Resident Surgeon. Salary, £140. Address the Hon. Sec.

Flintshire Dispensary.—House Surgeon. Salary, £100. Must be conversant with the Welsh language. Address the Hon. Sec., Dispensary, Holywell.

Bootle Borough Hospital.—House Surgeon. Salary, £80, with board, &c. Address the Chairman of Committee.

Festiniog, Oakley's Hospital.—Assistant Surgeon and a Dispenser. For particulars address the Medical Staff at the Hospital.

◆

APPOINTMENTS.

BELL, C. E., M.R.C.S., Surgeon to the Devon and Exeter Dispensary.

BIGGS, M. G., M.R.C.S.E., House Surgeon to the Essex and Colchester Hospital.

BROSTER, J., M.D., a Physician to the Royal South Hants Infirmary, Southampton.

BURNHAM, G. H., M.B., M.R.C.S.E., Resident Assistant House Surgeon to the Royal London Ophthalmic Hospital, Moorfields.

CAMPBELL, D., M.D., C.M., Public Analyst for Calne, and Medical Officer of Health for the Calne Urban Sanitary District.

CARLYLE, J., M.B., C.M., Medical Officer and Public Vaccinator for the Parishes of Newhills and Dyce, Aberdeenshire.

DONOVAN, J. F., M.D., C.M., Medical Attendant to the Royal Irish Constabulary, Killeagh, co. Cork.

DYSON, W., B.A., M.D., Physician to the Sheffield Hospital.

HABNEY, G., L.R.C.P.Ed., L.R.C.S.I., Medical Officer for the Cromford District of the Bakewell Union, Derbyshire.

HOLDEN, J., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for No. 4 District, and Public Vaccinator for No. 3 District, of the Preston Union.

LAW, J., M.D., Consulting Physician to the Leeds Public Hospital and Dispensary.

MACPHERSON, C., M.B., L.R.C.S.Ed., Medical Officer and Public Vaccinator for the Parish of Tingwall, Shetland.

MONCKTON, M., L.F.P.S.G., Medical Officer for the First Division of No 1 District of the Tonbridge Union.

WILDING, L. J., M.R.C.S.E., House Surgeon to the Worcester General Infirmary.

◆

Birth.

ALCOCK.—On the 19th ult., at Innishannon, co. Cork, the wife of Alexander Mann Alcock, L.R.C.S.I., L.K. & Q.C.P., of a daughter

◆

Marriages.

CORSCADDEN—ARMSTRONG.—On the 29th ult., at the Parish Church, Darenth, Thomas Corscadden, Holly Mount, Manorhamilton, to Eliza, third daughter of John Armstrong, M.D., J.P., Green street Green, Dartford.

DE LA COUR—TOOZE.—On the 30th ult., at St. Matthew's, Oakley Square, London, George Francis De la Cour, of Camden Road, N.W., to Julia Terry Southmeade, fourth daughter of the late Rev. Henry John Tooze, of Pehembury, Devon.

WINN—GORDON.—On the 14th ult., at St. James's Cathedral, Toronto, William Winn, Esq., Captain 1st (the Royal Scots) Regiment, son of Dr. Winn, of Harley Street, Cavendish Square, London, to Helen, daughter of the late Hon. James Gordon, of Toronto, Canada.

◆

Deaths.

BATTY.—On Nov. 22, at Stafford Street, Liverpool, Edward Batty, M.R.C.S.E., aged 82.

CAMERON.—On Nov. 19, at Hatfield, Yorkshire, Alexander Cameron, L.R.C.P.Ed.

CRESPIN.—On Nov. 24, at Harrington Square, Edgar Reginald Lagassicke Crespin, M.B., of Modbury.

DAVIES.—On Nov. 29, at Plasyn Llan, Llanfairtalhalarn, near Abergele, Mary, only daughter of Dr. Robert Davies, aged 24.

FARRAGE.—On Nov. 17, at Chippenham, William Farrage, L.R.C.P.Ed., aged 55.

HAMILTON.—On Nov. 23, at Parkstone, Dorsetshire, Andrew Hamilton, M.R.C.S.E., aged 81.

HARRISON.—On Nov. 26, at North Frederick Street, Dublin, Charles Harrison, L.A.H.D., aged 60.

KING.—On Nov. 26, at Hartest, Suffolk, George King, M.R.C.S.E., aged 79.

MACKINTOSH.—On Nov. 28, at Melville Street, Edinburgh, James Mackintosh, M.D., late Surgeon-Major Madras Army, aged 53.

MILLER.—On Nov. 16, at Dumbarton, John Miller, M.D., aged 70.

PARKER.—On Nov. 30, at Broomgrove Cottage, Sheffield, Samuel Parker, F.R.C.S., aged 57.

SMITH.—On Nov. 24, at Pembroke Road, Clifton, Bristol, Wm. Smith, M.R.C.S.E., aged 55.

SMITH.—On Nov. 21, at Barkerend Road, Bradford, Yorkshire, George Priestley Smith, M.R.C.S.E., aged 54.

WILLIAMS.—On Nov. 28, at Wrexham, George Harvey Williams, M.D., late of Rhyl, aged 57.

ON THE SCIENTIFIC AND EMPIRICAL INVESTIGATION OF EPILEPSIES.

By J. Hughlings Jackson, M.D., F.R.C.P.,
Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

CHAPTER X.—*Sequence of Spasm unilaterally beginning in Convulsions.*

In the cases we have been considering there are all ranges of spasm, from such as twitching of a digit to a seizure in which the whole body becomes convulsed. The spasm of the several parts is in these cases a very distinct sequence. It "goes up" the arm to the side of the face, then down the leg, affects the bilateral muscles, and finally the unilateral muscles of the other side. *It is to be noted, however, that the sequence is compound.*

In each differently beginning convulsion there are no doubt different directions of spreading throughout the body after the involvement of the part in which the spasm begins. To take the case of the limbs. A fit beginning in the hand goes *up* the arm and *down* the leg. A fit beginning in the foot goes up the leg, and down the arm. (*a*) In cases where the spasm starts in the side of the face, it usually, I believe, goes down the arm; I have few facts on this matter.

I limit what I have to say of sequence to those cases in which the spasm starts in one hand. I am sorry that I have but little to say. The spasm as a rule begins in the index finger and thumb; it next attacks the other fingers, then the arm. (*b*) The spasm next involves the face, and nearly at the same time goes down the leg (so far our first degree, see p. 185, Sept. 6). Then the eyes and head turn, the body twists to the side affected; the chest muscles become fixed (second degree, p. 185). Lastly, the unilateral muscles of the other side become involved (third degree, p. 185).

The following is extracted from papers I published, *Med. Times and Gazette*, Dec. 19, 1868. Both range and sequence are spoken of, and the figures are intended to illustrate that the sequence of spasm is compound: thus the figure 3 in each of the three following sentences points out that to the best of my power of observation the upper arm, the eyelid, and the thigh of the right side were in spasm at the same time. It is important to note these associations as doubtless they imply associations of movement represented in the centres discharged.

Unilateral Muscles of Right Side.

Arm.—(1) Thumb and index finger, (2) whole of fingers and forearm, (3) upper arm.

Face.—(3) Cheek drawn up, (3) closed, (4) both eyes to right, (5) head to the right.

Leg.—(3) Thigh, (4) leg.

Sometimes the leg is affected before the face.

Bilateral Muscles.

(3) The occipito-frontalis. (4) I think the next thing is that the two buccinators, the orbicularis oris, the right zygomatici, and depressor anguli oris, are contending. The appearance is an ovoid mouth drawn to the right, the large end of the ovoid being to the right. The lower jaw is drawn down. Next, the two masseters and temporals are acting, and bring the jaws together. (5) The thoracic and abdominal muscles are involved, the inspirations becoming snatched; the chest rocks, and in the severest cases, breathing seems to stop for an appreciable time at the height of a full inspiration.

(*a*) However in several cases the patients have told me that the spasm, after affecting the leg, affects next the hand and goes *up* the arm.

(*b*) There are obviously many sequences in the arm (as a patient says, "it twists about all manner of ways"), but they cannot be easily analysed. The presumption is, that the sequence in the arm (and in the whole body) will be different as the exact part of the hand first seized differs. The hand, the most important part of the body (see pp. 145 and 29, Aug. 28, 1876), will be represented in many places. A fit beginning in the little finger, would depend on discharge of a different centre from that discharged in a fit beginning in the thumb, although the whole hand will, I suppose, be represented in each of the centres and in many others.

Unilateral Muscles of the Left Side.

The unilateral muscles of the opposite side commence to move when the chest begins to be decidedly involved. First the head becomes straight, both eyes look forward, and then the head and eyes turn to the left, and the left arm and leg are in a spasm.

I must say again what I said when the above was written :—

"It is most important to observe convulsive paroxysms minutely, but it is obviously difficult to observe them precisely. It must be understood that the foregoing only purports to give what is, to the best of my belief, the *usual* sequence in *one* variety of those convulsions which begin unilaterally. I never forego an opportunity of watching patients in fits, but the opportunities are rare, and the observations are painfully difficult to make. I dare not therefore imply that the above is in all respects an accurate representation. Moreover, the description is admittedly incomplete." (*a*)

What we shall chiefly consider now is the order of representation of the movements of the left, the "second" side which, as aforesaid, we believe to be represented in the left side of the brain by non-decussating fibres (see Sept. 6, p. 187). We shall do this mainly by speaking of the difference in the convulsions on the right (first) and left (second) side, which imply differences in the representation of the same muscles (fellow muscles) of the two sides in the left side of the brain. The convulsions of course only gives us a very general knowledge of the order of representation of movements. In saying (p. 187) that the unilateral muscles of both sides have a double representation (a representation on each side of the brain), we did not imply that they were represented alike. We suggested that the representation becomes more unequal and more different the higher the class of animal, or rather significantly, the less bilateral and synchronous became the movements of the limbs of the two sides of its body. There are unfortunately few facts supplied by the observation of convulsive seizures which bear on the matter, that is, there are few precise observations on the convulsions of the "second side." Let us note some ways in which convulsion of the "second" side differs from the convulsion of the "first" side. It will not be forgotten that we are speaking of convulsions which have begun deliberately in one hand.

1. The convulsion is later.
2. It is less severe.
3. The parts are convulsed more nearly contemporaneously.
4. It is more quickly over.
5. The spasm is more tonic. (?)

All these differences are important. But there are others more important to note. We have to note the *sequence* of spasm in the several parts of this second side. There are very few observations, indeed, on this matter.

There is strong *à priori* warrant for the assumption that the movements of the second side are represented in different order from those of the first side, and therefore that in epileptic discharges of the centres representing them, the spasms will present a different sequence, That warrant is that in the descending atrophy to which we have referred in the last chapter (p. 187), whilst the wasting is of the fibres in the lateral column of the side opposite the half of the brain (motor tract) injured—that on the same half is in the anterior column. Thus the inference is warrantable that the two sets of fibres are for different kinds of movements of the two sides. (*b*) But if they do represent different kinds of *movements*, it does not follow that they do not pass to the same, *i.e.*, fellow muscles ; for muscles are represented in the nervous centres as movements. We may suppose, for example, that in the left half of the brain the muscles of the right side of the body are represented in one order (from voluntary to automatic ?) and those of the left side of the body in the inverse order (from automatic to voluntary (?), or, in chemical metaphor, the two sets of movements have the same *Composition* but a different *Constitution*, or again that the two are isomeric or metameric. Once more considering the muscles as notes, we may say that there are two different tunes formed (*a*) from the corresponding notes.

To demonstrate this difference of representation the mode of invasion of the "Second side" must be carefully watched in cases of convulsions. We have—taking a case in which the fit *begins* in one hand, say the right—to observe whether the left leg or the left arm is the part of the "second side" first *reached* by the spasm. And in each limb we have to note whether the spasm begins in the upper or lower part. But there is another thing to be observed—viz., whether spasm of the extensor or of the flexor muscles preponderates. For example, if, in the case of the arm (we still speak of the second side), the arm is first raised and then the fingers extended, or the reverse. These remarks are a reproduction from a paper in the *Lancet* (since reprinted as No. 1 of *Clinical and Physiological Researches on the Nervous System*, February 15, 1873. I wrote then, "I have, I regret to say, no useful observations on the order of spreading of spasm on the *left* side. [The fit is supposed to have begun in the right hand.] As I think it very important to make observations thereon, I will write down certain questions.

1. Does the spasm of the left side begin in the leg ?
2. Does it go *down* or *up* these limbs ?
3. Does it affect the extensors more than the flexors, or *vice versâ* ?
4. Is the spasm more tonic than on the other side ?

I have since had few answers to these questions. Before they were made I published the case of a boy whose fits began in his two outer (ulnar) fingers of the left side, and who said that *once* the arm of the right side was slightly involved, and that it began to be involved in its upper part (*Med. Times and Gazette*). In another case in which I saw many convulsions beginning in and passing up the right hand, the left side was reached by the spasm. My friend, Mr. Mercier, watched the left arm. The spasm passed *down* this limb.

Some highly important remarks on the sequence of spasm are made by Dr. Gower in a paper on a case of convulsion, published in the *Lancet* of Nov. 6, 1875. Among many other observations of scientific and practical value Dr. Gower draws attention to the following points :

(*a*) The fit is supposed to begin on the right side of the body, the discharging lesion being in the left side of the brain.

(*b*) Since, as this evidence seems to show, each side of the body sends fibres to, or receives fibres from, both sides of the brain, we are led to think of the arrangement in the optic commissure. We have, however, to add inter-cerebral fibres (cerebral commissures) analogous to the inter-retinal, and we have to add the commissures of the cord analogous (?) to the fibres which pass from one optic track to the other. The arrangement of fibres in the optic commissure, so far (Beale says) from being peculiar to the optic nerves, is found in every part of the body to which nerve fibres are distributed. These facts and inferences point to the conclusion—which *à priori* is likely—that the whole of the nervous system and its parts are developed on the same fundamental plan.—*Med. Times and Gaz.*, Oct. 23rd, 1869.

A difference, however, has to be pointed out. In the central nervous arrangement in each hemisphere the muscles of the limbs of the two sides of the body are represented in *different* order ; the diagram of chiasma of the fibres for the limbs must be represented on a plane surface.

(*a*) I quote the following from an article I published *Med. Times and Gaz.*, January 29, 1872 :—

"In describing the spread of the spasm the muscles in action were named, but it is better to speak of movements of the parts. The fit is a discharge of a centre which does not represent muscles directly, but which represents them indirectly as movements. There is, however, from the distribution of nerves to muscles by anatomically recognisable nerve trunks up to the centre, a gradually increasing complexity—an increasing harmony. Hilton's observations show that even in the ultimates of the body there is incipient co-ordination—incipient harmony. No doubt the very muscles represent in the *most general* form the method of co-ordination of the highest centres. But in noting what takes place in a fit, it is better not to speak of the muscles, but to put down what movements take ploce. When this is done we can afterwards consider the play of the several muscles we suppose to have been directly concerned."

"Invariably one arm [right] and both legs were convulsed, the other arm escaping entirely. May it be connected with the more frequent simultaneous use of the legs than of the arms? It is to be observed that, in the right leg, spasm of the extensors predominated; while in the left leg, that of the flexors was distinctly greater than that of the extensors."

In order to facilitate the comprehension of what has been said let us consider certain healthy movements which seem to me to be in ranges and sequences like the movements developed in that variety of convulsion which begins in one hand and *becomes* universal. I allude to what is technically called effort and in particular, to effort in lifting weights with one hand. Ignoring for convenience the possibility that any effort in lifting even a small weight requires a new equilibration of all the muscles of the body we shall note only the striking sequences of movement in lifting weights made gradually heavier. The words of our description will imply that there are distinct intervals in the movements as they spread; really they glide into one another as the weight becomes heavier.

If we lift a slight weight with the right hand we use only the muscles of the hand and forearm, if it be made gradually heavier, we bring into play those of the shoulder, next those of the right side of the spine, leg, then of the jaws and chest. At a certain stage the muscles of the opposite side of the body come into play. I should perhaps say at an uncertain stage, as the sequence is much more involved than I describe it. Speaking, however, of the second side only (*a*). What must happen first is stiffening of the muscles of the left side of the spine, next stiffening of the upper part of the left leg, next that limb is lifted off the ground in extension and away from the body, and a little in advance of it. Then the arm is raised, the forearm being in extension; the hand is extended, the fingers being straightened out. (This is an amplification of a paragraph from the paper already referred to in the *Lancet*, February 13, 1873.)

This spreading shows well also the compound sequence. (*b*) The heavier the weight, not only the more the arm is used, but the further does movement spread to automatic parts.

Another thing we see here is that the muscles of the same name on the two sides of the body are not constant congeners. The muscles of the upper arm are in the above instance of effort congeners of those of the upper part of the opposite leg. Probably the flexors of one side are in many actions the congeners of the extensors of the other side. It is so in the case of the muscles of the two eyes. The inferior oblique of one eye is the congener of the superior rectus of the other eye for lateral movement of the two eyes. (*c*)

Another thing to be noted is the kind of spasm in the different sequences. My own belief is that the further the range the more tonic, the less clonic, the spasm. In other words, the spasm of the more automatic parts is chiefly tonic. The correct expression is "discharge of parts representing more automatic and subordinate movements." The epileptic discharges of such centres, I suppose, produces tonic spasm. The relations betwixt tonic and clonic spasm is one of degree, for at the onset of all convulsions there is tonic spasm, which breaks down into clonic spasm, and, as above implied, the sooner the more voluntary is the part affected by the spasm. The following quotation from an article (*Med. Times and Gazette*, January 27, 1872) bears on these matters. The occurrence of tonic, soon followed by clonic spasm in the most limited convulsions shows that obstructed respiration and circulation of badly aerated blood is not necessary for the production of either.

"Just as there is an increasing harmony of movement from the muscles to the highest nerve-centres, so, no doubt, there is an increasing melody. Harmony of movements is space co-ordination—the co-ordination of simultaneous movements; melody of movements is time co-ordination—the co-ordination of movements in succession. The latter is scarcely traceable, however; but we are warranted in assuming that from the (nearly) equal and simple intervals of respiratory movements to the most unequal and intricate intervals of movements represented in the highest centres, there is a gradually increasing melody. The two kinds of co-ordination are inseparable in health, and in disease we have to note abnormal conditions of both; we have to observe not only the region affected by convulsive movements, but the intervals betwixt movements. As we observe that increase in range is from the voluntary to the automatic, it seems probable that, at the same time, the intervals of the movements developed become shorter. It is very difficult to note the latter in cases of convulsion ordinarily so called. But, using the word 'convulsion' in an unusually extended sense, we observe that the convulsions from disease of the cerebral hemisphere are chiefly clonic; and that the convulsions of tetanus, which affects more automatic movements (those represented in the cerebellum?), are chiefly tonic. In tonic spasm the intervals are so short that the very 'idea' of succession is lost; the intervals are indeed bridged over, and there is, in a sense, no apparent movement—as the humming-top, when in excessively rapid rotation, seems still."

I would in this connection remark that the study of "circus movement," and "rotations" from experimental injury of different parts of the encephalon is of importance in helping one to methods of precise investigations of convulsions.

Before leaving the subject of sequence of spasm I would urge again the importance of studying all varieties of one-sided mobile disorders in relation to one another. To all those depending on abnormal discharges I have given the name of Hemi-kineses. I say *all*, because I have been misunderstood to mean by that term only one variety—the Athetosis of Hammond. I quote the following from a paper I published ("West Riding Asylum Reports," vol. 3), "Localisation of Movements in Brains":—

"To give examples of the relations of different symptoms: there are several *mobile* counterparts of hemiplegia. There is hemi-chorea, there are certain cases of hemi-spasm, and there is what I may call hemi-contracture, a mixture of palsy and spasm. I call these one-sided mobile symptoms 'Hemi-kineses.' I believe that each of them depends on disease of the same *internal* region as does hemiplegia—the region of the corpus striatum. For the same *external* region is affected in each. To obtain a knowledge of the movements represented in the cerebral district mentioned, we have to study each one of these symptoms carefully. As some evidence that this method of study is practically useful, I may adduce Dr. Radcliffe's testimony. In his article on Chorea, (*a*) after stating the reasons I have advanced for the localisation of the changes producing chorea in convolutions near to the corpus striatum, he writes, 'For most assuredly the difficulties which beset any attempt to localise the choreic lesion in the nerve-centres, are not

---

(*a*) Everybody recognises simple degrees, as from lighter to heavier, but scarcely any attention is given to that what I have called compound degrees. Anyone might admit or easily understand that intellect varies directly with mass of brain, or with complexity of brain, or with a symmetry of the two hemispheres. But that it varies not according to degree of any one of them, but in a compound degree of the three factors is an hypothesis which would strike many as being not simply complex but as being confused. It may be untrue, but it is not confused.

(*b*) So in the convulsions the sequence is compound; as the most voluntary parts are more in spasm, the further does the spasm spreads to automatic parts.

(*c*) There must be automatic action before there is voluntary action. The chest must be fixed before the arm can use it as a fixed point. There is a prior wave of equilibration from automatic to voluntary although the general form of the entire sequence seems to be from the voluntary to the automatic, and in this way we have stated it.

(*a*) Reynolds' "System," 2nd edit., vol. ii., p. 199. (Passage not in first edition.)

b

a little simplified by thus insisting upon the clinical relations between hemi-chorea and hemiplegia, as a ground for believing that the region of the corpus striatum is the part affected in both disorders.'"

I may here mention that I do not include among Hemikineses paralysis agitans, nor the tremor sometimes attending unilateral dysæsthesia; these are, I consider, owing to destructive lesions, and differ from chorea toto cœlo. The same remark applies to the tremor of disseminated sclerosis.

(*To be continued.*)

INAUGURAL ADDRESS

DELIVERED AT THE

OPENING OF THE SESSION

OF THE

SURGICAL SOCIETY OF IRELAND.

By George H. Kidd, F.R.C.S.I., M.D.Edin.,
Master of the Coombe Lying-in Hospital, &c., &c.,
President of the Society.

It is one of the privileges of the President of the College of Surgeons to take the chair at the meetings of the Surgical Society, a privilege of which I gladly avail myself, knowing I shall have the assistance of your able and experienced secretaries in carrying on the business of the Session, besides the support of every member of the Society. My first business is to welcome you back to these halls, and to assure you of the unflagging interest taken by the College and its Council in your proceedings—proceedings which have done so much to advance surgery and have shed so much lustre on the College. The Society has now entered on a new era in its existence. Its management is now, with the exception of appointing the President, altogether in the hands of the members themselves, and it is to be hoped that they may feel the responsibility thus incurred a stimulus to still more vigorous efforts to further the objects of the Society, and so make it still more prosperous, and more productive of good work and true work, for the advancement of surgery and the maintenance of the honour and dignity of the Irish College.

Gentlemen,—In a body numbering so many members as ours, it could scarcely be hoped that each recurring anniversary would not find us with seats unfilled, names unanswered, when we call our muster-roll, and we have now to note the removal from amongst us of one whose place will not be easily filled, of one whose fame had reached to the outermost corners of the earth, a fame founded not less on his literary than on his more strictly professional work, and on his skill as an ophthalmic and aural surgeon.

Sir Wm. Robt. Wills Wilde was born in 1815, and died on the 19th of April, 1876. He commenced his medical studies by being apprenticed to the late Abraham Colles, and began practice in Dublin in 1841, devoting himself chiefly to ophthalmic and aural surgery, and opened a dispensary for patients with diseases of the eye and ear in Frederick Place, which was afterwards moved to Mark's Place. He finally purchased the building that had been used as a school of medicine in Park Street, now Lincoln Place, and converted it into an hospital—"St. Mark's." This he subsequently transferred as a free gift to trustees for the use of the nation.

In 1846 he became editor of the *Dublin Quarterly Journal of Medical Science*, and in a preface to the number for February in that year gave a most valuable and interesting historical account of Irish medicine. His "Report on the Tables of Deaths" in the Census of 1851 (upwards of 500 pages) is one of the most remarkable achievements of any time, being the medical history of Ireland from the earliest times down to 1851, compiled from original MSS. and documents. The "Table of Cosmical Phenomena, Epizootics, Famines, and Pestilences in Ireland," commencing Anno Mundi 2820 and ending A.D. 1851, will ever remain as a monument of Wilde's energetic industry, laborious research, and masterly genius.

Our own Government recognised in a small way his services as a statistician and national benefactor by conferring on him the order of knighthood. Other countries, however, had previously recognised his labours and conferred on him their honours. In 1853 he won, by his rare merits, a new royal appointment for the Dublin School of Medicine,—viz., Surgeon-Oculist in Ordinary to Her Majesty. Indeed, the Dublin School may well be proud of the author of "Aural Surgery," "Malformations and Congenital Defects of the Organs of Sight," "Condition of the Deaf and Dumb," "Epidemic Ophthalmia," and "Infantile Leucorrhœa." For many years he, by his teachings and brilliant talents, was one of the chief attractions here for foreigners, who always found his hospitable house open to them. Honourable and upright in word and deed he laboured for the glory of the Dublin School, and did much to perpetuate its greatness by his memoirs of Molyneux, Rutty, O'Halloran, Wilmot, Mosse, MacBride, and Curran. His literary and antiquarian works are of world-wide repute. His death has not only left a sad gap in social circles, but also in many other Societies besides our own.

This Society was founded for the cultivation of medicine as a whole, including all its subdivisions, medicine proper, surgery, obstetrics, therapeutics, and all their auxiliary sciences. This is as it ought to be, for medicine is one science, divisions in it are the remains of a dark and ignorant age. How could the surgeon neglect the consideration of constitutional conditions, or the physician ignore the aid to be derived from surgery. Nor are the requirements of the obstetrician less general. If he is to conduct his patient safely through her labour must he not, for instance, be able to detect the earliest symptoms of uræmic poisoning so as to guard her against the terrible convulsions that follow in its train. If her heart or lungs be diseased must not he know it that he may guard them from the strain of the expulsive efforts. Has he not to deal with many of the most grave diseases to which the human frame is liable, and which occur but too often in the puerperal state. Peritonitis, pleuritis, all the varieties of puerperal fever, accidental fevers, and even mania come but too frequently and tax to the utmost his medical skill. Must he not be prepared to avail himself of all the resources of surgery if he is to deal with hæmorrhages, lacerations, or any of the many varieties of tumours that may obstruct the birth of the child. Above all, must not *his* education be as perfect as it can be made, who, in the exercise of his profession, having the lives of two human beings committed to his care, may have to *hasten* the death of one to prevent that of both. Is not, then, medicine one great science, and how can one branch of it rank above another in value or importance. I am induced to draw your attention to these matters because, though this unity of medicine is fully recognised and acted on here, in other schools a fiction remains that obstetrics, if a branch of surgery at all, is a very inferior one, and one to which candidates may be admitted on a low standard of education, and by a restricted examination. This fiction has shown itself very recently in quarters where we should least have expected to meet it. Thus, in 1870, Professor Acland, of Oxford, proposed that a special diploma should be superadded to those already in existence, and given to those women who do not desire to have the same education as men, but who desire to have a public recognition that they are fit to practise in the diseases of women and children. Sir Dominic Corrigan has made a similar suggestion. The answer given by a lady, Mrs. Garrett-Anderson, to Dr. Acland may apply to both: "It would have been useful," she said, "if Dr. Acland had explained what part of the education given to medical students could be omitted with advantage in the case of those who intend to practise only among women and children. Is there any less need for a knowledge of anatomy and physiology or any other branch of medical knowledge, because the patient happens to be a woman or a child." During the present year the same question arose in the London College of Surgeons. Three ladies, anxious to become registered practitioners of medicine, and having failed to get on the "Register" by other means, applied to be admitted to examination for the midwifery diploma of the College, and the Council of the College thinking they were bound by their charter to accede to the application, ordered them to be examined by the midwifery court, but rather than comply with the order, Dr. Barnes first, and afterwards the other members of the midwifery court, resigned their appointments, and no other qualified persons could be found willing to accept the offices thus vacated. Consequently, these ladies remain unexamined.

Now if this were a question as to the propriety of admitting women to be practitioners of medicine I should not think it right to introduce it here, nor would you allow me to do so, but a higher and much more important question is involved—viz., whether obstetric science is an integral part of medicine, and whether it can be taught or practised with advantage to the community apart from that full degree of knowledge and skill in medicine and surgery which is held to be essential for the safe practice of the healing art. This is the real question at issue, for if these ladies had been examined and granted the midwifery diploma, they would not only have been entitled to registration and all the privileges of registered practitioners, but they would have gone forth with the stamp of the college guaranteeing their fitness to practise midwifery, though they had given no proof whatever of having obtained even an elementary knowledge of the other branches of the great science of medicine.

This question was the subject of a warm controversy in Dublin more than one hundred years ago, and the present system in this country may be looked on as the outgrowth of that controversy. The history of it is related by Dr. McClintock in his "Rise of the Dublin School of Midwifery."

The King and Queen's College of Physicians were empowered by their charter to give a licence in midwifery to persons having no other qualification, and not only did they do so, but they actually refused to admit practitioners of midwifery to the licence in medicine, holding it to be an infringement of their professional dignity that any of their members should practise this art. Dr., afterwards Sir, Fielding Ould was refused admission to the latter on this account, and a serious quarrel with Trinity College ensued, because they conferred an honorary degree of M.B. on him after the College of Physicians had refused to examine him.

While matters were in this state the governors of the Rotunda Lying-in Hospital in 1770 claimed for the certificate of attendance on the Hospital the force and authority of a diploma, and that it also should be regarded as a licence in midwifery. This raised the controversy. Many letters and pamphlets were published, and at length one writer appealed to Dr. Fleury, a very eminent teacher and practitioner of midwifery at the time, to give his opinion. Dr. Fleury was one of the physicians to the Meath Hospital and was in the habit, by permission of the board of Trinity College, of lecturing on midwifery in the school of the college, and to make his instruction practical he attended poor women at their own homes, and brought his pupils with him.

He was probably the first person to give a course of lectures on midwifery in Dublin. Thus appealed to, he published a pamphlet in which he very fully stated his opinion. He utterly rejected the idea that mere attendance at a lying-in hospital and upon obstetric lectures could make a man competent to practise midwifery. "The most enlightened professor of midwifery," he writes, "never can hope, by the best digested course of lectures on that subject, to make a skilful accoucheur of one who has not a competent knowledge of anatomy, chemistry, and, in short, of all the precognita of physic."

This view ultimately became generally adopted, and the College of Physicians not only ceased to confer their licence on unqualified persons, but, more wise than colleges elsewhere, opened their portals to midwifery practitioners, admitting tham to their highest offices. In 1847 and again in 1848 they elected Dr. Collins, an exclusively midwifery practitioner, their president, and since then Dr. Montgomery, Dr. Churchill, and Dr. Beatty, have held this same distinguished office.

The Irish College of Surgeons have, from their first incorporation in 1784, enlightened probably by the events going on around them, recognised the importance and dignity of midwifery, and given it a proper place. In their charter they only took power to grant a midwifery diploma to those of their own licentiates or fellows who sought for it as an extra qualification. Among the first professorships created in the College was one of midwifery which was at first held conjointly (for financial reasons) with that of anatomy and physiology, but in 1793 a special professor was appointed, Sir Henry Jebb, an ex-Assistant of the Rotundo Lying-in Hospital, and he was afterwards elected President of the College. Beatty and Denham, exclusively midwifery practitioners, have since held this proud position, and the College have now honoured even me by elevating me to the same rank.

The University of Dublin is at present organising a plan for conferring a degree in the obstetric art, and this also will be confined to those who have already obtained degrees in medicine and surgery; and the Queen's University have also instituted a diploma in midwifery, which they grant only to those who have obtained degrees in medicine and surgery.

The lying-in hospitals of Dublin still grant diplomas to such of their pupils as pass an examination at the end of their attendance on the hospital practice, but these diplomas are not registrable, and are only of value as secondary qualifications. It would be much better that these hospital diplomas should be done away with, but, unfortunately, the requirements of the Poor-law system render them necessary. They are the last mementoes in Ireland of the age when midwifery was neglected and thought unworthy to take equal rank with the other branches of the great science of medicine.

That the system thus developed in Ireland has worked well it is scarcely necessary for me to assert. Under it the Dublin school of midwifery has attained a high and wide-spread reputation, and if it is indebted to the recognition and encouragement it has received for much of the high position it holds, it will, I think, be admitted that it has in return contributed in some degree to the cultivation and furtherance of the great science of medicine of which it is one of not the least important branches.

◆

THE CONTAGIOUS DISEASES OF ANIMALS.

By George Fleming, F.R.G.S.

(*Continued from page 458.*)

The most formidable and harassing of the exotic contagions of animals of which we have as yet had any experience, are three in number—the rinderpest or "cattle-plague," and what are commonly known as the "lung-plague," and "foot-and-mouth" disease. The rinderpest has made only one great invasion of this country during the present century; and then, through the most unpardonable ignorance and supineness, it wrought an amount of destruction and ruin which is absolutely appalling, when we consider the short time it was allowed to revel unchecked among our herds and flocks. In the cattle-plague invasion of 1865 and 1866, we may set down the money loss from its ravages at something between ten and twelve millions of pounds. Indeed, it is scarcely possible to compute the total amount of damage it inflicted, as we had not very trustworthy means of arriving at the truth. Yet this is a purely contagious, and therefore a preventible malady.

But if the rinderpest caused such startling havoc in such a brief space, it must be confessed that the two other diseases—"lung-plague" and "foot-and-mouth" disease—have been no less serious scourges: inasmuch as, owing to their less fatality and their having been so many years domiciled in these islands, they have not attracted so much attention, though they have become none the less universal, and their ravages have been yearly on the increase.

For reasons which will be presently alluded to, we are unable to arrive at anything like a correct estimate of the damage inflicted on the national wealth by the two scourges just named, since their introduction some thirty-six years ago. Until within the last eight or nine years, no effort was made to ascertain the exact loss they were causing; and though it is now attempted to give a statement of this loss, yet the returns cannot be accepted as affording us any more than a very faint idea of the money swallowed up by these two contagious but preventible scourges. In fact, we are almost in the dark as to the actual damage, in pounds, shillings, and pence—to say nothing of the embarrassment to trade—which these two diseases occasion.

The "lung-plague" is pretty well a concealed disease, and one with whose prevalence the small cattle dealer and petty butcher are better acquainted, perhaps, than the police or other kind of inspector. Yet it has been calculated that in Edinburgh alone, the annual loss from it is between £200,000 and £300,000. For the six years ending with 1860, it has been estimated that there perished considerably more than a million of cattle in the United Kingdom, the value of which must have amounted to at least twelve millions of pounds. The tables of an English Cattle Insurance Company prove that from 1863 to 1866, the death-rate from this scourge was from fifty to sixty-three per cent. annually. If we can form any judgment from these figures, it will not be too much to assert that the "lung-plague" costs us at the very least £2,000,000 a year.

The malady has been carried from Great Britain to her colonies; and in Australia it is estimated that the stock of cattle is reduced by a million of pounds annually.

But we have had no time to notice this disease further than to observe, that what with its long duration in those attacked, the slow and protracted convalescence when they chance to recover, the consecutive disorders—perhaps permanent loss of condition—the non-productiveness of the animals for months, all this makes it one of the most disastrous plagues that can afflict a cattle-producing country.

The other exotic malady, "foot-and-mouth disease," though not nearly so fatal, is yet, perhaps a greater destroyer of the national wealth than the "lung-plague." We cannot arrive at anything approaching exactitude with regard to the damage it inflicts, as a large number of the outbreaks are never reported. Little is known as to the loss incurred from it previous to 1869; but from the attempts that have been made to arrive at a proximate estimate of the destruction it and lung-plague occasioned for the thirty years preceding that date, we may infer that both maladies had cost the country at least £84,000,000. If we add to this the ravages of the cattle-plague in 1865-66, we shall not be far wrong if we put down the damage sustained, from 1839 up to 1870, as £100,000,000.

But the ravages of foot-and-mouth disease have been almost yearly on the increase since then. In 1871, according to the report of the Veterinary Department of the Privy Council (which, however, cannot be relied upon, as it is certain to be below the mark), no fewer than 519,523 cattle or 10 per cent. of the entire stock of Great Britain, were attacked. Somersetshire, however, reported 12 per cent. attacked; and it is possible that some other counties had more. In 1872 the malady was so prevalent among cattle, sheep, and pigs, that in England and Scotland the direct money loss from it was rated at the astounding sum of £13,000,000; and even this enormous figure is supposed to be under the actual amount. In Leicestershire, for example, where an attempt was made to obtain returns of the number and species of creatures affected, and where the loss on each bovine animal was put down at the low figure of £2, and sheep and pigs at 10s., it was computed that a sum total of upwards of £340,000 would not have covered the loss in that county alone. In Cheshire, in the same year, one-third of the total horned stock was attacked, the money loss being valued at 9 to 10 per cent. of the whole head of cattle in the county. In Herefordshire, in that year also, it was ascertained that more than 35,000 cattle, 108,000 sheep, and 9,000 pigs were affected with it, the loss being estimated at £156,000. In Ireland, for the same year, though the cattle reported as diseased must have been a mere tithe of the number actually infected, the loss is reckoned at about £442,000. What the loss was in 1874 it is impossible to say, the Veterinary Department of the Privy Council having given up recording the outbreaks of the malady since 1871. It must certainly have been very great, as, in thirteen parishes around Shaftesbury alone, 10,000 cattle, or nearly one-fourth of all the stock in them, were attacked, the loss being at least £15,000 in this small district. In 1875, owing to the disease having been more widely diffused than it ever was before, the damage inflicted by it must have been considerably over eight millions of pounds. From east to west, and north to south, it raged with a violence and virulence which showed that time does not modify its intensity like some other contagious diseases. The county of Somerset alone lost £150,000 through it; while so far north as Aberdeen, the very lowest estimate shows that in this county 7,731 cattle and 8,954 sheep were attacked, the damage probably not being less than £65,000. Other counties, doubtless, suffered to a similar if not to a greater extent.

These astounded losses from three imported foreign diseases, which owe their maintenance and diffusion solely to their contagious properties, will testify at once to the immense importance of this subject from a money point of view alone. Two preventible contagions, which rob the country of four, six, eight, ten, or twelve millions of pounds annually, cannot be designated anything less than scourges of the greatest magnitude.

Some superficial people have tried to make light of "foot-and-mouth" disease, merely because it is not always very fatal. But they little know what it is among the cattle, sheep, and pigs of farmers who are not wealthy, or among the dairy stock of those whose living depends upon the produce of their cows. When it is considered how rapidly animals lose condition, especially fat stock, what losses occur when it appears among milch cows, cows in calf, and oxen, sheep, pigs, and even poultry, and the embarrassment it may, from its presence, occasion to agriculture and the cattle and milk trades, as well as the expense of curative measures, it cannot be denied for a moment that, even under the most favourable circumstances, this malady causes greater loss than the cattle-plague itself.

But we have other contagious maladies which, though they may be imported from abroad, like the three just alluded to, may yet be said to be "indigenous." One of these is the horrible disease "glanders" of the horse—which is transmissible to other species and also to mankind.

We are in the dark as to the extent to which the dangerous malady prevails, as here also the returns of the Veterinary Department of the Privy Council are not reliable. In London, where it exists to a far greater extent than is perhaps dreamed of, it is supposed to destroy horses to the value, annually, of £5,000; and in other parts of the country the loss may be set down at £20,000 more.

The ox suffers from scrofula, and some forms of blood disease which are contagious and destructive, but are not included in the Privy Council list.

The sheep is affected with some serious contagious maladies, but chiefly with a parasitic disease of the skin, that occasions much loss.

It may be said that thousands of pigs perish every year from contagious diseases which are not recognised by the authorities; and we do not know the extent of the loss they occasion, nor even the nature of the diseases.

Rabid dogs cause much destruction to property, and numbers of people die every year from hydrophobia; yet rabies is a terrible disease not mentioned in any of the official records of the Privy Council.

In fact, we are altogether uninformed as to the injury inflicted on the national wealth by many maladies which are very serious and alarming, and are yet preventible.

Clinical Records.

CASHEL UNION HOSPITAL.

Salicin in Acute Rheumatism.

(Under the care of Dr. LAFFAN.)

At the present moment, when this new remedy is on its trial, the publication of results appear called for. I recently admitted a woman, named A. F., into my wards with acute rheumatism. The wrist, knee, and ankle-joints were affected. The first-named joints were so much engaged as to oblige the woman to be fed. Slight effusion existed in the wrist and ankle-joints. She had been ten days ailing before admission. She was put under twenty grain doses of salicin, repeated every second hour. A saline purgative had to be given in consequence of the bowels being very much loaded. After the second salicin powder the patient was able to use her wrists freely, and after completing half a dozen she was nearly convalescent. There is a faint mitral murmur in this case. From the absence of all cardiac symptoms, I am not sure but that this murmur may have existed previous to the present attack. It at all events was unaffected by the salicin. In this case the result was too rapid to allow it to be set down as mere *post hoc*.

The salicin was continued for some time longer, but, giddiness coming on, its administration was suspended. I did this in consequence of the case published in *The Lancet* some time since, in which head symptoms supervened from large and prolonged doses of the drug. The giddiness soon disappeared, and the drug was again resumed. This woman is now convalescent.

Salicin so far, however, appears of value; what that exact value may be extended use can alone determine. There is the danger that by being rated too highly at first it may by and by fall into unmerited disrepute.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

FRIDAY, NOVEMBER 24TH, 1876.

Sir WILLIAM JENNER, Bart, M.D., D.C.L., F.R.S., President, in the Chair.

CASE OF LYMPHATIC LEUCOCYTHÆMIA, TREATED WITH PHOSPHORUS.

Dr. GOWERS read notes of this case; the patient being a lad, æt. 16, who had been under the care of Dr. Wilson Fox in University College Hospital. He presented extensive glandular enlargements in the neck, axillæ, and groins, and evidence of a large mass in the mediastinum. The spleen was slightly enlarged, and the temperature was uniformly raised several degrees. The blood presented a large excess of white corpuscles. Their proportion to the red was as one to four. One hundred and four were counted in one field. The glandular enlargements had been noticed only three months. During a fortnight of expectant treatment, little change was observed. Phosphorus was then commenced, one-thirtieth of a grain being administered three times a day.* A week's slight improvement was followed by an increase in all the symptoms, due apparently to some unwise exposure; but, during the second fortnight of the phosphorus treatment, there was a marked diminution in the number of white corpuscles. At the end of the fifth week they were reduced to a third of the original number, and the external glands were small and harder. A trace of albumen appeared in the urine; and, on account of obstinate diarrhœa, the phosphorus was omitted. The improvement in the special symptoms continued; and, a week later, only twenty-four white corpuscles could be counted in the field of the microscope, and the dulness produced by the mediastinal mass had sensibly diminished. The albumen in the urine, however, increased, fatty casts were found in it, and general œdema came on. The temperature fell, the patient became weaker, and finally died from asthenia—the number of white corpuscles showing to the last a progressive diminution. At the *post-mortem* examination, besides the external glands which could be felt, masses of agglomerated glands occupied both the anterior and the posterior mediastinum. In front, the mass occupied above the position of the thymus, and was adherent to the rib cartilages and to the left lung. A still larger mass in the posterior mediastinum lay around the trachea and aorta, and had perforated the pericardium. The abdominal glands were also enlarged. Most of the glands were hard and fibrous, or else caseating. Under the microscope, all showed lymphatic overgrowth and abundant leucocytes. In some, the overgrowth was undergoing fibroid, in others fatty, degeneration. The spleen weighed thirteen ounces and a-half; the Malpighian bodies had undergone lardaceous degeneration; it contained some caseous infarctions. Its tissue was infiltrated with leucocytes. The liver was slightly enlarged, and contained abundant minute growths, most of which were undergoing fatty degeneration. The kidneys were large and pale, and their tissue presented general granular and fatty degeneration, with a few leukæmic growths. The marrow of a tibia was abundant, and consisted of leucocyte-like cells massed together. Dr. Gowers drew special attention to the degeneration in the glands and in the liver, which seemed to be indicated during life by the diminution in their size, and this coincided with the improvement in the state of the blood. The spleen presented no degeneration which could be associated with the diminution in the white corpuscles since the Malpighian follicles are believed not to be specially concerned in the leucocythæmic process. Hence, it was probable that the leucocythæmia which existed was due to the granular overgrowth and not to the spleen. Renal disease was a rare complication of leucocythæmia, and it was further remarkable in this case from the acuteness of the process and the early evidence of fatty degeneration. What effect could be ascribed to the phosphorus? The known influence of phosphorus was to cause fatty degeneration, the condition found abundantly in this case. But such degenerations had occurred in cases in which no phosphorus had been given, and with so acute a course and elevation of temperature degenerations were likely to occur. The process might have been hastened by the phosphorus; but, if so, the drug must be suspected of an influence on the kidney degeneration. In conclusion, Dr. Gowers said he had brought forward the case rather as suggesting points for future observation than as itself settling the questions it raised.

A CASE OF HODGKIN'S DISEASE, WITH INCREASE IN THE WHITE CORPUSCLES OF THE BLOOD; TREATED WITH PHOSPHORUS.

Dr. W. S. GREENFIELD detailed this case. The patient, a woman, æt. 26, had never been strong, though suffering no special ailment, until about two years before, when she had attended as an out-patient at St. Bartholomew's Hospital, under Dr. Duckworth, for amenorrhœa. She stated that she had, at the same time, some glandular enlargement in the neck; but this appeared to have been doubtful. Some enlargement of the glands in the neck was noticed about January 1876; and from that time there was complete amenorrhœa and gradually increasing debility, which at last led her to seek advice. She was first seen by Dr. Greenfield at the beginning of May; and from that time till her death was under the care of Dr. Rogers, of Old Street, Dr. Greenfield seeing her in consultation with him. When first seen, she was greatly emaciated. There was a mass of enlarged glands in the right side of the neck, at the upper part, with some enlargement behind the sternomastoid; on the left side was corresponding, though less, enlargement, and there were also enlarged glands in the right axilla and in both groins. The patient suffered from hectic fever, with frequent profuse perspirations. There were also various attacks of dyspnœa, lasting a few minutes, which came on suddenly, often preceded by pulsation of the right carotid artery; then she became suddenly pale, half unconscious, the respiration becoming very laboured, and almost entirely abdominal. The right pupil was sometimes dilated during or after the attacks, and profuse perspiration frequently followed them. The spleen appeared to be slightly but not notably enlarged. The blood was not examined until later. Having in view the important results gained by Dr. Broadbent and Dr. Wilson Fox in leucocythæmia by the employment of phosphorus, Dr. Greenfield thought it would be desirable to try its effect in a disease which presented some analogies with it; and one-thirtieth of a grain of phosphorus was, therefore, given three times daily in pill, and was continued for six weeks. Ten days later, the blood, examined with a high power, showed a decided increase in the number of white corpucles, which appeared to be in the proportion of one white to fifteen red. There were also other white corpuscles, smaller than usual, and and a number of microcytes. The glandular swellings increased somewhat rapidly, and in the middle of June there was a large mass in the right axilla; the swellings in the neck had greatly increased, and there were masses of glands in the groins. The febrile attacks and perspirations continued unabated, and the patient became extremely emaciated and prostrate. The temperature, taken pretty regularly three or four times in the twenty-four hours, presented remarkable variations, the daily range extending over from 4 to 6 degrees Fahrenheit, and the elevation occurring very rapidly. On one occasion, a rise from 98 deg. to 103 deg. was observed in four hours, and from 97 deg. to 103 degrees in five hours. The highest temperature observed was 105·5 deg.; but temperatures of 104 deg. and 105 deg. were frequent, the highest usually occurred towards evening or at night, but with no great regularity. The patient lived for about four months, dying early in August. During the greater part of that time, the glandular enlargements increased, emaciation was progressive, and, after a temporary improvement, the dyspnœa became a more or less permanent symptom. Towards the end of life, the glandular swellings decreased in size, and some of them entirely disappeared. The temperature continued high, but during the last week of life it became lower, rarely rising above 101 deg. On *post-mortem* examination, there was found a mass of enlarged and indurated glands in the upper part of the right side of the neck; enlargement of the bronchial and mediastinal glands; and the mesenteric and lumbar glands were greatly hypertrophied. There were two smallish nodules of new growth, resembling indurated lymphatic glands in structure, in the liver. The spleen was but slightly enlarged and apparently free from patches of new growth, but was too much decomposed to permit of certainty on the point. There were scarcely any other marked visceral changes. Dr. Greenfield observed that the case was clinically a typical example of Trousseau's "adenie," "anæmic lyphatica," or "Hodgkin's disease." He thought that the increase in the proportion of white blood corpuscles was not sufficiently large to allow it to be designated as a case of leucocythæmia, nor were there any of the usual symptoms of that disease, such as epistaxis or other hæmorrhage. At the same time, the condition of the spleen was different from that which was observed in many cases, and regarded by Dr. Wilks as one of the essential anatomical lesions of Hodgkin's disease. The clinical features, however, were most typical—glandular enlargement, great and progressive, a peculiar anæmia, progressive emaciation, with irregular and high temperature. The condition of the spleen in five other cases which had fallen under his observation presented considerable variation; in only two did it present the typical characters of containing masses of new growth, aptly likened by Dr. Wilks to lumps of salt. At the same time the condition of spleen observed was equally inconsistent with typical leucocythæmia. Probably the case must be considered an intermediate one, and "anæmia lymphatica" would be the most appropriate name, rather than Virchow's "leukæmia lymphatica." In commenting more particularly on the symptoms observed, the author remarked that the earlier attacks of dyspnœa were probably due to pressure on nerves, the later to direct pressure on the trachea and bronchi of enlarged glands, a condition discovered *post-mortem*. The phosphorus was observed to have had but little influence on the progress of the disease; the glandular enlargement continuing and increasing during its use, and the subsequent apparent atrophy of the glands being accounted for, in all probability, by the induration—a similar occurrence having been observed in other cases. Nor did quinine, which was given throughout a great part of the course of the case, appear in any way to prevent the febrile attacks. The other treatment adopted consisted merely in palliative measures.

To be continued.

◆

SURGICAL SOCIETY OF IRELAND.

The first meeting of the session was held on Friday evening, November 24th, 1876, Dr. Kidd, President, in the chair.

The minutes of the previous meeting having been read by Mr. B. Wills Richardson and confirmed,

The President then delivered his

INAUGURAL ADDRESS,

which will be found at page 478.

DISEASE OF TARSUS.

Mr. H. G. Croly exhibited the foot of a young girl which he had removed by Symes's amputation at the ankle-joint. Though the disease was one of not uncommon occurrence, there were some points connected with the case that he thought worth mentioning. The disease existed for a couple of years, and followed a sprain of the ankle-joint. On admission to hospital there was a sinus observed in the region of the astragalus, and on examining the region of the os calcis it seemed as if the disease was confined exclusively to that bone. However, on amputating the foot by Symes's method, he found that the disease had extended into all the bones. The os calcis was very extensively diseased, as well as the astragalus. On making the incision for Symes's operation the os calcis broke down, and portion of it came away. He thought the case proved that though the disease was in one bone, the astragalus, the other bones were at the same time implicated.

NECROSIS OF TIBIA—KNEE-JOINT DISEASE.

Mr. Tyrrell exhibited a leg which he said he had removed from a girl, aged 14 years, who was admitted to the Mater Misericordiæ hospital. The report given was that about two years ago the patient got a pain in her knee, grew worse, and became laid up. She got temporary relief, but she came to hospital. She was worn very much on admission, and on an examination of the limb there was found to be extensive necrosis of the tibia, disease of the knee-joint, and also considerable atrophy of the whole limb. It was determined that the only operation to be performed was amputation of the thigh. It was interesting to observe in the specimen the extensive atrophy that was in all the parts. The femur was remarkably small, the compact tissue being merely about two lines in thickness, and the medullary membrane is correspondingly increased. The muscles had undergone fatty degeneration in the lower part of the thigh, and also in the leg, and the tibia was partly dislocated inwards, and there was also some ulceration. On slitting open the joint the bones were found to be exceedingly soft, and disease also existed at the extremity of the femur. This case also exhibited remarkably well the result of long continued inflammation. The bones showed an extreme degree of softening, and also the continued inaction of the muscles indicated fatty degeneration. In cutting through the parts necessary to remove the limb, not one particle of fatty tissue was met with—it was a mere fatty mass.

ENLARGED PROSTATE GLAND AND DISEASED BLADDER.

Mr. H. G. Croly showed another specimen which he had removed from the body of a man, aged 79 years, on the previous day. The man had been admitted to the City of Dublin Hospital with retention of urine, the bladder being distended to the umbilicus, and from the age of the patient he (Mr. Croly) at once suspected that the cause of the retention was an enlargement of the prostate gland, and on examination through the rectum he found that the prostate was very considerably enlarged. The instrument he selected to relieve the bladder was the ordinary prostatic catheter. On passing that instrument down as far as the termination of the spongy portion of the urethra the instrument would not go farther—in other words, the patient was suffering from, for many years, a stricture of that portion of the urethra. It was with very considerable difficulty that he got an instrument into the bladder. The urine, of course, presented the ordinary appearances so common in vesical catarrh. He passed the catheter twice a day for some time, and a little water dribbled away from the patient at other times, so that he was relieved regularly. He got all the usual symptoms—the low form of fever so common in these cases, and he died two days prior to this meeting. The bladder was a very well marked example of chronic disease. A very large abscess was found in one of the kidneys. There was also an abscess between the prostate gland and the rectum, and there was very considerable infiltration of the penis. The case he thought interesting in connection with the complication of permanent strictures with prostatic enlargement.

INTERNAL PILES AND PROLAPSE OF RECTUM.

Mr. **Croly** then communicated to the Society a paper on the subject of the treatment of internal piles, complicated with prolapse of the rectum, by means of the clamp and actual cautery. He said he wished to bring under the notice of the Society the result of his experience in the treatment of internal piles, some of them complicated with prolapse of the rectum, by actual cautery. He thought all practical surgeons would acknowledge that there was no disease which was more difficult of successful treatment than that of internal piles, and he would be very glad to hear the opinions of the surgeons who were present as to their experience in the treatment of piles by this special operation. The first case which he would allude to was one of a patient of sedentary habits, who began to suffer from bleeding piles about twenty-four years since, and stated that he used to lose a considerable quantity of blood daily, and that, with the exception of an interval of nearly six months, during which time there was no bleeding, he was never perfectly free from this ailment. About six years since the bowel came down for the first time when he was at stool, and then when out walking, and the disease increased yearly in severity until latterly he presented a truly lamentable picture. When at stool in the morning a great mass of internal piles, consisting of large, elongated, thickened, fleshy-looking folds of mucous membrane, together with a portion of the rectum, used to come down, in the reduction of which he used to spend about an hour and a-half daily. Many times on reaching his bedroom or office, from renewed prolapse he was obliged to repeat the same painful process. When standing, walking, sitting, or lying in his bed at night, the bowel would come down, and he would suffer agony until he had succeeded in replacing it. During this time had tried astringent injections of lead, tannic and gallic acids, and iron, and injections of cold water after each motion, stuping with oak-bark decoction and various ointments, galls, tannin and opium, matico and opium, tannin and lead, &c., &c.; had taken nux vomica, iron and quinine internally, and had used anal trusses of various kinds, and all this without deriving the slightest comfort from any one of the remedies. He at last consented to undergo an operation, and was operated on on the 15th November last year, the result being perfectly successful, and he was perfectly satisfied that no other mode of treatment would have been so in this case. The mucous membrane was considerably tightened by the operation of the clamp, and the removal of the folds of the skin round the anus. On the 6th of June last he operated upon another case. This patient, who was a young man, stated that he had suffered for seven years from internal piles, and when he went to stool, he used to pass quantities of blood. He was very fond of horse exercise, but he had to give up riding altogether, and was very much confined to his room. In that case, he removed a large number of internal piles, but he did not think it necessary to perform the operation for prolapse, by removal of skin round the anus, being induced not to do so from the age of the patient, and from the feel of the sphincter, after he had removed the internal piles. At all events, he prepared him by telling him that it was possible that subsequently the folds of skin would have to be removed. That second case was not so severe as the first one he had recorded, but it was a very severe case of piles and also did well. The next case to which he wished to draw attention was the case on which he operated on the 3rd of August last, a very difficult one in this way. The patient, had not only a quantity of internal piles obtruding at stool, but she had an old laceration of the vagina, which happened in one of her earlier confinements, and this encroached on the sphincter, so much so, that there was no support, and the rectum came down to a very large extent at stool. He operated on that patient, first, by removing the pile with the clamp and cautery, and then from the condition of the perinæum and the want of support, he removed in addition the folds of skin. That case did well also. In his hospital cases he had operated with the clamp in a considerable number of cases, and with success. There was a case that occurred lately, which was interesting in connection with the subject of the cure of prolapse. A woman, aged 55 years, had suffered a considerable time from prolapse of the rectum. He found she had no internal piles. The bowel came down to a considerable size. He removed the folds of mucous membrane from the bowel by means of the clamp, and arrested the hæmorrhage by cautery, and then he removed the radiating folds of skin around the anus. That woman was now in perfect health, and the bowel had never come down since the operation, and he treated the sphincter in that case as in the first operation. He believed that when they came to deal with cases of internal hæmorrhoids, they must either adopt the ligature, écraseur, clamp, or acids; he alluded, of course, to cases of internal piles of the very worst form, when the rectum came down along with the piles. He had spoken to a great many hospital surgeons in Dublin on the subject, and he had met many surgeons who had gone in for treating piles by this method, and therefore it would be interesting to the Society to hear the views of those surgeons on this special line of practice. With regard to the clamp, it was due to their countryman, the late Mr. Cusack, to say that he was the originator of it. In 1835, the clamp was introduced into surgery for the radical cure of piles by Mr. Cusack; and when last Christmas he had an interview with Mr. Smith, at King's College Hospital, that surgeon admitted that the clamp now modified by him was first introduced into surgery by Mr. Cusack. For some reason, however, the treatment was not followed up, and certainly it was due to Mr. Smith to say that he had revived that treatment, and brought it to a state of perfection. This clamp differed from Cusack's in having ivory blades, and the modification of it was that when the cautery was applied to the piles, the ivory blades, being non-conductors, the portion of the bowel which ought not to be touched by the cautery, was of course protected. With regard to the operation, he would say, making a section of the pile so as to leave at least a quarter of an inch of tissue above the edge of the clamp. Many surgeons said that they had hæmorrhage after the use of Smith's clamp and the cautery, but he had reason to think that such a result was owing not to the operation. If the piles were cut off level with the clamp, the tissue retracted from the level, and the cautery, which was supposed to be applied to the bleeding surface, was applied to the metal. The cautery was applied at a black heat before taking off the clamp, and when the surgeon relaxed pressure by unturning the screw, he would see if there were any vessel still spouting, and if necessary tighten the clamp again, and re-apply the cautery. He had only given his own experience. He had not had a single case of intermediate hæmorrhage, nor had he a case where he had to use ice, or take any other steps to arrest hæmorrhage. With regard to the operation for prolapse, and for the removal of the radiating folds of skin that operation was originally introduced into surgery by Hay, of Leeds. Dupetrant had improved the operation by extending the incision, and encroaching on the sphincter muscles, where the sphincter was relapsed. He (Mr. Croly) had adopted the acid treatment in some cases, but he thought the cases he had now mentioned were ones in which he would not himself have wished to adopt the ligature. He thought the subject was one of sufficient interest to bring under the notice of the Society.

Dr. **Little** regretted very much that Mr. Croly had not given the Society information as to the constitutional condition of his patients. It was well known that piles depended very often upon other conditions than congestion of the rectum—that there were constitutional conditions which gave rise to piles, and which required the careful consideration of the surgeon before any operative proceedings should be undertaken for their remedy. He had had several opportunities in his practice, though not an hospital surgeon, of treating cases of the kind described by Mr. Croly, and he had not found it necessary to resort to any operative procedure, for he had discovered the conditions which could be remedied by constitutional treatment were the causes for the piles. He had discovered in many cases what they had not heard from Dr. Croly, that congestion of the liver, mesenteric disease, cancers, &c., had been causes of piles. In cases of congestion of the liver, constitutional treatment had been quite sufficient to remedy the particular diseased condition affecting the patient. He would be very much pleased if Mr. Croly would give them some information as to the constitutional condition of his patients, whether there was disease of the liver, or disease of any of the abdominal organs in the cases which he had in other respects so satisfactorily described.

Mr. Edward Hamilton said he thought the Society was indebted to Mr. Croly for having brought the subject forward. He (Mr. Hamilton) had given a little attention to the subject of hæmorrhoids, and at one time was very fond of the use of the écraseur for that disease, but experience had led him to modify his faith in it, and he had not found it useful in as many cases as he at first thought it would be. No doubt there were many cases in which it was applicable, and when it was applicable, he thought it was the most convenient and desirable of all operations for internal piles, but there were many cases in which they could not use it. And casting about with a view of modifying the treatment when in Paris last summer, he saw an instrument which struck him as being exceedingly applicable in the treatment of internal piles. He was so pleased with the instrument that he was induced to purchase it, and he had the pleasure of exhibiting it to the Society that evening, and members would, he thought, perceive that it was a very convenient and very useful appliance. It was an instrument introduced by Dr. Paquelin, and was brought before the Academy of Science in Paris in May last. It was the simple action of petroleum combined with atmospheric air driven through a series of fine tubes through some dense metal, such as platinum. A very small amount of heat, such as a spirit-lamp, was sufficient to set the apparatus in working order. He had not yet had an opportunity of trying it; but hearing that this subject was to be discussed that evening, he brought the instrument before the Society. It was easily heated by driving the vapour through the tubes by working an air-ball. It could be allowed to cool and be reheated again in an instant at pleasure. It was very useful for applying a high degree of heat without much inconvenience.

The President said that Mr. Croly had spoken about the blade of Mr. Smith's modification of the clamp being made of ivory as a new application as an improvement on the instrument Mr. Cusack had introduced. He (the President) wished to observe that Mr. Cusack also had as a means of protecting the skin a layer of white chamois leather attached to the clamp and laying next the skin. It seemed to him (the President) that Dr. Smith's original clamp, whether it was the form he now adopted or not, he was not aware—differed somewhat from the instrument shown by Dr. Croly. He (the President) had seen hæmorrhage occur where he had removed the piles with the clamp and cautery—with Smith's original clamp. At all events, the action of the clamp was not parallel, as in the instrument now exhibited. It held the portion of the piles that was next the hinge of the clamp very closely, but the lower portion of the clamp was open, and the blades diverged. The blades of the clamp did not act parallel as Mr. Croly's did, and did not hold the piles to the whole extent. He thought it was an important modification of the instrument to have the blades acting parallel.

Mr. Tufnell said he had used this instrument for a considerable time, and it certainly acted most admirably. Really, what Mr. Croly had said was correct, but the great point was not to divide the piles in a line with the blades of the instrument, but to leave a good margin in view, and in that way, as they carefully relaxed the pressure upon the piles, they would see whether any of the vessels were inclined to spout. The only alteration that he thought desirable in the instrument was, that the screw-handle should be increased in size. At present it was too small, and when one's fingers were wet with blood in operating, it required a good deal of power and a great deal of pressure to sufficiently contract the vessels, owing to the small size of the circular disc. If that were made twice as large as now the surgeon would have greater power.

Mr. Tyrrell wished to know if he was to understand that Mr. Croly, in leaving a quarter of an inch of the pile extended beyond the clamp, claimed that as his own special plan; because if he, Mr. Tyrrell, recollected correctly, in Mr. Smith's book and Mr. Ellingham's work, both those writers laid stress upon that point upon having a certain portion of the pile protruding, so that after they applied the cautery they might open the clamp gradually to see if any point would bleed. That plan was mentioned in all the books which treated of this special subject.

Dr. Coppinger said that he had used the cautery in two cases of internal piles, and in the first case it had acted admirably, but, in the second, he omitted the precaution of leaving sufficient space outside the clamp for perfect cauterisation by means of the heated iron, and the consequence was that very severe hæmorrhage occurred about three hours after the operation, and was only arrested by plugging the rectum. The plugging, however, had the desired effect.

Dr. Bigger thought that the relation of Mr. Croly's cases might possibly have the effect of leading some practitioners, especially junior ones, into the error of supposing that these cases could be relieved in no other way than that which he had detailed. Ice was valuable, and constitution had to be considered. The clamp was useful, as was also the écraseur, with had been used with great success, but if there was anything that he objected to in its use it was that it was so frequently followed by extreme strangury. As to hæmorrhage, that, he thought, a careful surgeon would always avoid. Nitric acid was also a valuable agent. He would be sorry to see young men rush with the knife in cases of piles or prolapse. The cases mentioned by Mr. Croly were extreme cases, and they were of value as such.

Mr. Hayes said he thought the clamp which Mr. Croly had exhibited was designed by Mr. Sidney Jones, and not by Mr. Smith. He thought the clamp and cautery a useful mode of dealing with piles, and he had tried it himself in hospital practice.

Mr. Croly, in reply, said, with regard to the President's observations as to the parallelism of the blades of the clamp, that was one of the greatest improvements in it. As to the claim set forth by Mr. Hayes as to the clamp being Mr. Jones' invention, he, Mr. Croly, did not know who Mr. Jones was. Mr. Smith had claimed it as his improvement, and he, the speaker, had never heard that that claim was ever disputed. Regarding what the President had said as to the chamois protecting the blades, he, Mr. Croly, might be excused if he did not remember every point connected with the subject, but he was quite sure that the late Mr. Cusack was too able a surgeon to allow the heat to be misapplied. He thought, in connection with Dr. Coppinger's remarks, that the surgeon should not use the curved scissors. He thought he should cut the piles parallel with the scalpel. He did not think that he had claimed any originality for the plan of leaving a margin of a quarter of an inch. Prolapsus recti were removed by the écraseur and ligature, and with success; and there was a surgeon in the room, Dr. Thornley Stokes, who, in his, the speaker's, presence, had removed a very large prolapse of the rectum with a very good result. In mentioning his cases, he did not think that any one who listened to what he said would assert that he had stated he rushed with the clamp and cautery to every case of piles he met. The cases he had described were very bad cases. What Dr. Little had said had nothing whatever to do with the subject before the Society. He would not go into the treatment of piles by electuaries, or castor-oil doses.

The Society then adjourned.

PATHOLOGICAL SOCIETY OF LONDON.

At the last meeting of this Society, Dr. Lediard exhibited two specimens of Aneurism of the Thoracic Aorta. The first was from a stout, muscular man, æt. 32. The symptoms were cough, shortness of breath, occasional attacks of laryngeal dyspnœa, and a short, sharp, systolic murmur heard at the ensiform cartilage. Death occurred suddenly from rupture of the aneurism into the œsophagus. Posteriorly, it was adherent to and had caused erosion of three adjacent vertebræ, while an opening of the size of sixpence led into the gullet. In the second case, a woman, æt. 54, there was a pulsatory tumour behind the upper part of the sternum, engorgement of the veins of the neck, œdema, and dysphagia, frequent attacks of slight hæmoptysis, absence of left radial pulse, and a systolic murmur heard over the tumours. After death, which was occasioned by exhaustion, an aneurism was found in the arch of the aorta, which had invaded the manubrium sterni. The left subclavian artery was obliterated, the left carotid stretched over the wall of the sac, and the descending aorta dilated and much degenerated. The aneurism had opened into the trachea just above and to the left of its bifurcation. In these patients there was no history of syphilis. The pupils in each case were equal.—Mr. Lennox Browne said that in these cases the laryngoscopic examination often showed impaired motions of the vocal cords.—The Chairman (Mr. J. W. Hulke) referred to the fact (illustrated by Dr. Lediard's second case) that the apertures caused by bursting of aneurisms into mucous cavities are generally small, and give rise to a limited escape of blood, whereas their rupture into serous sacs is large, and leads to rapid and fatal hæmorrhage.

Mr. **Walsham** showed a specimen of Unobliterated Ductus Arteriosus in a male patient, æt. 47, and in whom there was another malformation present. Similar cases have been recorded by Drs. Fagge and Peacock, as well as by Dr. Greenhow in the last volume of the "Clinical Society's Transactions."

Mr. **Holmes** showed a specimen of Stricture of the Œsophagus, from a lady, æt. 35. Some of the circumstances of this case were remarkable. For several years before death, which occurred suddenly, and was preceded by pain and dyspnœa, there was temporary difficulty in swallowing, but the stricture was so incomplete, that she was able to take food to within two days of her death. The stricture was caused by a growth which was pronounced by Dr. E. J. Lee to be of a scirrhus nature, and very rapid ulceration had occurred between the gullet and trachea. It was thought by some of the members present the dysphagia was not caused so much by an actual stricture as by the normal movements of the pharynx being interfered with by the presence of the cancerous infiltration Mr. Wagstaffe), or by a rigidity and fixation of the walls of the gullet (Mr Holmes).

Mr. **Bullin** exhibited a specimen of a large fatty tumour, which was remarkable in occurring in a girl, only seven years of age, and which contained a number of striped muscular fibres, variously disposed throughout the tumour, and some of the fibres of which could be traced from the surface along the connective tissue into the interior. There was a possibility of the tumour being congenital, as although it was not noticed until one year after birth, yet it would have been difficult to detect it on account of its deep situation.

Mr. **Howse** showed a specimen of Ossification of the Axillary Artery, following injury in a man, æt. 39. There was no fracture of bone, but loss of sensation in the parts supplied by the median and ulnar nerve, independently, however, of any injury to the brachial flexus; and death occurred twenty-four days after from pneumonia. The axillary artery was much contracted in its second part, and its external wall was the seat of cancellous bony material, as in new formed callus. Mr. Howse said he had not been able to find any record of true ossification of arteries, as distinguished from ossification. The specimen was referred to the Morbid Growth Committee for microscopical examination.

Dr. **Barlow** exhibited a Brain of a Microcephaic infant, who had been brought to the hospital, suffering from congenital jaundice. The bile-ducts, however, were quite pervious. The head was remarkably small, with fontanelles closed, sutures approximated, and of a pyramidal shape. There were no nervous symptoms, and the child could suck, cry, and even smile. No convolutions were present on the convexity of the hemispheres, but there were some symptoms of their having been developed. The corpus callosum and septum lucidum were absent; and the lateral ventricles dilated. The foramen of Monro was only open on the left side. This, said Dr. Barlow, was an instance of hydrocephalus in a microcephalic child, the order of events being probably meningitis, with atrophy of the brain, the closure of the cranium over the atrophied brain, then a compensatory ventricular effusion. The report on the minute structure of the brain, which only weighed half an ounce, was deformed.

Mr. **Pearce Gould** also showed a specimen of spindle-celled sarcoma of the thigh, which, however, we have not space to notice.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning Price 5d. Post free, 5½d

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
„ IF PAID IN ADVANCE 1 1 0

⁂ Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.C.
A. H. JACOB, 23 Ely Place, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, DECEMBER 13, 1876.

RELATION OF IMPURE WATER TO PRODUCTION OF CHOLERA.

As the attention of the public is just now much more engrossed with the subject of small-pox than with that of cholera, we must offer some apology for bringing before the notice of our readers a question in which they may not feel much interest. Our apology is the more called for considering that only a few months back we took the opportunity of dwelling somewhat at length upon the conditions of the production and prevention of this pestilence in reference to some important reports that had appeared both in this country and in America. At that time we notice, in the course of our remarks the influence of impure water in the propagation of cholera, but we could then do no more than very briefly refer to the investigations of Dr. Snow and Mr. Simon, and to the fact that the above American reports furnished additional proof of the power of impure water in disseminating the disease. Nevertheless, the little we did say on the subject appeared to some who had themselves given some attention to the question, more than was warranted by the evidence before us, and as they entirely disbelieved that foul water had, under any circumstances, anything at all to do with the production of cholera, they endeavoured to throw ridicule upon the theory.

In the last number, however, of the *Indian Medical Gazette* there is a report by Dr. Arthur J. Payne, Health Officer of Calcutta, the object of which is "to set forth and prove the close practical connection between filthy water and cholera, but without entering upon the controversial topic of germs." At the commencement of this report we are informed that, after some years of marked improvement, cholera is now becoming in Calcutta yearly more and more productive, and that every year, under increase of local production, the probability becomes greater of a widespread epidemic which shall again draw the attention of the world to India as its birthplace. Moreover, Dr. Payne thinks that in the event of cholera again invading Europe the attention of nations will not be given so much to the conditions of its march through that continent as to those eastern places where past inaction shall have enabled the disease to maintain itself. And he goes on to say that, unless there is some more effective exercise of power among the sanitary authorities of Calcutta, this city will be held up to the condemnation of the world as a place where the people and the authorities have been content to maintain "a breeding-place for mortal disease, and have complacently sanctioned its dissemination through Europe." After making due allowance for the great sanitary and social improvements that have been made in Calcutta, Dr. Payne observes that, "vast areas of solid filth and numberless collections of liquid sewage remain untouched, except for baneful use by the people themselves. By clean drinking-water brought within reach of most of the inhabitants, the poison has indeed been deprived of one of its readiest means of access to the body, but the sources continue to exist. Not a week passes without proof in the death-lists of their actual power of local origination. . . . Though the chief thoroughfares are cleansed, the city, in its inward parts, its greatest area, has its soil saturated with excrement. The habits of past generations, which have made it so, continue in their disgusting details as free from interruption as though no thought of public health had ever penetrated here. For a plot of unguarded land about his house, the tenant sees no use but that of a latrine; and when his fluid filth runs or sinks into a hollow, he calls it a tank and washes in it." But with regard to the inflence of an impure water-supply upon the production of cholera, it appears from a table drawn up by Dr. Payne that, from the year 1872, "cholera production," which had fallen after the introduction of the new water-supply from numbers ranging from 5,078 to 3,592, to 1,563 in 1870, the year of the opening of the hydrants, and to 800 in the following year, has again began to increase, having risen from 800 in 1871 to 1,726 in 1875. In April, 1870, Calcutta found itself in possession of 800 hydrants erected along all its public roads and lanes, and supplied with water, the purity of which could bear comparison with that supplied to European cities. As long as there was an abundant and continuous supply of good water in the hydrants there was a "remarkable" fall in the amount of cholera production which was sustained until the continuous supply was interrupted; and was even sustained during the months of greatest normal mortality from the disease, thus showing the salutary influence of a good water-supply in face of seasonal and other conditions favourable to the prevalence of cholera. After stating that this interruption consisted in the flow of pure water being stopped—between 6 p.m. and 5 a.m., owing to a deficient supply of it, and that, consequently, the people were often driven to the use of the filthy stagnant pools of sewage called tanks, Dr. Payne goes on to say, "I am not concerned to advocate or refute the doctrine known as the 'water-theory' of cholera, under which it is contended that the spread of the disease is to be explained by especial contamination of drinking water with germs or other particles passed from the bodies of infected persons, but merely to claim for these ponds the power which no one denies to excremental filth in this form everywhere. . . . and to show on the evidence of facts that their effect on the public health is in strict accord with the forebodings of science concerning them, and with universal experience in other places." There are many other facts and observations in this able and interesting report, to which, did our space permit, we would willingly draw attention. Sufficient, however, has been said to show that even upon the evidence brought forward by Dr. Payne, the influence of impure water upon the production or prevalence of cholera should be by no means made light of, and that those who act at any rate upon the presumption that the prevalence of that disease is aggravated by means of an impure water-supply, will best consult their own interest and that of the public in general.

◆

IRISH COUNTY INFIRMARIES.

A VERY important decision has recently been given by the Court of Crown Cases Reserved in Dublin, in reference to the salaries of the surgeons of county infirmaries in Ireland. When the Medical Charities Amendment Act became law, on the 7th of August, 1871, the salary payable to the surgeon under the 5th of George III., c. 20, was to cease as soon as the surgeon should die or cease to hold office. The clause is as follows:—

> Where under the provisions of 5, Geo. III., c. 20 (I) any allowance or stipend is now payable to any officer of a county infirmary or other medical institution, such respective allowance or stipend should wholly cease to be payable to or for the use of such infirmary or medical institution under the provisions of the said act, when and as soon as the person holding such office at the time of the passing of this act shall wholly cease to hold the said Office in the said infirmary or medical institution.

The legality of grand jury votes in favour of these institutions had been raised before Baron Deasy, at the presentment assize for the county of Tipperary, by two ratepayers who objected to the share of the grant payable by the south riding, viz., £304 for the infirmary maintenance, and £28 4s. for the surgeon's salary. Baron Deasy had doubts upon the question, and reserved it for the superior court. The Association of Infirmary Surgeons appeared by Mr. Gerald Fitzgibbon, to sustain the vote, and contended that the section of the Medical Charities Act had not repealed sections 85 and 86 of the 6th and 7th William IV., and that both presentments were legal.

After a lengthened argument and deliberation, the judges agreed to *fiat* the presentment, and it may therefore, be concluded that the grand juries are authorised to make the usual annual grant even after the death of the surgeon who held office at the passing of the Medical Charities Act.

We think the occasion one for congratulation to the profession and the Irish poor, for the decision of the highest court of reference has given authority for a continuance of the grant of funds by grand juries for the maintenance of these valuable institutions. It has unfortunately been the policy of ministers who possess little knowledge of the medical wants of the Irish provinces, to abolish the county infirmaries, and transfer their functions to the workhouse hospitals. That policy, which originated in ignorance of the feeling of the better class of the sick poor, has failed because the cotter farmers, constabulary, and petty shop-keepers will not be induced to go into the workhouse, and will rather choose the discomforts and risks of remaining in their own cabins than mix with paupers in the union. Whether this feeling is reasonable or not, it exists, and to such an extent that all the hindrances thrown in the way of the county infirmaries have not done more than embarrass them. It would be greatly for the benefit of the sick poor, if some arrangement could be arrived at to terminate this silent antagonism between the union hospitals and county infirmaries. Each of these institutions has its own important use, and the medical system would be incomplete without both of them. We entirely concur with the following remarks made by the *Cashel Gazette* in reference to this subject:—

"The presentment sessions and the grand jury, who represent the taxpayers of the county, have it twice a year in their power to withhold grants, but as long as the institution is maintained in its traditional state of efficiency, the common sense of the county will not, from any ideas of false economy, refuse its wonted aid. However efficient the officials of workhouse hospitals may be, it is not desirable that all who require gratuitous surgical or medical aid, should be branded as paupers. Although poverty is no disgrace, still there is a proper pride, once inherent in most Irishmen—although nearly stamped out by Poor-law legislation—which should not entirely be ignored and discouraged, and we, therefore, hope to see that as long as the farming class of Ireland—not to say the gentry—retain a self-respect, and a regard for old and valuable institutions, that the county infirmaries will be retained in their full efficiency."

◆

THE OBSTETRIC ELEMENT IN GENERAL PRACTICE.

We have sometimes ventured to tread lightly on the domain of obstetric medicine, for we believe that this department of medicine is so important, and truly the subject is so interesting to us all socially, physiologically, and practically, that we are again tempted to make it the theme of our observations. Socially, we are interested in the increase of population in our private relations of life. Physiologically, we know of nothing that can interest the true student of medicine more than the occult laws of conception, the development of embryonic life, the process of parturition, and he must wonder and admire the marvellous adjustability of the female economy to the new requirements and demands made upon her.

Enveloped as are the primary phenomena of life in mystery, and though it may not be permitted us to fathom them, yet we can follow the physiologist and comparative anatomist in the researches of which our modern times have been prolific; and notably at the present time we may point out the painstaking work of Professor Turner on the structure and comparative anatomy of that wonderful mass, "the Placenta."

Practically, midwifery enters into the daily life of the practitioner, and is almost the key-stone to the formation of a successful practice. There are, we know, "obstetricians and obstetricians."

We have read of one to whom

"A primrose by a river's brim
A simple primrose was to him,
And nothing more."

And we have heard and read of men to whom "a woman in labour was a woman in labour, and nothing more."

But there are those to whom the parturient state developes a field for the exercise of the highest powers of the mind, and enables them to show patience, forbearance, kindness, tact, and to apply the principles of scientific and mechanical knowledge.

We have had in our pages to record new theories of the mechanism of the process of labour; we have had also to note practical improvements and variations in many of our obstetric operations. We may briefly cite bi-manual version—version as a substitute for craniotomy, the more scientific induction of premature labour, the true use and mechanical action of the forceps, &c., &c. However much has been done in the past there still remains a wide field for progress and scientific research.

We can point out one special accident in labour, viz., *post-partum* hæmorrhage, to which attention should be directed as the pathological conditions are not yet satisfactorily understood, and the treatment as laid down in our text-books does not seem based on sound physiological or common sense principles. *Post-partum* hæmorrhage is one of the most serious accidents that can happen the parturient.

Let us examine the treatment. The student, and even the practitioner, has not one defined general method of procedure to adopt; but has to combine many modes of action. We are told that preventive measures are best, and these mainly consist in the administration of ergot, pressure on the *uterus*, binding in lint. How often are these means unsatisfactory?

When the accident occurs, and the patient lies on the verge of death, we have a variety of means to select from. We are told still to continue the ergot—still to endeavour to excite *uterine* action—to apply cold water, ice, snow—to introduce the hand into the womb—to employ the electric current—to compress the abdominal *aorta*—to inject *per-chloride* of iron, and to resort to transfusion, &c. We are also to allow the patient plenty of fresh air, stimulants, &c. Have we any definite sheet-anchor to save the drifting ship? Is it better to introduce a clean, naked hand into the uterus at once, than to lose valuable time by the application of cold, &c. We know the tolerance of the uterus, and when such an irritating substance as the *per-chloride* of iron can be borne, the introduction of the hand must be of *minor* consequence. Tyler Smith (no mean authority) says in his manual, "I have not the same dread of introducing the clean hand into the uterus as many accoucheurs have in the present day" . . . "more mischief is caused from a kind of fear of the *uterus*, and of interfering with its natural action, than from bold and intelligent efforts to guide and control it." This was written before the age of the *per-chloride* of iron. In actual practice we have the spectacle of a woman in this condition, treated in this rude manner. She has to lie for hours in one position, after being deluged with cold water she must necessarily be uncomfortably depressed. She has been kneaded, ergotised, perchloridised, and it is a wonder that so many recover. Nature has certainly endowed the female economy with great powers of endurance, and a reserve of energy. Have we satisfactory evidence that post-partum hæmorrhage is one of the *sequelæ* of uterine *inertia?* Have we not reason to say that the true physiology of this state is not known? Looking back at the history of obstetrics, its improvements, its triumphs, may we not reasonably hope that some Naegelé, some Simpson, may arise to throw new light on the true causes of *post-partum* hæmorrhage, and that consequently a new treatment, simple and efficacious, will be introduced, and that another *opprobrium* of medicine will be swept away.

◆

Notes on Current Topics.

Religion and Doctoring.

In reply to our very earnest protest against the malversions of the prerogatives of Irish guardians and dispensary committeemen, (who are advised by the *Tipperary Free Press* and a few other of the extreme journals to select medical officers for their religion, not for their fitness), the said newspaper has responded in its choicest vocabulary. The *Free Press* designates our statement that religion in many instances supersedes professional attainments in the choice of medical officers as an "audacious slander," and proceeds to argue that there can be no forgetfulness of the special competency of competitors because certain qualifications are set down by the Local Government Board, which must be complied with by boards of guardians and dispensary commiteemen. The "audacious slander," we advisedly repeat and reassert—what, indeed, needs no assertion with those who know anything about the system—that in many districts in Ireland the skill or intelligence of candidates is utterly ignored, and their selection determined, if not wholly and solely, at least principally, by the religious stamp which they possess. We are too well versed in the candidature for dispensaries not to be able to speak *ex cathedra* on the subject, and we assert, in face of the rhodomantade of the *Tipperary Free Press* and such like prints, that there are numerous dispensary districts in Ireland within which it would be midsummer madness for any candidate saving him of the religion which dominates in the locality to present himself. There are districts in which the greatest ignoramus who can have scraped through the lowest qualifying examination will be placed in charge of the lives of the sick poor if he has received the ear-mark of the commanding creed, while the smartest, most industrious, highest qualified, and best recommended competitor will not score a vote if he be not "of the right sort." It is, in fact, the regular course for a surgeon who seeks a dispensary in such localities first of all to ascertain the religious bias of the committee before he entertains the question of candidature at all, and if encouraged by a coincidence of their doctrinal views with his own, then to open his canvass by a visit to the ecclesiastical adviser of the committee, failing whose approval he returns to town without going a step further in his canvass, a wiser if a sadder man. We don't in the least apply these statements more to one creed than another, and we believe such abuses are to be found in districts of all religions. Nor do we for a moment suggest that medical competency is disregarded *altogether* in a selection of candidates all of the required creed. It is, in fact, by the bigotry of journals like the *Tipperary Free Press* that such abuses are dictated and fostered, and our critic has, therefore, the less right to pretend ignorance, or to assume virtuous indignation.

As to the existence of a religious bias on our part, we avow that we repudiate and despise the interposition of sectarianism into any matter which involves the health and lives of the sick poor, and we deprecate and protest against the interference of medical men in either spiritual or worldly affairs of their patients. We object to medical clerics, just as we do to medical will makers, and hold that no man can be a good dispensary medical officer who dabbles in such matters. The *Free Press* endeavours to fix us with a sectarian tendency because we objected to a bygone appointment of a Poor-law inspector who happened to be of its own creed. We did not even know the doctrinal views of the gentleman in question at the time of the appointment, and we objected to the selection because it was at the time believed to have been secured by the grossest political jobbery. We are glad now to have the opportunity of saying that the job in question was atoned for by the success and efficiency of the gentleman selected, and that the public service lost nothing by the transaction, but rather gained a good officer.

The Pharmaceutical Society of Ireland.

The monthly meeting of the above society was held at the College of Physicians, Kildare Street, on Wednesday last, Sir Dominic J. Corrigan, President, in the chair. The following members were present:—Dr. Aquilla Smith, Vice-President; Mr. William Allen, Dr. Collins, Dr. Frazer, Mr. J. Goodwin, Mr. W. Hayes, Mr. E. M. Hodgson, Mr. J. T. Holmes, Mr. C. Payne, Belfast; Dr. Ryan, Dr. Emerson Reynolds, and Professor Tichborne. On the motion of Professor Tichborne, it was resolved that the first evening meeting of the members of the Pharmaceutical Society of Ireland for the reading of pharmaceutical papers be held on the 3rd of January, 1877, and that a programme of the papers to be read be sent to the members of the society a week before the meeting. A deputation of pharmaceutical chemists, consisting of Messrs. Mannin, Ferguson, Keatly, and Keogh, waited on the council for the purpose of ascertaining the intention of the council in cases of infringement of the Pharmacy Act. After some discussion, the council informed the deputation that it was not their intention to act as a prosecuting body.

Notice has been given that an examination of candidates for commissions in the medical service of the Royal Navy will be held at the University of London, on Monday, February 12. Notice is also given that an examination of candidates for twenty-seven appointments as surgeon in Her Majesty's Indian Medical Service will be held on the same day.

The Medical Press Defence Fund.

We continue to receive many letters of practical sympathy from our readers in all parts of the United Kingdom. These, together with the meetings held last week in London and Dublin which so many leaders of the profession attended in order to testify their appreciation of the course pursued by us in the late action for libel, are very encouraging in our uphill warfare against charlatanism, quackery, and deception; and our friends may feel assured that so long as we receive these distinguished marks of their approval, we shall continue our course unflinchingly, in the interests of our common profession and those of the public. But many of our correspondents have done more than send us a kind letter of sympathy and subscription towards our legal expenses; they have drawn attention to that want of sympathy which our medical contemporaries have shown, both in regard to the principles involved in the case, and the meeting held in our support. We entirely agree with the views of our correspondents on these points, and much regret that jealousy of a contemporary, and the good opinion of the profession expressed on its behalf, should be allowed to stand in the way of duty, on a question of so much interest to the profession at large. From this category we except *The Student's Journal* and *The Medical Examiner*, the editors of which have spoken out boldly upon the principle involved, and in its special bearing upon our case. Had *The Lancet*, *British Medical Journal*, or *The Medical Times* found themselves called upon to defend an opinion on practices which the profession almost universally condemned, we should have blushed to withhold our support, or to ignore a matter of professional and public interest, because it was more consonant with our personal feelings or interests. Perhaps the blushes of our contemporaries, from motives of self-interest, are only such as might be expected to rise on the face of the man who boasted that he supplied proper medicines to his patients at three farthings a head, and then made a large profit out of each transaction.

The Law of Libel.

The *Cork Constitution*, a leading paper of the South of Ireland, devotes the first place in its editorial columns to a severe and expressive opinion upon the case of Betts *v.* Tindall, and from it we quote a few extracts:—

"There can be (says our contemporary) but one opinion as to the hardships imposed by this verdict on the editor. His criticism was shown and acknowledged at the trial to have been perfectly free from personal animus or prejudice. There was no malice. On being remonstrated with and threatened and an apology demanded, the editor reperused the article complained of and found that as a point of dutv he could not retract nor could he alter his comments. They were made solely in the interests of the public good, as he from long experience as a hospital surgeon considered the advice which would be given for fourpence per head too cheap to be of much value, not allowing for the medicine which accompanied it. To the general public the fearless expression of opinion on the part of a journalist in any profession and the independence of such is of enormous value. These journals are the means by which quacks and charlatans of all grades and classes are kept in check. The watchful guardianship of professional honour and the *esprit de corps* of its members is entrusted to their keeping in a great measure. That this is the case is proved by the constant appeals made to their columns in cases of dispute or difficulty. In this case there was no signalling out of an individual to injure his character or reputation. There was a fair and impartial condemnation of a practice which in the eyes of the vast majority of the profession has been already denounced. Under these circumstances it was manifestly impossible for the editor to apologise. Had he done so he would have compromised the profession and ruined the character of his journal. There was hardly in this case a violation of the standard of literary good taste. This is but one case of many in which the justifiable freedom and function of a public journal in correcting abuses is hampered by imperfect and bungling legislation. The entire law of libel requires amendment. To mulct a journal because "it published a sneer at a man's competency," or because it threw doubts on the feasibility of a certain financial speculation, is, we conceive, with all respect for Baron Huddleston's legal acumen, hardly just. There can be but little doubt that had Dr. Jacob adopted any other course than the one he did he would be unworthy of holding the post of editor of the periodical. The judge himself almost allowed this in his charge. The good, however, which he has indirecly effected is great in drawing attention just at present, when other cases have also occurred, to the deficient state of the law of libel as it affects public journals. We can conceive nothing more disastrous to the interests of society than that the force of public opinion expressed through the press should be suppressed through fear of legal consequences, annoyance, and expense."

The Metropolitan Water Supply.

Major Bolton reports that during the past month of November the Thames water delivered by the Chelsea West Middlesex, Southwark, Grand Junction, and Lambeth Companies has suffered great deterioration by the floods, and the samples drawn were much contaminated with the organic matter held in solution. The West Middlesex was rather less impure than the others, but the water supplied by the Southwark Company was slightly turbid from inefficient filtration, and contained moving organisms. The Lea water supplied by the New River and East London Companies was of much better quality. It can scarcely be expected that Thames water, after the excessive rainfall and the consequent overflow of miles of land from Oxford to the intake of the water companies at West Moulsey and Thames Ditton, the floods bringing with them the excrement, &c., of animals, with tons weight of all kinds of impurities, will by any known method of filtration be made a wholesome potable drinking water. With the unusual high temperature for this season of the year we may look for an outbreak of typhoid fever in any of the towns situated along the Thames valley. Another source of danger to health is especially pointed out by Major Bolton—it is the contamination of water from the gases generated by sewage. Waste pipes from cisterns are frequently found to be in direct communication with the sewers. The gases thus flow back into the cisterns and become absorbed by the water. To prevent this the overflow pipe should be brought outside the house and the end left exposed to the air, instead of being carrried into the drain. The adoption of this plan will get rid of the poisonous effluvia and gases from the drains, which would otherwise ascend through the pipe, and not only be partly absorbed by the water in the cistern but be mixed with the air in the houses, thereby becoming a cause of fever and disease.

The New Medical Knights.

THE distinction which his Grace the Lord Lieutenant of Ireland (last week) conferred on Sir George Owens, Lord Mayor of Dublin, was shared by Sir William Miller, the Mayor of Londonderry, who is also a member of our profession, holding the highest position not only civic and social, but professional, in that city. Respecting Sir William Miller the testimony of his fellow-citizens to his worth is manifested by the fact that he has held office as a town councillor for twelve years, and as mayor for three years in succession. He is also the surgeon to the County Infirmary, and high in the favour of the Londonderry folk as a practitioner. The following short notices of the career of the two new medical knights is taken from the *Irish Times*:—

SIR WILLIAM MILLER, M.D.

Doctor William Miller, yesterday knighted by his Grace, is son of Alderman Joseph Ewing Miller, M.D., J.P., of Derry, who was twice Mayor under the old Corporation, and five times elected to that office under the reformed corporation. Alderman Miller, the father, was married to the daughter of Alderman Scott, whose family had a long association with the Maiden City. Mr. Scott also filled the office of chief magistrate, so that the present Mayor, Sir William, may be said, in a double sense, to have hereditary claims to whatever distinction belongs to the highest civic honours. Sir William is now in his forty-fifth year, is married, and is a Derry man by birth, residence, and connection. He was educated at Foyle College, from which he entered Trinity College, Dublin, where he took the degree of M.B. He is also a licentiate of the Royal College of Surgeons in Ireland. He was a member of the Derry Town Council twelve years ago, and first assumed the office of Mayor in 1875. He is now elected. for the third year in succession, Mayor for 1877. Sir William is following the footsteps of his father as a physician in an aristocratic and lucrative practice in the city and neighbouring counties. He has the charge of the County Infirmary, the medical superintendence of the County Prison, and holds other similar appointment.

SIR GEORGE B. OWENS, M.D.

Sir George B. Owens, M.D., Lord Mayor of Dublin, was born in Limerick. He is the son of the late George Owens, who filled the position of Barrack Master in that city. When sixteen years of age he came to Dublin to pursue the studies necessary to qualify him for his profession, and obtain his diploma in 1832. Dr. Owens, the same year, married a daughter of the late Major Owen, 67th Regiment, and settled at Mountmellick, in the Queen's County. In 1845 he removed to Dublin, and became successor to the late Dr. Ferguson, in Kildare Street, occupying the same house up to a couple of years ago, when he disposed of the premises to the proprietor of Maple's Hotel, and took up his residence in Baggot Street. Ten years have elapsed since he was elected Councillor for the Mansion House Ward, and he has retained that office to the present time without interruption. He has ever supported the conservative party, and always carried out his principles with such moderation as never to give offence to those who differed from him either in politics or religion. Sir George has been for a number of years a leading member of nearly all the medical boards in Dublin, and has on all occasions shown himself to be an earnest advocate of the rights and privileges of the profession to which he belongs. He takes an active interest in the management of the South Dublin Union, of which he is a guardian, and no one can deny that he has discharged the duties of Lord Mayor with urbanity, impartiality, and ability. Sir George has two sons and three daughters.

Spiritualism and Mesmerism.

IN a lecture by Dr. Carpenter at the London Institution last week on spiritual and mesmeric manifestations, we learn that floating in the air dates its origin from Simon Magus, a magician mentioned in the Acts of the Apostles. It is said this individual, having gone to Rome to exhibit his great powers before Nero, was taken up in his car and floated in the air until he was "brought to earth" by the prayers of St. Peter and St. Paul. The investigation of mesmerism and spiritualism requires scientific acumen and a knowlege of human nature was essential, from the extraordinary tendency of many minds to self-deception. Dr. Carpenter contended that scientific men and the public generally were justified in requiring a degree of proof as to the genuineness of spiritual manifestations above that required of the ordinary occurrences of life. He for one was open to admit any new force in nature if properly demonstrated and if proved in as satisfactory a manner as the existence and force of electricity, galvanism, and similar modern discoveries which not many years ago were new to men. What he complained of was the vague and unsatisfactory nature of the proofs they received from mesmerists and spiritualists. The late Mr. Braid, of Manchester, who had the faculty of falling into a reverie, could when in that state be led to say he saw anything, and on one occasion said he saw flames issuing from a magnet. The magnet was quietly, and without his knowledge, slipped into a box, and he then still saw the flames. With regard to mesmerism, Dr. Carpenter remarked that he did not question the reality of mesmeric sleep, during which the subject could be made to converse and describe almost anything suggested to him; but the question was whether that mesmeretic coma could be induced without the knowledge of the subject being operated upon. The fact was the subjects were affected entirely by their own imagination, and much of the result attained could only be done when the subject expected to be operated upon. As an instance of the effect of expectation he would give the results of some experiments made by Dr. Noble in France some years ago. Dr. Noble had a female subject very susceptible to magnetic influence, and being away from her a distance of 100 leagues, resolved to make some experiments. He sent a little magnetised note to be placed upon the patient's stomach, which had the effect of mesmerising her. He sent another note, unmagnetised, but it produced the same effect as the other, and then he got a friend to write a note in writing so like his own, that the girl took it to be his, and that had the same effect as the two others, proving that the result was really produced by the expectation on the part of the subject that mesmerism would follow its application. Mesmer believed in magnetism and the influence of the planets, and when at Paris, where he made a great deal of money by what he thought was a discovery, he challenged the scientific authorities of the period to investigate the matter. The French Academy appointed a commission to report upon mesmerism. They reported —"That on blindfolding those who seemed to be most susceptible to the influence of the magnetic fluid all its ordinary effects were produced when nothing was done to them, they imagining they were magnetised, while none of its effects were produced when they were really magactised but did not know it. Consequently, the effects were actually produced by imagination. These effects, though some cures might have been wrought, were not without danger, since the convulsions were often violent and likely to spread, especially amongst men of weak minds, and almost universally amongst women. So far as scientific men not having investigated these matters, they had examined them over and over again, but, as the results of their investigations had not been made generally public, new forms of the same sort of thing were continually cropping up, and people were induced to believe that there must be something in them. There were always plenty of people with an extraordinary readiness to believe in the marvellous, and, passing by real science, which was, he thought, marvellous enough—they go to these abnormal manifestations of diseased minds.

King Billy's Skeleton.

The *Philadelphia Medical Reporter* says, after the death of King Billy, the last of the native Tasmanians, which event occurred this summer, there was a contest for his skeleton. Two medical gentlemen wished to obtain it for the Royal College of Surgeons, London, and the Royal Society of Tasmania considered that it should remain on the island. The body was in charge of the Government General Hospital, and orders were given for its decent interment without molestation. The Royal College champion, however, surreptitiously secured the head, and put a white man's in its place, and the other party determined to prevent his having the whole skeleton, and so cut of King Billy's hands and feet, and placed them in the museum. The body in this shape was buried, and a strict watch was kept over the grave, but through some inefficiency the coffin was empty next morning.

German Pharmaceutical Statistics.

The *Phar. Zeitung* of the 18th ult., reports, as recorded in the *Pharmaceutical Journal*, that, according to the official statements, 233 pharmaceutical candidates have proved their claims to the title of "*Apotheker*" in the German Empire during the examination year 1875-76. Of this number 114 passed in Prussia, 49 in Bavaria, 22 in Saxony, 11 in Wurtemburg, 9 in Baden, 5 in Hesse, 5 in Mecklenburg, 3 in the duchy of Saxony, 6 in Brunswick, and 9 in Alsace-Lorraine. During the same year 653 medical men, 8 dentists, and 8 veterinary doctors passed. The number of apothekers is much smaller than in the three next previous years, the figures for those years being 347, 453, and 413; whilst on the other hand the number of medical students who have passed shows no falling off. The *Phar. Zeitung* appears to think the falling off in the pharmacists is due to the fact that under the present concession system, by which the number of pharmacies in Germany is strictly limited, it is not possible for so large a number as 400 annually to obtain an independent position. With only about 4,000 concessions in the whole empire this would require that on the average every pharmacy should change hands once in ten years. Judging from the fact that the gaps in the ranks of about 12,000 medical men are filled by 650 recruits yearly, it is thought that an addition of from 200 to 250 young pharmacists yearly should suffice for he wants of one-third of the number of pharmacies.

Another Raid on the Quacks.

At the Sheriff Court at Greenock several individuals were brought up charged with practising as physicians without holding the necessary qualifications. Archibald Chalmers, residing in Gourock, who has been through the medical curriculum, but has not obtained a diploma, was fined £5, with £5 expenses. James Edwards M'Guire, Greenock, was similarly dealt with. The Fiscal stated that M'Guire was simply a quack, who professed to cure everything on the shortest notice and most reasonable terms. M'Guire said he held an American diploma, which, however, he had lost in the course of his travels. A similar penalty was inflicted in the case of Samuel Loudon, known in Greenock as the "old army surgeon." He said that he had been twenty-one years in the Ambulance Department of the Army, and had had a good practice. The sheriff said that experience in nursing did not qualify him to act as a surgeon. The damage that he and others like him did with a community was incalculable.

The Efficacy of Vaccination.

In his return of this week, the Registrar-General brings forward an important argument in support of vaccination. In order, he says, to estimate satisfactorily the protective power of vaccination, it would be necessary to know the numbers of vaccinated and unvaccinated persons exposed to risk from small-pox. This information, as regards the adult population, is unfortunately not available, but recent vaccination reports show that at least 91 per cent. of the children living under five years of age in London are successfully vaccinated. It may thus be estimated that of the 348,441 children living in London in the middle of this year, between the ages of one and five years, 317,081 had been successfully vaccinated, and 31,360 were unvaccinated. At these ages, 50 deaths from small-pox were registered in London between 1st January and 18th November, 1876; of these, 1 was certified to be a vaccinated case, 35 to be unvaccinated, and in 14 cases the medical certificates did not furnish any information as to vaccination. Disregarding the "not stated" cases, it appears that only one death from small-pox occurred among the 317,081 vaccinated children living in London between one and five years of age, whereas 35 deaths from this disease were recorded among the 31,360 unvaccinated children at the same ages. Thus in equal numbers living, 372 deaths from small-pox occurred among unvaccinated, to one death from the same cause among vaccinated children at these ages.

Pycnanthemum Linifolium.

Mr. Charles Mohr stated at the meeting of the American Pharmaceutical Association that this plant is used in Alabama for debilitated and impaired conditions of the digestive organs by the negroes of that section. In attempting a chemical examination the author obtained an acid which by all the tests given appears to be identical with caffeo-tannic acid.

The mortality from typhoid in Paris, although lower than a month ago, is still alarmingly high. It caused 105 deaths last week.

Small-pox is increasing very considerably in Brussels.

A death occurred in the Hampstead Small-pox Hospital last week, from the accidental administration of an ounce of carbolic acid to a patient in mistake for port wine. An inquest was held on Saturday, when death from misadventure was recorded.

A serious epidemic of small-pox prevails in Liverpool, but active steps are being taken to stay its progress. It was announced on Saturday that the inmates of the Children's Infirmary had been attacked, and that the outdoor department of the institution was consequently closed *pro tem.*

A commission of physicians appointed by the Boston (America) Board of Health, reports that 1,500,000 gallons of water were sold in that city in 1874 as milk, for which nearly 500,000 dollars was paid. In one instance thirty-four cases of typhoid fever in twenty-four families were traced to the use of milk mixed with water drawn from a well near a cesspool.

We see no reason why chemists and druggists any more than other tradesmen should be compelled to keep open shop so late at night as is generally the case, and we are glad to observe they are moving for shorter hours. The idea was started about ten days back by chemists at the West End of London, and we hope their action will be backed by the trade throughout the United Kingdom.

Last week the fatal cases of small-pox in London rose to 67 against 43 the previous week. Of these 26 were certified as unvaccinated, and 25 as vaccinated; in the remaining 16 cases the medical certificates did not furnish any information as to vaccination. Of the 67 fatal cases, 34 were registered in the three Metropolitan Asylum Small-pox Hospitals at Homerton, Stockwell, and Hampstead, one in Highgate Small-pox Hospital, 3 in the Poplar Infirmary, and 2 in St. Thomas's Hospital.

The high honour of erecting a marble statue has been paid to Dr. Evan Pierce, coroner for the county of Denbigh, whose name will be remembered in connection with the Abergele Railway catastrophe. This token of the respect in which he is held in the neighbourhood was unveiled last week in the presence of a vast concourse of people. Dr. Pierce acknowledged the honour paid to him personally, and through him to the medical profession, in appropriate terms.

The Academy of Sciences and the Chemists of Paris celebrated on the 15th of November the fiftieth anniversary of the nomination of M. Chevreul as member of the Academy, in compliment to him. M. Chevreul ended his ninetieth year of age in the last week of August, and bears his great age with a wonderful degree of mirthfulness. M. Dumas presided at the banquet, and found himself surrounded, in honour of "the illustrious chief of the students of France," as he called him, by Messieurs Claude Bernard, Wurtz, Peligot, Cahours, Pasteur, Daubree, General Fave, Ferny, Joseph Bertrand, and many other of the most illustrious men of science.

A contemporary hears that the Branch Medical Council for England are likely to have some trouble over their refusal to register the honorary diploma of M.D. recently conferred on Surgeon Eustace, R.N., for his gallant conduct in the Ashantee expedition, by the Queen's University in Ireland. Some indignation is felt, inasmuch as in some notable instances, on a prior occasion, honorary degrees conferred by Trinity College, Dublin were registered without question. In that case, however, the registration was, it is alleged, permitted in error, and in contravention of the law, which gives no power to the Medical Council to register any degrees except after examination.

The *Independence Belge* mentions a speaking machine which is being exhibited at Brussels, Professor Faber being the inventor. The first person who conceived the idea of a speaking machine, according to Molière, who gives all the details of it in the *Bourgeois Gentilhomme*, was a French professor, but he did not succeed in perfecting it. Professor Faber has devoted twenty years to the completion of his machine, and has achieved a wonderful result. It possesses three organs, the lung or bellows which is blown by means of a lever worked by the foot; the larynx, which is constructed of one membrane, while we ourselves have two; and the mouth, which is of enormous size, and with a proportionate tongue. The person who makes the machine speak plays with his fingers on fourteen levers each of which is marked with a letter. By a combination of these levers in pairs the twelve remaining letters are spoken. The special practical use of the machine is to teach the deaf and dumb to speak. They are shown the movements which the tongue makes in pronouncing the several sounds, and are trained to imitate those motions which in consequence of the large size of the organs they can observe with ease.

The President and Fellows of the King and Queen's College of Physicians in Ireland have made arrangements for the delivery in the College Hall of annual courses of lectures on subjects connected with medical sciences. The lectures, six in number, are to be delivered in the months of January and February of each year. The following are the lecturers who have been selected by the College to deliver the series for 1877:—James Emerson Reynolds, M.D. Dub., Professor of Chemistry in the University of Dublin; Alexander Macalister, M.B. Dub., Professor of Zoology in the University of Dublin; and Arthur Wynne Foot, M.D. Dub., F.K.Q.C.P., Senior Physician to the Meath Hospital and County Dublin Infirmary. Dr. Reynolds will give two discourses on the "Influence of Chemical Constitution on Physiological and Therapeutical Action." Dr. Macalister will lecture on (1) "Researches on the Development of the Muscular System in Vertebrates," and (2) "Researches on the Intestinal Canal in Man and in the Higher Animals." Dr. Foot has selected "Tuberculosis" as the subject of the discourses to be delivered by him. The lectures will be open to all licentiates of the College free of charge, while all registered medical practitioners will be admitted on payment of a moderate sum.

MEDICAL WITNESSES.

On Saturday last a deputation, organised by the Council of the Irish Medical Association, waited on the Attorney-General for Ireland, to urge upon him an amendment of the 19th rule in the instructions to Crown Solicitors, which fixes the fee payable to medical witnesses at sessions courts at a guinea a day. We shall next week give fully the statements laid before the Attorney-General, and the memorial presented to him by the deputation, in which are set forth the points of amendment which the Association desires to obtain. The Attorney-General received the deputation with much courtesy, listened with attention to the arguments laid before him, and promised his best consideration of the questions.

Obituary.

MR. WILLIAM HARVEY.

We regret to have to notice the death of Mr. Wm. Harvey, F.R.C.S., and Surgeon to the Royal Dispensary for Diseases of the Ear.

Diseases of the ear is a legitimate specialty in medicine, and for a long time they have been recognised as such by the profession. And although we cannot say that our knowledge of this class of affections has been advanced very much by the special study that has been devoted to them, yet all honour is due to those who were among the first to draw especial attention to the subject. Mr. Harvey, who was seventy years of age when he died, was for thirty years surgeon to the Dispensary above mentioned, as well as aural surgeon to, and one of the founders of, the Great Northern Hospital. He was also a corresponding member of the Royal Medical Society of Madrid. His publications on the subject with which his name was chiefly associated are numerous, but those best known to the profession are his "Practical Synopsis of the Diseases of the Ear," published in 1847; "Rheumatism, Gout, and Neuralgia, affecting the Head and Ear;" and "The Ear in Health and Disease," published in 1854.

THE SALE OF METHYLATED SPIRITS FOR DRINKING.

At a Peace Court in Glasgow, last week, Robert Fulton, oil and colour merchant, was charged with a contravention of the Excise regulations, in selling a greater quantity of methylated spirits than was permissible under his license, which only warranted the sale of not more than one gallon; and also on two separate occasions having supplied four gills of methylated spirits to two men for drinking purposes, and as a beverage. For the offence of selling a greater quantity than was allowable the penalty was stated at £50; and for the "beverage" contravention the penalties were put at £200, in all £250. In reply to the Bench,

Mr. Fulton said he sold the spirit regularly as methylated spirit. He had not much in the shop himself, but there was a girl there who sold the spirit daily. He understood that he could not sell more than one gallon at a time, and he believed that his girl followed that rule. As to the matter of the spirit being sold as a beverage, they sold them to a number of persons who came for them. These persons were polishers and hatters, and they were very much annoyed with them. He had turned away as many as eight or ten at a time. He never suspected that the people were drinking the spirit. His conscience would not have allowed him to supply them had he suspected that they did so. He told his employés not to supply the spirit to people who did not appear to be dealing honestly, and they frequently required to call in the aid of the police to put some of the persons out.

Aitken, private detective, spoke to the fact of having received information that a number of people were regularly to be seen drinking some kind of spirit in the closes adjoining the shop entrance. He asked the people whom he found drinking the spirit where they got it, and they told him it was at Fulton's. He went there, asked for a gill, and got it from a young woman, being asked no questions. He also sent in other persons for spirit, and they got it. He asked only for spirit, not methylated spirit.

John Lindsay, tailor, said he knew the defendant's shop, and had been several times there purchasing spirit. He was in the habit of drinking it as a beverage. He knew other people who did the same thing. He had drunk as much as half a gill at a time, and he supposed he took as much as he could get, more or less. He had drunk as much as two half-mutchkins. The price was 3d. the half-mutchkin; the whiskey he used generally cost him one shilling the half-mutchkin.

Mr. Douglas said the case was brought up under the Act 24 and 25 Vic., c. 91, which stipulated that methylated spirit was to be used for art and manufacturing purposes solely, and a special provision was added prohibiting its use as a beverage. The defendant was bound to be satisfied that the spirit was got for no other than manufacturing purposes. He was clearly responsible for seeing that it was not used for other purposes, and if he failed so to satisfy himself then the responsibility of that neglect lay on his own shoulders, and he must take the consequences.

Mr. Fulton said he was not aware that it was illegal to sell any small quantities to people for working purposes, and he had done all he could to see that none who were likely to drink the spirit received a supply.

The Bench inflicted the lowest penalty allowed, which was the fourth of each sum in each count, amounting in all to £62 10s. They had no power to impose a less sum, and the judgment of the Court was for the amount stated.

◆

Medical News.

University of London.—The following gentlemen passed the recent M.D. examination.

Batterbury, George Henry, King's College.
Benham, Henry James, University College.
Dukes, Clement, B.S., St. Thomas's Hospital.
Duncan, Peter Thomas, B.S. (*Medal*), University College.
Garlick, George, University College.
Harris, Vincent Dormer, St. Bartholomew's Hospital.
Houghton, Walter Benoni, B.S., Univ., & Charing Cross Hospitals.
Hullard, Jean Arthur, B.S., B.Sc., University College.
Leech, Daniel John, Owens College.
Lowe, Walter, George, St. Bartholomew's Hospital.
Verco, Joseph Cooke (*Gold Medal*), St. Bartholomew's Hospital.

B.S. Examination.—Examination for Honours.

First Class.

Pepper, Augustus Joseph (*Scholarship and Gold Medal*), University College.
Duncan, Andrew, M.D. (*Gold Medal*), King's College.

Second Class.

Ottley, Walter, University College.

Vital Statistics.—From the Registrar-General's reports we learn that during last week 5,687 births and 3,755 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 1,932. The mortality from all causes was at the average rate of 24 deaths annually in every 1,000 persons living. The annual death-rate was 18 per 1,000 in Edinburgh, 23 in London, 27 in Glasgow, and 29 in Dublin. In the other large towns the rates were—Brighton 25 Portsmouth 19, Hull 25, Bristol 19, Newcastle-upon-Tyne 21, Nottingham 18, Birmingham 20, Norwich 18, Leeds 28, Plymouth 20, Sunderland 31, Liverpool 29, Leicester 24, Bradford 23, Sheffield 21, Manchester 30, Wolverhampton 20, Oldham 32, and Salford 38. The annual death-rate from the principal zymotic diseases in these averaged 3·4 per 1,000, and ranged from 1·5 and 1·7 in Plymouth and Bristol, to 7·2 and 9·8 in Sunderland and

Salford. Measles caused 12 deaths in Salford, and scarlet-fever 8 in Portsmouth and 7 in Sunderland. Eighty-five deaths were referred to small-pox, against 81 and 65 in the two preceding weeks; 67 occurred in London, 6 in Manchester and Salford, 11 in Liverpool, 1 in Portsmouth, and not one in the other towns.

University of Aberdeen. — The following have been appointed examiners—viz.: Robert W. Reid, M.D., in Anatomy; John Urquhart, M.D., Chemistry and Physiology; James W. H. Traill, M.A., M,D., in Botany and Zoology; T. Maclagan, M.D., in the Practice of Medicine and Pathology; John C. Ogilvie Will, M.D., in Surgery and Materia Medica; and Robert Turner, M.D., in Midwifery and Medical Jurisprudence.

The Mortality of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were:—In Calcutta 27, Bombay 23, Madras 40, Paris 29, Brussels 21, Amsterdam 28, Rotterdam 28, The Hague 29, Copenhagen 23, Stockholm 25, Christiania 22, Berlin 25, Hamburg 23, Breslau 28, Munich 34, Vienna 26, Buda-Pesth 38, Rome 29, Naples 30, Turin 24, New York 21, and Brooklyn 18. The fatal cases of typhoid fever in Paris were 105, against 171, 150, and 103 in the three preceding weeks. Small-pox caused 14 deaths in Brussels, against 4 in the previous weeks.

Certifying Surgeons under the Factory Acts.—On Monday, a deputation of the certifying medical officers of Great Britain and Ireland had an interview with the Home Secretary as to certain recommendations made by the Royal Commission on the Factory and Workshops Acts. After listening to the various complaints and suggestions from the members of the deputation, the Home Secretary assured them that he was not a friend of what was called paternal legislation, and he was not likely to put anything into an Act of Parliament excepting what was absolutely necessary for the protection of persons who could not help themselves. He would see that so long as they had important duties to perform to the public that they should be reasonably remunerated for the performance of those duties, and he should take care that their suggestions should have due weight given to them.

◆

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Medical Defence Fund.—We hope to publish a list of subscriptions to this Fund in our next.

Dr. J. H. Chapman, Hon. Sec. of the Medical Press Defence Fund, requests us to acknowledge the receipt by him of subscriptions from many gentlemen. He will forward formal acknowledgements in due course, and will include the amounts in the first advertised lists.

◆

VACANCIES.

Carlow Union.—Medical Officer for the Tullow Dispensary District. Salary, £120, exclusive of £20 a year as Sanitary Officer. (See Advt.)

Cancer Hospital, Brompton.—Resident House Surgeon. An honorarium of 100 guineas with board is attached to the office. (See Advt.)

Hospital for Sick Children, Pendlebury, Manchester.—Assistant Physician. Salary, £300 per annum. Applications, with testimonials, should be sent to the Chairman of the Medical Staff, Gartside, Manchester. (See Advt.)

Flintshire Dispensary.—House Surgeon. Salary, £100. Must be conversant with the Welsh language. Address the Hon. Sec., Dispensary, Holywell.

Bournemouth General Dispensary.—Resident Surgeon. Salary, £140. Address the Hon. Sec.

Festiniog, Oakley's Hospital.—Assistant Surgeon and a Dispenser. For particulars address the Medical Staff at the Hospital.

Western Ophthalmic Hospital, Marylebone Road.—House Surgeon. Stipend, £40 per annum. Apply to the Secretary.

Hospital for Sick Children, Great Ormond Street, W.C.—Assistant Physician on the Staff. Honorary. And a Junior House Surgeon. Salary, £50, with board and lodgings. Applicants must address Mr. S. Whitford, at the Hospital.

National Hospital for the Paralysed and Epileptic, Bloomsbury, W.C. —Resident Medical Registrar. Salary, £100, with board and lodgings. Applications to the Secretary.

London Hospital.—Medical and Surgical Registrars for 1877. Salary for each appointment, £100. Applications to the House Committee at the Hospital.

Suffolk County Asylum.—Assistant Medical Officer. Salary commencing at £100, with board and lodgings. Address the Medical Superintendent at Melton.

Preston Royal Infirmary.—Junior House Surgeon. Salary, £100, with board and lodgings. Applications to the House Surgeon.

Whitehaven Infirmary.—Resident House Surgeon. Salary, £150. Address the Hon. Sec. at the Infirmary, Whitehaven, Cumberland.

Northampton General Infirmary.—House Surgeon. Salary, £125, with board and lodgings. Applicants must address the Secretary.

◆

APPOINTMENTS.

Barron, T. W., B.A., M.B., Lecturer on Materia Medica in the University of Durham College of Medicine, Newcastle-on-Tyne.

Browne, W. J., L.R.C.S.I., L.R.C.P.Ed., Medical Officer, &c., to the Church Hill Dispensary District of the Letterkenny Union, co. Donegal.

Buchanan, A. M., M.A., M.D., Lecturer on Anatomy in Anderson's University, has been appointed an Examiner in Anatomy to the Faculty of Physicians and Surgeons, Glasgow, for three years.

Case, Mr. H., Medical Superintendent of the Metropolitan Asylum, Leavesden.

Drummond, D. D., M A., M.D., Lecturer on Therapeutics at the University of Durham College of Medicine, Newcastle-on-Tyne.

Edwards, E. P., L.R.C.P.Ed., Medical Officer of Health for the Anglesey United Sanitary Districts.

Good, Mr. F. T., Assistant House Surgeon to the Derbyshire General Infirmary, Derby.

Gray, F. A., L.R.C.P.L., M.R.C.S.E., Medical Officer for the Newton-Poppleford District of the St. Thomas Union, Exeter.

McCarthy, Chas., L.A.H., L.M., Resident Apothecary to Dr. Steeven's Hospital, Dublin.

McDonnell, J., L.R.C.P.Ed., L.R.C.S.I., Medical Officer, &c., for the Killashee Dispensary District of the Longford Union.

Miller, A., L.R.C.P.Ed., Out-door Physician-Accoucheur to the Glasgow Lying-in Hospital for the Eastern District of the City.

Moore, J. M., L.R.C.P.Ed., L.R.C.S.Ed., L.M., Medical Officer, &c., to the Dungiven Dispensary District of the Limavady Union, co. Londonderry.

Paul, R., M.R.C.S.E., House Surgeon to the Loughborough Dispensary and Infirmary.

Smith, H. A., M.B., F.R.C.S.E., Medical Officer for No. 3 District of the City of London Union.

Snow, R., L.R.C.S.I., L.M., L.K.Q.C.P.I., Resident Medical Officer to Trinity College, Glenalmond, Perthshire.

Thomas, W. R., M.D., Physician to the Sheffield Public Hospital and Dispensary.

◆

Marriages.

Aldridge—Cooper.—On the 5th inst., at Whitcombe Church, Dorchester, John Petty Aldridge, M.D., J.P., to Selina, widow of the late A. L. Cooper, both of Dorchester.

Bourke—Beytagh.—On the 29th ult., at Dublin, Martin E. Bourke, Surgeon, R.N., Quinsborough, co. Clare, to Lucie de Brimont, daughter of Edward T. Ffrench Beytagh, Q.C., of Claremont, co. Roscommon.

Cowdell—Pinsent.—On the 6th inst., at the Cathedral, Madras, Arthur S. Cowdell, third son of the late C. Cowdell, of Dorchester, to Mary Victoria, only daughter of the late Thos. Ayling, R.N.

◆

Deaths.

Arthy.—On Nov. 29, at Fincham, Norfolk, Edward Arthur Arthy, L.S.A.L.

Forrest.—On Nov. 29, at Broomey Hill, Hereford, Dr. Charles Forrest, aged 82.

Forsayeth.—On Nov. 28, at Templemore, co. Tipperary, R. M. Forsayeth, M.D., for many years Medical Officer of Templemore.

Gibson.—On Nov. 19, at Middlesborough, William Gibson, M.R.C.S.E., aged 25.

Harvey.—On Dec. 5, at George Street, Hanover Square, Wm. Harvey, F.R.C.S.E., late of Soho Square.

Little.—On Dec. 5, at Caldwell's Place, Sligo, William Swayne Little, M.D., Surgeon to the Sligo County Infirmary, aged 65.

Little.—On Nov. 25, at Sutton-Benger, Wilts, Edward Moore Little, L.R.C.P.L.

Mannings.—On Nov. 28, at Downton, Wilts, George Mannings, M.R.C.S.E., aged 33.

Mayo.—On Nov. 27, at Winchester, Charles Mayo, F.R.C.S.E., aged 67.

Robinson.—On Nov. 29, at Ditchling, Sussex, Mark Anthony Robinson, M.R.C.S.E., aged 61.

Wroe.—On Dec. 7, at Lower Broughton, Manchester, John Birch Wroe, aged 43.

Apply to the Clerks at the Railway Stations, the Local Agents, or
64 CORNHILL, and 10 REGENT STREET, LONDON.
WILLIAM J. VIAN, Secretary.

IRISH POOR-LAW INTELLIGENCE.

THE SANITARY ACT IN IRELAND: — AN ENGLISHMAN'S EXPERIENCE OF THE MATTER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Being one of those men whose sole business in life is to mind other people's, and having read somewhat "On the present working of the Sanitary Act in Ireland" in your pages, I determined, notwithstanding the urgent entreaties of my family, to see for myself. Having taken leave of my family and offered up prayers for my safety, and having, moreover, provided myself with a complete suit of quilted armour to protect myself from Fenian bullets, I in due time arrived at Holyhead and took steamer to Dublin. Landing at the North Wall I took a cab, and having narrowly escaped drowning in the mud, I drove to the Great Southern and Western Railway, and as I proceeded debated with myself whether I should go south or west. An accident decided my route. While walking up and down the platform I overheard a conversation between a frieze-coated farmer and a friend, the former of whom stated that at the "Boord" they always "kept down the doctors." Politely inquiring where this enlightened member of the sanitary authority (you see, sir, I had already picked up somewhat on the matter) lived, he, touching his hat (to do them justice, the Irish are always polite), answered at "Knocknaboccaugh." To "Knock down the cripple," therefore, I determined to go. Bye the way, I am not sure whether the translation of it is "Knock down the cripple," or not, but I believe it is as close a translation as I can make of the name. So after many vicissitudes I arrived at my destination, and getting out of the tram I hired the only vehicle available—a jaunting car, and if *jaunting* is the diminutive of *jolting* car, a very bad name it is, for the motion is a combination of being tossed in a blanket, and undergoing a rough sea voyage. However, after no more serious accidents than having my nose brought violently against the opposite panel half a dozen times, and being kept perpetually sliding off the seat and on again, I got to the hotel. "Hotel" painted by a local artist evidently, on a board nailed up at an angle to the lintel. The landlady, fat, fair, and forty, received me courteously, and ushered me to my bed-room, smelling strongly of pigs, accounted for by the evening previous having been the eve of a pig fair, and numerous dealers having slept in the room. Devoting that evening to indigestion in the shape of a very tough fowl, and headache embodied in a tumbler of fiery whisky, I determined next morning to commence inspection and inquiries. Asking next morning for the relieving officer (a term sometimes synonymous with parochial starvation), I was duly introduced to a gentleman, who, however empowered to afford out-door relief, looked very like wanting it badly himself, at least in the matter of clothes, but he was a regular scarecrow—a very embodiment of the laws of ventilation in his own person, and an admirable example of good drainage in his boots, which certainly let the water out as quickly as they let it in. He had nothing else remarkable about him, except a way of twisting his head suddenly from side to side, as if he was in the habit of answering questions to many people at the same time, doubtless contracted from the repeated badgering of my gentlemen of the Board of Guardians. I may say that he had a book which looked like the tickets of a lottery, printed in red ink, sticking out of an aperture which was once a pocket, and which appeared (to judge from the dirt of the cover, and the larger half being torn out) to have been often in requisition. On my asking him to show me the town, he became very civil and obsequious (I afterwards found out that he took me for the Poor-law inspector), and murmuring something about the doctor, led the way. I may say that whatever was wrong, or whenever I expressed my disapprobation of the state sanitary, or otherwise, of any thing or place, I was immediately met with the explanation that the doctor had said this, or done that, and in fact that the doctor appeared to be expected to bear the blame of everything—to be a sort of sanitary scapegoat. Did only an old woman ask what we meant by looking at her pigstye, "the doctor had ordered it to be inspected." "Bad scran to the doctor," was the answer. I pondered deeply on the matter, and after a while concluded that the doctor must be an ass, or if he was not, and had any feeling, that he was certainly a lunatic. In both conjectures I was wrong. I afterwards met him, a tall, middle-aged man, with the patient look on his face that you see with a poor ass, when he turns his head round if you give him a blow of your stick as you pass by. That weary look you see on men's faces who are continually driven and worried. No elasticity in the step, no brightness of the eye, except that heaven-born brightness of the mind, which no red tickets can quench, or no grinding down from boards of guardians can, *thank God*, quite put out.

But to return. Accompanied by my sub-sanitary scarecrow, I left the hotel, and before descending to particulars, in other words, before diving into backyards and mounting garrets, took a bird's-eye view of the place. And, good heavens, what a village, and what a place to build a village! Fancy one long street, with another at right angles, built on the top of a hill, exactly like a sugar-loaf. The backyards are lower than the houses themselves; hence the effect of a shower of rain is to flood them. The water then trickles into the backyards and forms cesspools. The houses themselves of various sizes, reminding one of a militia regiment at muster, some thatched, with little corn-fields on their tops; some slated and aristocratic-looking, a few radiant with whitewash, many weeping green tears, or striped, like the ancient Celts, with green woad.

With an apologetic murmur from my friend about the doctor, we entered No. 1 cabin, and as well as we could see for smoke, saw a horse standing in a sort of railed-off stable, close to the stairs and right under the sleeping apartment. A little child was sleeping in a kind of box close behind him, and the horse staling *actually bespattered the child's face.* The little baby had sore eyes, raw, red, and ulcerated. The smell from the place was sickening. Was anything done about this? Oh, yes, the doctor reported it, it was reported to the sub-sanitary officer, the man was summoned, the doctor was expected to be prosecutor, attorney in fact, everything combined, the R. M. would not hear of such a thing as the doctor prosecuting, and the whole thing fell through. The next time the man was served with a notice he said he would keep the horse there in spite of the devil and the board of guardians. The devil certainly has not troubled himself in the matter; indeed, it is rather in his line; neither have the board of guardians.

As for cesspools, we got perfectly tired of them. In fact, cesspools were the almost universal rule. Cesspools composed of water alone, cesspools composed of water and every conceivable filth and dirt, cesspools that when one stirred them with his stick stank again, cesspools whose owners had been cautioned, and which were thinly covered over with earth, which only wanted a shower to make them as bad as ever. Cesspools which seemed to be alive, and to move with corruption. Cesspools ploughed up by pigs, cesspools covered over with brambles and gorse cuttings. Every now and then my companion dived his hands into a hole in my garment,—I would be afraid to call it a coat, and pulled out a paper. "What's this?" asked the owner. "A summons from the Board," was the reply, "to fill up your cesspool and remove your manure." "Are these orders ever attended to?" I asked. "No," was the answer. "Are they ever summoned?" I queried. The man laughed at the question. "Now," said I, "how much are you paid for your work?" "Two pounds ten shillings per annum," was the answer. "No wonder," said I, "for the place to be in such a state."

Among other places we inspected a lodging-house The outside was not certainly very gorgeous-looking. No one certainly would mistake it for the Charing Cross. Picture to yourself, Sir, a cabin such as you see in any Irish village, of one storey, put the place where the ceiling usually is boarded, and a kind of trap door leading up to the roof. Fancy a hole in which an ordinary-sized man could not stand upright, about fourteen feet long and ten feet wide by four feet high. In that narrow space I saw four beds jammed head to tail and tail to head, and in that room, if one may call it so, I heard for a positive fact from the mouth of the constable of police that *twenty people* slept in those four beds. The fact was reported to the board of guardians, and no action was taken in the matter. The water was dripping through the roof, the beds were moving with insects, and by the time I got out I was half eaten. Truly I ran more danger from the pulex irritans than ever I did from Fenian pebbles and cut wire fencing. Necessaries there were none, at least in the houses of the poor, the usual place for depositing soil seemed to be the hall door, or along the walls of the houses outside. As for the sexes, separation appeared not to be thought of. I saw an old piper and four beggar women, one along with the piper confined to bed through illness, sleeping in the same small room. On expressing my opinion to the sanitary sub-officer that such things should not be, his answer was, "Oh, sure they are all old."

Being sick of inspecting cesspools, cabins, and lodging-houses, I adjourned to the hotel, and inviting the relieving officer to take a glass of punch, he gladly consented, and being warmed by the same his tongue became loose and he volunteered the following history anent the proposed putting up of a pump in the neighbouring village. It appeared that a neighbouring hamlet being badly in want of water, and containing, moreover, a large school-house, the medical officer thought it his duty to report the dearth of water in the usual way, and immediately the sanitary game of battledore and shuttlecock commenced. Now the chairman of the board of guardians was greatly opposed to any reform that cost money, and being a lawyer to boot, was well versed in the law's delays and the most approved methods for driving, and at full gallop too, a coach and four through an Act of Parliament. Being, moreover, a man who had a deep knowledge of men, and knowing that the best way to influence the *genus homo* is through his pocket, he set to work and so settled the matter, that the area of taxation was put on a very small proportion of the townlands, and, moreover, that the townlands *that had the least interest in the matter* should be taxed. This at once brought the matter to a dead-lock. The local committee met time after time, until they were sick of the matter, obstacle after obstacle presented itself; now it was a man claiming compensation for water which he alleged belonged to him, then it was an engineer who found it impossible to convey water under two streams and across a deep glen, or, worse still, against gravity. So the Local Government Board sent message after message, and order after order, to the board of guardians—the board of guardians to the Committee who sent back their resolutions to the Local Government Board, who sent it back again to the board of guardians. The board of guardians could do nothing without the committee, and the committee without the board of guardians. The end was that instead of many hands—or rather heads—making light work, there was no work done at all. Some time before this practical illustration of the present working of the Sanitary Act in Ireland, the village was full of fever of a typhoid type; it was no unusual thing to see six and seven children lying in the same bed. House after house, and cabin after cabin, became a nest of fever, and at last it came to pass that the fever vanished, simply for the reason that nearly all the children either recovered or died of it, and the fire burned out for want of fuel. The medical officer was pooh-poohed, he did not know his business—he was an alarmist. The executive sanitary officer having a higher degree (being an M.D. of St. ——) than the dispensary officer (who was only an M.B. of Trinity College, Dublin), said that some of the cases were not typhoid fever, and that other cases were not fever at all. So the matter stands: the players have thrown aside their battledores, and are refreshing themselves with the lemonade of their good intentions, a few earnest ones, disgusted at their discomfiture, most of them laughing at the game as very good fun, and all jingling in their pockets the extra halfpence they have saved. *O Tempora! O Mores!* A halfpenny or two in the pound saved at the expense of the bowels of their neighbours. Let typhoid fever, diarrhœa, and our old foe the cholera work their wicked will, but above all things, gentlemen of the board of guardians, let us keep down the rates. We must not mind extra expense in keeping the widows for years in the poor-house, and the children possibly for life—that doesn't show you know; but to have a halfpenny in the pound extra for special purposes stuck up on the telegraph posts and posted on blind doors—perish the thought! From "*O Temps*" to "thought" are my reflections, induced by an extra half of the fiery, and not the words of the chairman of any board of guardians. I think it only due to the gentlemen to mention it.

The whisky is finished, my friend the scarecrow has departed, the "good, round, tenpenny mould, four to the pound," is flickering in its socket, and I think it high time to say—Adieu.

And remain, Sir,
Your obedient servant,
A SASSANACH.

P.S.—Though seeing a good deal of Ireland, I cannot say I saw anything of the Fenians. Indeed, after enquiring into the action of guardians and others, I was more inclined to cry out—save me from my friends!

ABUSE OF "RED TICKETS" IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—That instructive and important case "Woods *v.* Crumley" could, I think, be turned to very good account by getting the legal bearings of the case on members of committees printed in hand-bill form, and supplied to each dispensary medical officer for distribution according to his discretion.

A dozen or so of the forms for the information of acting members, present or future, would be an ample supply, and I venture to say that the dispensary medical officers would readily subscribe the necessary expense.

Supplying the hon. secretaries would not be at all sufficient, as "meetings" are, as a rule, but few and badly attended.

An effectual check, would I am convinced, be thus put to the "abuse of red tickets."

Truly yours,
A SUFFERER.

[No doubt the Irish Medical Association would readily undertake to carry our correspondent's suggestion into effect when the case is finally decided. At present the matter is on appeal to a higher court. If Dr. Woods should be defeated on a point of law, it would be judicious for the Council of the Association to try out the first representative case, and thus establish the law already laid down by Judge Fitzgerald.—ED. M. P. & C.]

◆

DISPENSARY OFFICERS' GRIEVANCES.

TO THE EDITOR.

SIR,—The case of Dr. Scott, of Ballina, published in your Supplement of 29th November, can scarcely fail to alarm the medical officers of Ireland, first on account of the enormous amount of work evidently required by the Local Government Board; and, secondly, from the severity of the punishment inflicted for even a mere oversight.

Dr. Scott clearly (and naturally) considered Mrs. Mullen's case finally disposed of on the occasion of his visit, and surely it would be no hardship on the parties to send for him again if wanted; nevertheless, because he did not continue his attendance without any reason whatever to think it was necessary, he has been called on to resign, which means that he is to be thrown on the world, perhaps for the remainder of his life, disgraced and probably broken-hearted.

It is clear that the Local Government Board requires of us an amount of professional attendance on the sick poor that it is out of our power to give, while our salaries are so low as they are at present, and that Board may rest assured that a proper increase of salary would be a far more effectual remedy than any number of dismissals they could make.

Must it not be *evident* that our miserable salaries are totally insufficient to enable us to perform all the travelling required? If we fall short, the blame rests not with us, but with those who keep from us the means necessary to enable us to discharge our onerous duties.

Why not send a deputation to the Local Government Board pointing out the *justice* and the *absolute necessity* of having that Board issue an order, not for a dismissal of medical officers, but for their proper remuneration, and directing boards of guardians to grant a minimum salary of £150 a year. This should be granted without subjecting the medical officers to the hurtfulness of the local begging process.

As to the sanitary business, it is a decided pecuniary loss, as in large districts most of us have to keep a second horse at an annual cost of £40 at least, in lieu of which we get £15. How long is this miserable state of things to be allowed to last?

Truly yours,
ONE OF THE ILL-PAID.

December 3, 1876.

SURGEONS TO THE ROYAL IRISH CONSTABULARY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—In the proceedings of the Irish Medical Association, as detailed in "The Poor-law Intelligence" of the 8th inst., I was very glad to see that the Association is at last likely to assume the form of a Medical Association in a true sense. I refer to the discussion on the subject of the medical officers of the Royal Irish Constabulary, and I hope that this is the beginning of a more liberal and professional epoch in the history of that valuable Association. It is quite right that the dispensary doctor should have a prior claim over a practitioner living outside his district to the post of constabulary surgeon in such district; but it is too absurd in these days of common sense to hold that because a dispensary committee appoint a doctor to a dispensary district that he is the most suitable of the candidates, and more absurd still to imagine that our wise dispensary committees and Boards of Guardians are better qualified to decide on the relative merits of medical men for a post totally unconnected with the Poor-law than those gentlemen who fill the onerous posts of general and local inspectors of the Royal Irish Constabulary. I trust before long to see the office of police doctor on a proper footing, the R. I. C. surgeon combining in himself the offices of police doctor and medico-legal jurist, and in no way subservient to ignorant local committees. It is ridiculous to imagine a dozen of our typical P. L. G.'s dictating to the Inspector-General of Constabulary as to who he must appoint surgeon to the force in their locality. The days of professional disability are passing away, and to use an Americanism, "One man is as good as another, and far better."

Yours faithfully,
Nov. 13, 1876. ANTI-HUMBUG.

[Our correspondent unfairly ignores the very valuable assistance for many years given by the Irish Medical Association to *all* the interests of the profession, irrespective of departments. The dispensary medical officers greatly outnumber any other class, of provincial practioner and their duties and various associated appointments render them, as experience has conclusively proved, out of all proportion, liable to grievances. The Association is and aims at being representative of all interests, and the remark that "it is *at last likely to assume* the form of a *medical association*" is an unwarrantable assertion, if it be meant to convey the idea that it is not a representative body in the full sense, and we fail to see any other inference to be drawn from it. We are thoroughly conversant with the working of the Association, and until it be shown that complaints made to it have not been dealt with to the utmost of its abilities, it is not fair to cast any imputation upon men who, many of them without the least personal interest, devote most valuable time and ability to the profession The suggestion of previous want of liberality on the part of the Association is equally unfair, and could only emanate from one in ignorance of what is and has been going on. Our correspondent considers himself a man of "common sense" evidently, but appears to think that rare commodity is wanting in the Council of the Irish Medical Association, because they think "the dispensary medical officer being a *district* officer is more suited, and has higher claims to an appointment requiring district visiting than the workhouse medical officer, who is an hospital surgeon; and independently of this consideration, they fear that competition for these appointments might possibly result in a smaller remuneration being offered by the authorities." As to the absurdity alluded to by our correspondent, we wonder his "common sense" did not show him that it actually was the authorities of the Royal Irish Constabulary who selected the dispensary medical officers and excluded the workhouse doctors from the local constabulary medical appointments—the very act of which he complains, and in which the dispensary committees and guardians had no act or part whatever whether by dictation or otherwise.—ED. M. P. & C.]

BOYLE UNION.

THE ABUSE OF RED TICKETS.

THE following letter was read:—

GENTLEMEN—I beg leave to submit a visiting ticket for your investigation on which I have attended. The father has a holding of prime land, a very comfortable house, three cows and three ewes—in fact has no appearance of poverty, his fuel supply consisting of a rick of turf containing at the least three cwt.

May I under such circumstances ask you kindly to have the ticket cancelled in order to prevent compulsion of my further attendance The distance to be travelled is over six miles, and I have to walk through the fields for at least an English mile to the house.

I remain, gentlemen, your very obedient servant,
THOMAS DODSON PALMER.

The Chairman thought the matter should be referred to the Dispensary Committee.

Mr. Powell states the dispensary committee meets only once or twice a year; and the doctor would have to attend for a long time before the ticket might be cancelled.

The Chairman said all they could do with it was to refer it to the dispensary committee.

Captain Robertson thought that a very roundabout way.

Mr. Sharkey thought all the board had to do was to cancel it.

Captain Robertson said if a red ticket is issued to a man, and the doctor goes there and finds him comfortable he questions if the doctor cannot sue him.

Mr. Powell mentioned the case of "Woods v. Crumley" before Mr. Justice Fitzgerald at the Monaghan Assizes.

The Chairman ruled that it be referred to the dispensary committee.

Captain Robertson referred to the Act bearing on it to see whether the guardians had any power in it. Finding they had none he thought to show the doctor they attended to his statements, they should refer the dispensary committee to the Poor-law Act under the head of Medical Relief, sec. 9.

This course was agreed to and a ruling made to that effect.

The Board of Guardians have no cancelling power. The ninth section of the Medical Charities Act is as follows:—

> Every member of such dispensary committee shall have power to afford medical relief by the issue of a ticket addressed to the medical officer of the district, directing him to afford medicine and advice to or attend any poor person resident therein; and it shall be the duty of the medical officer to afford medicine and advice, or to attend such poor person, as thereby directed: Provided always, that if any person who shall obtain a ticket for medical attendance shall, at a meeting *of the committee* after the issue of the ticket be declared *by a majority of the members then present* not to be a fit object for dispensary relief, the ticket shall be cancelled, and the holder thereof disentitled to further relief.

A dispensary medical officer under such circumstances has no course to pursue but to ask for a special meeting of his committee, or else continue his attendance until the next ordinary meeting, which means practically until the case is disposed of. He may then, with or without cancellation of ticket, sue for his reasonable fees for attendance on the case, but his remedy does not lie against the patient but against the grantor of the ticket, and nothing which the said grantor might put on the ticket as to the means of the patient, would protect him against having to pay the doctor for such attendance.

EYE DISEASES AND INJURIES.

A Course of Lectures

DELIVERED IN THE

CITY OF DUBLIN HOSPITAL.

By Archibald Hamilton Jacob, A.M. and M D. Dub. Univ., F.R.C.S.I.,

Surgeon to the Dublin Eye and Ear Infirmary, and formerly Ophthalmic Surgeon to the City of Dublin Hospital.

(*Continued from page* 378, *Vol. XIII.*)

In my last lecture I brought to a conclusion my observations on the injuries in the neighbourhood of the eye—to the lids and lacrymal sac, to the walls of the orbit, and, finally, dealt with penetrating wounds of the orbit, involving, in some instances, the brain, and ending fatally. I now proceed to consider those injuries which are more especially the province of the ophthalmic surgeon, inasmuch as they involve the eye-ball itself. It will be profitable to you if I repeat what I said in an earlier lecture as to the means which the hand of Nature has provided for the protection of the organ which is of supreme importance in the animal economy, but which is peculiarly vulnerable in the nature of its structure.

Nature's Protection to the Eye. The provision made by Nature for the protection of the eye from injury is of so perfect a character that it is not as much subject to serious lesions as might be expected; and when we consider how vulnerable to attack, how easily destroyed by slight injuries, and how vitally essential to the efficient working of the human machine the eye is, our admiration of the means provided for its protection is enhanced. Though the eye must necessarily be presented to all attacks, and used directly in all manual processes, and is thus, under all circumstances, placed in the most likely position for injury, it is relatively but seldom that it sustains a destructive injury, and it enjoys comparative immunity from the extensive lesions which every day present themselves as the result of blows about the face. The lightning speed of this warning from the eye to the brain and back again to the lid-muscles is almost inconceivable.

You must have observed this fact for yourselves, for in the daily run of hospital injuries all parts of the face and head seem to suffer more than the eye, though it is usually the object selected for attack.

Let us consider what it is which affords so sure a guard to the eye.

In the first place, the strong orbital ridges of the frontal, malar, and maxillary bones, effectually bear off blows from any body larger than the eye itself; while the eye keeps guard, and by giving the signal for a rapid jerk of the head, and the involuntary and spasmodic closure of the lids, protects the globe from the access of smaller bodies. A remarkable instance of this has been recently noted in the medical journals. A chemist was examining a small bottle of explosive liquid between his eye and the light, at half arm's length. By a shake the liquid exploded, and the fragments of the bottle and its contents were violently scattered. On recovering from the shock of the explosion, which was so violent as to blow him off his feet, the chemist at once felt that his face and lids were severely burned. To his great relief, he found, however, that his eyes were perfectly safe, the small fraction of a second which the contents of the bottle occupied in traversing the distance from hand to eyes, had sufficed for the retina to receive its impression, to transmit the signal to the brain, and for the brain to issue its order to the orbicularis palpebrarum, which closed tightly in compliance. That this latter protection is of great importance is proved by the frequent occurrence of accidents to one eye, when the other has been previously lost.

With lightning speed the retina transmits to the brain its warning of danger. By an instantaneous, almost convulsive, and involuntary movement the head is removed from the direction of danger, and the eye is tightly covered by the lid; even if the blow or missile take effect in the exact direction of the eye, the whole force is sustained by the anterior arches of the orbit, if it be too large to penetrate within the cavity, and if sufficiently small to enter, it meets with nothing on which to expend its force, except a hard, tight slippery globe, resting on a cushion of fat, and free to escape in any direction from the pressure.

The lashes, also, acting as a sort of grating or sieve, entrap all sorts of minute objects, which, should they, in spite of all these protections, obtain an entrance, are met by an instantaneous deluge of tears, which carries them away before they can inflict any injury.

In addition to these extrinsic protective provisions, the eye derives its greatest security from its own perfect mobility, and the elasticity of the cushion of adipose and cellular tissue on which it rests, and from the extreme strength of the sclerotic; so that while the body of the eye itself will bear almost any amount of violence from a blunt or rounded missile, the structures on which it rests will receive without injury the greater part of any shock which may be communicated to it. The every day proof of this fact is, that amongst the thousand black eyes given and received, rupture of the eyeball is a rare accident.

Ecchymosis beneath the Conjunctiva. Proceeding now to the injuries of the eye-ball itself, and to some of the consequences therefrom, I present to you, firstly, an illustration of an ecchymosis beneath the conjunctiva (Fig. 1), with the appearance of which it is necessary that you should be familiar, as you may easily be deceived respecting the gravity of the accident by the very alarming appearance which the eye presents. Sub-conjunctival ecchymoses are more usually caused by a slight scratch than by a heavy blow, and are very commonly the result of great straining on the part of the patient, either in coughing or retching, especially those who are in the anæmic condition which encourages small hæmorrhages under the skin, and in such cases there need be no injury at all. In this way ecchymoses are frequently observed in cases of purpura, and occasionally in Asiatic cholera. The effusion of blood beneath the conjunctiva may be distinguished from any other form of vascularity—

a. By its brilliant uniform scarlet velvety surface, when recent, which completely hides the sclerotic.

b. By the absence of any visible blood-vessels.

c. By the irregular ragged edge.

It may be so large as to occupy the whole sub-conjunctival cellular tissue, and to raise up the conjunctiva into folds, or it may amount to no more than a small scarlet spot on the sclerotic. It never invades the corneal conjunctiva, because the attachments of the conjunctiva to the anterior elastic cornea are much closer than those which connect it with the sclerotic.

Treatment.—Surgical interference for sub-conjunctival hæmorrhage is neither necessary not effective. If the patient will wait, the ecchymoses are best let alone, and they will go through the sequences of colour usual in the case of a black eye, until they finally disappear in eight or ten days. If the effusion be excessive in any one spot, the conjunctiva may, without fear of mischief, be divided, and the blood squeezed out; and if a patient be impatient for restoration of good looks, a lotion may be prescribed to aid absorption.

The following is the formula which I have used, but I do not claim for it any very decided effect:—

℞ Potass. iodid., ʒ2;
Tr. Arnic. montan., ʒjss.;
Aq. rosami, ad., ℥6;
p. lotio.

The following collyrium, though inelegant, is more effective:—

℞ Ol. jecor asel., ℥j.;
Pot. iodid., gr. 5;
Iodinii., gr. j.
p. collyr.

Compression is a very useful procedure, when it is desired to effect absorption, and a compress of lint soaked in an unirritating lotion of iodide of potassium, and bandaged tightly on the eye will be suitable in the treatment of persons who can adopt it.

Lacerations of the Conjunctiva. Conjunctival lacerations are very common, and usually quite unimportant in their effects. The eye is watery looking, and the secretion of tears increased; the conjunctiva may also be slightly injected, the patient complaining of feeling as if a grain of sand was under the lid, or a hair turned in upon the eye. There is usually some difficulty in finding the situation of the laceration, on account of the transparency of the conjunctival fold.

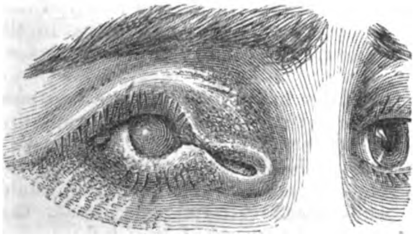
Treatment.—If the laceration be small it will be sufficient to keep the lid closed, and apply a cooling lotion externally. If very large, it will be necessary to place the edges of the wound as nearly as possible in apposition and introduce a couple of the finest silk sutures, closing and bandaging the eye afterwards to prevent motion.

Burns of the Conjunctiva. The conjunctiva may be the subject of extensive destruction by burns—the most common forms of the injury being from gunpowder, from quicklime, and from sulphuric acid in cases of vitrol-throwing. Of these, the burn by lime is that which more especially affects the conjunctiva, while the injuries by gunpowder and vitriol usually involve the whole eye, and frequently end in its destruction. I have also seen eschars of the conjunctiva from a splash of whisky thrown in the face, and such burns have seemed to me much more severe than the strength of the spirit would seem to account for, whence I conclude that the cheap fiery liquids sold in low public houses must contain something—perhaps capsicum—more irritating than pure spirit.

Injury of the Eye by Lime. This form of injury, which is beautifully depicted by the late Mr. Wardrop in his work on the eye, from which I have copied the illustration, is common amongst bricklayer's labourers, in consequence of the ebullitions which take place in the hasty slacking of lime, and which are sometimes strong enough to splash the lime into the eye. However happening, the injury is very dangerous, and the more so because the effect of the caustic alkali is rapid, and the patient is seldom seen until much mischief is done. The first effect of pure lime is to disintegrate or burn the entire conjunctiva wherever it lodges, and even to destroy the corneal surface in the same way. If the lime only lodges in spots, those parts of the conjunctiva will suffer and the remainder escape, because the lime being insoluble does not spread to any serious extent, and, moreover, the process of slacking absorbs all the tear-water, and the deposit is, therefore, not washed away. Commonly, even when the lime is in the form of mortar, the conjunctiva is removed from the entire cornea, which then appears as a dull opal-coloured surface surrounded by the chemosed conjunctiva, and appearing as if buried in a pit in the surrounding vascular tissues, as illustrated in the Figure (6). Vision is almost *nil*, the pain violent, but of a smarting rather than an aching character, and the flow of tears excessive. If the conjunctiva be burned off only in patches these places will appear as shallow depressions usually with the cake of lime adherent to their bottoms.

Treatment.—The first indication is to remove the lime very thoroughly, which, in consequence of the closeness of its adhesion, is a troublesome and painful proceeding. The eye-lids should be fully everted, all that can be removed by a camel's hair-brush taken off, and all that cannot, picked away by forceps or even dug out if necessary with the needle or Walton's gouge. The deepest part of the conjunctival fold often contains a quantity of the lime, which may be overlooked if not searched for. When the large portions are removed, the surface should be syringed with weak vinegar and water, which will form with the remaining small particles an innocuous acetate of lime. The removal of the lime having been completely effected, a drop of atropine should be instilled, and then a couple of drops of fine oil or sweet glycerine and the lids closed. Astringents, such as weak nitrate of silver solution and sulphate of zinc are sometimes recommended, but I have found them very irritating in such cases and worse than useless. Acetate of lead lotions must be specially avoided as they will deposit a coating of insoluble-chloride-carbonate and albuminate of lead in the ulcerated surface, which will heal in and remain as a permanent stain. According to the extent of the injury, the subsequent treatment must be directed to allay inflammation. Cooling lotions externally will be suitable in slight cases, those more severe, will require leeching to the temple, and poulticing.

Effects.—If burns of the conjunctiva be superficial and not involving the whole thickness of the membrane, the damage will be quickly repaired by the reproduction of epithelium, and no perceptible scar will remain. Mr. Lawson in his work on "Injuries of the Eye" says :—"If the injury extends deeper than the epithelium, so as to include the connective tissue in which it rests, the whole thickness of the mucous membrane will be destroyed and a slough will form, which will slowly separate before any attempt is made to repair the gap. When such complete destruction of the part ensues, the space is not filled up by a growth of new tissue, but the wound is gradually closed by a drawing together of its sides and a contracted cicatrix is formed." This statement is accurate when applied to extreme cases, but it must not be assumed that contraction and adhesion of the lids will occur in all cases in which the conjunctiva is totally destroyed, for I have seen more than one case of lime-burn in which the cornea seemed absolutely bare, and which, nevertheless, received a fresh conjunctival covering after a few weeks. The special danger of deep burns of the conjunctiva—especially those which involve the palpebral as well as the ocular conjunctiva—is the occurrence of symblepharon or adhesion of the ulcerated surfaces in the act of cicatrisation. This symblepharon is well illustrated in the figure (3) which I have borrowed from Dalrymples "Atlas of Plates." Frequently, the adhesions are more extensive and irremediable than those depicted in the plates, and the attention of the surgeon must be devoted as much to prevent them as to allay inflammation or restore sight. In these cases of lime-burn—especially when the lime has been but partially slacked before it enters the eye—it is unfortunately but seldom that the injury is restricted to the conjunctiva. Very frequently the cornea is burned, sometimes even to the greater part of its thickness, and a slough is the result, with partial or entire destruction of the eye. In treating these cases, the lids must be separated each day, in order to prevent adhesions of the conjunctiva to the ocular globe, and the greatest injury is commonly done by uneducated people, who bandage up the eye and leave it so until the pain and discharge abate. I have just now under treatment a case of symblepharon which was caused by this error, and of which I give an illustration.



It will be observed that the edges of the upper and lower lid are attached together so as to leave but a small central opening for vision. At the external canthus also the lid is adherent to the eye-ball. This condition was caused by the retention of a bandage and compress on the eye for ten days after the accident. When the eye is opened, the sloughs if there be any, should be lifted off, and the surface cleaned with a syringe, and if there seem to be a tendency towards adhesion and contraction,—which is most commonly found in the sinus of the lower lid—a small slip of lint may be placed so as to separate the approximated parts. Local applications introduced between the lids must be emollient, such as sweet oil or fresh glycerine. If astringents be admissible, I think vin. opii. is the most advantageous. It will be readily understood that, inasmuch as the slough must be cast off, it is better to aid their elimination in every way, and there will be no use in depleting the patient to avert inflammation which will be more properly dealt with as it arises.

(*To be continued.*)

THE CONTAGIOUS DISEASES OF ANIMALS.

By George Fleming, F.R.G.S.

(*Continued from page* 481.)

With regard to the influence of the contagious diseases of animals upon the health of the nation, I am sorry I can say but very little indeed. The sanitary science of man is only in its infancy, while the sanitary science of animals scarcely exists ; and until these two most important branches of medicine have attained a greater development than they can at present boast of, we shall not be in a position to estimate the amount of injury to health we suffer from in our dealings or our contact (external or internal) with animals.

The money loss from the more prevalent and serious of the diseases which attack cattle, sheep, and pigs must, to a certain extent, affect the public health, and especially that of the poorer classes, as it has a tendency to heighten the price of food, and to place that of good quality beyond their reach. What is originally an individual loss—a loss to the breeder or feeder of animals—becomes in this way a public loss, which increases as it extends outwards: from the cow-shed or pasture to the lowly dwelling in the close, foul alley, because it is made a pretext for higher prices than the occasion really requires.

But the poorer classes suffer still more, perhaps, from the low-priced flesh of unhealthy animals, which they are compelled to buy. There cannot be the least hesitation in asserting that a regular traffic in diseased animals is carried out on a large scale in town and country ; and if the flesh from them is not absolutely hurtful, it is at the very least less nutritious than that of healthy, properly-conditioned animals.

But there is every reason to fear that much of this flesh must be credited with increasing the bills of mortality to an extent that we cannot at present imagine. It is only now and again, and by mere chance, as it were, that instances of the traffic we have mentioned are lighted upon, and that we hear of the poisonous flesh of animals which have died or been killed in consequence of a fatal malady, being seized by an inspector. It is still more rare to hear of poor people actually suffering from consuming this kind of flesh. Yet, comparatively speaking, very few cattle, sheep, or pigs which die from, or are slaughtered for disease, find their way to the knacker, or are buried. It is, we fear, not at all unusual to kill and dispose of the flesh of these creatures after they have been medically treated, and made to swallow drugs which will act as poisons on those persons who are so unfortunate as to consume this flesh ; and when the animals are suddenly seized with a fatal malady, it is the custom to call in the butcher to kill them, and dress their carcases for the market.

The flesh of the ox, sheep, pig, and goat may be injurious, nay, absolutely poisonous, from disease ; or it may be most pernicious from the presence of parasites, which will infest the bodies of the people who consume it.

Recent researches have shown, in the clearest manner, that scrofula or tuberculosis—a contagious disease—is very common in cattle, and especially in dairy cows—and that not only will the flesh of these produce consumption in other animals fed upon it—and particularly young animals—but that their milk also will infect. We dare not experiment upon human beings, to ascertain whether such a terrible result is possible with them, but judging from analogy, we cannot venture to doubt it. The flesh and the milk of scrofulous cattle enter regularly into the diet of probably thousands of people every year. That contamination may take place from the milk is, perhaps, the most serious reflection, as this is rarely boiled; for it has been proved that a high temperature will destroy the infective property, and hence the flesh, if thoroughly cooked, may be rendered inert.

When we remember that milk is the staple diet of young children, and that infantile diarrhœa and glandular affections of a scrofulous nature annually carry off large numbers, while phthisis in young people and adults is a wide-spread and fatal malady, we are brought face to face with the serious question as to the share the flesh and milk of diseased cattle may have in the production of this mortality.

Not only this, but some other diseases or local conditions infect the milk, so much used as an article of diet. Evidence in abundance goes to prove that in "foot-and-mouth" disease the milk is positively injurious; it will kill young animals, and it affects children, and even adults, who partake of it.

There cannot be a doubt that the manner in which cows are kept has a great influence, not only on their own health, but also on that of those who consume their produce. Insanitary conditions may render such secretions as the milk very hurtful, and poisons may even be conveyed through the medium of that fluid, without the animals themselves exhibiting much, if any, disturbance. We are only on the threshold of our inquiries into these alarming but, nevertheless, necessary to be recognised facts in sanitary science.

We have now to consider what, under the circumstances, we require to protect the wealth and preserve the health of the country, in so far as the contagious diseases of animals are concerned.

The prime essential of such a protection is a sanitary organisation that will meet both requirements. At present this does not exist, and has never existed in this country. And yet in no part of the world has the necessity for it been more evident or more urgent during very many years. Though two of the destructive diseases we have more particularly alluded to, and which are now always with us, invaded the country some thirty-five years ago, I cannot discover that any steps were taken up to 1865 to check their ravages, limit their extension, or properly ascertain their nature and mode of diffusion.

Had the sanitary science or medicine of the lower animals been what it might and should have been in 1839, the country would have been spared the invasion of these diseases, as they were well known on the Continent, and had been recognised as serious contagious years before they were introduced to us. Our insular position should have insured our exemption from them had veterinary science been on a proper footing, and competent to afford advice as to the measures necessary for their exclusion from our shores, or extinction when they did appear. As it was, they were not recognised, and were permitted to spread with all the rapidity and virulence that marks the course of newly-introduced contagions of this description. Up to 1865 the two diseases were allowed to exist and to be carried about evidently without let or hindrance. In that year, however, the introduction of the cattle-plague caused a great panic, which, in 1866, led to suppressive measures being adopted for the extinction of that malady; and these measures also had the effect of pretty well extinguishing the "foot-and-mouth" disease and "lung-plague." The sharp lesson taught by the "cattle-plague" directed attention to the damage wrought by the other diseases, which began to prevail again as soon as the restrictions were removed, and fresh importations of contagion allowed. A veterinary department of the Privy Council was formed during the cattle-plague panic, and this undertook the control, more or less, of these maladies. For various reasons, which are not far to seek, however, neither the prevalence nor the virulence of contagious diseases appear to have been modified to any appreciable extent; indeed, since 1866, the country has been more severely scourged than before that year. The attempts made to limit the destruction of these diseases have failed, simply because it was impossible they could succeed; while the endeavour to carry them out has been attended with serious inconvenience to the country and heavy expense.

Any one possessing the slightest acquaintance with these contagious diseases, of sanitary science, of the traffic in animals, and of the character of many of those who own or deal in them (for conscientious scruples appear to be abolished when such maladies prevail), could have foretold that the attempts would not only have been utterly futile, but that they would also prove onerous and unsatisfactory in every way.

In the first place, those most concerned were not informed as to the nature and more important features of the diseases to be combated; in the next place, the carrying out of the measures was left to the local authorities, who, perhaps energetic in the extreme in one county, may have been as supine and negligent in another; and, thirdly, there were very few competent men employed to carry out the necessary sanitary operations.

The latter was, perhaps, the most serious omission; for instead of the authorities entrusting such important duties as the tracing and controlling outbreaks of disease, and guarding against its extension by every means which science and intelligence can alone suggest, this was left chiefly to policemen, who, when in doubt as to the nature of the malady an animal was suffering from, called in a veterinary surgeon or "cow-leech" (for qualifications are not essential) merely to settle that point. The members of the veterinary profession must, as a body, disclaim all responsibility for the enormous losses the country has sustained for so many years. Indeed, if they could lift up their voice, they would complain bitterly of the neglect with which their science and their services have been treated by the country during all this time of national loss and embarrassment,

Veterinary science has been allowed to struggle into existence, or perish in the attempt to maintain itself, in Britain, as if it was of no value or consideration. And in 1865 and 1866, during the reign of the cattle-plague, its graduates were exposed to the grossest abuse and indignity to which a profession has ever had to submit in any land, merely because they spoke truthfully, and, declining to pander to the mistaken notions of those who ought to have known better, they pointed out the real nature of the malady. And yet they had at last to be called in to extinguish that pestilence, when physicians, amateurs, empirics, policemen, and local authorities had failed to cure or check its spread. No sooner had they done so than they were once more placed in the background, where they will remain, in all probability, until the same heterogeneous forces have broken down in their futile endeavours to rid the country of the scourges which now afflict it.

It only remains to say that the measures now in force, and the machinery at work in carrying them into operation, will never effect the object with which, we presume, they were devised—the suppression of contagious diseases, until an efficient sanitary organisation is established, in which well-trained veterinarians, under Government direction, and independent of local influences, shall play the chief part, and be held responsible for the sanitary condition of their districts: advising the local authorities on important questions, watching the movements of cattle, keeping a careful eye on fairs and markets, superintending personally the more essential operations needed for the extinction of a contagion when it suddenly manifests itself, and directing the police while carrying out instructions in sanitary affairs, instead of being directed by these functionaries. Until this is done, which is not now done, we shall never rid ourselves of these scourges, nor save ourselves from loss and embarrassment. On the contrary, we may expect to see them yearly on the increase, and have perpetually exemplified the painful results of a "penny wise and pound foolish" policy.

It is a grave mistake to suppose that the exclusion of foreign animals alone would rid the country of its contagious maladies. Foreign countries suffer less from them than we do, as these diseases are not so prevalent in them, and are more energetically dealt with. If our importations from the Continent were stopped to-morrow, we should scarcely be better off; because, for want of proper measures and proper means, we cannot extinguish the disease germs, which are either active or latent in every county, every district, and nearly every cowshed and pasture throughout the land. If we had to export to the Continent, I fear our neighbours across the Channel would find us indeed dangerous importers in the matter of contagious diseases.

What we require in the sanitary service I have mentioned; and this, besides rendering other benefits of a most important character than those pertaining to contagious diseases, would scarcely cost us a fraction of the money loss we now suffer. In addition to this, we require a more energetic, responsible, enlightened, and efficient central administration. There should be no permissive legislation for the control of contagious diseases by local authorities, who often have no interest in their exclusion and suppression; but more frequently have every inducement to wink at their existence, in order that they may obtain credit for keeping down county rates. Whatever measures may be necessary should be universally applied throughout Great Britain and Ireland, and if possible with more rigour to those parts which export.

It is a grave mistake to omit any part of the country from the operation of laws which may be deemed necessary for the suppression of contagious diseases, and especially if that part is much infected. Such an omission must not only be fatal to success, but will prove a serious hardship to other parts where the measures are attempted to be rigidly carried out.

Information as to the prevalence of disease among animals is urgently required, and this could be obtained by the organisation I have described, and would be found much more exact, interesting, valuable, and reliable than that procured by uneducated policemen.

While extinguishing contagious diseases within our own shores, care must be exercised that they are not introduced from without. With this object in view, animals which are imported for fattening, or other purposes that require their admission into the interior of the country alive, should be drawn, whenever possible, from uninfected regions; or if this cannot be done, then they should certainly undergo a period of quarantine. Animals fit for immediate slaughter should, if they must be carried alive to our shores, be killed at the port of debarkation. There need be little difficulty in this. No country in the world is better situated for the carrying out of such a proposal. With numerous excellent ports studded in most favourable situations all round our coasts, and railways traversing the country in every direction, there is no reason whatever why the present inconvenient, and only too often very cruel system of conveying ship-exhausted, and perhaps diseased cattle long distances in railway trucks all over the land, and at great risk to home stock, should be continued. To abolish it should tend to cheapen flesh from foreign sources, diminish the chances of introducing fresh supplies of contagion, and would certainly prove most humane and economical.

I have no faith in port inspection for the detection of contagious diseases, and am convinced that this is a fallacy. It is impossible for any inspector to detect disease in a latent form, or to discover if apparently healthy animals have herded with those which were sick; and unless he can do this, in very many instances his services must be worse than useless.

The details which are absolutely necessary to be observed in the suppression or prevention of contagious diseases, I cannot touch upon here. Suffice it to say that they are not observed in the country at present, and they can only be carried into effective operation by the sanitary organisation I have indicated.

With regard to the preservation of the public health, so far as its relation to animal diseases is concerned, this also must be left to the management of such an organisation. None but the best-trained veterinarians can protect the public in this direction; and until the inspection of meat and milk, dairy, stable, kennel, and pasture, slaughter-house and butcher's stall, are placed under their supervision, the public must incur risk and suffer loss. Here one of the first essentials is the establishing of public slaughter-houses in every town and city. The majority of private slaughter-houses are simply an abomination, and a disgrace to the age we live in. They are a fertile source of contagious diseases among animals; from their situation, and the way in which they are kept, they are nothing less than a public nuisance, and it is in them that animals diseased, or otherwise unfit for food, are prepared for the market.

In public slaughter-houses animals can be inspected before and after they are killed; and if found to be suffering from a contagious disease their origin can be traced, and perhaps foci of contagion be in this way discovered and extinguished. The abolition of private slaughter-houses would spare unfortunate animals an amount of torture of which the public has no idea

Such are the remarks which I have ventured to bring before you on one of the most important subjects connected with the sanitary science and the welfare of our country. I have endeavoured to do so without blaming unjustly either governments, professions, or individuals. Governments are swayed in such matters as this by their advisers, and these, doubtless, advise to the best of their knowledge. In direct proportion as their knowledge is exact, and as their advice is adopted by governments, so does the public benefit. But conflicting interests may often baffle statesmen, and render them hesitating and inclined to adopt temporising or half-measures. In the presence of such contagious diseases as have scourged this country during this century, half-measures are worse than useless, and incline the public to lose faith in sanitary science altogether. The stern fact must be looked in the face, that for ten years imperfect attempts, whose only recommendation was that they were cheap, have not only failed to diminish the prevalence of these maladies, which have rather increased, but they have been a source of great embarrassment to trade, and have materially tended to increase the price of food. We appear to avoid looking at things as they really are, and to shut our ears to the truth. Political, class, or party considerations should have no place in such a question as this. The loss and embarrassment may first fall upon, and be most severely felt by, the breeders, feeders, and owners of animals, but these are quickly shared by the whole nation, and the result becomes a public calamity.

No country in Europe has, possibly, sustained greater loss during the last thirty-five years than our own; yet no country, perhaps, should have suffered less. With the finest breed of horses, and the most magnificent herds and flocks in the world, and a teeming population, whose health and wealth are largely centred in these, we have almost entirely neglected to protect them from the ravages of diseases of home and foreign origin, by forgetting to foster and encourage that science which alone can accomplish this. That neglect has cost Britain and her colonies untold millions. Until it is acknowledged, the omission repaired, and veterinary science placed in its proper position, so that it can yield its benefits to the full, we must be prepared to record annually the heavy damages to health and wealth inflicted upon us through the influence of the contagious diseases of animals.

At one time the British army suffered the greatest losses from disease among its horses. Through the enlightened influence of those who commanded it, veterinary science was allowed to come into play; and now disease is scarcely known, while the efficiency and durability of the animals are vastly increased. This is merely because there is an organisation of trained men, and a competent central authority to guide and direct them. What holds good in the one case must hold good in the other. Let us trust that the public may be led to recognise this incontrovertible fact. If in the army we acted in regard to this matter as in civil life, our troop stables would soon be converted into hospitals, and the knackers would drive a flourishing trade. It only requires a patriotic resolution, enlightened views, and a well-organised service to preserve the wealth and protect the health of the country, so far as the domesticated animals are concerned. Surely these can be forthcoming!

Clinical Records.

JERVIS STREET HOSPITAL.

Operation Cases under the care of Dr. Meldon.

Large Mulberry Calculus—Lithotomy—Recovery.

(Reported by Richard J. L. Hughes, Resident.)

Patrick Breen, a delicate looking boy of sixteen years of age, was admitted into Jervis Street Hospital on the 16th of January, under the care of Dr. Meldon. He was born and lives at Glin, Co. Limerick; his parents are quite healthy, and he enjoyed good health until about two years previous to his admission. At this time he noticed that he had to void his urine oftener than usual. To this, however, but little attention was paid until some months later, when the passing of the water caused him to suffer uneasiness in the passage followed by pain at the meatus. During two months which followed the occurrence of this symptom, he pursued his usual avocations; but as the pain had considerably increased, his friends brought him to Dr. Macdonnell, of Glin, who diagnosed stone in the bladder, and as the friends would not consent to any operation, prescribed palliatives, which gave him immediate relief.

Early in December the symptoms returned, and about Christmas an abscess formed, and opened in the scrotum, through which urine shortly after passed, with relief to the symptoms. On admission into hospital he was weak, had little or no appetite, slept badly, and was constantly bathed in perspiration. The urine was discharged through a fistula in the scrotum—the site of the former abscess—he suffered much pain during micturition; his pulse was 120 and very weak, the temperature was 100°, and the urine was albuminous. Dr. Meldon ordered rest, tonics, and opiates, with good nutritious diet, hot baths, &c. Two days after his admission, an attempt was made to pass a catheter, but even No. 1 would not pass beyond the membranous portion of the urethra. At the end of a fortnight an instrument (No ½) was got into the bladder, and as it passed over the obstruction in the urethra, it conveyed the sensation of passing over a roughened surface. From this date a considerable portion of the urine was passed through the natural passage, and by the daily use of larger instruments, the passage was made to admit a fair-sized sound. The patient was now sounded under chloroform, and a stone immediately felt. He was examined on several occasions subsequently, when the stone was always found in the same position.

On the 25th of March, after the usual preliminary treatment, Dr. Meldon performed lithotomy by the lateral incisions. It was found impossible to keep any urine in the bladder, as it escaped immediately through the fistula. On entering the bladder, Dr. Meldon found that the stone, which was more than two inches in length, was lying across the wound. A little manipulation, however, enabled him to grasp it in its long diameter, but considerable force had to be used in removing it, owing to its size and the fact that it was adherent to the lining membrane of the bladder, a portion of which remained attached to the stone after it was removed. The scoop and syringe subsequently brought away several fragments. From this date he recovered rapidly, sleeping well, and suffering no pain. On the 3rd of April water came through the urethra, and next day some passed through the fistula. On the 30th of April the wound had almost healed, and little or no water passed through the wound. On the 20th of May he returned home.

In his remarks to the students, Dr. Meldon drew their attention to a similar case to the present one, which he operated on sometime previously in this hospital, and which is reported on the 1st of December, in the Medical Press, and mentioned that he expected in the present instance to have found two distinct stones, one small one and impacted in the urethra, and the other, a large one, in the bladder. Instead of that, the calculus, which weighed six drachms, seemed to have been made up of two fair-sized stones united together. In neither of these cases were the calculi encysted.

CASES IN PRACTICE.

Reported by John W. Martin, M.D.,
The Grange, Dronfield, near Sheffield,
Late Assistant-Surgeon, Mayfield Factory Dispensary, Portlaw, Ireland.

Case XVIII.—*Cardiac Dulness Enlarged—Pericardiac Friction Murmur—Weakening of the first sound of the Heart—Heart's Action Excited; Impulse increased in Strength—Headache—Dyspnœa—Pungent Heat of Skin—Tubular Respiration—Increased Distinctness in the Voice Sounds—Flattening of the Percussion Note at the outset, followed by marked Dulness in the Clavicular and Subclavicular, the Scapular and Inter-scapular Regions—Treatment—Recovery.*

M. B——, æt. 17, previously a strong healthy girl, a factory operative, came under my observation, March 15th, 1876. On Sunday, February 27th, in the course of a long walk to visit some relations, she was exposed to cold, and received a severe wetting. The following Wednesday, March 1st, she was attacked with a violent headache and severe cough, unattended by expectoration, and during the ensuing night had well-marked rigors, accompanied by severe febrile disturbances. These symptoms abated towards morning, allowing her to continue at work. Next day felt a pain in the region of the heart, and found great difficulty in going up or down stairs, the exertion producing dyspnœa. She neglected seeking advice until the date of these notes. At my first visit complained chiefly of the violence of the headache, and of the pain in the region of the heart. Surface of body hot, dry, and pungent to the touch. Face flushed. Bowels constipated; her tongue presenting a foul appearance, being thickly coated with a heavy white fur. There was no tenderness over the cardiac region. Heart's action excited; its impulse greatly increased in strength, and accompanied by strong fremissement. The area of dulness measured 3 × 3 inches from the upper border of the fourth rib on the left side, and from the middle of the sternum, opposite the fifth intercostal space, over towards the left mammæ. No special tenderness over the præcordium. Both sounds of the heart present, but altered in character. They were equalised in length, *the first* being indistinct and masked by a loud systolic friction bruit, which was widely diffused over the whole area of the heart's surface from the apex to the base; *the second*, short and greatly accentuated. A careful examination of the chest demonstrated a flattening of the percussion note throughout, but no absolute dulness. Respiratory sounds were roughened and tubular, there were no râles. She was troubled with a hard cough, unattended by expectoration. Pulse 120, full and hard. Urine abundant, clear, and high coloured. She has never suffered from illness, with the exception of attacks of rheumatism, to which she is very susceptible. The medical history of her family good. I ordered hot turpentine stupes to be applied over the chest, to be followed up with linseed poultices frequently repeated.

℞ Potass. bicarb, ʒiij. ;
Tr. aconiti, ʒj. ;
Syrupi, ℥j. ;
Aqua ad, ℥viij. ♏

Two tablespoonfuls to be taken every fourth hour.

March 16.—Slight improvement in her general condition; special symptoms much as before. Removed to hospital. Treatment continued.

March 17.—Skin cool; free from pain or cough; slept well. Temperature, 98·3; pulse, 112, and firmer. General condition much improved. The area of cardiac dulness unchanged; heart's action stronger; *first sound* gaining strength; the *second*, strongly accentuated; friction bruit very loud and distinct over the whole surface of the heart, specially towards the apex. The physical signs of consolidation or congestion—viz., dulness, tubular respiration, loss of the vesicular murmur, and increased distinctness in the enunciation of the voice sounds present in the clavicular and sub-clavicular, the scapular, and inter-scapular regions. Urine passed in abundance, clear, and high coloured. Bowels regular.

Turpentine stupes and hot linseed-poultices ordered to the back of her chest.

℞ Potass. iodide, ʒj. ;
Tr. digitalis, ʒij. ;
Tr. cinchonæ, ℥js. ;
Sp. am. aromat., ʒij. ;
Infusi cinchonæ ad, ℥viij. ♏

Two tablespoonfuls to be taken three times a day.

March 20.—Improving; *crepetus redux* heard in the affected portions of the lungs. Heart symptoms improving. Able to get out of bed. Changed the turpentine stupes and poultices for frictions with a stimulating liniment. Mixture continued.

March 23.—Tongue furred; bowels confined; urine depositing lithates freely; appetite variable; heart and lung symptoms much improved. Pulse 96, full and firm. Directed a dose of castor-oil to be given, and changed the mixture.

℞ Sp. am. aromat., ℥js. ;
Potass. bicarb., ʒij. ;
Infusi gentianæ, ad ℥viij. ♏

Two tablespoonfuls three times a day.

March 31.—Convalescent. Area of heart dulness measured 2 × 2 inches in diameter; heart's action regular; impulse strong; both sounds normal; no trace of the friction murmur present. Lungs healthy; respiratory murmur restored to its proper vesicular character; percussion note everywhere resonant; voice sounds normal. Appetite healthy. Treatment continued.

April 1.—Discharged cured. Able to resume work.

In conclusion, I think the concurrence of accentuated second sound of the heart and the first appearance of the physical signs of complete consolidation in the affected portions of the lungs worthy of especial note as a clinical fact in the foregoing case.

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

At the meeting of this Society, held on the 12th inst., two interesting papers were read, one by Dr. Wickham Legg, and the other by Mr. Spencer Watson. Mr. Legg's paper was on a "Case of Hæmophilia complicated with Multiple Nævi." The patient was 65 years of age, suffered from epistaxis, to which he had been subject since boyhood, and he had always shown a tendency to bleed from traumatic causes. His mother had died from "loss of blood and dropsy," and one of his sisters and two of his own children suffered from epistaxis. There were also numerous small nævi over the face and various parts of the trunk, which were first noticed twenty-four years ago. He had also suffered for many years from occasional and painful swelling of the joints, especially the great toe, and his attacks of epistaxis were frequently brought on by outbursts of violent temper, to which, from his passionate disposition, he was liable. When seen by Mr. Legg he had been daily suffering from bleeding for a period of six weeks, but had been benefited by the administration of perchloride of iron. The author of the paper said it was difficult to account for the articular affection; but he thought that the coincidence of nævi with the hæmorrhagic tendency confirmed his theory that the complaint was due to a congenital weakness of the vessels, which probably remained permanently in a stage of early formation.

Mr. **Sedgwick** supported Dr. Legg's view of the pathology of hæmophilia. He also referred to cases due to separation of the umbilical cord. Such cases were especially prevalent in America, and most of the infants affected were males. Many cases of hereditary epistaxis showed no disposition to bleed in any other part of the body.

Mr. **Birkett** said he had never met with a case of nævus associated with the hæmorrhagic diathesis, but he thought that the term "nævus" was used rather loosely. Nævus was, in his opinion, essentially a dense fibrous structure, resembling that of the corpora cavernosa and spongiosum, its greater or less vascularity depending upon its blood supply being arterial or venous. He did not consider small nævoid points to come under the head of nævi.

Dr. **Legg**, in reply, said that the cases of umbilical hæmorrhage referred to by Mr. Sedgwick should not be classed with those of hæmophilia. Nor could he agree with Mr. Birkett's definition of nævi, many of which were entirely composed of a congeries of vessels.

The paper of Mr. W. Spencer Watson was on a "Case of Spasmodic Contraction of the Muscles of the Forearm and Hand, treated by Excision of a portion of the Median and Ulnar Nerves." A young lady, æt. 19, had been subject to infantile paralysis, when nine months old, since which her right arm and ankle had been contracted at the wrist and ankle. Recently the hand and arm had been the seat of violent spasmodic movement; while want of sleep and exhaustion had given rise to paroxysms of hysteria. As various other remedies, including division of some of the flexor tendons, failed to give any permanent relief, a portion of the median nerve of the elbow was excised, with the view of more completely quelling the irritability of the flexors. The operation was successful, and was attended by a reduction in the temperature of the limb. As, however, the deep abductors of the hand and the deep flexors in the forearm kept the wrist permanently contracted, Mr. Watson excised a portion of the ulnar nerve, behind the inner condyle of the humerus. By this means the defective muscles were so perfectly released that the position of the wrist and flexors assumed their natural appearance. This last operation was performed twelve months ago, since which pain and spasmodic movement of the arm and shoulder have been the chief symptoms complained of. The author observed that these operations had been performed on the hypothesis that, although the original lesion was central, the affection had been aggravated by peripheral irritation, Mr. Nunn said he would have preferred simple divsion, rather than excision of a portion of the nerve, in the hope that the irritation causing the spasm might be removed, without permanently disabling the limb. Mr. Hulke alluded to the effect of stretching a nerve, as practised in Germany, and by Mr. Callender, as a means of destroying the conductility of a nerve; and Mr. Barwell had found this stretching of the nerve very successful in a severe case of epilepsy, caused by a neuromatous growth in a stump, following amputation of the shoulder-joint. But Mr. Barwell and Mr. T. Smith seemed to think that less severe measures might have been successful, and that the hysterical symptoms might have been taken into consideration. Sir James Paget defended the view that had been taken of the case by Mr.

Watson, as well as the treatment adopted. He had seen the case, and it was evidently one of infantile paralysis, followed by contraction and wasting of the limb, and after a time, by absolute distortions and shortening. Dr. Adair Mitchell had in some cases adopted the same measures, but, judging from his own experience, he feared the cure in Mr. Watson's case would not be permanent. In reply, Mr. Watson said that his case could not be regarded as one of hysteria; for, among other reasons which he specified, the temperature of the affected limb was as much as 2° F. higher than its fellow, a circumstance which showed considerable expenditure of nerve energy.

◆

MEDICAL SOCIETY OF DUBLIN.

The second meeting of the session of this Society was held on Wednesday, December 6th, in the College of Physicians.

Dr. **Fitzpatrick** was called upon to preside, in the absence of the President. After he had thanked the meeting for the compliment paid him in asking him to take the chair, he said the London meetings were attended by men of the highest position and largest practice; but in Dublin it was a rare thing to see one of their leading men attending to countenance and support the Society by his presence. He regretted that such apathy was shown by the leading members of the profession in Dublin to support the Society, and hoped it would not continue, for if it did, it would be very injurious to its interests. He thought the present state of things showed that they had not in Dublin the same energy that was exercised by the profession in London. (Hear, hear.)

Dr. J. W. **Moore** read notes of six cases of acute rheumatism, in the treatment of which he had used salicylic acid. 180 grains was the total quantity administered in the first case, but the patient on leaving the hospital caught a cold and had a relapse. During the second case, 116 grains were administered, and the patient was discharged well on the 18th day. In the third case, that of a woman, aged 33 years, after three days' treatment by the acid, she expressed herself quite well; 250 grains were given in that case. 400 grains were given in the fourth case, and on the 22nd day of her illness the patient left the hospital well. The patient in the fifth case only remained in hospital a few days, during which 150 grains were administered. There was rapid convalescence in the sixth case, in which 160 grains were administered. In order to estimate the value of a salicylic acid, it would be necessary to compare the cases treated by it with those treated by the old forms of treatment. He would therefore take the cases of ten patients, which were under treatment during a given time in the wards of the Meath Hospital, over which he had charge. The first case was 22 days in hospital; the second 41 days; the third (a mild attack), the patient the subject of mitral valve disease, admitted the 15th day of her illness, 8 days; the fourth, 42 days in hospital (the patient still feverish when he left); the fifth, 26 days; sixth, 34 days; seventh, 42 days; and eighth, 15 days only; the 9th, a fortnight; and the 10th a very mild attack of acute rheumatic fever, yet the patient was in hospital for three weeks. It would therefore be seen that these ten patients spent an average term of 26·6 days in hospital under treatment, while the seven cases (if the relapse in the first was to be regarded as a second case) treated by the salicylic acid, remained in hospital an average time of 12·4 days. Making every allowance in favour of the older methods of treatment, as against the salicylic acid, the mean duration of the stay in hospital was now only one-half of what it used to be. An examination of the clinical charts in the cases he had referred to, showed that under the ordinary methods the average number of days when pyrexia set in was 19·3, while under the salicylic acid it was 4·6 days, so that the symptom of feverishness was one-fourth as persistent in the last-named series of cases as in the first. The striking effect of the salicylic acid was the very speedy relief it afforded to the patient's sufferings; and not only was pain relieved, but the redness and swelling quickly disappeared from the affected joints. With regard to the administration of the acid and the dose, he would give 5-grain doses every hour, and at longer intervals by night. That comparatively small dose, frequently repeated, acted satisfactorily, never disagreed with the patients, and was not objected to by them. The total quantity usually given in the twenty-four hours was 80 grains. No tocsic symptoms were noticed, except a slight singing in the ear in one case. In a case of scarlatina the salicylic acid acted very beneficially on the sore throat; the patient expressed himself better, and became speedily well. As to the form in which the medicine was given:—The powder originally employed in Germany was not given for obvious reasons. The formula adopted for the most part was this: 80 grains of the salicylic acid, 1 ounce glycerine, and 7 ounces of warm water. Of that mixture, containing 10 grains to the ounce, one tablespoonful was given every hour. The formula recommended by Dr. Duffey had also been adopted with success. Salicylic acid and milk was tried, but it sickened the stomach. All the cases he had referred to were cases of acute rheumatism. Dr. Moore said the conclusions to which his limited experience of salicylic acid had led him were that the acid appeared to be a valuable—almost a specific remedy in the treatment of acute rheumatism; that with the administration of moderate doses, 5 grains given every hour, a marked amelioration of the symptoms usually occurs; the temperature and pulse fall, the pain and swelling subside, and the patient sleeps. Doses of 5 grains each were sufficient to produce an impression on the disease. If the acid was pushed too far, it sometimes caused singing in the ears, &c. Under these circumstances, its administration should be temporarily suspended. To prevent relapse the acid should be given in small doses, at gradually lengthening periods. He would conclude his paper in the words of the paper recently published by Dr. Coates, of Belfast: "There can be no doubt that a medicine which cuts short the disease, as I believe no doubt it does, must render the liability to these complications less."

The **President** had no experience of the use of salicylic acid, but of all the varieties of treatment it appeared to him to be the most efficacious; it was the alkaline, of course, after looking to the cardiac complications.

Dr. **McKay** had treated a third attack of acute rheumatism with salicin. The effect was certainly marvellous. He gave half drachm doses four times a day, and while the previous attacks lasted about six weeks, this last attack was quite cured in a fortnight. He used nothing but salicin. There was in the case no cardiac complication.

Dr. **Grimshaw** had prepared abstracts of sixteen cases of acute rheumatism, fourteen of which had been treated by salicylic acid and two by salicin. There were about six other cases of which he had notes, and he was glad to say his experience confirmed altogether that which Dr. Moore had detailed in his paper. His (Dr. Grimshaw's) observations confirmed altogether Dr. Moore's, and there was no doubt of the rapidity of the action of the remedy, and he found in most of the instances that all the febrile symptoms and pain were gone in five or six days, and in other cases before that time. In only one case did he find salicylic fail to act. That case, however, ran six weeks, and the patient recovered very slowly. He usually administered 10-grain doses every two hours, in the same form as Dr. Moore. There was some doubt as to whether the acid was of as much value in cases of cardiac complication. He had also used the acid in enteric fever, and found it beneficial.

Dr. **Henry Kennedy** called attention to the two papers recently published by Sir Wm. Gull and Dr. Sutton, in which by the mint water treatment convalescence was restored in eleven days. There could be no doubt of the accuracy of the details of those papers. He also referred to a paper published by Sir Dominic Corrigan, in which he advocated the use of opium in these cases, and where the cures are as quick as some of the cases that Dr. Moore had detailed. Besides that, there had been a case brought forward in London where there had been untoward effects from the use of salicylic acid, and when the acid was withheld the bad symptoms disappeared. The evidence in favour of the acid was certainly strong, but with such facts as he had mentioned, they must, he thought, be slow in coming to conclusions about the specific effects of salicylic acid as a remedy.

Dr. Duffey observed that the case of poisoning commented on by Dr. Kennedy had been proved to be due to the use of impure salicylic acid. The acid used in the case was found to contain a quantity of carbolic acid.

Dr. Moore, in reply, observed that there was no special examination of the urine in the cases, except to see the colouring action of the ferric chloride solution, where the acid was not used. The perspiration disappeared rapidly. With the subsidence of every symptom of feverishness and swelling of the joints—coincidentally with that there was a decided increase of urinary secretion. With regard to the mint water and opium forms of treatment, he would say that by the use of the salicylic acid, the duration of the treatment was one-third shorter than the opium, and twice as short as the mint-water treatment. He would also say that he was not a believer in the thoroughly specific action of the acid remedy in acute rheumatism; but he thought it was his duty to try that remedy, and he accordingly had done so, and had placed the results as honestly as he could before the Society in the paper he had read. (Applause.)

Dr. J. Magee Finney read the notes of some cases of chorea—which, although not complicated, were markedly typical—where he had successfully employed the treatment recommended by Hammond—strychnia and ether spray. The remedy administered in that way was a most useful one, and it was not difficult to get the patient to take it, as its bitterness could be got over by the use of the various syrups. There was a brief discussion, in which nothing of importance was elicited.

The Society then adjourned.

◆

CLINICAL SOCIETY OF LONDON.

Friday, November 24th, 1876.

Sir William Jenner, Bart, M.D., D.C.L., F.R.S., President, in the Chair.

A CASE OF LEUKÆMIA.

Dr. Goodhart read notes of the following case:—A married woman, æt. 45, at present under the care of Dr. Pavy in Guy's Hospital, came under notice first early in June this year. She had never been pregnant, and menstruation ceased two years ago. Her family history showed no weak strain, neither cancer, rheumatism, gout, or bleeding being known. When about seventeen years old, she had three attacks of rheumatic fever, and since then had been troubled with rheumatic pains and weakness at her heart. Of late she had been weakly, and six years ago had inflammation of the kidneys without dropsy. Her habits appeared to have been strictly temperate. Twenty months before admission she had a boil on her thigh, which bled freely on being opened, and she had lost much blood, and ever since then she had been weakly and pale. After that she had fistula *in ano*, was operated upon and recovered. Then the glands in the neck and axillæ enlarged, and then she had a long attack of "dropsy," which had never quite subsided. The glands had since then gone down again. When admitted she had general anasarca, great pallor, and a distended abdomen, the latter due in great part to a large liver, possibly to some enlargement of the spleen, which, however, did not come below the ribs; and some indefinite lumps in the abdomen, probably due to glandular enlargement in other parts. At first there was no definite glandular enlargement elsewhere. The urine was normal. Temperature normal, and pulse 128. A loud mitral *bruit* was heard at the apex of the heart. The blood was watery-looking, and contained a large excess of colourless corpuscles—sixty colourless to one hundred red. The latter quite normal, but the colourless very small; most of them one-half to one-third smaller than the red globules and granular. She was ordered one-thirtieth of a grain of phosphorus, in the form of a pill, three times a day within a day or two of admission, and she continued this for about three months. During this time the condition of the blood varied much; sometimes the colourless corpuscles were not out of proportion to the red; at others they were ten, twenty, thirty per cent. and more of all the corpuscles in the microscopic field. The colourless globules were sometimes of normal large size; at others, and much more frequently, very small. The blood always remained watery and poor. Notwithstanding the want of improvement in the blood, the patient's general health improved, and this, too, even as the glands in the neck and axillæ enlarged. But the glandular enlargement, though evident on palpation, had never been a marked feature in the case, and was not so now. Latterly the patient has had pericarditis, pneumonia, and epistaxis, but got round from all these attacks, and still remained in better general health than she was. The abdominal enlargement remained much as it was; the liver being very large, the spleen by no means so evidently. Dr. Goodhart remarked that, inasmuch as the case was fortunately still incomplete, the patient being still alive, the exact state of affairs must yet be doubtful—whether Hodgkin's disease alone existed, or splenic leukæmia alone, or both together. The amount of visible glandular enlargement was not great, and the spleen might ultimately prove to be larger than could be diagnosed from the present conditions. But, on the whole, the case seems more probably one of lymphatic leukæmia, and particularly so from the state of the blood, which showed an excess of very small colourless corpuscles, such as had been described by Virchow as occurring in the lymphatic variety of leukæmia. It differed from the typical Hodgkin's disease in the large number of these corpuscles. He had said that the patient had been treated by phosphorus for four months and without any apparent influence on the course of the disease; but he did not bring it forward so much to pit it against other cases treated in like manner as to lay stress upon the variations in the blood found in leukæmia, and to raise the question what clinical significance had white-celled blood. The cases before the Society showed how variable was the condition of the blood, and if one took a still wider range, it would be found that in some cases large white cells were in excess. In some, small white cells, in others the red corpuscles were also of variable shape, and free nuclei were to be found; in others, again, the serum was crowded with granules, and leucocytes were not to be found in excess at all. The importance of this variation in the constituents of the blood was likely to be lost sight of, because the blood was a fluid tissue; but, if the whole blood were imagined as crowded into the space of a single organ, such as the liver, then we might recognise that there was enough difference in the changes classed under a common term (leukæmia) to constitute several separate diseases; and it seemed that, till we were quite sure that leukæmia was only *one* disease, the discussion of the treatment of leukæmic cases by any given remedy might be an attempt to compare likenesses when we should be contrasting differences. It was in special reference to leukæmia in general, not to this or that variety, that these remarks were made, and they bore upon a class of cases which those who saw much of the diseases of children were, doubtless, familiar with—viz., leukæmia in association with splenic enlargement in children, which, under any treatment, got well. He had seen in the last two years six such cases. The average extent of leukæmia being from forty to sixty leucocytes in a field where there should be but four or five; all in children under two years old; and they had all improved under treatment; some with phosphorus, some with iodide of iron, &c. Then, as if to show the close relationship there is between a curable and an incurable leukæmia, another child, ten months old, was seen in an apparently similar state to the others as to its spleen, but without any leukæmia; nothing, in fact, to indicate that it would not do as well as the others had done. The leukæmia subsequently became developed, and it died with purpura and the usual characteristic changes in the liver, spleen, kidneys, &c. From cases such as these it was concluded that leukæmia is either a disease of several stages, of which, perhaps, anæmia of some kind, rather than leukæmia, is the first, and then curable; and such cases as had been narrated in the course of the evening were the more advanced, and, in many cases, incurable, or else, as had been suggested, several distinct conditions had become mixed under a common symptom.

SPLENIC LEUCOCYTHÆMIA.

Sir **William Jenner** read short notes of three cases of this disease treated with phosphorus. The first case was that of a lady, a patient of Mr Fielden, of Shildon, who was first seen by Sir W. Jenner early in June last; she had well marked splenic leucocythæmia. Her morning temperature was natural; the evening temperature was about 100 deg. Fahr. There was frequent epistaxis, and once there was bleeding from the gums. For two years previously there had been chronic follicular ulceration of the pharynx, which had also disappeared, and then recurred. On July 15th, phosphorus in capsules, containing one-thirtieth of a grain of the drug, began to be administered regularly twice or three times a day, the patient having taken *Pil Phosphori* for about six weeks previously. On November 8th, Mr. Fielden reported that the phosphorus capsules had been taken repeatedly for four months, but that the benefit to the patient was inappreciable. The spleen continued to enlarge; the epistaxis still occurred, though at rarer intervals; the night perspirations, though for a time apparently checked, had returned, and the patient had complained of extreme giddiness on movement. The temperature did not vary much, and had never been above 101 deg. During Sir William's absence from town in the autumn, the patient had consulted Dr. Broadbent, who could not speak hopefully of the issue of the case, but had advised steady perseverance in the treatment by phosphorus. Dr. Broadbent had estimated the proportion of the white to the red corpuscles as one to five; but Mr. Fielden had frequently examined the blood and thought the white as numerous as the red corpuscles. The patient had suffered from bilious disorder from time to time, and symptoms of this kind Dr. Broadbent had remarked had "ushered in improvement in his case." For this reason, the phosphorus had sometimes to be temporarily discontinued. More than two doses daily could not usually be tolerated, the patient complaining much of the disagreeable eructation produced by the remedy. The second patient was a barrister, æt. 71; he also had splenic leucocythæmia. On July 1st, 1875, the spleen reached two fingers' breadth below the umbilicus; the notch was at the level of the umbilicus, and the extreme anterior border of the spleen was one fingers' breadth to the right of the umbilicus. The white corpuscles in his blood were extremely numerous. His temperature was 100 deg. On November 2nd, 1876, the spleen was four finger's breadth below, and two inside the level of, the umbilicus. The white corpuscles were as numerous as the red; his breathlessness was extreme; his temperature 100 deg. He had been taking pil. phosphori, gr. iij. three times a day, except for the last week, during which he had taken it only twice daily. He was decidedly worse as to his spleen, number of his white corpuscles, and breathlessness; was losing flesh, looked pale, and was worse. The third case was that of a single lady, æt. 38, whom Sir William Jenner had seen with Mr. John Croft, on May 8th, 1876. This was a well-marked case of splenic leucocythæmia; the enlargement of the spleen having been first observed in the beginning of this year. The symptoms were those usually present in the disease; epistaxis, loss of flesh, sense of breathlessness, languour, weakness, and night perspirations. Her temperature was 99 deg. The blood showed a great excess of white corpuscles. Pil. phosphori, gr. iij. *ter die sumend*, was ordered. The patient, however, continued to grow weaker. Her temperature ranged from 97½ to 101 deg. Having taken the phosphorus pills steadily for more than two months, she died on July 26th, 1876.

DUBLIN OBSTETRICAL SOCIETY.

The second meeting of the session was held on Saturday, December 9th, 1876, the President, Dr. **Darby**, being in the Chair.

Dr. **Lombe Atthill** exhibited a specimen of a Myxomatous Tumour which he had removed from a patient in the Rotundo Lying-in Hospital. Before operating, the tumour, which was attached to the left labium, appeared to be the size of a hen's egg. The patient was a healthy young married woman, and the tumour appeared twelvemonths before admission to hospital, at which time she was pregnant, and before delivery it had grown to the size of a walnut. After labour, the tumour seemed to disappear, but the subsequent history of the case showed that it only partially disappeared. It again increased, this time greatly in size, and completely overlapped the orifice of the vagina. The tumour was smooth, firm, and elastic, and communicated an indistinct sense of fluctuation; so much so that he deemed it advisable to puncture it, but no fluid escaped. At this time he thought he had to deal with a tumour about the size of a hen's egg, but when he began to remove it he had to cut deeper and deeper, and he thought that from the superior surface he had had to go down four or five inches. The depth was so great—so far beyond his sight—that he felt considerable anxiety lest he would cut an artery. He enucleated the tumour with his fingers and the handle of the knife, and not the blade. She had very moderate hæmorrhage at the time of the operation, but on the third day subsequently there was smart secondary hæmorrhage, which necessitated his applying several pluggets of cotton, saturated with chloride of iron. The tumour, when removed, filled his two hands, and he plugged the cavity left by it with cotton. The patient made a good recovery. The left labium was still the size of a walnut, and there was a probability that one day she might have to return to the hospital to have it amputated. The tumour had been submitted to examination under the microscope, and it proved to be one of the myxomatous type of the most gentle kind. The specimen was an unusual one. There was no pedicle to it, and the capsule was very indistinct.

Dr. **Lombe Atthill** exhibited a specimen of a huge mass of epithelioma, after the operation for the removal for which the patient died. The mass projected into the vagina, and he deemed it his duty to amputate the cervix. The operation was an exceedingly difficult one, but he thought, after considerable trouble, that he had got a tolerable healthy structure, and that there would be a probability of prolonging the woman's life for a few weeks. Owing, however, to the cancerous mass growing upwards as well as downwards (was, in fact, mushroom shaped), he found that the wire had caught in one of the folds, and that he had opened the cavity of the peritoneum. There was no hæmorrhage, and no great collapse. He thought it was his duty to leave the patient alone, as such cases were not necessarily fatal. The patient, however, died in about 48 hours. He thought of performing the operation of Marion Sims, but the mass was so large that he never would have succeeded by the operation, and even if it had been performed successfully the woman's life could not have been prolonged to any material extent. The case illustrated the danger of the possibility of opening the peritoneum in endeavouring to amputate the cervix.

The Society then adjourned.

Vital Statistics.—From the Registrar-General's reports we learn that during last week 5,833 births and 3,579 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,254. The mortality from all causes was at the average rate of 23 deaths annually in every 1,000 persons living. The annual death-rate was 24 per 1,000 in Edinburgh, 22 in London, 23 in Glasgow, and 24 in Dublin. In the other large towns the rates were—Brighton 19, Portsmouth 24, Hull 27, Bristol 22, Newcastle-upon-Tyne 19, Nottingham 25, Birmingham 21, Norwich 27, Leeds 26, Plymouth 25, Sunderland 24, Liverpool 27, Leicester 28, Bradford 22, Sheffield 21, Manchester 30, Wolverhampton 26, Oldham 42, and Salford 34. The annual death-rate from the principal zymotic diseases in these averaged 3·5 per 1,000, and ranged from 1·1 in Sheffield, Hull, and Nottingham, to 6·7 and 8·7 in Sunderland and Salford. Measles and scarlet fever were both fatally prevalent in Portsmouth, and the death-rate from scarlet fever was excessive in Brighton, Wolverhampton, Sunderland, and Leicester. Seventy-eight deaths were referred to small-pox, against 65 and 85 in the two preceding weeks; 50 occurred in London, 12 in Salford, 15 in Liverpool, 1 in Brighton, and not one in the other towns.

The Mortality of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were:—In Calcutta 30, Bombay 28, Madras 35, Paris 26, Brussels 24, Amsterdam 29, Rotterdam 26, The Hague 26, Copenhagen 22, Stockholm 23, Christiania 20, Berlin 26, Hamburg 26, Breslau 25, Munich 33, Vienna 25, Buda-Pesth 39, Rome 28, Naples 28, Turin 23, New York 20, and Brooklyn 18. The fatal cases of typhoid fever in Paris were 86, against 103, and 105 in the two preceding weeks. Typhus caused 18 deaths in Buda-Pesth.

Registered for Transmission Abroad.

WEDNESDAY, DECEMBER 20, 1876.

ALCOHOL AND THE LATE ARCTIC EXPEDITION.

Although the late Arctic Expedition has not given that unqualified satisfaction which was reasonably expected, it has at all events furnished fresh and important evidence with regard to a question on which many still entertain some doubt, and in which most medical men have taken great interest. That the use of alcoholic stimulants was of no use, but was actually prejudicial, during exposure to severe and prolonged cold, had been in a great measure proved by the experience of former Arctic voyagers, as well as by experiment, and the teachings of physiology. It is well known that the amount of combustion going on, and therefore of heat generated, in the body, is pretty accurately gauged by the amount of carbonic acid gas exhaled by the lungs. But it has been shown that, instead of increasing the amount of this gas by pulmonary exhalation, the administration of alcohol in large quantities actually diminishes it; while the experiments of other investigators with the clinical thermometer, also showed that alcohol, in tolerably full doses, lowers the temperature of the body. Besides, physiology has long taught us, and the public know from personal experience, that the action of alcohol on the system is essentially that of a stimulus, increasing for a time the vital activity of the body, but being followed by a depression of power and a loss of resistance to cold, which are in proportion to the amount of the previous stimulation.

Hence, if the body has, during this reactionary stage, to endure unusual exertion, or is exposed to great and prolonged cold, the evils resulting from the previous stimulation will very soon show themselves. This fact is a matter of common experience, and is well illustrated by the following experiment. Dr. Richardson placed a warm-blooded animal, insensibly asleep in the third stage of alcoholic narcotism, in a chamber, the air of which was reduced in temperature to ten degrees below freezing point, along with another animal, which had received no alcohol. He found that both slept under these circumstances, but the alcoholised animal slept to die. The former awakens cold and uninjured, in a warmer air, even if the degree of cold be carried lower, and be continued for a long time.

But the large amount of testimony that has been already accumulated, especially ftom the experience of whalers and former Arctic voyagers, is of still greater value than conclusions drawn from experiments, and is in itself sufficient to show the fallacy of relying upon stimulants as a means of withstanding the intense cold experienced in the Arctic regions and other Northern latitudes. The guides of Chamouni and the Oberland discard as hurtful the use of spirits when out on their winter expeditions amid the Alpine snows. Capt. Chadwick, in his evidence before an Admiralty committee, deposed that among the American whaling fleet there was not one in twenty in which spirits were allowed. According to Dr. Parkes, the Russian army on their march in very cold weather, not only use no spirits, but no man who has taken any is allowed to march owing to his great liability to frost-bite; and, according to the same authority, the Canadian lumbermen, who spend the whole winter in the backwoods employed upon the hardest labour and exposed to the most intense cold, are allowed no spirits, but have an unlimited quantity of tea. The evidence of our most celebrated Arctic voyagers is of a similar character. Both Capt. Parry and Sir John Franklin opposed the use of ardent spirits during their expeditions; and as far back as 1832, Dr. King, who acted as surgeon during the expedition under Capt. Ross, testified to the superiority of tea and coffee over alcoholic stimulants. Capt. Parry's opinion on the subject was very decided. Spirits, he said, are certainly not necessary; they let the cold in instead of keeping the cold out, and they do sailors harm. There may be cases, he adds, of exhaustion, where spirits are needed as medicine, but as an article of diet they do ten thousand times more harm than good. Similar testimony is furnished by Capt. McClure, who explored the North West Passage; by Capt. Kennedy, who conducted one of the relief expeditions sent out in search of Sir John Franklin; by Dr. Hayes, the surgeon of Kane's expedition; by Sir John Richardson, who, in 1847, undertook an overland journey through Rupert's Land and the Arctic seas; and by the veteran Dr. Rae, who very recently addressed a letter to one of our medical contemporaries respecting the injurious effects of alcohol in cold climates.

We have, as briefly as possible, run over the more important evidence of former Arctic explorers with the view of showing that the case against alcohol is not merely supported by the testimony of a few teetotallers attached to the late expedition under Sir George Nares, or even by that of a few prejudiced leaders of former expeditions, but by the unanimous opinion of all those who have had to endure the cold and hardships incidental to an Arctic winter, and whose character and position entitle their testimony to be received with unreserved confidence. The cold, however, that was experienced during the late expedition was greater than ever before registered, and therefore the evidence of those total-abstainers who accompanied this expedition may be considered as clenching all that which had been formerly obtained on the subject. The lowest degrees of cold hitherto noticed have been 45 deg. below zero, by Captain M'Clure in 1852; 50 deg. below zero, by Captain Ross in 1820; and 63 deg. by Sir E. Belcher in 1853: whereas the extremest degree of cold experienced under Sir George Nares, was 104 deg. of frost, or 72 deg. below zero. Moreover, not only was the cold the severest that has ever been known, but the sledging expeditions, during which the climax of cold weather was reached, were conducted under circumstances of great hardship, over ground which rendered progress almost impossible, and with a scarcity of medical comforts, which rendered it almost unbearable. Nevertheless, the total abstainers, who formed a part of these expeditions, underwent the ordeal imposed upon them with a success which was truly remarkable, and which must finally set at rest the question of the utility or not of alcoholic stimulants as a means of resisting extreme and protracted cold. It appears that the total abstainers, who went out with the last expedition, were six in number, viz.: William Malley, Adam Ayles, William Gore, Joiner, and Self, of the ship *Alert*, and Henry Petty of the *Discovery*. Now it is said that the only men who did any sledge-travelling worth speaking of, and who, it is further stated, enjoyed a perfect immunity from scurvy, were Malley, Ayles, Joiner, and Self; but,—and this a point we shall hereafter allude to—two of these men took to drinking during the toilsome sledge-journeys. On the termination of the sledging duties, the abstainers found that they had surpassed the other portion of the crew in the number of days sledging performed. On this occasion Ayles had been out 110 days, and Malley 98, and according to the evidence of the latter neither of these men were attacked by scurvy, but enjoyed good health, and were only weakened by their arduous duties in sledging work. Ayles and Lieutenant Aldritch were among the party of nine men which, during a sledging excursion, was so attacked by scurvy that all except Ayles and Aldritch were in a helpless condition. The latter officer was not a total abstainer, but he is described as being next to one, and as having diluted his rum more than any other member of the expedition. Henry Petty, captain's steward on board the *Discovery*, was the only total abstainer on board that ship. He was sledging sixty days in all, and his work was such that he was more exposed to the cold than any man in the ship. He nevertheless enjoyed good health, and both slept and ate well during the whole of the expedition.

When Dr. Colan's official report appears we may see reason to supplement or slightly modify the above statement, but on the whole we do not for a moment question the trustworthiness of the information that has as yet reached us, especially as it, as we have seen, agrees with the evidence which has been furnished on the subject by former Artic explorers. It may, then be considered as settled that indulgence in alcoholic stimulants during prolonged exposure of the body to intense cold is unnecessary and actually injurious. This is the legitimate conclusion that may be drawn from such facts as those to which we have just drawn attention. Other questions, however, have been raised, and other conclusions have been drawn in connection with this subject, that require more careful consideration, and of these we hope to take some notice on a future occasion.

MR. KNOX ON FOREIGN DIPLOMAS.

The judgment which Mr. Knox gave a few days ago in the case of the East London Medical Defence Association *v.* John Hamilton, of 404 Oxford Street, is so remarkable as to call for the serious attention of all who are interested in the suppression of irregular practitioners.

The defendant was summoned by Dr. R. Spencer Carpenter, on behalf of the above Association, for unlawfully pretending to be, and using the name and title of, doctor of medicine. The case against him was shortly this:—Medicine was proved to have been purchased at the defendant's shop. The name of Dr. Hamilton was about his premises, and he called himself Dr. Hamilton. His name was not on the "Medical Register," but he exhibited a diploma in his window, representing himself as a graduate of the Metropolitan College of New York. Neither, however was this diploma shown to be genuine, nor did it appear that the defendant had received any regular medical education. For his defence, Mr. Besley urged that his client had obtained the diploma as above mentioned, and that as long as Dr. Hamilton stated what he was, there could be no intention to deceive the public. His defence, however, was better secured by the construction which Mr. Knox put upon the Medical Act, as the following quotation will show:—

> Mr. Knox observed "that, according to his judgment, a good deal of misconception appeared to exist as to the Medical Act of 1858. The meaning of that Act for present purposes was, not only that a man should not wilfully and falsely pretend to be what he was not—that was not sufficient; a man must not pretend to have a right to any of the titles and qualifications recited in the 40th section of the Act. Such pretence apart, any private person might, without peril from the Act, prescribe for and treat any person who might be so unwise as to trust his health and life to such untrained minds and unskilled hands.
>
> . . . .
>
> The whole scope and meaning of the 55 sections of the Act were the protection of the medical profession here, and therefore, the protection of the British public, by distinguishing qualified from unqualified practitioners, and by a carefully-devised system of guarantees, conceived on British forms only. That being so, from the preamble to the schedule only British arrangements are discussed. It was hard to think that when a man holds himself out as a graduate of a foreign university, and trumpeted the fact forth to the world, he could in reason be said to offend against the 40th section. If there was nothing illegal so far as this was concerned in the use of a foreign medical title, what right had the magistrate to inquire whether it was a genuine one, or whether it had been obtained by the merest trickery and imposture? It might be worn by a man who was an ornament to his noble profession, or by the most pitiful quack, whose name was entitled to registration only in the annals of the criminal courts. Such an one might escape free under the Act, but he might be reached by the law of manslaughter or false pretences. That was one of the cases in which he might say he had strained such faculties as he possessed to see his way clear to a conviction, but he could not. The defendant had called himself a New York Doctor, and nothing else. The summons must be dismissed." Nor was the summons merely dismissed, as he would not give Mr. Besley permission to bring the case before a superior court.

We cannot look upon this judgment in any other light than as a complete *exposé* of the weak points of the Medical Act of 1858, and which, unfortunately, will for a long time serve no other purpose than that of increasing the number of unqualified practitioners in this metropolis. We can not find fault with the construction which Mr. Knox has put upon the meaning of the Medical Act, but it is evident that he ruled according to the letter rather than according to the spirit of the law, and that he had under his consideration the actual meaning of that Act rather than the objects for which it was framed. For several reasons, which we cannot now mention, prosecutions under this Act have always been "few and far between," but in future, unless Mr. Knox's judgment be reversed by a superior court, few prosecutors will be found to have anything to to do with these cases. Now the ignorant and credulous masses must, for aught the law can do, be at the mercy of any man who puts the symbol of "Dr." before his name, sports a chemist's shop, sets up a red lamp, and thrusts into his window a foreign diploma, which he may, perhaps, have purchased for a few guineas. He may not have passed any examination, and he may not have received any medical education, but provided he does not pretend to practise on the strength of any British license or qualification and merely makes use of some foreign medical title, he is at perfect liberty, as far as the Act can touch him, to do just as he likes. He "calls himself" a New York doctor, or a Giessen doctor, and so forth, "and nothing else." He may have obtained his diploma "by the merest trickery and imposture," but the Act does not provide against any such contingency, and he is not likely to be summoned for "false pretences," for he will take care, as far as a possible prosecutor is concerned, to pretend to be no better than he is.

It is quite evident that as far as the interest of the British public is concerned, the Medical Act of 1858 is in a great measure a failure, as it neither enables them to distinguish the qualified from the unqualified practitioner, nor can it punish those who are clever enough to evade its provisions.

Nor can we help remarking the contrast between the actual working of this Act and the action taken by the medical profession itself. While the latter are, by projecting a conjoint board, and by raising the standard of medical examination, endeavouring to supply the public with a more highly educated class of practitioners than that now in practice, our judges and interpreters of the law allow that men may practise medicine who have no other guarantee of their professional qualifications than that presented by some foreign and often worthless diploma.

◆

Notes on Current Topics.

The Anti-Vivisectionists in Dublin.

It will be recollected that a wicked attempt was made by the anti-vivisection fanatics of Dublin to check the flow of public charity towards the Hospital Sunday Fund, by printing and posting throughout the city a large placard, in rhyme, which falsely stated that vivisection was practised in Dublin hospitals. This statement having been proved to be absolutely untrue, and it having been stated that the committee of the Anti-Vivisection Society knew it to be so when the placard was issued, and an official of the Society for the Prevention of Cruelty to Animals having written to the papers to repudiate any connection on the part of that Society with the anti-vivisectionists—the committee found it necessary to eat their own words and admit that the statement in their doggrel placard was false. About the same time the hon. sec. of the society issued a circular to the members of the medical profession in Dublin, in which it was requested that the recipient would state whether he did or did not desire the abolition of vivisection. Such an inquiry was reasonable, though it could hardly have been expected that any considerable number of doctors would express an opinion on the subject, or reply to it at all. But to force from the profession an answer *pro* or *con.*, the letter wound up with a statement that it was intended to publish the names of those who expressed themselves favourable to the views of the anti-vivisectionists, and that *every one omitting to reply* would be noted as a vivisectionist, and, therefore, in the eyes of the abolitionists, a villain of the deepest dye. This piece of impertinence evoked, as might be anticipated, a great deal of indignation in the profession, and we suspect that Miss Swifte's correspondence of the next few days was not of a suave or complimentary nature. The following week the committee held a meeting and published a report of its proceedings in *Saunder's Newsletter*, which report contained the statement that "several of the leading physicians wrote in answer to the circulars, expressing themselves strongly opposed to vivisection."

Feeling some doubts, derived from intercourse with the profession in Dublin, as to the correctness of this statement, the Editor of the Medical Press addressed to Miss Swifte the following letter :—

"Medical Press and Circular,
"23 Ely Place, Dec. 4, 1876.

"The Editor presents his compliments to Miss Swifte. Having observed in *Saunder's Newsletter*, of the 3rd inst., report of meeting of Committee of Society for Abolition of Vivisection, in which it is stated that 'several of the leading physicians wrote in answer to circulars, expressing themselves strongly opposed to vivisection,' the Editor will feel obliged if Miss Swifte will be good enough to inform him of the names of the gentlemen who have so expressed themselves. The Editor would be specially anxious to know the exact terms in which these gentlemen conveyed 'strongly' their views, and—if it be not overtaxing Miss Swifte's kindness—would feel much obliged if she could state

"*a.* The number of circulars issued to the medical profession on the subject ;

"*b.* The number of those who expressed themselves as in favour of the abolition of vivisection ;

"*c.* The number of those who either returned no reply, or else declined to state their views.

"The Editor trusts that he may be excused trespassing on Miss Swifte's time, but thinks it right to observe that if Miss Swifte declines or omits to furnish the information which he asks, he will consider himself entitled to assume that no 'leading physicians' have expressed themselves in favour of abolition of vivisection."

In reply to this letter, Miss Swifte wrote that she could not afford the information asked for without consulting the committee, which would meet on the 13th inst. We have since received the following letter :—

Whitechurch Lodge, Rathfarnham,
Dec. 14th, 1876.

The Hon. Sec. of the Irish Society for Abolition of Vivisection presents her compliments to the Editor of the Medical Press and Circular and begs to enclose a resolution passed by the committee of that Society yesterday.

Resolution.—In reply to a letter from the Editor of the MEDICAL PRESS AND CIRCULAR, the committee of the Irish Society for Abolition of Vivisection, resolve—"That, inasmuch as several gentlemen of the city had, in their replies to a letter sent them from this Society, intimated the probability of persecution (*sic*) as the result of the publicity of their names, the committee are not prepared to put their friends in this position.—Dec. 13th, 1876."

We beg to point out that the information which we requested could not possibly have involved the committee in any legal responsibility, because we only wanted the names and the expressions used by those gentlemen—if such there might be—who were stated to have expressed themselves "strongly" in favour of Miss Swifte's views. Surely no action would lie for the publication of such names, or of the statistics of Miss Swifte's canvass. The resolution is plainly a lame excuse for not answering questions to which, probably, no answer can be given, except one which would prove the falsity of the published statements of the committee. To be plain, we don't believe that any number of leading physicians in Dublin expressed themselves as they are represented, but, on the contrary, we believe that the reply of the profession to Miss Swifte's circular was a unanimously indignant refusal of information.

The Goverment and the Anti-Vivisectionists.

THE irrepressible and sensational Jesse is once more in the field, and announces, with a flourish of trumpets, his Phœnix-like resuscitation from the ashes of a society the Vice-Chancellor was called upon to suppress. Once more he advertises himself as the treasurer and secretary of a society for the "total abolition and utter suppression of vivisection, or putting animals to death by torture under any pretence whatever," but "which has no connection with any other." He announces that "the Government has inoculated society with the virus of a moral ulcer, and that ulcer, unless extirpated, must necessarily spread from hospital to hospital, college to college, and school to school, over the length and breadth of the land." In short, that he alone holds the Magna Charta of animals' rights, and without his will and pleasure it shall not be lawful to kick any jackass in the land. This inflated maligner of a humane and honourable profession has had the audacity to interrogate the Home Secretary on the question of licences. He wished to know how many licences had been granted by Her Majesty's Government since the passing of the "Cruelty to Animals Act ;" and he desired to be made acquainted with the names of persons to whom licences had been granted, and whether they would be pilloried in the *London Gazette* or elsewhere. The following reply was sent in answer to this impertinent inquiry :—

"Whitehall, Nov. 28, 1876.

"Sir,—I am directed by the Secretary of State to acknowledge the receipt of your letter of the 23rd inst., and to acquaint you in reply, for the information of the society on behalf of whom you write, that he must decline to furnish the statement requested as to the carrying out of the Act 39 and 40 Victoria, chap. 77, to private applicants. I am to add that the names of holders of licences under the Act will not be published in the *London Gazette*.

"I am, &c.,
"A. F. O. LIDDELL."

The Scurvy and Lime-juice Controversy.

THE "scurvy" dispute on the limejuice question which has raged since the return of the Arctic Expedition will be staggered by the clear and decisive letter from the pen of the intrepid Arctic traveller, Admiral Richards, in the *Times* of Saturday last, and which we commend to the notice of the freshwater scribblers who are struggling to keep up an unprofitable discussion on this question. Fleet-Surgeon R. C. Scott as positively states that :—"In the autumn of 1852, Sir L. M'Clintock and himself were absent, travelling 38 days, and accomplished 222 miles, the temperature ranging from + 28 to + 35 degrees, and they took no lime-juice, and all returned in the best of health. In 1853, Sir L. M'Clintock was away 106 days, and travelled 1,200 miles without a supply of lime-juice, and all returned in the best of health ; while those who had not been away, and who had taken their daily supply of lime-juice, showed less vigour of health. Again, in 1854, Mr. Keabbe was absent 71 days, travelling 863 miles, and took no lime-juice, and no symptom of scurvy appeared among his party. Without in any way desiring to prejudice the value of this agent, it is quite clear then that to something more than the want of lime-juice we must attribute the outbreak of scurvy. The cause was far more likely to be the exceptionally bad weather, the snow and slush, which depressed the vital powers.

Metropolitan Hospital Sunday Fund.

THE annual general meeting of the Hospital Sunday Fund took place on Wednesday last, in the Egyptian Hall of the Mansion House, under the presidency of the Lord Mayor. The meeting was numerously attended by the clergy and supporters of the fund, the chief business being the election of Council, confirmation of alterations in the rules, and fixing the day for Hospital Sunday in the ensuing year. The Lord Mayor, in opening the proceedings, expressed his warm sympathy with the object, and his sincere desire to promote it and serve it to the best of his abilities, and hoped that in the next year it might prove more successful than on any previous occasion. The Rev. Canon Miller moved the adoption of the laws, as revised by the Council, and explained that amongst the chief alterations were, that those hospitals and dispensaries only which were managed by a committee duly constituted, and which produce their printed reports, with balance-sheets duly audited for the last three years, should be allowed to participate in the fund. That the Council should be authorised to recommend, through their secretary, on the application of the contributing ministers and others,, in-patients and out-patients to the several hospitals and dispensaries sharing in the "Hospital Sunday" collection ; but their recommendations should be equal to half the number only of what might be claimed by annual subscribers whose contributions in the the aggregate should represent a sum similar in the award made out of the "Hospital Sunday Fund" to the respective hospital or dispensary. The necessity for some modification of this rule became obvious, as the increased demand for letters must have swamped certain hospitals ; those, for instance, for the treatment of consumption, like Brompton and Victoria Park, where the demand fo admission, as a rule, exceeds the accommodation, and cannot by any possibility engage to receive an unlimited number of letters from any source. The re-election of the Council, with the substitution of three names for those who had been removed by death or other causes, was moved by Mr. S. Morley, M.P., and in so doing he eulogised the work of the Council, and recommended the meeting to request it to continue its services. Bishop Claughton, on moving the next resolution, expressed himself satisfied with the work done, and gratified to find that the fund had taken a firm hold on the public mind. The Bishop of London (he said) after a careful consideration of the convenience of the clergy, had fixed the 17th of June, the third Sunday after Trinity, for the collection of 1877, and the Chief Rabbi believed that the 16th of June would in every way suit the Jewish congregation, and that every effort would be made amongst them on behalf of the medical charities of the metropolis. We were not a little amused last week to find a medical contemporary apparently awaking from a slumber over the Report of the Distribution Committee, given in our columns some months ago, but which it appears has only just attracted the notice of the editor, and who in a tone of injured innocence asks his readers to join in a condemnation of the treasurer for having "only now authorised a distribution of the fund," and proceeds to say, "*some of the amounts have not yet been received.*" As our readers have been made aware, the fund was duly distributed early in the month of August, and it is therefore unlikely that any institution can have complained of not having received its accredited share of the Hospital Sunday Fund.

Erasures from the Medical Register.

In consequence of the magisterial decision on the legality of foreign diplomas, in the case of the quack "Dr." Hamilton, about which we have expressed our opinion in another column, we understand that the General Medical Council intend to erase the names of Henry Pointer Kirk, Old Bradford, Notts; Thomas Richardson, Millom, Cumberland; and Caleb Henry Yemans, of Bermondsey, from the *Medical Register*. These gentlemen, by some unexplained means, obtained admission to the columns of the *Register*, and were in consequence a source of strength to Hamilton in his defence. The Metropolitan College of New York has long since ceased to exist in consequence of corrupt practices, and this case having caused attention to be drawn to the names before mentioned, they will be struck off in future editions of the work.

The New Registrar of the Medical Council.

Before the publication of our next, the new Registrar of the General Medical Council will have entered upon his official duties, and we wish him every success. It is true they are not of a particularly arduous nature, and we have no doubt that if he be a man whose habits are of an industrious turn, it will be some time before he is able to accustom himself to his new sphere. Still, halving one's labour, and increasing one's pay, is not a matter which usually leads to qualms of conscience, and we have no doubt that Mr. Miller will, under the circumstances, be able to transfer his thoughts from school duties to the Registration of Diplomas without very much difficulty. A good deal of noise has been made about the appointment being given to a non-medical man on the retirement of Dr. Hawkins. On this point it is too late for protestation, and we are not inclined to join in the cry; still, we much regret that none of the medical candidates for the post were considered equal to those of the gentleman appointed. The decision having been delegated by the whole Council to Drs. Acland, Quain, Aquilla Smith, Andrew Wood, Pitman, Humphry, and Simon, comprising the Executive Committee, we are not justified in questioning the verdict of such a body of gentlemen, but are content to leave it where it is.

Treatment of Phthisis.

In looking through the very excellent work which Dr. Austin Flint has written on phthisis, and which is based on a history of 670 cases, we were struck with the propriety of one or two of the therapeutic agents which Dr. Flint strongly recommends in the treatment of this disease, and which are by no means so much appreciated as they ought to be. We allude to active out-door exercise and a liberal allowance of stimulants. Change of habits, he observes, from the in-door and sedentary to out-door and active, is more favourable than any other hygienic measure. He has also seen many cases in which alcohol in large quantities seemed to do good, and he says he has seen no instances of bad moral effects from the habitual use of stimulants in phthisis. He has seen cases where as much as a pint of whisky has been taken with benefit daily by a girl of eighteen. Dr. Flint is not very partial to medicinal treatment, an opinion which is shared by Dr. H. Bennet and other English writers; and he observes that in many of the instances in which the arrest of the disease, partial or complete, took place, there was no medicinal treatment worth mentioning. He is also of opinion that the benefits derived in a large proportion of cases from change of residence are due more to incidental circumstances than to any climatic agency. The great efficacy of active out-door exercise, when it can be taken, is too well known to require any comment from us; but the propriety or not, of giving stimulants is another question, especially at a time when total abstinence is so thrust upon our attention both in health and disease. We certainly should not like to administer whisky, even to a Scotchman, in the heroic doses above mentioned, but the evidence in favour of a liberal allowance of some spirit, or of some malt liquor—such as Guinness's stout—in some forms or stages of phthisis is too strong to be easily disposed of. We can call to mind several instances in which the free administration of alcoholic stimulants has had a marked effect in retarding the progress of phthisis, and no doubt there are many practitioners whose experience has led them to form a similar favourable opinion of them. *Apropos* of this question of the utility or not of spirituous or malt liquors in phthisis, it has been supposed that publicans are peculiarly exempt from this disease. Many years ago, Dr. Atkinson, physician to the Wakefield Dispensary, published some observations on the "Comparative Exemption of Publicans from Phthisis," in which he showed a general mortality in the above town among adults, from phthisis, of rather less than 1 in 3, and in publicans 1 in 12½. "Now," he says, "allowing great latitude for mistakes, still the mortality by phthisis in publicans is comparatively small. What a more extensive investigation would prove it would be difficult to say, but there is here sufficient to demand further inquiries." It is, moreover, well known that the heroic treatment of consumption recommended by Sydenham consisted chiefly in horse exercise, while a more recent writer, Dr. Robert Hull, strongly relied upon a liberal diet, consisting of beef-steaks and porter, and discarded all medicinal means.

Infants' Feeding Bottles.

In the *Boston Medical Journal*, Dr. Emerson draws attention to the mischievous consequences often arising from this method of feeding infants. "There is a point," he says, "which I wish to allude to, namely, the great habit among the rich and the poor of using the nursing-bottle with the flexible tube. It is an invention of which Herod might have been proud. It is always in the baby-waggon and the crib, in hot sun or close air. The child falls asleep with the nipple in its mouth. The mouth is usually never washed; the bottle and tube are, 'with scalding water and soda,' so the mothers say, if you ask. Smell it, and see what you think." There are few of our readers engaged in general practice who will not be able to endorse these remarks, and also have not frequently suspected that many of the ailments they have been called upon to treat in this class of patients have been caused or aggravated by the abuse of these bottles. In some respects, the principle of their construction—especially of the nipple and elastic tube—is good. But the chief objections to their use consist in their leading parents to habits of uncleanliness, and into the temptation of giving infants, of perhaps only a few months old, a larger quantity, or a coarser kind of food, than they are able to digest or assimilate. The bottles often get into a filthy condition, and their contents become acrid and rancid; and this circumstance is alone sufficient to give rise to indigestion, acidity of the stomach, flatulency, colic, diarrhœa, and various other complaints, the real cause of which not only continues from day to day, and from week to week, but, unfortunately, often escapes the notice of the medical attendant, who goes on prescribing drug after drug, and all to no effect, when a little attention to the preparation of its food would be alone sufficient both to cure the little patient's ailments, and prevent a future attack. Then, again, it is to be remembered how constantly the child is plied with food, whether it wants it or not, "just to keep it quiet," and allowed to suck at the empty bottle, and fill its stomach with wind, until its cries and sufferings, or its own instinctive aversion to the bottle, at last stops the officious and injurious treatment of its mother or nurse. From a close observation we have given to this subject, we are convinced that half the infants brought up by hand, even among the better classes of society, fall victims to improper feeding, although from the apparent attention that is given to the child, and owing to the tricks of nurses, the attention of the mother, and even of the practitioner, himself, is often diverted from the original cause of their premature death. We have dwelt upon this subject, because we think the family doctor is frequently not so watchful as he ought to be with regard to the manner in which his little patients are fed, the regularity with which they are fed, the quality and the quantity of food that is provided for them, and the kind and condition of the utensils from which the food is taken.

The Colorado Beetle.

The Board of Customs has just issued an order to the custom officers of the several ports in reference to the Colorado beetle. The order is accompanied by a sketch and description of the insect. A previous order of the Board had directed the examination of all potatoes brought from North America, with a view to prevent the introduction of the beetle into this country, and the present order instructs the officers of customs that, in addition to the precautions to be taken under the order referred to, "they are, especially during the months of August and September, to look for and destroy any beetle answering the description given, which they may find on board vessels or on wharves, quays, sheds, or on packages landed from vessels, and they are to encourage other persons to do the same." The insect is thus described:—"The colour is yellow, with black spots on the fore-part, and ten black stripe, five on each of the wing covers. It is somewhat like a large ladybird, but is rather longer in shape, and is also striped, which no species of the ladybird is."

The Originator of the Banting System.

In our last we gave a short obituary notice of the late Mr. Wm. Harvey, F.R.C.S., with a hasty sketch of his researches on, and additions to, our knowledge of aural pathology. In justice to the memory of the deceased, we ought to add that he initiated the Banting system of treatment for corpulence, although, from the fact of Mr. Banting's name being associated with it, and not our late *confrère's*, credit is often erroneously given for the discovery—if we may so term it—to the patient instead of the doctor; and as a correspondent has drawn our attention to the omission, we are anxious that the real facts should be known.

Sanitation v. Explosion.

The proceedings of the Castlebar Guardians, reported in a local paper, supply us with a rich illustration of the relative value at which an Irish Board of Guardians assesses sanitation, and the pleasure of a little quiet arrangement of their own. The Explosives Act has just come into operation, having been passed in 1875, for the protection of the public against such a catastrophe as the Regents Canal explosion. It puts restrictions on the carriage and storage of dynamite and large quantities of gunpowder, and is an excellent piece of legislation in its way. It is, however, not particularly suitable to the town of Castlebar, where a few canisters of fowling powder in the local mart is probably the sum total of the explosives, an amount of material scarcely requiring the surveillance of an inspector. The Board of Guardians, however, includes amongst its members two gentlemen named Larminie, and, by way of coincidence, it happens that a Mr. H. C. Larminie was, with great alacrity, appointed inspector of explosives for the City of Castlebar, at a salary of £20 a year; but the Local Government Board are obtuse enough not to be able to discover the functions to be discharged by that officer, or any authority in the Act for his appointment. Our only concern with the matter is to observe that the Castlebar Guardians—whose anxiety lest Castlebar might suffer a volcanic fate is so praiseworthy—can only afford for its sanitary officers half the salary of its explosive inspector. No wonder that such caution animates the Board, for we observe that on the day to which our report refers there were present six guardians, of whom two were Larminies.

Dr. Winslow's "Spiritualistic Madness."

It is not generally known that "spiritualism" is one of the principal causes of the increase of insanity "both in England and America," and especially of that desponding and melancholic type known as "religious insanity." If such be the case, Dr. Winslow's interesting pamphlet has not been published before it is wanted, as the public cannot be too soon apprised of the risk they incur in allowing themselves to be led astray by this great delusion of the nineteenth century. So prevalent is spiritualism, and so baneful has been its influence in America, that we are informed that nearly ten thousand persons having gone insane on the subject, are confined in the lunatic asylums of the United States. This seems to us almost incredible, and we think there must be some mistake in the reports from which Dr. Winslow has derived his information. A large portion of the pamphlet is devoted to an account of the various forms of fanaticism, religious epidemics, demonomaniacs, &c., which prevailed centuries ago; and although all that is pretty familiar to the profession, the general reader also will see in the pages before us, that this spiritualistic mania is no new thing. "The possession of our tables by unseen spirits, and our slates by invisible writing are simply resuscitations, under another form, of the beliefs which prevailed epidemically in the Middle Ages."

With regard to the relation of spiritualism to insanity, the upholders of that belief maintain that their doctrine is unable to produce mental alienation, but on the other hand is a preservative against it. This is of course an opinion in which no medical man would join, at the same time we doubt whether it can be truly said that spiritualism is one of the principal causes of the increase of insanity. In most of the cases where people have gone mad on spiritualism, there must have been a strong disposition to that disease hereditary or acquired, and we feel confident that unless this predisposition exists, all the spiritualism in the world will not lead to insanity. We feel quite certain that were Dr. Johnson now alive he might be a believer in spiritualism, but that he would never have become insame. We know that Mr. Serjeant Cox, and several other eminent men are more or less believers in spiritualism, but we feel equally certain that neither Mr. Cox, nor Mr. Wallace, nor Mr. Crookes will, on that account become inmates of a lunatic asylum. A strong pre-occupation, however, of the mind with such questions as spiritualism, gives the direction which the insanity may take, or may act as an exciting cause, in the development of a disease to which the individual is already strongly disposed. All the inflammable materials are ready at hand, and spiritualism may be the spark which makes them burst out into an open flame. It is a well-known fact, says Dr. Winslow, that in America the mediums become haggard idiots, mad, or stupid; and it is stated in an American journal, that "not a week passes in which we do not hear that some of these unfortunates destroy themselves by suicide, or are removed to a lunatic asylum. The mediums often manifest signs of an abnormal condition of their mental faculties, and among certain of them are found unequivocal indications for a true demoniacal possession." We should say, however, that these mediums do not merely manifest signs of abnormal mental action, but that an abnormal condition of their mental faculties and an extreme nervous excitability lie at the very foundation of the phenomena with which they are said to be gifted. Nevertheless, view it in any light we please, as a cause or simply as a manifestation of insanity, there can be only one opinion as to the baneful influence which a belief in this absurd creed will have upon society if it is allowed to go unchecked, and therefore we think that the wide circulation of such a pamphlet as this will go a great way towards stemming the tide of superstition, by which a portion of society is at present overtaken.

Anæsthetics.

With a view of collecting precise data relative to the effects of chloroform and ether, the Surgeon-General of the United States Army has issued a circular directing medical officers to record, during the year 1877, the cases in which recourse is had to anæsthetics, noting the following particulars:—Name and age of subject, nature of the anæsthetic, the quantity used in maintaining anæsthesia, the time required to induce complete insensibility, the time the anæsthetic influence was maintained, the mode of administration, and whether vomiting, excitement, or great prostration was observed during or after the administration.

Camphor in Ill-conditioned Wounds.

Under the name "phenicated camphor," Dr. Saulez describes (*Bull. de Therap.*) a combination of carbolic acid and camphor, which exerts a remarkable influence on wounds of an unhealthy character, as proved by him in the Romarantin Hospital. The acid will take up a large quantity of camphor, but Dr. Saulez ordinarily employs a solution of two grammes and a half of the powder in one of the acid (9 grammes to one of alcohol), which produces a pale yellow oleaginous liquid, in which the disagreeable odour of the acid is no longer to be recognised. It is not miscible with water or glycerine, and in employing it we have first to emulsify it by the addition of a twentieth part of the phenicated camphor either to olive oil or infusion of saponaria.

Smoking Belladonna in Asthma.

Dr. Reeves states, in the *Melbourne Med. Record*, that smoke derived from the leaves of belladonna possesses much more power in cutting short an attack of asthma than that from stramonium. A long pipe is the best means of smoking them, the patient being instructed to draw the smoke deep into the chest. If, when the attack is at its height, he has not the power of doing this, the leaves may be placed in a saucer containing lighted charcoal or wood-ashes, which should be placed on a chair in front of the patient—this chair, as well as his own, being covered with a large sheet, so as to confine the fumes before the leaves are put on the hot charcoal. From two and a half to five grains of the leaves are sufficient when smoked, and from five to twenty grains when burned. If the smoke is drawn deeply into the chest, the relief is immediate, expectoration of phlegm taking place. It is in the spasmodic form of asthma, where there is little or no expectoration, that the greatest relief is obtained, for when the tubes are loaded with mucus the smoke cannot get access to their muscular tissue. The relief is most marked when the remedy is used after the paroxysm has commenced, before the spasm prevents access of air to the smaller tubes and air-cells. Tobacco-smokers do not receive the same amount of relief as others. Temporary headache of a throbbing character may be produced if the leaves are used too freely.

Adulteration in Japan.

In the early part of the year we called the attention of Her Majesty's Government to the serious risk to health, and even life, to which Europeans and natives alike in Japan were subjected on account of the frauds practised there by a set of unprincipled rascals, who made a flourishing trade by copying the labels of all the best known articles of food, medicine, &c., exported from Great Britain, and selling under them, as genuine, dangerous and filthy compounds of their own manufacture. The victims of these frauds, believing they were getting what they paid for, consumed the purchased article, to find, in the majority of instances, that they had simply been cheated by outward appearance. In other cases, however, grave results ensned, and poisioning was not an infrequent occurrence. We are glad to find that our Government took immediate action in the matter by drawing the attention of the Japanese authorities to these practices, which are fraught with so much danger, and as a result the guilty parties were discovered and arrested. Their trial, however, proceeded but slowly, and it was not until the 14th of September that Sir H. Parkes was informed that sentence had that day been pronounced against the forgerers of Dr. Collis Browne's labels and the manufacture of spurious chlorodyne, 40 days' penal servitude having been adjudged to the manufacturers of the compound, end 60 and 50 days respectively to the engraver and the printer of the labels, the profits of the fraud and the stock of counterfeit chlorodyne on hand having also been forfeited, as well as the money received for the engraving and printing.

Sir H. Parkes, through Loid Tenterden, adds that within a month after he had made his complaint, certain "Regulations for the issue of Licenses for Medicine" were published by the Japanese authorities, containing proivsions for the analysis of all prepared medicines, manufactured in Japan, and for the issue of license stamps to be attached to them, and these regulations, he trusts, coupled with the deterrent effect likely to be produced by the penalties imposed in the present case, will go far to prevent the repetition of offences of this class in the future.

The Small-pox Epidemic in London.

The Local Government Board has addressed a letter to to the various boards of Guardians in the metropolis, stating that the increase of small-pox within the last few weeks had rendered the accomodation at the disposal of the managers of the Metaopolitan Asylums District inadequate to meet the requirements, and that it was necessary to specially draw the attention of boards of guardians to the subject. Referring to the action of the guardians of the Westminster Union in opposing the use by the Asylums Board of their hospitrl at Battersea, tne Board thought it right to avert to the fact that on the occasion of tne small-pox epidemic of 1890-71, many of the boards of guardians in the metropolis rendered very valuable service in supplementing the efforts of the managers. They, therefore, deemed it desiragle that guardians should take the matter into srrious consideration, with the view of deciding what provisions they could at once make for the for the treatment of their own cases in some separate buildiug, pending the completion of further arrangements by the managers. In consequence of all the small-pox hospitals of the Metropolitan Asylums District Board being full, the Kensington guardians have ordered an iron house at May Place, Notting Hill, to be fitted up so as to accomodate seventeen patients. This temporary hospital will be ready for use early in next week. Thirty-three cases are reported to have occuured in Kensington during the past four weeks. The Wandfworth guardians have deecided to erect a temporary hospstal in the stone-yard of the workhouse, at an estimated cost of £1000. The building will be completed in a month, and will hold thirty beds. At Fulham it is proposed erect six additional pavilions, which would provide accomodation for about 390 patients, and at deptford to erect sevnn, to provide accomodation for 390 patients. The extra expense is estimated at £16.705, anp at Deptford £25,000. In the Stockwell small-pox hospital 58 patients have been received during the the past fortnight; 13 have died, and 38 have been discharged, leaving 142 treatment. The report from Homerton states that there has been a large increase in typhoid fever. Since the 8th, 151 patients had been received, 5 had died, and 146 remained. During the fortnight 73 small-pox patients had been recieved, 80 had besn discharged recovered, and 14 had died, leaving 143 under treatment. At Hampstead 133 patients have been received during the fortnight, 63 have been discharged, 35 have died, and there remain under treatment 272.

Typhoid seems to be gradually subsiding in Paris, the deaths in each of the last three weeks have shown a gradual decline.

A renal calculus, recently passed by a patient of M. Laborde, was found, on chemical examination, to contain 75 per cent. of peroxide of iron. This singular fact is stated in *Les Mondes* to be quite authentic.

The zymotic rate of mortality was somewhat less in London last week than in the preceding.

"**The Visiting List**" for 1877 (John Smith & Co., Long Acre).—This indispensable Visiting List makes now its thirty-first annual appearance. The lengthened experience of its publishers has brought it as near perfection as possible; and in size, workmanship, and arrangement, it leaves nothing to be desired. It is not less useful to the physician and surgeon, than to the general practitioner, enabling each more effectually to fulfil his engagements with order, method, and punctuality.

A deputation, representing Margate, Ramsgate, and St. Lawrence, three separate unions, waited on Tuesday last upon the President of the Local Government Board, to ask that the Board would grant a provisional order, sanctioning the erection of a hospital on a piece of ground purchased by the three unions for the reception of patients suffering from small-pox. Mr. Sclater-Booth intimated that he would do all he could, by framing a measure, to meet the requirements of the case.

Raw meat is now used to a considerable extent as an agent of hygiene and therapeutics. The following directions with regard to it, from the *Journal de Pharmacie*, may not be without interest. Beef is preferable to mutton. The fat should be removed (one reason being that it may contain crysticercus). The best part is the *room steak* (*sic*). The fibres are here best suited for rasping (*râpage*) in longitudinal direction. This is the best mode of division. Chopping removes from the meat most of its juice, and does not give such good division. The rasping is done with a sharp knife-blade—the sharper the better. The piece of meat should be pretty thick, and of lozenge shape; the rasping can be done on all the facings, in the natural direction of the muscular fibre. The piece should rest, held by one end, on a resistant and slightly inclined plane. The meat is generally reduced to the form of a pill or bolus, which is rolled in powdered sugar or crumb of bread. If it cannot be taken thus, it may be given under the mask of bouillon, which should be cold. One of the best methods is to prepare a thin porridge of tapioca; let it cool till it cannot cook the meat in the least. Then the meat, finely rasped, is introduced into a small quantity of cold soup till the mixture is complete. This mixture has the aspect and consistence of a fine soup of tomatoes. Next the tapioca porridge is gradually poured on this soup, the mixture being constantly stirred. Thus a homogeneous porridge is obtained, in which the meat is so well concealed that no one would detect it unless previously advised of its presence.

Obituary.

DR. LITTLE, OF SLIGO.

We have to record the demise of Dr. William Swayne Little, M.D., which melancholy event took place at his residence on Tuesday week last. When the sad news of his demise became fully known in Sligo, on Wednesday morning, it created the most painful feelings of regret amongst all classes, and the entire town showed signs of universal mourning, and shutters were put up on every shop window, and the blinds pulled down on every private dwelling-house. For two generations the family was connected with Sligo town and county by ties of such a nature as make up the best associations in any community. His father, whom many in Sligo recollect as an able professional man, a genial friend, and an honourable citizen, held the appointment of surgeon to the county infirmary and jail for a period of seventeen years, having been appointed in the memorable year of 1832. His name is still cherished in Sligo, and a tribute to his memory is placed in the hall of the County Infirmary, the scene of his many victories over disease of all kinds. In 1849 the late Dr. Little succeeded his father as surgeon to those two county institutions, having had considerable practice previously as a dispensary doctor in Athlone and Headford, county Galway. During his connection with the County Infirmary, his skill as a surgeon was acknowledged to be of no mean order. Besides the post of surgeon to the County Infirmary and jail (both appointments being joined by Act of Parliament) the late Dr. Little held the office of consulting and visiting physician to the District Lunatic Asylum. How he discharged the duties connected with this important post can be inferred from the fact that at a meeting of the governors, held on Wednesday last, the following resolution was adopted:—"The governors of the asylum, having heard with great regret the death of Dr. Little, who for upwards of twenty-nine years faithfully discharged the duties of consulting visiting physician to this institution, they beg to offer to his bereaved widow and family their sincerest sympathies in the irreparable loss they have sustained, and they trust that an all-wise Providence may strengthen them in their heavy affliction." Dr. Little enjoyed a very large private practice, and even during the late years of his life, when a debilitated frame made him resign a great deal of it, he was consulted extensively, and his professional brethren were always glad to have his assistance and opinion in all critical cases. Dr. Little possessed a cultured mind and remarkable conversational powers. He was a careful and diligent reader, and all matters relating to or having any connection with his profession he studied with deep interest. In all the pursuits or recreations of life requiring deep thought or a careful exercise of the mind he was proficient, and he had a very wide-spread and judicious acquaintance with modern literature in all its branches. As a member of the medical profession, he was very careful to protect its interests, and he took a pride in defending the county institution he was placed in charge of. He on several occasions reduced to writing and published his opinions respecting many important questions. His pamphlet on the water supply of Sligo was a masterpiece, and he in no small way contributed towards the carrying of the Sligo Improvement Bill.—*Sligo Independent*, Dec. 9, 1876.

Medical News.

Royal College of Surgeons of England.—The following gentlemen were admitted Fellows of this College on the 14th inst.:—

Appleyard, John, M.B., L.R.C.P. Lond., Bradford.
Davies, Francis Joseph, Newport, Monmouthshire.
Deakin, Charles W. S., L.S.A., H.M. Bengal Army.
Fisher, Frederick Richard, L.S.A., Grosvenor Street.
Jackson, George, L.R.C.P. Lond., Plymouth.
Macready, Jonathan F. C. H., Cheltenham.
Odell, William, L.S.A., Hertford.
Tyson, William Joseph, L.R.C.P. Lond., Folkestone.
Verdon, Henry W., L.S.A., Eccles, near Manchester.
Whittle, Edward George, M.B. Lond., Brighton.

One candidate passed in Surgery, and when qualified in Medicine will be admitted a Fellow; and four failed to satisfy the Court of Examiners, and were referred to twelve months' further professional study.

University of London.—H. Franklin Parsons, M.D. (*Gold Medal*), St. Mary's Hospital, has passed the examination in subjects relating to Public Health.

A School of Homœopathy.—Our friends of the homœopathic persuasion having resolved that a school in which their peculiar views may be taught is necessary, held a meeting in London last week for the purpose of propounding the scheme, and inviting subscriptions towards the establishment of both hospital and school. Lord Ebury occupied the Chair, and the Hon. Sec. stated that a sum of £20,000 was needed for the buildings, and £700 as annual income. Towards this, £1,200 in donations, and about £400 a year had been promised.

◆

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

NOTICE TO OUR READERS.—As Christmas day intervenes before the publication of our next, and we are anxious that the compositors should not be at work on our behalf on that day, the publication of the journal will be delayed until Thursday. The half-yearly Index will be given in the following number, January 3rd, 1877.

MILITIA SURGEONS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me to remind those surgeons who have not sent in their returns that it will be impossible for the committee to make out a correct statement' to lay before the Secretary for War, should they not comply with the resolution passed at the general meeting. At present only one-half the number of forms have been returned, and it must be obvious that, unless we are *all* of one mind in assisting in getting up as complete a case as possible, our cause will fail in obtaining that outside support to which it is entitled. We have many promises from M.P.'s, and I trust, with a good case to lay before them, the support of very many more. Isolated attacks upon the authorities have hitherto only led to slaughter in detail; therefore, in this, which is probably our last advance, "let us move forward, shoulder to shoulder."

I am, Sir,
Your obedient servant.
MEMBER OF COMMITTEE, M.S.S.

OMNIA SANITAS condemns himself by his own statement. The fact that only one child was "poisoned by vaccine virus," as he politely terms it, out of 317,081 children vaccinated, is the rare exception which proves the rule.

DR. GOODCHILD, Leamington.—Your letter arrived last week as we were at press—too late for insertion.

THE SURGEONS' WORK IN VOICE-PRODUCTION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Mr. George Dawson, one of England's most popular lecturers, having been prematurely, as it seems, cut off in life by rupture of the aorta, I venture to inquire of medical men whether this gentleman's intensely bad voice-production—necessitating the maximum diaphragmatic pressure—may not have been a primary cause of the local weakness? If it be so, another, and a forcible, proof is afforded that voice-production is the surgeon's work. The tonicity of voice balances diaphragmatic pressure and laryngeal resistance.

I shall be glad of opinions.

Yours truly,
CHAS. LUNN.

MR. COOKSON.—Thanks for the information, we shall doubtless find it useful at some future time.

DR. M.—We will send a representative.

ANXIETY.—We are not in possession of the author's name of the Satire, "Medical Men and Manners of the Nineteenth Century," just issued.

◆

VACANCIES.

Middlesex Third County Lunatic Asylum, Banstead.—Three Assistant Medical Officers. The salaries attached are—£200, £150, and £120, advancing to £250, £200, and £150 respectively, each with apartments and board. Forms of application may be had of the Clerk. (See Advt.)

Carlow Union.—Medical Officer for the Tullow Dispensary District. Salary, £120, exclusive of £20 a year as Sanitary Officer. (See Advt.)

Cancer Hospital, Brompton.—Resident House Surgeon. An honorarium of 100 guineas with board is attached to the office. (See Advt.)

Hospital for Sick Children, Pendlebury, Manchester.—Assistant Physician. Salary, £300 per annum. Applications, with testimonials, should be sent to the Chairman of the Medical Staff, Gartside, Manchester. (See Advt.)

Naas Union, Clane Dispensary District.—Medical Officer. Salary, £125 per annum, exclusive of fees. (See Advt.)

Sussex County Hospital, Brighton.—Surgeon and Assistant Surgeon. Both are honorary appointments. Testimonials to the Secretary.

APPOINTMENTS.

- JOULE, Mr. J. S., a Resident Clinical Assistant to the Hospital for Consumption and Diseases of the Chest, Brompton.
- BENNETT, W. H., Surgical Registrar and Administrator of Anæsthetics at St. George's Hospital.
- BOYS, A. H., L.R.C.P.Ed., M.R.C.S.E., Medical Officer of Health for No 8 Sub-district of the Bedminster Rural Sanitary District.
- CARTER, A. H., M.D., M.R.C.P.L., Physician to the Queen's Hospital, Birmingham.
- LAUTON, H. A., L.R.C.P.L., M.R.C.S.E., Medical Officer and Public Vaccinator for the Third District of the Poole Union.
- LEESON, J. R., M.B., &c., House Physician to St. Thomas's Hospital.
- MORRISH, R. A., M.R.C.S.E., Medical Officer and Public Vaccinator for the Castor District of the Peterborough Union.
- MOXON, W., M.R.C.S.E., House Surgeon to the Birmingham and Midland Free Hospital for Sick Children.
- QUICKE, W. J., L.S.A., Resident Obstetric Assistant to the Westminster Hospital.
- RAYE, J. J. A., L.K.Q.C.P.I., L.R.C.S.I., L.S.A.L., Medical Officer to the Lincoln United Friendly Societies' Dispensary.
- ROBERTS, J. L., M.B., C.M., Medical Officer of Health for the Ruthin Urban Sanitary District.
- THURSFIELD, W. N., M.D., Medical Officer of Health for the Brosely Urban Sanitary District.
- WILLIAMS, R., L.R.C.P.Ed., Medical Officer and Public Vaccinator for the No. 4 or Llaurug District of the Carnarvon Union.

◆

Deaths.

- GAIRDNER.—On Dec. 12, at Northumberland Street, Edinburgh, John Gairdner, M.D., F.R.C.S.E., aged 86.
- MARCHANT.—On Dec. 13, at Tanshelf, Pontefract, Mary Anne, widow of Francis Marchant, M.D., of Hemsworth, Yorkshire, aged 76.
- PLUMBE.—On Dec. 6, at Maidenhead, Samuel Alderson Plumbe, M.D., aged 52.
- PORTEOUS.—On Dec. 8, at Sutton-at-Hone, Surgeon-General H. W. Porteous, Madras Medical Department (Retired List), aged 63.
- SANDERSON.—On Dec. 3, at Musselburgh, Henry Sanderson, Surgeon R.N., aged 83.
- SWAYNE.—On Dec. 9, at Belgrave Road, Dublin, Edward Crawford Swayne, L.K.Q.C.P.I., aged 55.

MIDDLESEX THIRD COUNTY LUNATIC ASYLUM, BANSTEAD DOWNS, Near SUTTON.

The Committe appointed to provide the above-named Asylum, are prepared to receive applications for the undermentioned appointments.

A Senior Assistant Medical Officer.
A Second Assistant Medical Officer.
A Junor Assistant Medical Officer who will also act as Dispenser.

The Salary of the Senior Assistant will commence at £200 per annum, increasing annually by £10 to £250.

The Salary of the Second Assistant will commence at £150. per annum, increasing annually by £10 to £200.

The Salary of the Junior assistant will commence at £120 per annum, increasing annually by £10 to £150 and they will each be entitled to furnished Apartments, Rations, Washing and Attendance. Candidates must be unmarried, be between 24 and 35 years of age, and be duly registered as Surgeons and Apothecaries, and they will have to act under the direction and control of the Superintendents.

All these appointments will be held subject to such Rules and Regulations as the Committe may from time to time determine, and be determinable, by either party, on one calendar months notice.

Printed forms, on which applications MUST be made, may be obtained on written application to the Clerk of the Committee at the Asylum, and the said Form must be returned; duly filled up, together with COPIES of Testimonials, on or before Tuesday, January 18th 1877, and notice will be given thereafter to such selected Candidates as the Committee may desire to see.

All canvassing in person is strictly prohibited, and will disqualify Candidates, and no Travelling Expenses will be allowed.

The successful Candidates will be required to enter upon their duties on Monday, February 19th 1877, or on such subsequent day as the Committee may decide.

By order of the Committee.

Dec. 16. 1876.

THE DENTAL HOSPITAL of DUBLIN.—For the Treatment of Diseases of the Teeth and Deformities of the Mouth, BERESFORD PLACE.

There is now established in Dublin an Hospital solely devoted to the Treatment of these Diseases, which will afford Gratuitous Relief to the Suffering Poor. Open daily from 9 till 10 a.m.

CONSULTING PHYSICIANS.

Thomas Hayden, Esq., Fellow and Vice-President of the King and Queen's College of Physicians in Ireland, and Physician to the Mater Misericordiæ Hospital.
George F. Duffey, Esq., M.D., F.K.Q.C.P.I., Physician to Mercer's Hospital.

CONSULTING SURGEONS.

Edward D. Mapother, Esq., M.D., Surgeon to St. Vincent's Hospital.
Henry Gray Croly, Esq., F.R.C.S.I., Senior Surgeon to the City of Dublin Hospital, Member of the Court of Surgical Examiners, Royal College of Surgeons.

DENTAL SURGEONS.

Mark J. Bloom, Esq.
Francis M'Clean, Esq., L.F.P. and S. Glasg.
John O'Duffy, Esq., M.O.S. Gt. Brit.
J. H. Longford, Esq., M.O.S., Gt. Brit.
Henry Sherlock, Esq., L.R.C.S.I.

As the maintenance of this Institution depends solely upon voluntary contributions, the public are earnestly requested to consider its importance.

Subecriptions and Donations will be received by any member of the Staff, or may be lodged to the credit of J. H. Longford, Esq., Hon. Treasurer, in the Royal Bank, or any of its Branches. Hon. Secretary—John O'Duffy, Esq.

CASE OF MITRAL INSUFFICIENCY, ANASARCA, SOME ASCITES AND HYDROTHORAX, WITH SCANTY AND ALBUMINOUS URINE.—ILLUSTRATIVE TRACINGS.

By C. Handfield Jones, M.B. Cantab., F.R.S.,
Physician to St. Mary's Hospital.

E. P. F——, æt. 19, admitted October 18th, 1875. Had rheumatic fever four years ago; ill on and off the last three years. Her legs were swollen in November, 1874, and are considerably swollen now. Her breath is short; she has orthopnœa. Heart's impulse marked in epigastrium, and also as far as three inches below the nipple. A loud prolonged systolic murmur is heard at fifth space in nipple line, also at xiphoid, and at midsternum, but is very feeble at second right cartilage. This murmur is heard in both backs, is distinctly synchronous with the cardiac impulse at left side of epigastrium. Cardiac dulness is increased to left side and upwards. Pulse weak, small, not quite regular, about 140. Air entering lungs posteriorly pretty freely; small crepitations are heard in left lower back, but there is no decided dulness. Lower depending part of abdomen rather dull. Urine scanty, thick with lithates, contains much albumen. Ordered diet.

Pot. bitart., ʒiij.;
Liq. taraxaci, ʒix. ♏
Capiet cochl, j., minim, *bis die.*

Ammon. carb., gr. iv.;
Tr. digitalis, ♏x.;
Inf. cascarill., ℥j. *ter die.*

Oct. 23rd.—Not much cough, no expectoration. Dulness in middle and lower left back, breathing almost null at lower third of left back; in mid-third inspiration very harsh, and no vesicular breathing; in upper third breathing tolerably good. Fremitus absent in middle of left back, distinct in right. In upper right back breathing fairly good, in lower rather weak, and attended with moist râles. Vocal resonance rather œgophonic. Bowels much confined. Pil. hyd. c. coloc., gr. viij., *h. m.*

25th.—Looks much better; urine pale and clear, not albuminous; quantity, about 30 ozs. Air enters left lung more freely at posterior part, inspiration much less harsh.

27th.—Legs almost quite free from anasarca. Breathing quite full and good in both backs. Pulse 84, regular, jerky. Pt. c. mist., *bis die*, et c. elect. *semel.*

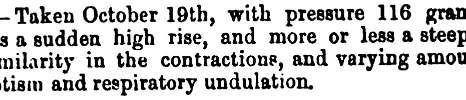
29th.—No dyspnœa in sitting posture, can lie down much better. Pulse 88, small, weak, and regular.

Ferri ammon. citrat., gr. viij.;
Ammon. carb., gr. iv.;
Tr. nucis vomic., ♏x.;
Tr. calumb., ♏.x.;
Aq., ℥j. *ter die.*

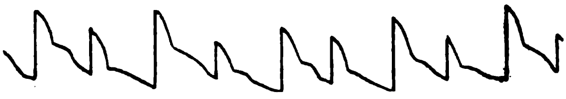
Nov. 3rd.—Murmur persists. Pulmonary second sound at second left costal cartilage is markedly intensified.

6th.—Pulse 87; left radial compressed by 206 grammes both before and after exertion—walking up and down the ward—but the second observation was too long delayed. Tracings taken before and after the exertion were almost the same in form, but a pressure of 60 grammes gave the best tracing before, and one of 84 after. No tracing could be got with 120 grammes. Lips were of good colour, she seemed well. Went out soon after.

Description of Tracings.

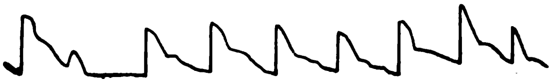


I.—Taken October 19th, with pressure 116 grammes, shows a sudden high rise, and more or less a steep fall, dissimilarity in the contractions, and varying amount of dicrotism and respiratory undulation.

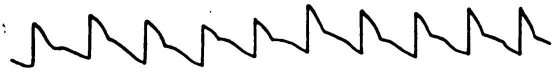


II.—Taken October 27th, when tr. digitalis, ♏.x., *ter die* had been administered nine days, with pressure 112.

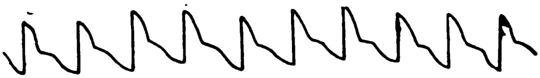
The height of the primary rise is greatly increased, the dicrotism is lessened, the dissimilarity is less, but a weak beat succeeds each stronger in an orderly alternation.



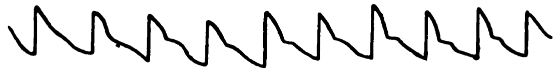
III.—Taken October 29th, with pressure 115, shows notable irregularity and inequality at the beginning and end of the tracing, while the middle part is very orderly and uniform. The rise is much less considerable, probably from the arteries having acquired more tone.



IV.—Taken November 2nd, with pressure 120, shows a much greater degree of uniformity, slight dicrotism, and a slight respiratory curve. Digitalis omitted Oct. 29th.



V.—Taken with pressure 60, while at rest, and



VI.—Taken with 84, after some exertion, shows no notable difference; only the rise in VI. is higher than in V., probably from the heart being a little excited. The rate of the pulse is about the same.

Remarks.—The amount of lesion to the mitral valve in this case must have been serious to have produced so much dropsy as existed on admission. Yet it is certain that it was not simply the regurgitation of blood which occasioned the *remove* of the circulation and serous effusion, but this *plus* debility of the nervous and muscular apparatus of the heart. The organic lesion was irreparable, but not so the functional defect. Under the influence of digitalis, iron, and ammonia, the latter was greatly amended. Examination of the pulse and its tracings will show us how this came to be. The rate of the pulse was at first about 140, it fell in nine days to 84. Now, as Chauveau shows that in acceleration of the pulse the diastole is specially abbreviated, he denies, in fact, that the systole is at all; it results that the ventricles had at first much less time to receive blood from the systemic and pulmonic veins than was the case subsequently. By measuring the width of the eight first periods from the left in I. we find the total space equals 2·7 inches, while in II. the corresponding space equals 3·7 inches. In I. the space occupied by the eight first systoles is 1·1 inch, in II. the corresponding space is 1·35 inch. The eight first diastoles in I. must equal 1·6 inch, and in II. 2·2 inches. In IV. the width of eight periods equals 3·5 inches, that of the eight systoles equals 1·3 inches; therefore, the diastoles must be 2·2 inches. There is, therefore, distinct proof of lengthening of the systoles and diastoles, though the latter are more lengthened than the former. This implies that the ventricles had time to receive an ampler charge of blood, and contracted somewhat more deliberately. No doubt can exist that steady, sustained contraction must impel the mass of blood more efficiently than a hurried brief jerk. The one has hardly started the mass of blood before it ceases to act, the other continues to propel the blood after the onward movement has commenced. In the present instance, and in many others of mitral regurgitation, the prolonged character of the murmur affords considerable evidence that the systole is of good length. Brevity of diastole seems to be in certain cases a sufficient cause of great retardation of the flow of blood from the veins. Sir F. Watson has recorded a case of very rapid action of the heart in which anasarca and hepatic enlargement were produced by the paroxysm. These phenomena imply great venous distension, resulting, it would seem, from the heart's cavities not remaining relaxed long enough to admit a due amount of blood. Another ill result of brevity of diastole is a very serious one—viz., that the heart's period of repose is shortened, so that the power of the organ fails rapidly for lack of time to recruit itself. This is well insisted on by Dr. Fothergill (*vide* p. 4 of his work on the heart). The improvement which ensued in regularity and uniformity of action is well exhibited by the tracings. In II. every other beat is small, the intervening ones being ample. In III. four consecutive beats are quite similar, but the preceding and succeeding show considerable variation. In IV., V., and VI. there is almost perfect uniformity and regularity. Comparison of V. and VI. shows that exertion produced no deterioration of the form of the tracing—a very favourable sign. The circumstance that when the last two tracings were taken the pressure found suitable to develope their form well was materially less than that employed for the first, appears at first sight to imply a lessening of the heart's efficiency. This, however, is not really the case. For a distinction must be made between the *reserve* force of the heart and its *acting*. If the former be increased, though the latter be diminished, the change is favourable. A heart which is acting leisurely and easily may exert much less actual force than one which is struggling against difficulties, but it is in much less danger of being over-fatigued and failing altogether. In some instances of death from asphyxia, the pulse is of very fair force up to within a short time of its final cessation. The height of the rise in eight systoles of I. equals 2·25 inches, in II. equals 3·55 inches. The large excess of 1·3 inch is, I believe, in some good degree a measure of the increased force of the contractions of the left ventricle. For though increased height *may* be produced by sudden impulse, jerking the lever off the knife-edge, and not by true expansion, yet, where there is no other manifestation of the tidal wave than that afforded by the primary rise, it seems to me most probable that the latter does really indicate the amount of expansion. This, if the arterial tension has not lessened, which certainly was not the case here, must depends on the cardiac force. In proof of this, the dicrotism may be appealed to. It is much more considerable in I. than in any of the other tracings. This implies that in the latter the tonic contraction of the arteries was greater than in the first, and, consequently, that the increased height of the rise cannot be due to increased yielding of the arterial wall. This conclusion, however, does not apply to tracings V. and VI. At the date when II. was taken the signs of improvement in the general condition were very marked. In IV., taken six days later than II., the eight first rises equal 2·9 inches, showing a reduction of acting force after the omission of the digitalis, but yet a considerable increase above the original figure in I.

The above results are quite in accordance with modern notions of the action of digitalis, and the history altogether affords a fair illustration of the approved treatment of one of our most common forms of cardiac trouble. I can hardly conceive that measures of a different kind can ever be advisable, even when the action of the heart may appear to be over-excited and excessive. In such instances the heart is almost always labouring under difficulties, either inherent in its own structure, the arterioles, the capillaries, or the veins; and, being overtaxed, has made heavy demands on its fund of reserve force. I should be most reluctant to sanction the employment of aconite in cases of hypertrophy and cardiac uneasiness, whatever the cause of the hypertrophy might be. The local application of ice, and subcutaneous morphia, or belladonna ointment, would be far preferable.

The albuminuria in this case undoubtedly depended on venous congestion, which produced serous effusion in the kidney, just as it did in the areolar tissue and pleura. It will be admitted that it must have been considerable to have had these effects. Its origin in debility, and rapidity of the heart's action, have been already noticed.

In conclusion, I would make the following the moral of the above story: Let rapid and jerky action of the heart be heedfully distinguished from quiet and effective. The one comes of debility and increases it, the other tells of strength and to spare. The one has a show of power only, the latter has it really.

◆

EXCISION OF THE ELBOW (*a*).

By Henry J. Tyrrell, F.R.C.S.I., &c.

Surgeon to the Mater Misericordiæ Hospital, Dublin, and Professor of Surgery in the Catholic University.

I have performed the operation of excision of the elbow eight times, and always with success; but it is not my intention to trouble the Society with a detailed account of my first six cases. I shall dismiss them by saying that in all I made a single straight incision; did not look for or see the ulnar nerve, and put them in a gutta-percha or poroplastic splint, moulded to the back of the arm and forearm.

With my sixth case I had more trouble than usual—erysipelas attacked the wound, delaying the healing of it, and rendering frequent dressing necessary.

On consideration, I thought the splint would be just as efficacious if applied on the front of the limb, leaving the wound exposed; and in future I determined to apply the splint to the front, and not to the back of the limb, as is usually recommended. I also determined to place the limb straight, extended; the bones well asunder, as in that position the wound was most favourably disposed for healing quickly, and that when the skin was healed, or nearly so, I could easily bend the splint and forearm to any angle required, or place the arm, without a splint, in a sling.

Last summer I had two opportunities of putting my views into practice.

Last June, John Harrington, a farm labourer from Croom, co. Limerick, was admitted into the Mater Misericordiæ Hospital, under my care, recommended by my friend Dr. Hartigan. He had caries of the bones of the right elbow, and six sinuses, leading to dead bone, discharging pus copiously, opened on the back and sides of the arm and forearm. The joint was much swollen, painful, and the forearm and hand powerless. His health was satisfactory.

He stated that the disease commenced about eighteen months ago, without any apparent cause.

I excised the bones, and you have the portions removed on the table. A straight incision, five inches long, was made; the ulnar nerve was not seen nor looked for. There was considerable oozing after the operation. A drainage tube was placed in the wound, one end hanging out (the lower). The wound was stitched with carbolised gut; and the forearm and arm, bandaged with a flannel roller (except where the wound was), was placed in a straight anterior poro-plastic splint, extending from a little below the axilla to the fingers. The splint was comfortably padded with cotton wool. The wound was dressed with muslin and tenax, and a few turns of a roller kept both the splint steady and the dressing in its place.

Six hours after the operation smart hæmorrhage came on. The blood came from the upper part of the wound. I removed the dressing, opened the wound, and stuffed it with a ribbon of lint saturated with the tincture of the pernitrate of iron. The bleeding did not recur. After forty-eight hours I removed the ribbon of lint. No other complication took place. On the twenty-second day after the operation the wound was almost healed. I removed the splint, bent it to a right angle, and, without the slightest pain, adjusted the arm in it. Passive motion, &c., was used, and he returned home August 15th quite well.

In this case the mode of dressing was very convenient, for I was able to deal with the hæmorrhage without taking off the splint or disturbing the bones.

Frederick Fokes, aged fifteen, an English lad, was admitted, June the 19th, into the Mater Misericordiæ Hospital, under my care. He stated that he was discharged from another Dublin hospital a few days since. Why, I did not inquire, as I place no reliance on the statements made by patients who leave or are discharged from one hospital and gain admission into another.

On examination, I found the left elbow much swollen and tender to the touch, but not discoloured. On bending the forearm on the arm, crepitus could be felt, but not heard. The pain on flexion was very severe. He said the disease commenced a year ago, and originated in a fall on the elbow.

I diagnosed chronic thickening of the synovial membrane and ulceration of the cartilages of the bones.

I advised resection, and performed the operation on July 17th by a single straight incision, and carefully avoided looking for the ulnar nerve. I was much surprised to find the bones as much diseased as they were. The specimens are on the table.

There was scarcely any hæmorrhage; no vessel required ligatures. Two or three were twisted. The wound was dressed, and a splint applied, as in Harrington's case. The drainage-tube was taken out on the second day without taking off the dressing. On the fourth day after the operation I removed the tenax and muslin, and had the satisfaction to find the wound almost all healed by the first intention.

On the fourteenth day after the operation I removed the straight splint, bent it in the middle, and adjusted the arm to it. In a few days afterwards the patient removed the splint himself, and kept his arm in a sling. He left the hospital August 17th, the wound long since healed, and the forearm rapidly gaining strength and motion. No medicine of any kind was given to this patient, and from the time of the operation he had no pain.

Now, I venture to think that the splint and mode of dressing I advocate is efficient, simple, inexpensive, satisfactory in its results, and most comfortable to the patient.

In conclusion, I would remark that the best way to avoid injuring the ulnar nerve is not to look for it.

◆

ON SYPHILITIC PHTHISIS.

A CONTRIBUTION TO THE DEBATE IN THE MEDICAL SOCIETY OF THE COLLEGE OF PHYSICIANS OF IRELAND.

By Chas. R. Drysdale, M.D., M.R.C.P. Lond., F.R.C.S. Eng.,

Senior Physician to the Metropolitan Free Hospital of London; Physician to the North London Consumption Hospital, and to the Bolsover Street Lock Hospital.

The case of syphilitic phthisis recently brought before the Medical Society of the College of Physicians of Ireland by Dr. MacSwiney, and which excited such a very important debate, has tempted me also to write a short essay on this subject. There has always been a disposition on the part of medical writers to speak of phthisis as being sometimes a product of syphilis; but it must be confessed that, before the time of Ricord no very accurate description of the disease was given, so that even now there are many who altogether deny the existence of such a disease; whilst, again, many observers seem to confuse common phthisis with the special lesion of the lungs which alone deserves the name of syphilitic consumption Examples of both opinions occurred in the debate. Ancient authors, even in the 18th and early part of the 19th century, were far too credulous as to the causation of phthisis by venereal disease; for instance, we hear of pneumonia produced by suppression of a discharge, or venereal phthisis produced by the disappearance of gonorrhœal discharges.

(*a*) Read before the Surgical Society of Ireland. The discussion will be found at page 522.

This over-credulity of our forefathers has led, by reaching to an almost complete disbelief on the part of most medical men as to the existence of any kind of phthisis produced by venereal contagion; and hence, it is to be feared that many cases of true syphilitic phthisis are allowed to pass untreated altogether, because of a prejudice which has grown up as to the absolute non-existence of such a disease. Syphilis, however, may produce, I am convinced from experience, special lesions in the lungs, or it may produce ordinary tubercular disease of these organs by its action on the nutrition. No one who has seen much of syphilis can doubt the action of the disease in the occasional production of tuberculosis in persons who are entirely without any hereditary predisposition, and who would, had they not contracted syphilis, never have been attacked with pulmonary tuberculosis. Syphilis, in such a case, acts as a depressing and anæmiating agent, just as want, misery, and alcoholic fluids act. The consumption which is produced in such cases as these in no way differs from ordinary phthisis pulmonales; it therefore is not amenable to any special treatment, and is not the kind of phthisis that would be spoken of with any useful purpose as *syphilitic* in this place.

From my own observation, as physician to a special hospital for consumption, syphilitic phthisis is certainly a rare disease, although it probably is more frequent than it appears to be, because it is doubtless unrecognised in practice. There is no doubt that many of the cases of syphilitic phthisis which have been from time to time reported, have only been recognised in the post-mortem room; and it must be remembered that it is not in the early period of syphilis that such a disease is to be dreaded, but rather far on in the tertiary period, at a time when patients and others have almost forgotten that syphilis had pre-existed five, ten, or even more years after the occurrence of the primary or secondary symptoms. Lancereaux reports a case where a woman, æt. 41, died of syphilitic phthisis, when there was merely a history of hereditary syphilis.

Syphilis produces, in its tertiary period, two species of lung disease—gummy deposits and sclerosis. The sclerosis of the lungs produced by syphilis resembles syphilitic cirrhosis of the liver, and consists in a proliferation of the connective tissue of the lungs, which causes the cells of the alveoli to degenerate. This new tissue soon becomes organised into fibroid masses of interstitial pneumonia. This kind of lesion, caused by syphilis, is not peculiar to the lung; but may be found in the other organs of the body, almost without exception. When its form is circumscribed, it forms knots scattered through the lungs, and rarely attacks any large portion of these organs. The portions of the lung affected are often whitish in colour, and variable in size—sometimes as large as a hazel-nut. When on the surface of the lung, they are often accompanied by great thickening of the serous membrane, just as is seen in syphilitic testicle and in syphilitic cirrhosis. They frequently leave scars after them, resembling those seen in the liver of syphilis.

Gummy tumours of the lungs do not in any way differ from those seen in other organs. They are, when in the crude state, solid, homogeneous, compact, dry on section, yellowish in colour, and with a cheesy centre; of volume varying from that of a grain of hemp and a hazel nut. They are usually seen only in small numbers on the lung, (in this point differing purely from tubercles) and are usually only found in one lung, and in any of the lobes indifferently. In this they differ from tubercle, which so universally shows a preference for the upper lobes. These gummy tumours conduct themselves in the lungs as elsewhere; they commence to soften in their interior, and become transformed into a yellowish fluid, which causes an ulcerative process around them just as in other regions. The process may cause the perforation of the bronchial tubes, and produce cavities, the contents of which are expectorated. The walls of the cavities produced by the elimination of growing tumours are covered by a cheesy, white matter, and exteriorly they are surrounded by a hard fabric mass. Such cavities may, in rare circumstances, reach the size of a small orange: in general, they are not larger than a hazel nut. These cavities are generally associated with the form in interstitial pneumonia previously described.

It is often very difficult to make any distinction between gummy tumours and tubercles: and it is only by means of some concomitant circumstances, that this diagnosis can sometimes be made out. In the first place, tuberculosis ordinarily attacks both lungs; and prefers the apices, which, as before said, is not the case with gummy tumour. Gummy tumours are generally few in number, and their size is greater than that of tubercle, as a general rule. They are yellowish in colour, and semi-transparent. Gummy tumours are harder than tubercles. The microscope does not give any precise information as to diagnosis. Thus Cornil—one of the best authorities on tubercle—speaks of the two as differing only in shade, not in opposition. Tubercle and gummy tumours are composed, in fact, of the same elements. It is said that the nuclei of new formation are less numerous in the gummy mass than in the tubercle; that the gummy tumour is composed of large granular bodies, whilst in tubercle only we find only atrophied nuclei very finely granular. These are differences too slightly accentuated to be of much value.

The symptoms of pulmonary syphilis are various. The disease commences, for the most part, silently. Slight bronchial breathing, or weakening of the respiratory murmur, with slight cough, may be all that indicate the commencement of the disease. Afterwards we may notice dyspnœa, cough, yellowish expectoration, and hæmoptysis. The patients fall off in strength, and lose their appetite. They have night sweats and hectic, with verperal exacerbations: lastly, emaciation, marasmus, and death—exactly as in ordinary or tubercular phthisis pulmonalis. As in ordinary phthisis, in the third stage there are heard the *râles* of cavities, gurgling, cavernous breathing, and bronchophony or pectoriloquy. The progress of the disease is not, as a rule, so rapid as that of *tubercular* or *ordinary* consumption.

It appears that many, very many, cases of *latent* syphilitic phthisis must occur; since pathological anatomists are continually describing appearances in the lungs of persons who have died of other diseases due to former syphilitic disease. Such lesions of the lungs are not contested, but admitted by all to exist. In other cases of syphilitic phthisis, the health of the patient does not seem greatly to be affected by the lung disease. Such cases have been dilated upon by the illustrious Dr. Alfred Fournier and by Bazin, the great writer on skin diseases of the Hôpital Saint Louis, of Paris. The latter author speaks of "intense pulmonary lesions with perfect health" as one of the characteristics of cases of syphilitic disease of the lungs. Such effects of the products of syphilis in the lungs are doubtless found in nature; but they are the exception, for syphilitic phthisis is ordinarily accompanied by the same *cortège* of symptoms which are so well known as the accompaniments of that dreaded disease—pulmonary consumption.

The prognosis of syphilitic consumption is, even when treatment is left out of account, by no means so bad as that of tuberculosis of the lungs. It is, for instance, possible that a lesion which remains localised, and only affects the general health but slightly, may spontaneously be repaired; and autopsies show this to be frequently the case. When, however, the local lesion is accompanied by a loss of nutrition and other symptoms (such as affections of the liver and other viscera accompanying the lung disease), phthisis syphilitica may prove a most fatal disease. Of course, if the nature of the disease be discovered in time, and before the cavities in the lungs have become very large, the prognosis is greatly to be influenced by the happy effects of treatment.

If we read over the histories of syphilitic phthisis, which are scattered through medical authors, we shall find either that the disease has been considered as ordinary phthisis during its whole course, or that it has for a certain time been mistaken for ordinary consumption. In short, pulmonary syphilitic lesions are too often unrecognised. Hence the great importance of marking accurately the points of diagnosis of the disease; otherwise the patient will be allowed to die of a disease which is quite curable. In rare cases pulmonary syphilitic disease appears without any other symptoms of syphilis being present. At other times it is accompanied by exostosis, laryngitis, perforation of the soft or hard palate, or by some tertiary skin disease. In the latter case (the one cited by Dr. McSwiney is an example of this type) the attentive practitioner may at once ask himself whether, when there is extensive syphilitic disease of other organs, the lung disease, too, may not be syphilitic? The case is quite different where no other syphilitic symptom is present, and it is in such cases that the practitioner is almost inevitably led into considering the disease as one of simple tuberculosis.

One of the rules, then, in most cases of pulmonary phthisis in adults is that we should always keep in mind the *possibility* that the disease may be syphilitic. By doing this we shall occasionally be enabled to verify our supposition by finding some hitherto unnoticed syphilitic symptom, such as an exostosis, or, at any rate, the superficial scars of a past syphilitic skin eruption of the tertiary period. Having our attention once aroused to the possible existence of the disease of the lungs being specific, it then becomes useful to remember that syphilitic deposits in the lung are usually circumscribed, that they affect *any* part of the lung, and not exclusively the apex, as is almost invariably the case with tubercle. Syphilitic deposits are almost as common in the lower and middle lobes as in the superior lobes. Such an occurrence, then, should at once awaken our suspicions.

Tuberculosis of the lungs usually produces very rapidly indeed great disturbance in the nutrition of the whole body, languor of digestion, pallor, emaciation, and the facies of consumption. This is not the case in syphilitic consumption, which never proceeds so rapidly as tuberculosis in its effects on the general health of the patient. It is only in a slow and tardy manner that it undermines the strength and produces its fatal results. We fail to discover in pulmonary syphilis, as a necessary element, the constitution of tuberculosis, neither do we necessarily notice the narrow diameter of the upper part of the thorax or the salient cheek-bones, nor the incurvation of the finger nails, which are so habitually seen in ordinary tuberculosis. Besides which, tuberculosis is very often, indeed, hereditary, and this, of course, is not necessarily the case in syphilitic phthisis.

In a certain number of cases, the diagnosis remains uncertain, because syphilitic phthisis has no pathognomonic symptom, and tubercular phthisis exhibits all degrees of rapidity and severity. And, again, since there is no reason why a syphilitic person should not become tubercular, we have constantly to bear in mind that a person with syphilitic symptoms, and affected with pulmonary consumption *may* be affected with tuberculosis. Yet, whenever we are in the slightest doubt it clearly is the duty of the practitioner to treat the case as if it might be one of the more curable form, and not abandon it to expectation and hygienic remedies alone. If we have to do with tubercular phthisis, the prognosis, as all practitioners of experience know too well, is gloomy in the extreme; and, thus, we risk nothing in cautiously using the remedies which are known to be curative in syphilis. And there can be no doubt that patients, who have been abandoned without hope by practitioners, who did not try this method of treatment, have occasionally been restored to excellent health by special treatment of the disease.

The treatment of pulmonary phthisis is that of syphilis in its tertiary stage. Iodide of potassium, and, perhaps, mercury. The iodide of potassium should be prescribed in doses of ten or twenty grains, twice, thrice, or even six times daily. As to mercury, if administered at all, it may as well be rubbed in, in drachm doses, in the axilla, in order to avoid the evil effects of that remedy on the digestive organs. As to local treatment, it may be useful occasionally to prescribe mustard poultices, blistering, fluid painted over the infra-clavicular regions, or tincture of iodine, as revulsions. Cod-liver oil and iron are also indicated. If the disease be in its early period, such treatment should very soon produce a cure. Just as in tertiary sore throat, the use of iodide of potassium produces so often quite marvellous effects, so does this drug occasionally act in cases of syphilitic phthisis. Even in cases where large cavities exist, and cachexia accompanies the cavernous breathing and gurgling, we may hope occasionally to achieve a cure, remembering, in the words of Ricord, that "L'impossible est parfois possible dans la Vérole."

◆

CASE OF POST-PARTUM HÆMORRHAGE,

OCCURRING

EIGHT DAYS AFTER CONFINEMENT; INJECTION OF LIQUOR FERRI PERCHLORIDI; COMPLETE RECOVERY.

By Hugh Alexander Davis, M.D.,
Medical Officer to Newport Dispensary and Workhouse, co. Mayo.

On the evening of the 25th May last, I received a visiting ticket to attend a poor woman, living a mile from my residence, who was reported to be in a dying state from bleeding. On learning a few particulars, I got some brandy, tinct. opii, a syringe, and liq. ferri perchloridi, and immediately went to the house of my patient, whom I found in a very low state—almost pulseless, cold, and sighing heavily; the bed under her was perfectly saturated with blood, she having been bleeding for several hours. I opened the window, raised her hips, and lowered her head, and administered to her a tablespoonful of brandy id conjunction with 20 minims of tincture of opium, and applied cloths wrung out of cold water over uterus and vulvæ. The flooding went on unchecked by the application of cold, the woman rallied slightly from the effects of the brandy, and not wishing to apply too much cold externally, I injected cold water into the vagina, and watched the result. The flooding slightly diminished, but after ten minutes came on as heavy as ever. The woman being on the brink of the grave, I administered brandy at intervals, and not seeing much improvement in the condition of my patient, and her life fast ebbing away, I injected alum water into the uterus by means of a syphon-enema syringe fitted with a long vagina pipe, which reached the fundus of the uterus easily, the injection had the effect of temporarily arresting the flow, but in a quarter of an hour the flooding returned as bad as ever. I tried every method recognised as having effect in such cases, but all in vain; then seeing that my patient would succumb to the complaint, I instantly mixed a solution of liq. ferri perchloridi in the proportion of one part to four parts of water, and re-inserted the pipe of the syringe (after carefully expelling the air) into the cervix and up to the fundus of the uterus and slowly injected the solution. The effect *was magical,* a little blood coagulated by the presence of the iron came away, but the flooding was totally arrested to my great delight. I placed a warm napkin to the vulvæ, and carefully administered brandy, at intervals; not a single drop of blood appeared after the styptic injection, the woman rallied a good deal, a return of the temperature of the body showed returning strength, and towards morning she slept very fairly; she continued to grow better day by day, and made a complete recovery; not a single bad symptom having arisen. She was confined on May 17th, and had a perfectly natural labour, the placenta coming away ten minutes after the birth of child. On the 25th of May she walked to town, an Irish mile, almost up a continuous hill, and when she went home early in the evening the flooding commenced, her delicate state of health afterwards was removed by good nourishment and preparations of iron and tonics and in a few months after she was as strong as ever she felt before.

The following points may be observed :—

1. The date at which the hæmorrhage took place as being very unusual.

2. The perfect restoration to health of the patient, considering her low state at the time of injection, and the nature of the injection.

◆

CASES IN PRACTICE.

Reported by John W. Martin, M.D.,
The Grange, Dronfield, near Sheffield,
Late Assistant-Surgeon, Mayfield Factory Dispensary, Portlaw, Ireland.

Case XIX.—*Death occurring seventeen hours after seizure.—Symptoms: Pain in the Right Side; Frontal Headache; Free Vomiting of a White Phlegmy Matter, which was unstained with bile or blood; and Dyspnœa.—History of the Deceased having received a Kicking from another boy about an hour preceding the onset of the attack; also, that he had always been a strong healthy lad, never having had a day's illness.—Post-Mortem Examination.—Inquest.*

The following case is possessed of many features of interest, from a medical and medico-legal point of view, which I think deserving of notice :—On the 28th of November, about 3 p.m., Joseph Ward asked me to visit his son, æt. 9, residing at Totley, near Sheffield, some four miles distant from Dronfield. Having an urgent call in another direction, I promised to do so as soon as possible. On arrival at his house, about 5.15 p.m., I was informed that he had been dead since 2 o'clock. I found him lying in the same position in which he had died, presenting the appearances of one who had been laid out after death, the arms lying close by his side, and the lower extremities extended. The eyelids were closed, and the mouth shut. The body was still warm. The fingers were clenched into the palms of the hands. There was *very strongly-marked muscular rigidity throughout the body.* The lower portion of the abdomen, the front and back of the thighs, the back, and portions of the upper extremities were already much discoloured by venous capillary congestion. Those present stated that he had always been a strong healthy lad, never having had a day's illness in his life, or taken a shilling's worth of medicine. He had been ill since 9 p.m. the preceding evening. First complained of frontal headache, pain in the right side, nausea, and free vomiting of a white phlegmy matter, which was unstained by bile or blood. Great dyspnœa, so much so, that his mother applied a large mustard poultice over the chest. They were positive that he had eaten nothing which could have disagreed with him. They did not then inform me of a fact, which I subsequently learned, that he had taken the best half of a powder, obtained from a quack in the neighbourhood; but as the other half was given to his youngest brother with benefit, it is evident that it had no connection with the fatal result of the case. They then informed me that he had received a kick in the right side—the seat of pain—the previous evening, about an hour previous to his seizure with the symptoms of which he complained. I examined the side and surface of the body generally most carefully, but could detect no mark of violence. Thinking that possibly there might be rupture of the liver or other internal injury, I told his parents that it was a case for an inquest, that I could not possibly certify the cause of death, until a *post-mortem* examination had been made, and a careful investigation of all the facts of the case had been gone into.

In compliance with an order from the coroner, assisted by Dr. Bolton, of Dronfield, we made a most careful examination of the body, to determine the possibility of death having been caused by the kick said to have been received by the deceased, with the following result:—

Post-mortem.—The body well developed; cadaveric rigidity well marked; no sign of decomposition, or external mark of violence; surface discolouration of body already described more intense. On exposing the thoracic cavity, found all the organs *in situ*; the left pleura perfectly healthy; the right pleura *strongly adherent throughout the anterior and posterior surfaces of the upper lobes of that lung, also between the lobes;* these adhesions were with great difficulty broken down, and were evidently of old-standing, showing the previous existence of an extensive attack of pleuritis. Both lungs, on section, were greatly congested, but otherwise healthy. On removing the calvarium, found intense venous congestion of the membranes of the brain. In the superior longitudinal and lateral sinuses found *firm fibrinous clots free from all discolouration of blood.* The substance of the brain appeared quite healthy. The lateral ventricles were filled with an abnormal quantity of fluid. Pericardium perfectly healthy; the heart normal in size; both ventricles filled with large clots of the same description as were found in the veins of the head. These clots were evidently formed some time previous to death. The valves of the heart were perfect, and free from all appearance of disease. There was no fracture of the ribs, or other fracture. There were no marks of injury in the internal surface of the cavity of the abdomen, nor above the right hip, or elsewhere. The liver was healthy and unruptured; the kidneys healthy; no abnormal appearance in the coats of the stomach, or in the condition of the intestines. The abnormal conditions present may briefly be summed up as consisting of—

1st. Old-standing adhesions in the right pleura.

2nd. Intense congestion of the membranes of the brain.

3rd. Presence of fluid in the blood ventricles of the brain.

4th. Presence of fibrinous clots, as described, in the sinuses of the brain and in both ventricles of the heart.

In view of these facts, I felt fully justified in pronouncing that the boy's death had occurred from "natural causes," and not from the effects of any violence he may have received. I attributed death to congestion of the membranes of the brain, due to the condition of the blood, which showed a marked tendency to the production of fibrinous clots. This tendency was in all probability due to the existence of the rheumatic dyscrasia, an opinion, to which, I think, the pre-existing attack of pleuritis, which passed unnoticed by the boy's parents, lends considerable support.

Amongst the questions that arose at the inquest were the following :—

1st. Could the deceased have received a kick sufficiently severe to cause death without any mark of violence being left?

2nd. Could a kick received in the hip so injure the spine as to induce cerebral congestion and death?

3rd. Was there any connection between the supposed violence and the presence of the clots described?

In reply to the first, I said it was possible in the yielding portions of the body, but in the present instance, the evidence given by a companion of the deceased, declared that the boy had been kicked just over the trochantes major of right femur, and that he had seen the mark left, which was very black.

With regard to the second question, I thought it most unlikely; but being pressed by the coroner for a positive answer, I declined to affirm the point one way or another, on the ground that I had not sufficient experience to enable me to arrive at a decisive conclusion.

As for the third point, I thought I might very safely affirm that there was no possible connection.

With regard to the case itself, I present the facts to speak for themselves; but I regard the presence of such large, firm, undiscoloured clots in both chambers of the heart, and in the cerebral sinuses, without any apparent accompanying disease of the internal coats of the vessels, taken in connection with the existence of old-standing and extensive pleuritic adhesions, as a fact of no little clinical interest.

Transactions of Societies

CLINICAL SOCIETY OF LONDON.

ADJOURNED DEBATE ON THE TREATMENT OF LEUCOCYTHÆMIA AND LYMPHADENOMA BY PHOSPHORUS.

Dr. **Greenhow** said that the cases which had been cited showed that phosphorus was of no use in leucocythæmia. He looked upon that point as settled, and confined his remarks to certain features of the disease, such as pigmentation of the skin, and the pyrexial attacks which occasionally occurred.

Dr. **Broadbent** laid before the Society the whole of his experience on the subject. His first case, which had been already reported in the *Practitioner*, recovered, but after the boy had remained well for sometime, he was carried off by an acute attack of pneumonia. His second case was under treatment for a few days only, the patient being alarmed at the attention given to him, and leaving the hospital. His third case was marked by enlargement of the spleen and liver, intermittent hæmaturia, and the characteristic appearance of anæmia. Phosphorus seemed to cause pain in the stomach, diarrhœa, and inflammation of the spleen. The man refused to remain in the hospital, and was rather worse than better for the treatment pursued. Dr. Broadbent had also tried phosphorus in lymphadenoma. In one case in which symmetrical enlargement of the glands of the neck, with anæmia and dyspnœa, continued to increase for some months, in spite of the usual remedies; phosphorus effected complete recovery. The second case was a hopeless one, as the patient was reduced to a skeleton, and all her glands were enormously enlarged. In the third case, which was chronic, there was enlargement of the glands of the neck, axilla, and groins. The beneficial effect of the phosphorus was very remarkable, but as the patient had pushed the remedy too far, she had an attack of sickness and diarrhœa, and became weak and otherwise ill. The glands, however, still greatly diminished, and Dr. Broadbent hoped still to bring the patient before the Society. He also referred to two other cases in which, however, no phosphorus had been given, and in one of which the patient soon died of pernicious anæmia only. He would also class with these cases those of intermittent hæmaturia, as well as those of Addison's disease. With regard to the latter the symptoms were very similar, the changes of temperature, the vomitings, the great debility, being much the same, while the pigmentation of the skin was often excessive, not only in that disease, but also in splenic leucocythæmia, and in essential anæmia. The disease did not essentially consist in any accumulation of the white corpuscles in the spleen and marrow of the bones, but there was, perhaps, previous to this some failure in the relationship subsisting between the blood and the tissues or glands. On these grounds he had been led to use phosphorus. Like arsenic, phosphorus produces a marked granular degeneration of all the structures of the body, but it was generally allowed to be a valuable remedy when used in appropriate cases. There was both a pathological and therapeutical analogy between these two drugs. In many cases of skin disease phosphorus was often better than arsenic, as was recently shown in the case of a girl suffering from inveterate psoriasis. He did not think that this drug was a specific but had done much good in the diseases above-mentioned. It must also be used cautiously, as it was capable of doing much harm. With regard to the mode of administering it, he relied upon the capsules only, as the pills generally emerged from the rectum unaltered, and as phosphorus rapidly oxidised, it could do no good unless it could be absorbed from the stomach in an unoxidised form.

Dr. **Wilson Fox** said he was almost as responsible as Dr. Broadbent was for the treatment of leucocythæmia by phosphorus. He regretted that the subsequent progress of the case which he had published in the *Lancet* had not been favourable. The man came under treatment in November, 1874, and left the hospital in May, 1875, cured, with the exception of having an enlarged spleen. In the spring of this year, however, he was again admitted into the hospital for acute pneumonia, and had died in Devonshire from a bursting of the spleen. Now, said Dr. Fox, one of two things must have happened during the early period of this case—either he must have made a wrong diagnosis in saying it was a case of leucocythæmia, which could scarcely be the fact considering the number of white corpuscles found in the blood, the great loss in the patient's original weight, the pyrexial attacks, the enlargement of the spleen, and his almost hopeless state—or it was one of spontaneous cure of the disease just as the phosphorus (which was either useful, useless, or injurious) was given on the recommendation of Dr. Broadbent. The cure was evidently only temporary, but it was nevertheless distinct while it lasted, and under its use the patient regained strength, colour, appetite, and the normal condition of the blood. Was it, then, worth while making any further trial of phosphorus in leukæmia? Or must they look upon that disease as incurable? One case had been mentioned in Virchow's work, and four in Mosler's work, in which recovery had taken place, and with regard to Dr. Gowers's case, he (Dr. Fox) had had a patient who suffered from enlarged spleen, multiple increase of the lymphatic glands, albuminuria, lardaceous kidney, and some mischief in the lung. At all events, there was plenty of evidence to show that phosphorus would not, in moderate doses, cause fatty kidneys. There was, however, much confusion about the characters and distinctions of these diseases. Virchow had at first recognised two kinds of leukæmia, splenic and lymphatic, and some thought that Hodgkin's disease was occasionally associated with increase of white corpuscles. But Dr. Fox thought that this disease of enlarged lymphatics without such alteration formed a distinct clinical group, and that the distinction between it and leukæmia had better be maintained.

Mr. **Callender** thought that the treatment of leucocythæmia by transfusion was worthy of attention, especially if Dr. Roussel's ingenious method of performing the operation was adopted.

Dr. **Moxon** questioned whether the existence of twenty to thirty white corpuscles in the field on the occasion when the microscopic power used was about ¼ inch objective, was evidence of Dr. Fox's diagnosis of leukæmia being correct. It was generally held that a proportion of one white to twenty red was required to constitute leukæmia, and a well-marked case would have 2,000 rather than 20 white corpuscles in the field. In cancer there was often a large increase of white corpuscles, and this fact he had used as a means of diagnosing between idiopathic anæmia and gastric cancer. The case to which he referred (one of anæmia), and which had been treated with phosphorus, was no exception to the rule of invariable ill-success which had marked the use of this drug in the many cases (nearly 30) in which he had tried it. The presence of twenty to thirty white corpuscles was no evidence of leukæmia; and as Dr. Fox's case, which seemed an extremely doubtful one, was the only one distinctly benefited by the phosphorus, the evidence adduced in favour of that remedy was very feeble. As for Dr. Broadbent's cases, they were quite a satire upon his hopeful advocacy of the drug; so much so, that he had fallen back upon a less mournful list of cases of lymphadenoma, which was an entirely distinct disease. Even with regard to the apparent greater success attending the use of phosphorus in that disease, Dr. Moxon drew attention to the great spontaneous variation which often takes place in the size of the glands, and which variations often raise delusive expectations of cure, and occurs under the use of several different drugs. He had seen a very bad case of lymphadenoma, in which the great enlargement of the glands almost entirely disappeared under the use of bromide of potassium. He did not, therefore, think there was much to be said in favour of phosphorus. He had recently brought forward two cases of true leukæmia, in which the phosphorus treatment had been unsuccessful, and he had in that paper endeavoured to show that no such thing as lymphatic leukæmia existed. He had searched through the record of cases, and the results were embodied in the Society's *Transactions*.

In reply to Sir W. Jenner, Dr. **Moxon** said that he did not mean to say that all his cases treated by phosphorus had died suddenly, but that they were not benefited by it.

Dr. **Bastian** said that the relationship of splenic leukæmia to glandular enlargements was obscure and questionable. He thought with Dr. Broadbent that leucocythæmia was not a disease *per se*, but a something superadded in the course of other diseases, especially of the spleen, more than of the other glands.

Dr. W. S. **Donkin** thought this was the most puzzling discussion to which he had ever listened. A number of different terms were used to describe the same condition, while leucocythæmia was used to describe the condition of the blood in this affection. We could apparently do little good, either with phosphorus or any other remedy. The diseases anterior to that of the blood appeared to him to deserve more attention.

Sir W. **Jenner** hoped that more facts would have been contributed to the meeting. He thought that Dr. Broadbent's observations on the value of phosphorus in psoriasis were important, as showing that the drug had a real and important action on nutrition.

Dr. **Gowers**, in reply, said, Dr. Dyce Duckworth had written to him to say that he had prescribed phosphorus for leukæmia and chronic nervous diseases, without meeting with albuminuria, and in leukæmia without any benefit. Albuminuria was usually present in non-fatal cases of acute phosphorus-poisoning, and one case, in which the late Dr. Anstie prescribed this drug in medicinal doses, was attended with albuminuria. Moreover, the degeneration in the new growths in glands and the liver should be at least partly ascribed to the phosphorus, if the latter caused the degeneration of the kidney. The effect of this remedy in diminishing the proportion of the white to the red corpuscles of the blood was, in his case, very remarkable; and he had reason to believe that the glands are the chief source of the excess of white corpuscles, and yet the leucocythæmia was lymphatic. He had given the phosphorus in combination with common resin, the compound being powdered and made into pills with tragacanth.

Sir W. **Jenner** concluded the discussion by saying that in his opinion, phosphorus might be of use in lymphadenoma, but it was apparently useless in splenic leucocythæmia.

◆

SURGICAL SOCIETY OF IRELAND.

The second meeting of the session was held on Friday, December 8th, 1876. In the absence of the President, the chair was occupied by Dr. **Robert McDonnell**, the Vice-President.

Mr. **Swanzy** read a communication on

SOME CASES OF AMPLYOPIA,

which, with the discussion thereon, will appear in our next.

Mr. **Tyrrell** then read a paper on

EXCISION OF THE ELBOW-JOINT.

which will be found at page 517.

Mr. H. G. **Croly** said that every practical surgeon would agree that the single long incision was the best incision by which to remove the joint; and it removed the very grave objection to the transverse incision, which when they set up passive motion was easily torn open. With regard to the ulnar nerve question, he might mention that as far back as 1858, when he was resident surgeon of the hospital with which he was still connected, he saw Mr. Tufnell excise a man's elbow-joint for compound fracture, and it then struck him (Mr. Croly) as rather curious that the ulnar nerve was not seen at all during the operation, and the case was not one of a diseased joint. The case made a good recovery, and ever since he (Mr. Croly) had taught his pupils, and also adopted the rule himself, not to look out for the ulnar nerve. He thought in operating that the principle should be not to look for the ulnar nerve at all, but to clear all the tissues over the condyle, and not take the slightest notice of the nerve. In connection with this operation, he thought they were more disposed to take away too little bone, instead of too much, and when they took away a good deal of bone they had much better results. Hearing that this paper was to be read, he had brought down a man on whom he had operated some years ago, and whom the members could see. It was an interesting fact that they had every motion of the joint perfect. This man could throw a sack over his shoulder, wheel a barrow, and in fact do everything with the arm that had been operated upon, that he could do with the perfect one. With regard to the mode of putting up the arm, he might observe that he had now in hospital a little boy, who was recovering from the operation. He had removed a great deal of his humerus, and the boy was treated in a sling. Last winter, when he (Mr. Croly) was in London, in going round some of the wards of St. George's Hospital with Mr. Pollock, he saw a case of resection, and in reply to a question he put, that gentleman informed him that lately he had put up such cases with a sling, and he was still satisfied that this, as compared with putting up in splints or similar apparatus, was better in these cases. He thought that everything that Mr. Tyrrell had stated in his paper agreed with his (Mr. Croly's) experience.

Mr. B. W. **Richardson** said it had been his lot to see the ulnar nerve in one case at the Adelaide Hospital, about a year ago. It was a case of Dr. Barton's, in which the nerve was turned over the condyle.

Mr. **Tyrrell** had but little to say in reply, as there was no necessity, on account of no questions being asked. He thought that, although simplicity was the order of the day in excision of the elbow, as a matter of comfort to the patient, to keep the arm perfectly dressed by means of the straight splint, and so the limb could be disturbed without giving the patient any trouble. Even presuming that it had anything to say to the after consequences, as a matter of comfort to the patient, he thought what he had stated was the best. He was glad to find that Mr. Croly agreed with him as to the non-seeing of the ulnar nerve. The very fact of hooking up the nerve on the condyle might cause so much irritation, as eventually to destroy the function of the nerve. He thought, in conclusion, that the operation was an admirable one, and that it should be practised without hesitation.

EPITHELIOMA.

Mr. **Richardson** exhibited some stained sections of epithelioma under the microscope. He said that during last summer he removed an epithelioma from the lower lip of a gentleman, in one of the pay-wards of the Adelaide Hospital. At the time that he performed the operation, he had not leisure for making sections of it, but during one of the recent cold days he had cut several exceedingly thin ones with the freezing microtome. These were so good, he brought a couple to the meeting. They were under the microscopes on the table. One was a section through the ulcerated portion of the cancer, and showed very large projecting cancerous papillæ. The other was a section through a deeper part of the diseased structure, which showed a well-marked alveolar stroma, having the alveoli crammed with epithelial cells. The sections were stained with picro-carmine, and mounted in glycerine containing a trace of carbolic acid.

The **Vice-President** inquired what did Mr. Richardson preserve the specimen in previous to the section cutting?

Mr. **Richardson** replied that he preserved it in a modified Muller's fluid, made with bichromate of ammonia instead of bichromate of potash, as he found that the former did not delay carmine staining like the latter.

The **Vice-President** said he had examined the specimens, and could recommend them to the members of the Society as being extremely beautiful. Mr. Richardson would agree with him that the method of making sections by freezing had thrown a flood of light upon the subject of microscopic anatomy. The sections made by the freezing process were infinitely superior to those already made for the examination of the tissues. He had inquired what fluid Mr. Richardson had preserved the specimen in because it was, he thought, of great consequence that any surgeons in Dublin who wished to have tumours examined by competent persons, should take every trouble to have them preserved in proper fluid at the time, so that they might be preserved in good order for those persons who were specialists in the difficult subject of pathological anatomy. He was in the habit of using Muller's fluid, and they also had in the hospital with which he was connected, wide-mouthed bottles which they used; and small portions of the tumour that might be removed, were put, hanging by a thread, in a bottle of that kind, for the quantity of fluid must be large in proportion to the thing that was to be preserved, and thus it would keep for a long time. Then they could be submitted to microscopic examination by the person to whom the surgeon wished to send the tumour. Muller's bromide of potash was a cheap salt, was always readily at hand, and gave good results. He, therefore, would recommend its use.

Mr. **Richardson** mentioned that he used Rutherford's freezing microtome which he had had modified by doubling the size of the box, which rendered the freezing process more rapid.

The Society then adjourned.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, DECEMBER 20, 1876.

THE CLINICAL SOCIETY ON THE PHOSPHORUS TREATMENT OF LEUCOCYTHÆMIA.

There are few who have been in the habit of attending the meetings of our medical societies who will deny that the discussions which take place on these occasions are sometimes open to criticism. Remarks which are wholly irrelevant to the subject under discussion, inferences drawn from insufficient data, "false facts," and still more "false theories," these are among the little failings from which few scientific meetings are exempt. Nevertheless, it is equally certain that the papers read at our medical societies, as well as the discussions which follow, are of great practical value, and take no small part in the advancement of both the science and practice of medicine. Cases are brought forward which throw a new light upon the pathology, the diagnosis, or the therapeutics of some disease. The hasty conclusions, or the sanguine expectations of one member are corrected or abated by the experience of another, and, what is more to our present purpose, some new remedy all powerful perhaps for good or for evil, is relegated to its proper place in the armamentaria of our Pharmacopœia.

No better illustration of the truth of these remarks could be afforded than by the discussion which has recently monopolised two meetings of the Clinical Society on the value of phosphorus in the treatment of leucocythæmia. Phosphorus is one of those drugs of which great expectations have been formed, and in respect of which the disappointment has been almost as great as the expectations. Phosphorus is one important constituent of the body, especially of the bones, the brain, and the nervous system. As a medicine it has been long known to exert some influence over the nervous system, to act as a sudorific, and to have a specific action over some inveterate diseases of the skin. It has been used as an aphrodisiac. It has been used in a few chronic affections of the nervous system. Burgess long ago recommended it in lupus and psoriasis. It has given fresh hopes to the phthisical; and recently, two preparations of it have been for the first time introduced into the British Pharmacopœia. Then, again, phosphorus in poisonous doses had long been known to cause fatty degeneration of the tissues, especially of the glands, and it was therefore not unreasonable to think it might be of service in a disease in which the glands were prominently affected. Chemically, too, it was in some respects allied to arsenic. It was supposed to have, like arsenic, some influence over the nutritive processes, and likewise had, as we have just said, been found of some value in the treatment of inveterate diseases of the skin. The antecedents, therefore, of this drug were in its favour, and we were not surprised that the meeting of the society was numerously attended when it was announced that two or three papers were to be read upon its therapeutic value in a class of diseases in which it had never been employed.

The evidence, however, which was adduced in favour of phosphorus as a remedy for leucocythæmia was, to say the least, far from satisfactory. In a case of lymphatic leucocythæmia, under the care of Dr. Gowers, the administration of phosphorus appeared to diminish very much the number of white corpuscles in the blood, and to reduce the enlargement of the glands, although it did not check the progress of the disease. Before the commencement of the phosphorus treatment, 104 white corpuscles were counted in the field, the proportion of the red being as one to four; while at the expiration of six weeks only twenty-four white corpuscles could be counted, the enlargement of the glands having at the same time very sensibly diminished. Again, in a case of Hodgkin's disease, accompanied by leukæmia, Dr. Goodhart administered phosphorus, with the apparent effect of greatly improving the condition of the blood, but without diminishing the glandular enlargement. At first, an examination of the blood showed sixty white corpuscles to 100 red, while a month or five weeks after the commencement of the phosphorus the relative quantity of white and red corpuscles was reduced almost to the normal standard. The next witness in favour of the phosphorus treatment of these diseases was Dr. Broadbent, who was the first to treat leucocythæmia by that drug; but his evidence only went to show that in two cases of lymphadenoma the phosphorus appeared to have a marked effect in reducing the size of the glands, and in improving the general health. Dr. Broadbent's good opinion of the drug was somewhat supported by that of Dr. Wilson Fox, who had treated a case of leucocythæmia with partial success. The cure in his case was only temporary, but it was, he said, none the less distinct while it lasted.

Such is all the evidence that could be adduced at these two meetings in favour of the treatment of leucocythæmia and its allied diseases by phosphorus, and considering how meagre and feeble this evidence is, it is rather surprising that it should have been brought before the notice of the Society at all.

On the other hand, the facts that were arranged against the employment of this drug in the leucocythæmic class of disorder were quite overwhelming. In not one of the cases brought forward had the patient recovered. In the case of Hodgkin's disease, treated by Dr. Greenfield, the number of white corpuscles of the blood and the glandular enlargement materially increased under the use of the phosphorus, which, indeed, had no effect upon the progress of the disease. In Dr. Goodhart's case, which was still under treatment, the phosphorus had done little good, and, up to a recent date, the pallor and the condition of the blood remained unaltered. Sir Wm. Jenner's three cases were still more decisive of the question, inasmuch as in these cases the drug neither retarded the fatal progress of the disease nor improved the condition of the blood. Still more remarkable was the ill-success of the phosphorus in the hands of the very physicians who had had most faith in its therapeutic value. And we think that Dr. Moxon was quite justified in saying that Dr. Broadbent's cases formed a very sad catalogue—quite a satire on his hopeful advocacy of the drug. In his first case of leucocythæmia the patient remained apparently well for some time, but subsequently died from a disorder, the nature of which was not very clear. His second patient took to flight, having, perhaps, some instinctive aversion to the phosphorus treatment. In his third case, the phosphorus did actual mischief, irritating the spleen and stomach, and causing diarrhœa. The patient refused to remain in the hospital, and was "worse on going out than on admission." His cases of lymphadenoma were not quite so bad, as in some of them temporary diminution of the tumours had followed the use of the phosphorus. But then Dr. Moxon very properly drew the attention of the Society to a possible fallacy which might go far to vitiate the inference that had been drawn with regard to the supposed beneficial effect of this drug in lymphadenoma. This was the fact that a very remarkable and spontaneous variation in the size of the glandular tumours was a frequent clinical feature of that disease, this variation occurring under the use of very different drugs. Even in Dr. Fox's case, the true nature of which was rather doubtful, but which was the only one distinctly benefited by the phosphorus; the evidence in favour of this remedy was, as Dr Moxon said, very feeble, the case, too, having "ended miserably in a burst spleen at last." Lastly, we have the adverse experience of Dr. Moxon and of Dr. Dyce Duckworth. The latter gentleman stated in his letter to Dr. Gowers that he had given phosphorus in leukæmia without any benefit; while, as we have already seen, Dr. Moxon was more sceptical on the subject than any other member present. He had prescribed this remedy in nearly thirty cases, and the treatment had been attended with "invariable ill-success."

We may, therefore, consider that the question as to whether phosphorus is of any use in leucocythæmia is pretty well settled, agreeing with Sir Wm. Jenner, that it is apparently useless in that disease, although it may be of some use in lymphadenoma.

We may, however, remark that the class of disorders which we are now considering are at present, as respects therapeutical research, as favourable for successful empirical, as they are unfavourable for successful rational, treatment. We cannot expect to find a rational method of treatment for diseases, the pathology of which is remarkably obscure; and, unfortunately, neither the papers read nor the subsequent discussion threw any more light upon the nature of the disease than they did upon its treatment. The discussion elicited a remarkable difference of opinion with regard to the relationship of splenic leukæmia to glandular and lymphatic disorders. Whilst the majority of the members agreed in viewing lymphadenoma and splenic leukæmia as distinct diseases, Dr. Broadbent would class not only them, but also Addison's disease, intermittent hæmaturia, and essential anæmia under the same category. It follows, therefore, that, until the pathology of these disorders is better understood, their treatment must be in a great measure empirical. But, inasmuch as they for the present belong to the incurable class of diseases, there is ample scope for therapeutical investigation. Where a disease frequently terminates in recovery, the value of a remedy is not so easily tested. Where, on the other hand, it is invariably fatal, and that too within a comparatively short period, it is more easy to correctly estimate the value of a drug, in prolonging life or actually curing the disease. Perhaps, therefore, the therapeutics of these affections may yet be in advance of their pathology; and, at all events, we need not despair of one day finding a remedy or plan of treatment which shall be far more successful, and far less open to criticism, than that to which our attention has been recently drawn.

PROGRESS OF THE SMALL-POX.

Since we last drew attention to the subject the prevailing epidemic of small-pox has been steadily on the increase, and it looks as though we are to be visited with as sore a plague as that which occurred in 1871. That plague took about seven months to run its full course, while the one by which we are now visited has already lasted ten months without showing any signs of abatement. While only two months ago a couple of hospitals were sufficient to meet the requirements of the epidemic, there are now four open for the accommodation of small-pox patients, namely, the regular Small-pox Hospital, and those of Hampstead, Homerton, and Stockwell. And while, moreover, two months ago there were only 178 patients in the hospitals, there are now over 700. The recent mortality from the disease is equally significant. During the week ending on the 16th inst., 75 deaths were registered, a number which exceeded any previous weekly return since the decline of the epidemic in 1871-2, and which showed an increase of 25 upon the number recorded during the previous week. We must also bear in mind that the mortality is also increasing among private families, and that the epidemic is spreading more rapidly among the middle and upper classes of society. Quite recently the death of a young lady, the wife of a curate, took place from small-pox, contracted while visiting the poor in her husband's parish. In fact, the plague appears to be increasing faster than hospital accommodation can be found for the infected; and, what is more to be regretted, the prejudices and selfishness of local authorities, or of the people themselves continue to throw obstacles in the way of providing this accommodation, and of properly isolating the patients affected. Thus, in the beginning of the present month the Local Government Board, in order to meet the pressure put upon them by the rapid increase of the epidemic, decided upon appropriating for the use of the district the workhouse school of the Westminster Union. At first the guardians of that union, acceded to the proposal, but, afterwards in deference to an influential deputation of residents, who vehemently protested against such a movement, they refused to give up the school, "unless they were legally compelled to carry out the order of the Government Board." Of course, this was out of the question, for while they were going to law, the unfortunate patients would be dying of small-pox. Notwithstanding, however, these and similar obstacles in the way, much has recently been done towards providing more asylums. Thus, at Fulham, the Local Government Board are erecting six additional pavilions, so that when these are completed, there will be then in all, capable of providing for 280 patients. Eleven more houses have also been contracted for at Deptford, which will supply accommodation for 320 patients.

Now, although the last returns show that as yet the present epidemic is not so severe as that which occurred in 1871, there is no knowing the extent to which it may reach, and it is at all events severe enough to show that, in spite of the warning given to us by the last visitation of this plague, vaccination must have been most woefully neglected. That this is the case we unfortunately have too many proofs. And what is more to be regretted, not only the public, but even we and the officers of the law are to some extent responsible for this neglect. A person, we are informed, was recently punished at the Petty Sessions for "irregularities in filling up vaccination forms extending back so far as 1874, and in the course of the defence, it was shown that those irregularities were sometimes of a most gross and shameful nature. The great exposure, however, to the epidemic through the neglect or the imperfect performance of vaccination, arises from the apathy, indifference, or ignorance of the community. We say ignorance advisedly, for many are under the idea that if they have been vaccinated in their infancy, or if they have been vaccinated a few years after, or if they were vaccinated a few years ago, and it "did not take," or if they can only show on their arms one good mark of the vaccine pustule. they are perfectly secure.

If, therefore, the force of the present outbreak is to be stemmed, and if we are in future to prevent the occurrence of such epidemics it is evident that the people and the profession must more heartily and persistently cooperate in enforcing the thoroughly and repeated performance of vaccination. Fortunately, the lay press assists us much in drawing the attention of the public to the necessity and advantages of this operation, and probably the education of the masses will do more. But we can only rely upon such assistance when these visitations are actually upon us. It is during the periods of almost complete immunity from them, that we, our sanitary authorities, and the public, are responsible for their future occurrence, or for their severity when they do happen, and it is during these periods that we and the local authorities need be especially vigilant that the operation of vaccination be everywhere properly performed.

◆

SIXTY-TWO deaths from typhoid occurred in Paris last week, against 105 and 86 in the two weeks preceding.

Notes on Current Topics.

Transfusion at the London Hospital.

EVERY one will admire the courage and humanity which Mr. James Adams recently showed in allowing himself to be bled for the transfusion of blood into a patient he was himself attending. The boy under Mr. Adams's care was suffering from hip disease in an advanced stage, with evidence of amyloid degeneration in the viscera, and œdema of the affected limb. It was thought advisable to perform amputation at the hip-joint. Although the boy lost no blood during the operation, he was very prostrate and anæmic, and the pulse became extremely weak and small. As Dr. Roussel happened to be present, demonstrating the action of his new apparatus for transfusion, it was resolved to take advantage of the opportunity thus presented, and to perform transfusion at once. Accordingly, and without completing the operation, Mr. Adams supplied six ounces of blood from his own arm, after which, with his arm bandaged, he proceeded to finish the operation. The boy was, for a time, much improved by the transfusion, but unfortunately died two days after. The generosity and kindness of Mr. Adams were the more remarkable considering the cool manner and the readiness with which he submitted to be bled, and considering, moreover, that the boy was not at the time dying from loss of blood, and that therefore the incentive was not so strong as it might have been.

Accidents in the Hunting Field.

THE hunting field has during the past week furnished rather more than an average number of severe accidents, both to man and horse. The Hon. R. E. Plunkett, member for West Gloucestershire, sustained a concussion of the brain, from which it is doubtful at present whether he will recover. Mr. Moore, of Heddington, whilst out with the Duke of Beaufort's hounds, staked a valuable horse, and sustained serious injuries. Mr. Wadworth, of Devizes, was thrown and had his arm broken. A fine hunter which the Marquis of Worcester was riding slipped and dislocated his shoulder. Colonel Arthur was severely injured about the head; and Major Trench, while out with the Heythrop hounds, was thrown and fractured his right arm. Major Tremen received injuries so severe that Sir James Paget was hastily summoned to his assistance. Mr. Gilroy's (of Craigie) horse took fright, and pitched him off with so much violence amongst the trees that his face was sadly disfigured, and some bones broken, by coming in contact with the trunks of some of them. Mr. J. H. Gascoigne, while out with the Meynell hounds, was thrown while jumping and dislocated his shoulder, and received other injuries of an alarming character. Mr. George Brown, of Tedbury Park, was thrown with considerable violence, and sustained a lacerated scalp wound several inches in length. Numerous minor accidents are recorded, all of which tend to show how eagerly country gentlemen and those who can afford to indulge in the expensive luxury of horseflesh and the chase will do so, in spite of its attendant risks to life and limb.

A letter from a sporting gentleman, in the last number of *The Sporting Magazine*, gives some idea of the cruelty of the huntsmen of a former generation, and which may be food for reflection for the vivisectionists. It appears that the Nimrods of the period were much given to badger hunting, and on one occasion an unfortunate animal furnished the gentlemen of the hunt with sport for several days. On the first day he was turned out, and received ten minutes "law" before huntsmen and hounds pursued him, and he then gave them a three miles' run before he was caught and brought back in a bag. On the second day his "law" was increased to half-an-hour, and a man mounted on a fleet horse was sent after him to flog him on; but he ran so fast that his pursuer could only get an occasional cut at him, although furnished with a very long whip, and at the end of "*a glorious run of twenty-five miles*" he was once more taken alive and brought back. A third day's torture came, with a three-quarter's-of-an-hour's "law," and produced a run of eighteen miles, after which the badger was once more bagged; and but for the poor brute having been carelessly starved to death, or, in the words of the writer, "came to a premature death," this kind of amusement would have been kept up until Councillor Jenkins, one of the huntsmen, should have been duly furnished with his hams, "for," says the writer, "it was the custom of that part of the country to cure the posteriors of badgers and eat them for hams."

The Army Medical and Pharmaceutical Services in Russia and Turkey.

THE possible outbreak of war between Russia and Turkey may give interest to a few particulars respecting the military pharmaceutical services, which the *Pharmaceutical Journal* quotes in its last issue :—

> "In Russia the mobilisation of the army, by which the number of troops under arms has been considerably increased, naturally required also a corresponding strengthening of the medical *personnel*. It is estimated by the military authorities that in case of war, besides the ordinary number on the peace establishment, there will be required 1,140 additional medical men, 324 pharmacists, and 60 veterinarians. The *Pharmaceutische Zeitung* says that in order to obtain this increased number in the event of an outbreak of war, a plan has been drawn up and sanctioned by the military medical department. In this it is provided that the time of discharging the students from the Medico-Chirurgical School shall be hastened, that all persons serving in the military medical reserve shall be called into active service, and that their places shall be supplied by others in the civil service, or in independent practice, and that medical men living in districts where military operations are being carried on should be induced to join the service.
>
> "The pay of physicians on active service is to range from 994 to 2,291 roubles, or from about £156 to £350 sterling. The pay of pharmacists on active service ranges from 994 to 1,411 roubles, or £156 to £220. The independent and retired practitioners entering the military medical service temporarily are to be paid from 150 to 250 roubles, or £23 10s. to £39 monthly. Pharmaceutists of this class are to be paid from £23 10s. to £30 monthly.
>
> "Concerning the Turkish apothecaries, Professor Landerer writes that those specially available in the military service are trained in a school at Constantinople. In this pharmaceutical school the French language is used by the professors, though few among their auditory are conversant with it. Their pupils are Turkish apprentices, who at some time have had the fortune to serve with some of the French and Italian immigrant pharmacists who are scattered by hundreds over the kingdom, from whom they have acquired such an amount of knowledge as a respectable German apprentice would pick up in six months. In the school they are taught botany, pharmaceutical chemistry (with practical examples, limited, however, to the preparation of plasters, ointments, and similar preparations), and the elements of physics. These pupils are remunerated by the Government, and after a theoretical pupilage of twelve to eighteen months, they are drafted into the military service."

The Royal Institution Arrangements.

IT is announced that the probable arrangements for the Friday evening meetings of the Royal Institution before Easter will include lectures by Professor Tyndall, Professor Huxley, Professor Osborne Reynolds, Mr. Francis Galton, Professor F. Guthrie, Mr. J. F. Moulton, Sir John Lubbock, Mr. F. J. Bramwell, and Professor Gladstone. The Christmas lectures, adapted to a juvenile auditory, are to be delivered by Professor Gladstone, the subject being "The Chemistry of Fire."

Outbreak of Fever on Board H.M.S. "Valiant."

On Saturday week last, at Foynes, co. Limerick, eleven sailors suffering from fever were removed in a tender from Her Majesty's ship *Valiant*, lying at Foynes, to St. John's Fever Hospital, Limerick. It was rumoured that the disease was of a malignant type, and considerable alarm was created. At the request of the mayor, Dr. Gelston, the visiting physician of the hospital, Dr. Barry, consulting sanitary officer, and Mr. Corbett attended at the office of Mr. Connolly, law adviser of the corporation. The Mayor said the captain of the *Valiant* should have communicated with him before he sent the men. He wished Dr. Gelston would telegraph to the commander to have no more of the sailors sent to Limerick. He approved of the action of the railway people having refused to send the men by rail. Dr. Gelston assured him that the fever from which the men suffered was of the mildest form, that six of them were convalescent, three convalescing, and only too ill. The Executive Sanitary Officer telegraphed to the L.G.B. for instructions, and they stated in reply that men becoming sick in vessels lying at Tarbert should be sent to the Glyn Workhouse.

The Quack's Charter.

WE referred last week to the judgment of Mr. Knox, the London magistrate, who decided in favour of a quack named Hamilton who had been prosecuted by the Defence Association. It will be instructive to place before our readers the entire judgment, inasmuch as it establishes a principle of supreme importance to illegitimate practitioners, and, therefore, indirectly to the profession. It will be recollected that "Dr." John Hamilton, of 404 Oxford Street, was recently summoned before Mr. Knox by Dr. Carpenter, on behalf of the East London Medical Defence Association, for pretending to be and using the name and title of doctor of medicine.

On the previous hearing Mr. Besley, for the defendant, stated that his client had undergone the proper examinations, and had obtained a diploma from the Metropolitan College of New York. The diploma of that college was displayed in the window of his house, and he contended that as long as Dr. Hamilton stated what he was there could be no intention to deceive the public. At the time the defendant received his diploma he was qualified to register, but, registration not being imperative, he failed to register, and could not do so now.

Mr. Knox said, that according to his judgment, a good deal of misconception appeared to exist as to the Medical Act of 1858. The meaning of that Act for present purposes was, not only that a man should not wilfully and falsely pretend to be what he was not—that was not sufficient; a man must not pretend to have a right to any of the titles and qualifications recited in the 40th section of the Act. He must not pretend to be or take or use the name or title of a physician, doctor of medicine, and so on. Neither must he use any name, title, addition, or description implying that he was registered under the Act, or that he was recognised by law as a physician, surgeon, licentiate in medicine, and so forth. Such pretence apart, any private person might, without peril from the Act, prescribe for and treat any person who might be so unwise as to trust his health and life to such untrained minds and unskilful hands. So far of laymen; but with regard to *bonâ fide* medical men, a surgeon need not be registered. The penalty for non-registration was that a man could not recover his fees and could not hold certain offices. But he must not pretend to be registered if he was not on the Register. So with regard to the title of physician, doctor, and so on. It would be found in the reported case of *Andrews* v. *Stysop* that Baron Martin—the other judges agreeing with him—laid it down as law that a man must not pretend to be on equal footing with any regularly bred and registered physician in England. The offence here was the assumption of the title of M.D., without mention of the University of Philadelphia, from which the degree proceeded. The words of the 34th section were very express. The words "duly or legally qualified medical practitioner," or any words importing a person "recognised by law"—mark the term, for it was used again in the 40th section, the penal one—when used in any Act of Parliament, should be taken to mean a person registered under the Medical Act. By the use of this simple test two-thirds of the section were got rid of, for no one surely would argue that a man who wrote M.D. of Berlin, St. Petersburgh, &c., after his name assumed to be registered under the Medical Act of 1858. It was only the first part of the 40th section which would give one a moment's pause. Persons must not pretend to be a physician, surgeon, general practitioner, or apothecary if they were not such, or use any name or title implying that they were registered. Surely that must apply to British medical titles? The whole scope and meaning of the 55 sections of the Act were the protection of the medical profession here, and, therefore, the protection of the British public, by distinguishing qualified from unqualified practitioners, and by a carefully devised system of guarantees, conceived on British forms only. That being so, from the preamble to the schedule only British arrangements are discussed. It was hard to think that when a man held himself out as a graduate of a foreign University, and trumpeted the fact forth to the world, he could in reason be said to offend against the 40th section. That brought Mr. Knox to the second point. If there was nothing illegal so far as this was concerned in the use of a foreign medical title, what right had the magistrate to inquire whether it was a genuine one, or whether it had been obtained by the merest trickery and imposture? It might be worn by a man who was an ornament to his noble profession, or by the most pitiful quack whose name was entitled to registration only in the annals of the criminal courts. Such a one might escape free under the Act, but he might be reached by the law of manslaughter or false pretences. That was one of the cases in which he might say he had strained such facilities as he possessed to see his way to a conviction, but he could not. The defendant had called himself a New York doctor, and nothing else. The summons, he regretted to say, must be dismissed.

Opium in the Treatment of Rigid Os Uteri.

It often happens that when new remedies come into vogue some of our older and most reputed agents are apt to be neglected. Opium in the treatment of tedious labours, depending upon a rigid or contracted state of the os uteri, is not so frequently resorted to now as it formerly was, chloral or chloroform being often used in its place. We are, therefore, glad to see that in the *Virginia Medical Monthly* for November, Dr. Z. Collins McElroy, calling the attention of the profession to the subject by a clinical illustration of his views and practice. In reference to his case he asks—Why is this woman's os uteri in this state of rigidity or constant tension? Is it a pathological condition, to be changed by lancet, hip-baths, chloroform, &c.? "Undoubtedly the os in this case had the physiological function of contraction to retain the contents of the womb, in all respects analogous to that of the sphincter of the bowel and bladder, whose physiological design is contraction. A rigid os uteri, therefore, is a natural process out of time, rather than a pathological one." . . . . . . "It is simply a misapplication of a natural force intended to accomplish an important end—delivery." To restrain this misapplication of force, and obtain a co-operation of all available force for the completion of labour, the profession has had recourse to various measures, but the one remedy which will most certainly effect this purpose is opium, and it is upon this agent that Dr. McElroy relies in the management of such cases.

Apropos of this subject, and of the remark we just made about our partiality for new remedies, Dr. Agnew has, in the same journal, a paper on the use of gelseminium for dilation of the cervix uteri in the non-puerperal state. He says he has found it successful in two or three cases where even very small instruments could not be introduced, and it appears from a note to this paper that Dr. R. S. Payne, U.S., had nearly two years ago found it to be of value in two cases of rigid os uteri and sphincter perinei. Whether, however, this opinion will be endorsed by the experience of other practitioners has still to be proved.

Quinine in the Treatment of Fissures of the Nipple.

Obstetric practitioners are much more in the habit of using quinine after child-birth than they were formerly, but we scarcely expected to hear that this agent would be found useful in the treatment of an affection which has always been regarded as more amenable to local than to constitutional remedies. Dr. Le Diberder, however, chief physician to the Lorient Hospital, is of opinion that the frequent failure of local treatment arises from the fact that this affection is only a manifestation of general disorder of the system. He says that the appearance of the fissures is soon followed by a general febrile state, of an intermittent nature, and during which the local affection is very likely to pass into engorgement of the breast, and even abscess. Accordingly, he thinks quinine will prove to be of the greatest service in those cases; and during a long experience of it he has always found that a cure was effected in from three to five days. He generally prescribed a dose of six grains early in the morning, and a similar dose about eleven o'clock a.m. Local treatment was considered of secondary importance, being confined chiefly to poultices and some simple wash or salve.

Ergot as a Preventive of After-pains.

In the same paper from which we have made the above note (*Annales de Gynécologie*, Sept. 1876), Dr. Le Diberder makes some observations on the use of ergot in the prevention of after-pains. He gives half a drachm in divided doses, directly after the expulsion of the placenta, with the object of bringing about a firm and persistent contraction of the uterus, in place of the alternate contractions and relaxations to which after-pains are due.

This treatment is by no means original, as we have known it to be adopted by several practitioners, especially those who practise it in the country. We doubt, however, its propriety or its success in all cases. In reference to this subject, we think it is not generally known that Sir Charles Locock was of opinion that these pains are in a great measure owing to the retention of coagula in the uterus and cervix uteri. He was therefore for many years in the habit of making firm pressure on the uterus directly after delivery, so as to promote their expulsion, and even of drawing them from the os and cervix uteri, when their expulsion was delayed. He used to say that in no instance where this practice was adopted, had after-pains occurred.

Abortion-Mongering in Melbourne.

If we are to judge from an article in a recent number of the *Melbourne Medical Record* the morality of the inhabitants of that town is rather at a discount. "Dr. Youl," observes the editor of that journal, "said truly in summing up in the case of Florence Derry, who died from acute peritonitis, consequently on a miscarriage, that abortion was procured daily. His practice as a doctor was limited, compared to others, but women had come to him, applying to have abortion procured upon them. He could not understand how medical men, supposed to be respectable, descended to such practices, but he was well aware they did. They might be actuated sometimes by pity, but no doubt it was more frequently money.

"The doctor's experience is that of every medical man in Melbourne. Scarcely a day passes that they are not applied to. From the needle- or servant girl who tenders her half-guinea fee for 'something to bring on her courses,' to the victim of more genteeler pretensions, who insinuates in a confidential manner, 'If you put me all right, doctor, my friend will pay you anything you like to charge.' Not long since an American captain was surprised that a medical man should refuse to take one hundred guineas to procure abortion, and yet that man, and it must be said to his credit, was hourly expecting the bailiffs to be put into his house for rent."

We are glad to see that, at any rate, the immorality above referred to is not in any way shared by the profession in Melbourne. To have the offer of one hundred guineas just at the time when the bailiffs are about entering your house, is certainly no small temptation.

The mortality at Alexandria is exceedingly high just now, averaging 54 deaths per 1,000 of the population, about double the rate at present existing in any of our Indian cities.

Illegal Practitioners and the East London Medical Defence Association.

Due acknowledgment and thanks are due from the profession to the East London Medical Association, for the crusade it is undertaking against the unqualified and irregular practitioners of London. In the comments which we made in our last issue, on the judgment recently delivered by Mr. Knox in the case of the notorious "Dr." Hamilton, we drew attention to the mischief which would result if that judgment is allowed to go unchallenged. We are, therefore, glad to hear that the above Association has appealed against Mr. Knox's ruling, and that the question as to whether the mere possession of some American diploma is to entitle any one to practise, will be soon settled in the Court of Exchequer. A great deal will depend upon this forthcoming decision, for were it to be in favour of these so-called American doctors, the more densely populated districts of the metropolis would soon be inundated with a class of practitioners which would entirely frustrate the objects of the Medical Act of 1858, and would do incalculable mischief as regards the interests of society and the dignity of the profession.

From the following account, however, of another prosecution under the Medical Act, it would seem that Mr. Knox has seen reason to modify the opinion he gave on the last occasion. The "Dr." Bell referred to, was we believe, a quack of the worst type, and was exposed in the well-known book on "Quacks and Quackery."

It appears that Henry Thos. Lewis, of 102 Wardour St., was summoned before Mr. Knox, by Dr. Robert Carpenter, on behalf of the East London Medical Defence Association, for unlawfully and falsely pretending to be and taking and using the title of doctor in medicine, contrary to the 40th section of the 21 and 22 Vic., c. 90, known as the Medical Act.—Mr. Pridham prosecuted; Mr. Henry Kisch, barrister, appeared for defendant.—Mr. Knox, after hearing the evidence, remarked that in the present case the defendant had assumed to be Dr. Bell, a person who, by the mouth of his own witnesses, was proved to be long since deceased. The detective went into the shop; he asked for Dr. Bell. The defendant said he was Dr. Bell, and handed to the detective a card as his, with the title inscribed on it. He then remarked on the detective's sickly appearance, and offered to provide him with a bottle of medicine for 6s. which would do him good. Now, merely the assumption of the title of doctor, with nothing more, may mean one of several things; but when a man holds himself out as a doctor in a doctor's shop, and offers to prescribe for you, surely it is not a violent inference to draw that he holds himself out as a doctor of medicine and not doctor of law, of music, and so forth. Then as to the words "artfully and falsely," in the statute. Surely, as in this case the defendant assumed to represent a dead man, there could be no great doubt as to this point. He held himself out as Dr. Bell, and practised medicine. This is a clear case of a violation of the Act of Parliament.—The full penalty of £20 must be paid, and £1 3s. costs.

Remarkable Longevity.

Dr. Ornstein, of Athens, reports in *Virchow's Archiv* (says the *Boston Journal of Chemistry*) the death in Smyrna of George Stravarides, at the age of 132 years. Although this Methuselah had always lived an irregular life, and had consumed an average of more than 100 drachms of brandy daily, he retained the full possession of all his five senses—as also a complete set of teeth—up to the moment of his death. He also continued to the last to attend to the duties of his avocation—a baker. This man was born in 1743, in the reign of Mohammed I., and lived during the reigns of nine Sultans!

SEVENTY-FIVE deaths from small-pox occurred in London last week, against 85 and 78 in the two previous weeks,

MR. SYDNEY GIBBONS has recently delivered a lecture before the Australian Health Society at Melbourne, on "Kissing and its Consequences," his object being to show that many forms of disease, especially those presumed to depend upon fungoid bodies for their reproduction, are communicated by this means. We urge the attention of the promoters of the new city of Hygeiopolis to this item.

AN Act to restrict the use and sale of poisons in the province of New South Wales, came into force on September 1. In accordance with the 9th section, the Governor, with the advice of the Executive Council, has for the purposes of the Act appointed a Board of Pharmacy, consisting of the President of the New South Wales Medical Board, the medical adviser to the government, and the Council of the Pharmaceutical Society of New South Wales.

THE Society of Public Analysts, says the *Chemist and Druggist*, seems to be in serious trouble. The president (Dr. Redwood), vice-president (Mr. Wanklyn), and treasurer (Dr. Stevenson) have all resigned their offices, generally accompanying their resignation with some observation not complimentary to the faithful few who remain.

While the star of the Public Analysts' Society seems to be declining, a new association with more ambitious aims is in process of formation. A number of eminent chemists are aiming to organise a "guild," membership of which is really to signify chemical ability. Several meetings have been held, and at present a sub-committee is considering the constitution of the proposed organisation.

◆

MEMORIAL TO THE LATE DR. BEATTY OF DUBLIN.

THE ceremony of handing over the memorial of the late Dr. Beatty, which has been erected in St. Patrick's Cathedral, took place on Friday last, the Right Hon. the Lord Mayor Sir G. B. Owens, M.D., attending to give over charge of the tablet to the Church Representative Body.

Amongst those who were present were —

The Presidents of the Colleges of Physicians and Surgeons; Mr. Porter, Surgeon to the Queen in Ireland; Mr. Stokes, Dr. Tufnell, Dr. Guinness Beatty, Dr. Robert Beatty, Dr. Macnamara, &c.

The tablet, which is of black polished marble, with a scroll in the centre, is placed in the northern wall of the Cathedral, and over the whole, in white marble, is the crest of the deceased, with the motto, "Non vi sed arte." The scroll bears this inscription :—"This tablet is erected by his professional friends to the memory of Thomas Edward Beatty, M.D., President of the Royal College of Surgeons in Ireland, 1850, and President of the King and Queen's College of Physicians, 1864; who died on the 3rd of May, 1872, in the 73rd year of his age. Of noble nature, generous, kind, and just, he lived and died beloved by all who knew him."

Dr. Tufnell said—That as honorary secretary, the duty devolves upon him of requesting the Lord Mayor to unveil the tablet. The committee had selected this mural site for the memorial because they found it to be appropriate. They placed the tablet in close proximity to the statue of Henry Richard Dawson, the revered Dean of this Cathedral, whose existence was passed in relieving the destitute of this district; and near to that of John M'Neill Boyd, who sacrificed himself in endeavouring to save the life of others. These men were both of noble nature, and such was Thomas Edward Beatty.

Sir George B. Owens, M.D., Lord Mayor—Dr. Tufnell, let me assure you and the members of my profession whom I see around me, of the great pleasure I feel in having the honour and privilege of unveiling this tablet to the memory of the late much respected and lamented Dr. Thomas Beatty, who filled the high offices of President both of the Colleges of Physicians and Surgeons—an honour, I believe, unknown to any other member of that profession which he adorned. I, as Chief Magistrate of this city, where he spent his useful life, feel happy to do all honour to his memory. The committee, I consider, have chosen a most appropriate site for this tablet beneath the shadow of this magnificent old cathedral, where the beautiful and pealing anthems he so much loved are daily sung, and where the passing youth will henceforth look upon it, and perhaps feel a laudable wish to follow his noble example. I now commit it to the safe keeping of the dean and chapter of this cathedral, knowing well that they will guard and preserve it as a lasting memorial of a good man and a distinguished physician. Dr. Tufnell, I consider, is entitled to the best thanks of the profession for his great zeal and energy as hon. secretary of the committee in carrying out so successfully the object they had at heart.

The Dean of St. Patrick's (on the part of the representative body) took charge of the tablet. and after a vote of thanks to the Lord Mayor, the proceeding terminated.

Literature.

HANDBOOK OF RURAL SANITARY SCIENCE. (a)

THE preface explains that the first half of the book, written by Mr. Gardner, is the essay which gained a prize offered by Dr. Lory Marsh for the best paper "On the powers possessed, but not exercised by the Local Government Board, and to the effect of diversity of opinion existing amongst its advisers. As to any new powers they would suggest as desirable to invest the Board with. As to the applicability of the standards of pollution—of effluent waters recommended by the Rivers Pollution Commissioners, and the subject of the non-pollution of rivers."

This quotation will give some idea of the contents of the book.

Mr. Gardner's essay is compact and practical: after a few statistics are given on the percentage of preventable diseases, &c., and the "horrible examples" have been held up, we go into practical matters. Dwelling-houses and their construction, sewers and closets (the writer gives the merits of dry and water closets very fairly). In the chapter on Pollution of Rivers and Disposal of Sewage, we have an extract from the Commissioners' Reports, very uncomplimentary to mankind. We find that human beings constitute nearly one-third of the live stock of this country, and they consume the produce of twenty-three millions of acres, "cattle, sheep, and pigs fed on them, and imported food as well, to the extent of two-fifths of the estimated quantity of our home-grown wheat, and probably one-twentieth or more in excess of our home-grown meat. Now what does this gormandizing animal do for his country?—for his native soil (literally, we mean)—"he is virtually useless," says the report. The sheep is far more valuable, "the best live stock known to English agriculture." Seriously, this is an important matter—the time-honoured cesspool, so common in the country (*happily*, so rare in the town), is the means of returning to his potato garden, in another form, the elementary bodies which the labourer had taken from it in the crops. This is done more safely and healthily, if more expensively, by the Moule system.

(a) Handbook of Rural Sanitary Science. By C. F. Gardner, William Berry, L.R.C.P. Ed., M.R.C.S.E., C. N. Cresswell, Barrister-at-Law, and Thomas Hennell, Assist. Inst. C.E. Edited by Lory Marsh, M.D. London: Smith, Elder, and Co. 1876.

In the chapter on water supply, it is stated that "75 per cent. of village wells are more or less contaminated with sewage." This we believe to be an excessive percentage. And is it possible that drinking water at Leyland could contain 27 *per cent. of animal* contamination? ("24,360 parts in 100,000"). Surely none would consciously imbibe such mud as this!

On the whole, the standards fixed by the River Pollution Commissioners are received by the scientific as fair, but scarcely stringent enough.

Dr. Berry, of Wigan, contributes a chapter which much resembles a condensation of the essay, which occupied the first five chapters. It contains many interesting data on the subject of water supply, the average amount consumed per head of population in the larger towns being twenty-three gallons, while the amount *supplied*, or available for each person, varies extremely. Mr. Gardner tells us the ancient Romans were allowed 340 gallons ahead in the day; the New Yorkers may have 300 gallons; the London waterworks supply thirty-three gallons.

Chapter VII. is by C. N. Cresswell, Esq., barrister-at-law, and is chiefly concerned with legislative matter.

Mr. Hennell's (the last) chapter is very good: it shows the necessity for a Central Board, which exercises its "powers for obtaining information and record rather than the accomplishment of sanitary work." It grants facilities to local authorities for carrying out work. The paper also clearly sets forth the modes of operation of the various authorities in sanitary matters, and concludes with these remarks:—"The value of compulsory power in the hands of a central government is likely to be greater, in its indirect effect of imposing on the country generally the importance of sanitary work, than in any direct results which will be obtained by its exercise in the few instances in which it is brought into action."

The editor adds some final notes on the present insufficiency of health legislation, and some extracts from the essays of Dr. Ward (on sewage and the like), and of Mr. Tyson (on atmospheric impurity). It is a readable and useful book—not an exhaustive treatise—especially adapted for the *sanitating laity*—landlords, guardians, and other benevolent individuals.

◆

COMPENDIUM OF HISTOLOGY (*a*).

Professor Frey is well known in histological literature as an original observer, but especially as a compiler. Not the least valuable part of his systematic work on histology is the copious and accurate list of references at the end of each chapter. An unceasing study of the contemporary literature in this department of science is utilised in the work he has lately published as a compendium of the present state of our knowledge regarding it. Such works have an undeniable utility; but at the same time there are inherent defects attending them which it is hardly possible to avoid, and our author at least has not always succeeded in doing so. The reader of a compendium is in search of systematic doctrine and statements of facts, and is not inclined to receive patiently discussions on doubtful matters, which would indeed be worse than useless in preparing for an examination. To such students this book must prove welcome. It is not too long, is generally clear, and is decided enough to be simple and concise on many points which are still in a very unsettled state.

As most of the familiar woodcuts in Professor Frey's previous books are again made to do duty in this, with one or two new ones added, the work is copiously illustrated.

It may be noted that Waldeger's views regarding the cells of connective tissue are adopted as established facts and that the existence of stomata in capillary bloodvessels is taught as being equally beyond doubt—points which suffice to indicate the dogmatic style in which the book is written.

Those who wish to have a theoretical acquaintance with the essential points in histology will find the book useful. On the other hand, with those who are desirous of obtaining real and practical knowledge, it cannot take the place of other standard works which are now easily accessible.

The translator sometimes tries our patience. When he can do so much better, why give us sentences like these?—"Concerning the Pacinian capsules, we have abundant and no-longer-to-be-doubted material;" "I have seen them in the calf (Krause's terminal bulbs), but have not had a sufficiency of human autopsies."

"The nerves," he tells us, "after previous curved excursions or looped windings, enter the tactile bodies manifoldly." Again: "As with the subsequently-to-be-mentioned brain, &c." Dr. Cutter can write good English when he likes, and is, therefore the less to be excused for engrafting lumbering German phraseology on a flexible English stem with which it is incompatible.

◆

HANDBOOK OF THERAPEUTICS.

It is unnecessary to say much about this new edition of Professor Ringer's well-known Handbook. It has earned for itself such a position, and is so widely known, that any review of it is almost needless. A brief chapter has been added on the Gelseminium Sempervirens. But it gives rather the physiological action of the agent than says much about its use in practice. It seems most useful in neuralgia. It is rather disappointing to find little or nothing about the utility of jaborandi, an agent of much promise. Neither again is anything said about salicylic acid in the treatment of rheumatic fever. It is impossible to regard these omissions as oversights; they must be the result of design. It is clear that Professor Ringer does not regard the action of these agents as sufficiently cleared up to permit of his putting them into his handbook. Several chapters have been elaborated, as that on belladonna, for instance. The utility of belladonna in checking the sweats of phthisis, especially the night sweats of the early stages, is beyond all belief by those who have not tried it. Where the doses mentioned by Professor Ringer fail, larger doses are indicated, and may be given without fear, as in these cases there is a certain toleration of the drug. In other forms of sweating it is equally valuable. Professor Ringer evidently has his heart in his subject.

His Grace the Duke of Marlborough, Lord-Lieutenant of Ireland, has made the following appointments to the Viceregal Court and Household:—

Physician-in-Ordinary—W. Hatchell, M.D., F.R.C.S.I.

Surgeon-in-Ordinary—Philip Crampton Smyly, M.D., F.R.C.S.I.

Surgeon to Household—James Stannus Hughes, M.D., F.R.C.S.I.

Surgeon-Dentist-in-Ordinary—Robert H. Moore, Esq., F.R.C.S.I.

(*a*) "Compendium of Histology." Twenty-four Lectures by Heinrich Frey, Professor. Translated from the German, by permission of the author, by George R. Cutter, M.D. London: Smith, Elder, and Co. 1876.

LECTURES ON ORTHOPÆDIC SURGERY. (*a*)

The first point to which our attention is attracted on opening this book is the large size of the type and the wide blanks and margins. Such a criticism may appear unworthy of a reviewer; but having noticed the fact, he is apt to conclude that the author had only a certain amount to say, but that he was anxious for his words to appear in as grand and impressive a form as possible. When a so-called specialist brings out a second edition of his work, his readers have a right to expect that it will be something more than a reprint with a "few alterations." Possibly, Mr. Brodhurst may have no more information to impart, or else he would hardly have said in the *preface to the second edition*, "the volume retains the same form as before."

Essential paralysis of infants is treated on in the first chapter, where it is spoken of as giving rise to deformities, yet all that the author has to tell of the treatment of these disorders—or, in other words, of the paralysis itself—is comprehended in nine short lines of large print (p. 16).

The chapter (xviii.) on lateral curvature of the spine is well written and full, yet we find nothing in it which we should not get in Holme's "System of Surgery." Moreover, in that work we should find a complete account of angular curvature, while Mr. Brodhurst, having undertaken the subject, dismisses it in the last short chapter. We maintain that if caries of the spine belongs to orthopædic surgery, it should be treated in such a work as that now before us most thoroughly. If a surgeon invested in Mr. Brodhurst's book with a view to a better knowledge of the treatment of caries of the spine, with the newest views, he would be sadly disappointed.

Although the "contents" of these lectures are shown to be divided into three parts and twenty chapters, still the author does not consider the volume to be worthy of an index.

◆

A MANUAL OF GENERAL PATHOLOGY. (*b*)

The bare fact of this important work having been through five editions since 1862, shows in what esteem it is held in Germany, and the American translators of the sixth edition must be congratulated on the result of their endeavours to render into English what they rightly consider to be "a thorough *resumé* of the elements of medicine." Throughout the book references to authors have been carefully noted, whilst the metric measures and centigrade thermometric scale have been retained. It seems impossible to do justice to the 700 closely-printed pages in a short review—indeed, we shall have to satisfy ourselves with merely drawing attention to what we take to be its chief features.

The book commences with the epigrammatic statement that it is impossible to give a short and clear definition of disease. The first part of the work (29 pages) is taken up with "general nosology," and the following hundred pages are occupied with "general etiology," in which the predisposing and exciting causes of disease are passed in review, such as age, sex, atmospheric influences, soil, climate, and occupation. In this part also is included a comprehensive account of the vegetable and animal parasites, and we read that Dr. Wagner considers porrigo tonsurans to be of a nervous, not parasitic, nature. The second part concludes with the consideration of contagions and epidemics. The third part is devoted to general pathological anatomy and physiology, and the fourth to the pathology of the blood.

In the account of pyæmia we read that the disease is started by the absorption from without of substances which are mechanically or chemically noxious. What is called "embolic pyæmia" causes the majority of fatal cases after severe operations in hospitals, and the large mortality in lying-in-hospitals, in proportion to that in private practice. When treating of fevers the attention of the physician is directed to the condition of the arterial pulse. Nor is such a direction out of place, for students of the present day seem to be taught less of this great index to the physical condition than was formerly the case. Indeed, except with a certain few teachers, a *quick* and a *frequent* pulse are the same thing. Thermometers and sphygmographs ought not to take the place of the physician's hand or finger; they should be merely supplemental aids to diagnosis.

A careful account is given of the variations in the amount of the various excreta in fever, together with the opinions of numerous authorities as to the effects of refrigeration, as well as of the essential phenomena of the disease. Many pages of small print are devoted to the discussion of the various fever theories; but as regards the subject of hæmophilia, the author tells us nothing new. He seems to infer, however, that a disproportion between the amount of blood and the capacity of the blood-vessels may in certain cases account for the morbid symptoms.

The short account given of syphiloma is very clear, notwithstanding that it is the digest of the views of upwards of a dozen authors whose names are given in the bibliography. The connective tissues are said to be the starting point of deposits, which are generally composed of cells, nuclei, and new formations of connective tissues. The membranes affected are rendered incapable of performing their function on account of the deposit pressing on nerves, capillaries, and ganglion cells. "In canals (p. 436) there results, besides a contraction which exists, an influence which varies with the locality." In this way the advent of syphilitic pneumonia is explained, for in cavities containing air the new growth eventually produces complete evacuation of the air, and the part becomes solid.

There can be no doubt that the translation of Wagner's "Pathology" is a great addition to our standard works in this department of medical literature, but we are bound to state that we have rarely come across so ill-written a book, even in a translation from the German. True, Dr. Seguin confesses in his preface that "elegance of style has not been aimed at," and that for "awkward sentences in the English" allowance must be made. But sentences eight or ten lines in length are something more than awkward, especially when they occur at short intervals in heavy reading. Occasionally, we find fourteen lines without a full stop (pp. 484, 592). To a German reader this may be of little moment, but when such peculiarities are retained in an English translation, it can only be at the sacrifice of clearness.

Correspondence.

THE LEGALITY OF FOREIGN DIPLOMAS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In your last number I read with no little interest and attention your remarks on the judgment of Mr. Knox in the unsuccessful prosecution of John Hamilton, M.D. (Metropolitan College, New York), by the East London Medical Defence Association; and while I feel that nothing is freer to give than advice, nothing easier than criticism, I must at the same time declare my opinion that the prosecution was in its "make up" and conduct singularly incomplete.

Your report, *inter alia*, states that medicine was proved to have been purchased at defendant's shop. Now if this was so, why was he not prosecuted under the Apothecaries' Act of 1815? This Act, it must be remembered, still exists, and has full force against "Dr." Hamilton and his kind, for the Act of 1858 neither gives, nor was meant to give, these irregular practitioners any protection.

Before the invention of breech-loaders a sportsman who, when game was abundant, would go out shooting with a

---

(*a*) "Lectures on Orthopædic Surgery. By B. E. Brodhurst, F.R.C.S. Second edition. London: J. and A. Churchill.

(*b*) "A Manual of General Pathology." By Ernst Wagner, M.D., Professor of Pathology in the University of Leipzig. Translated from the Sixth German Edition, by Drs. Van Duyn and Seguin. London: Sampson, Low, and Co.

single-barrelled fowling-piece, if a double-barrelled one *could* be *obtained*, would not be accounted very wise. And similarly must the prosecutors in this case be accounted for not making theirs a double-barrelled prosecution when they had the power.

However it may be in the metropolis, here in the north at any rate the Apothecaries' Act "runs," and is also much respected *at times*. It is barely four years since a deputy-judge, sitting in the Durham County Court, astonished me by his "judgment," in which he informed me that under the Apothecaries' Act I was liable to a *heavy penalty* for every bottle of medicine which I supplied to my patients upon my own prescription. I took early steps to nullify this famous decision. But as a proof that the Act is still in force against the "irregular" faculty, it is only a week to-day since Judge Meynell, in Sunderland County Court, mulcted Mr. John Coull in the sum of £20 and costs for practising as an apothecary.

The legal or judicial, like the medical, mind, is sometimes subject to variations, and consequently is not beyond enlightenment; and with this view I respectfully recommend Mr. Meynell's judgment to the consideration of his metropolitan brethren.

I am, Sir, respectfully yours,

J. C. Flanagan, L.R.C.P. Edin.

Houghton-le-Spring, Durham.

RUPTURE OF THE UTERUS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In the Medical Press and Circular of the 15th inst. I noticed a case of rupture of the uterus reported by Dr. Metge, of Inch-Gorey, but the particulars are so scanty, that to a tyro like myself it is scarcely worth reading. I do not wish to say anything against the treatment of the case, as no two cases are alike, and no one can say what is best to be done except the attendant.

To begin with, he states the funis presented, and it was pulseless. He gave her a dose of ergot, and as she was cold and the skin moist, he ordered whiskey-punch, and in less than an hour alarming symptoms set in—viz., hiccough. Now, Dr. Metge never mentions how long the patient had been in labour, nor the amount of dilatation of the os uteri, nor the state of the soft parts, nor does he mention where the fœtal head was, but the *post-mortem* shows the head impacted in the pelvis. Now, I would like to know what amount of impaction existed, and at what part of the pelvis, whether brim, cavity, or outlet. To my mind, it seems that the patient was in a state of exhaustion when first seen, hence we have the cold and moist skin, and then follows the hiccough, another symptom of exhaustion; but, although the patient may have been weak, still it was not so with the uterus, for we all know the tonic spasm produced by ergot continues in an uninterrupted role, and then the head being impacted, or any other complication occurring, the uterus ruptures, and the scene usually closes.

I shall feel obliged if Dr. Metge will kindly answer the following questions, and give all the details possible, through the medium of your columns:—

1st. State of patient as to presentation, &c.

2nd. What proportion of ergot, and what dose?

3rd. Does he attribute the rupture of the uterus to the action of ergot?

4th. Supposing such a case to occur again—that is, exhausted patient, head impacted, &c., would he not be inclined to temporise, omit ergot, give stimulants, send for forceps and deliver?

Hoping you will excuse this rambling letter,

I remain, faithfully yours,

J. M. Elliott, L.R.C.P. & S. Ed.

Rathfriland, Nov. 18, 1876.

INFLAMMATION, &c.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Should you think the following worthy of notice, you will perhaps grant them a place in your truly valuable paper. The ideas and opinions, good or bad, right or wrong, all emanate from Your most obedient,

Alex. Lane, M.D., R.N.

Douglas, Isle of Man.

1. Inflammation is simply increased arterial action, let the case and cause be what they may.
2. The word "Fever," as applying to a substantive disease is a "misnomer," the disease for which it stands might just as well be called "cephalalgia." It is simply a symptom of increased arterial action, particularly in the digestive organs, too often ending in some species of enteritis.
3. Intermittent fever does not exist as a specific disease; the disease is truly ague produced by a specific poison, has one paroxysm and three stages, the cold, hot, and sweating.
4. Gout, one paroxysm of increased arterial action caused by an excess of chalky or earthy matter in the blood. As soon as this foreign matter has been deposited round the joint or joints, the increased arterial action ceases, the pain ceases, and the cure proceeds gradually.
5. In about 1845 I found that the acetic acid of the acetate of lead had a greater affinity for the active principle of opium than lead, and consequently the latter in combination have been set free and the compound useless, thus deceiving both patient and medical attendant for a long period. I proved that opium was no protection, that the lead by itself was not poisonous, and I gave it by itself in doses of ten grains.
6. You cannot cure gout because you cannot arrest the increased arterial action of the arteries of the toe, which is kept up until all earthy matter has been deposited.

On looking calmly over the whole matter, it appears to me that increased arterial action is the active principle of almost all diseases, let the causes be what they may; but what can one think when a physician gravely states in print that fever or heat of skin is the cause and not the result of ileo-coloritis; how a hot skin, the result of incraased arterial action, could produce "enteritis," the actual result of increased arterial action itself, I cannot possibly imagine; it is, therefore, the insidious action of this you have to contend against under a large variety of shades; but chronic affections have nothing in common with this, such as dyspepsia in all its shapes and varieties, depending chiefly upon debility, and following each other in almost ridiculous varieties; because debility of the blood depends upon debility of the stomach, and this depends upon poverty of food; but debility of this organ may be said to be the chief couse of general debility, you can look at them and trace them to their source as you have thousands of examples in patients.

◆

Obituary.

FIFTY YEARS AN IRISH POOR-LAW MEDICAL OFFICER.

DEATH OF DR. WILKIN.

Died at his residence, Lisbellard, County Fermanagh, on Friday, the 15th inst., after a comparatively short illness, Dr. James Wilkin, in the 85th year of his age. A brief outline of his long and useful career may be of some interest. When a very young man he was attached to the army in the Peninsular War, and saw active service; and at the peace of Waterloo he returned to his native country, where he has constantly resided ever since, spending his time and talents usefully and honourably. In 1827 he was appointed medical officer of the Churchill Dispensary, under the patronage of the Marquis of Ely, and for a period of over twenty-three years discharged the duties of that office with credit and ability. And when the Medical Charities Act came into operation he was appointed medical officer of the Ely Dispensary in the Enniskillen Union, and the Churchill Dispensary in the Ballyshannon Union, where he laboured for over twenty years, with the utmost satisfaction to all concerned.

In 1872, being then over eighty years of age, he tendered his resignation to the committee of management of the Ely Dispensary, and by that body reluctantly accepted, and resolutions were unanimously adopted requesting the Board of Guardians to recommend to the Commissioners that the highest rate of retiring allowance be given him—expressing their regret at losing the services of a laborious, efficient, and obliging officer. He next tendered his resignation to the Churchill Dispensary Committee, who adopted similar resolutions. Shortly afterwards the committees and friends presented him with an address suitable to the occasion, warmly worded and accompanied with a valuable piece of plate bearing an appropriate inscription.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted Licentiates of the above college on December 22nd :—

Ballard, Philip, Bromyard.
Bull, James Weston, Guy's Hospital, S.E.
Clapp, Robert, Teignmouth.
Ellis, Philip Mackay, St. George's Hospital, S.W.
Eve, Frederick Samuel, St. Bartholomew's Hospital, E.C.
Ferguson, John, Ardwick, Manchester.
Green, Alfred Withers, Guy's Hospital, S.E.
Gross, Charles, Guy's Hospital, S.E.
Harris, Arthur Byam, Wotton-under-Edge.
Jones, Valentine Llewellyn Watson, Dowlais.
Masani, Hormasji Dadabhoy, 3 Bulstrode Street, W.
Moone, John, 63 Queen's Crescent, N.W.
Perry, Francis Frederick, University Hospital, W.C.
Robinson, Ernest Laurie, St. George's Hospital, S.W.
Robinson, George Winsor, St. Thomas's Hospital, S.E.
Wallis, Kenneth Serjeant, Edmonton.

The followinng candidates having passed in medicine and midwifery, will receive the college licence on obtaining a qualification in surgery recognised by this college :—

Dingle, William Alfred, Millbrook, Southampton.
Gomes, Dominic Anthony, 85 Hereford Road, W.

Title of a Sanatory Establishment to be opened by the Secretary of the Irish Society for Abolition of Vivisection—Swifte's Hospital.

South London School of Chemistry and Pharmacy.—The Annual Festival Dinner of past and present students of this popular school was given on Friday evening last in the large hall of the Horns, Kennington, Dr. Muter in the chair, with Mr. Baxter vice-chairman. The hall was filled with an enthusiastic and appreciative audience, many members of which having come from all parts of the kingdom to do honour to their much respected teacher and host, Dr. Muter was also supported by members of the medical profession, and by representatives of the medical and pharmaceutical press. Altogether a very pleasant evening was spent, every one wishihg that continuance of success it has met with in the past.

An Irish Surgeon in Bulgaria.—The Bulgarian correspondent of the *Times* writes as follows regarding a young Dublin surgeon :—"Hospitals, of course, are of but little utility unless the services of medical men can be secured in connection with them. Native doctors could not be persuaded to leave Philippopolis to undertake the arduous duties which would have been imposed upon them ; Greeks and Armenians did not sufficiently sympathise with the Bulgarians to tender their services ; and Turks, had they volunteered, would probably have felt as uncomfortable in the circumstances as the patients upon whom they attended. Fortune, however, favoured Lady Strangford, for at Bazardjik she met with a young Irish doctor, Dr. Stoker, who enlisted in the service of Lady Strangford. I cannot speak too highly of the active and energetic manner in which this young doctor discharges the duties entrusted to him. He rides here and there through all the weathers, and over the abominable roads of the country, visiting the different hospitals, supplying medicines, and bringing into the sick wards a bright and smiling face, which wins at once the confidence of the patients."

NOTES FROM OUR EXCHANGES.

Edited by John W. Martin, M.D., Dronfield.

Late Assistant Surgeon Mayfield Factory Dispensary, Portlaw, Ireland.

(*Archives of Clinical Surgery*, Sept., 1876.)

The successful application of the galvano-puncture to the treatment of ununited fracture is reported (p. 117) by J. E. Brown, M.D., House Surgeon, Brooklyn City Hospital, Brooklyn N.Y., as having occurred in the clinique of Dr. Minor :—

C. W., male, æt. 31, always healthy, sustained a compound fracture of the tibia and fibula at their middle third, left leg, by the fall of a bale of jute weighing two hundred pounds.

At the end of three months the external wound had healed ; the fractured bones, however, were only united by ligamentous tissue. All other means failing, galvano-puncture was resorted to. The needles were inserted between the fragments twice a week, and the current allowed to pass through them for about five minutes at each time. The treatment was continued for two months, when ossification was complete. Patient was discharged with a sound leg.

A case of the same nature, the humerus being the bone affected, is also reported by Dr. Brown as having occurred in the clinique of Dr. Speir, successfully treated by resection, the ends of the bones being wired together, the wound closed, and immobility of the limb secured by means of a Richardson's splint. At the end of six weeks, firm union had taken place, the wires were removed, and the wound allowed to heal.

C. A. Palmer, M.D., House Surgeon at the Mercy Hospital, Chicago, Ill., reports (page 117) a successful case of ovariotomy, as having occurred under Dr. W. H. Byford's care. Tumour was of three years' growth. Assigned cause, an attack of Syrian fever, from which the patient had suffered some years previously. The abdominal incision was about five inches in length, made in the median line. There were a few adhesions, easily broken down with the hands. The cyst was of the unilocular variety, weighing with its purulent contents, nine and three-quarter pounds. Partial evacuation of its contents was practised with the trocar. The pedicle was tied with a double ligature. No mention is made of the nature of the ligature or its subsequent treatment, whether secured outside or dropped back into the cavity of the abdomen. A roll of cotton was placed over the closed wound, all being secured by a flannel roller. The patient did well, being discharged cured in twenty-three days.

An unsuccessful case of ovariotomy is reported from the Troy Hospital, Troy, N.Y., by Dr. C. C. Schuyler, Assistant Surgeon (p. 120). The patient was under the care of Dr. Le Roy McLean; she was æt. 23 years ; unmarried ; growth of tumour thirteen months. Right ovary affected. When admitted under Dr. McLean's care, she presented the appearance of a woman eight or nine months pregnant ; her general health was good and menstruation regular. After operation, the cyst was found unilocular ; there were no adhesions, and the pedicle is described as good ; this was transfixed, and held crosswise of the incision, by a large accupressure needle. Having been the subject of bronchial affection, a fact unknown before the operation, distressing cough and excessive secretion in the bronchial tubes set in five hours after the completion of the operation. This complication refused to yield to every form of treatment. Owing to it, a constant strain was evident upon the pedicle, which separated and fell back into the abdomen on the second day. The patient died on the seventh day of septicæmia.

Dr. Palmer reports a case under the care of Dr. Edmond Andrews, Mercy Hospital, Chicago, Ill. (p. 116), in which the operation of colotomy, was successfully performed March 15th, 1876, as a means of affording temporary relief to the troubles arising from cancerous infiltration of the tissues about the rectum and sigmoid flexure. Some months later the tissues about the artificial anus became infiltrated with cancerous matter ; on August 5th the whole of the cavity of the pelvis was filled with the tumour the lower extremities were œdematous. Dissolution was imminent.

R. W. Taylor, M.D., Physician to the Charity and

Bellevue Hospitals, publishes an interesting communication upon the transmission of syphilis. His remarks are based upon a series of clinical studies, two of which he makes special note of. In both, as far as prolonged and careful observation could make out, the mother was *completely* free from every trace of syphilitic taint. The facts all went to establish the transmissibility of syphilitic disease from the father to child, through a healthy mother, without affecting the latter. Dr. Taylor's observations extended over a period of several years in the case of each individual.

He also found that mercury, given to the father, has the power *pro. tem.* of destroying the activity of the disease, and that where a proper course of treatment has been submitted to, a syphilised parent will procreate a healthy child. These are facts of great importance, and are deserving, from a practical point of view, of the most careful consideration.

THE SIGNIFICANCE OF AN UNRUPTURED HYMEN IN PREGNANT WOMEN.

Professor Gustav Braun, of Vienna, in the *Wiener Med. Wochenschrift* (*Med. and Surg. Reporter*, August 19th, page 152), arrives at the following conclusions in connection with this subject:—

1st. An unruptured condition of the hymen cannot alone be regarded as a sign of virginity.

2nd. The hymen may possess so much elasticity that a not very voluminous organ may penetrate the aperture without leaving any trace of its presence in the vagina, so that the individual may be regarded as a virgin in the anatomical, but not in the gynæcological sense.

3rd. Various cases show that for impregnation to be produced it is not requisite that penetration of the vagina should take place, the deposition of semen within the vulva being sufficient.

4th. The accumulated blood seems to be more favourably discharged by spontaneous openings than by operative procedure.

5th. An "*error loci*" may occur, the urethra taking the place of the vagina as a channel for copulation.

6th. An imperforate hymen cannot be regarded as a preventive of delivery.

These conclusions are based upon a series of clinical observations which place them beyond dispute.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

MR ROSSETER.—The *Veterinary Journal* has just completed its third volume. The publishers are Messrs. Baillière, Tindall, and Cox, and the subscription per annum is 18s. We are informed by the publishers that one or two of the early numbers are out of print.

G. B. C.—The question of copyright was settled at the end of last month in favour of the plaintiffs. We do not remember at which court; the parties concerned would probably give you the information you seek more fully.

FEES FOR THE EXAMINATION OF LUNATICS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly inform me in your next issue of the MEDICAL PRESS on the following:—

I was called on the 16th to visit a supposed lunatic and received £1 1s. from his relatives. On the 18th, I attended with two magistrates to examine and certify. Was I entitled to claim from them also an order for my fee on the board of guardians?

I am, dear Sir,
Your obedient servant,
E S.

[We doubt that the magistrates could legally order payment of a fee in such case. By Sec. 10 of 30th and 31st Vic., cap. 118, the justices are directed to "call to their assistance a medical officer in the case of a person *discovered and apprehended* under circumstances denoting a derangement of mind and a purpose of committing a crime." By Sec. 14 of 38th and 39th Vic., cap. 67, it is made "lawful for any two justices causing any person to be examined by any medical officer as *therein mentioned*," to order a fee. We rather think that the words "discovered and apprehended" confines the justices to cases in which the police, not the relatives, are the acting parties. In any case, the justices have a complete discretion, and may or may not order a fee as they see fit, even although the examination and certifying be done at the instance of the police. We have, however, been able to discover nothing in either the Medical Charities' Act or the Lunacy Acts, or the Dispensary regulations to compel the medical officer to attend the magistrates for such duty, and, so far as we can form an opinion, we believe that the medical officer need not attend unless his fee is guaranteed.—ED. M. P. & C]

MEDICUS, referring to the articles that have appeared from time to time on the subject of adulteration, wishes our opinion upon "thick" and "thin" cocoas. If he will refer to the analytical reports published in our columns some time since, he will find that *all cocoas which thicken in the cup are adulterated with starch*. There is no exception to this rule, as it is as impossible to make a thick fluid with pure cocoa powder as with tea or coffee. The best cocoa contains about 50 per cent. of natural cocoa oil or butter, and this has been found to be far too large a proportion for ordinary digestions. Dr. Muter says: "The only objection which can and does exist to its use in a state of purity is the excessive proportion of fat, which renders it too rich for most digestions, and gives, unfortunately, a colourable excuse for its adulteration." . . . In the best and highest priced cocoas and essences this excess of fat is removed for the purpose of rendering the article more easy of assimilation Our correspondent can now judge for himself which is the better to take, "thick" or "thin" cocoas."

OBSTETRICAL SOCIETY OF LONDON.—On Wednesday next, at 8 p.m., the Annual Meeting of this Society will be held. Election of officers and council will be the principal business, after which the President will deliver an address. Cases of "Trismus Nascentium and Pyæmia in Children" will be brought forward by Drs. Napier, Roper, and Edis.
